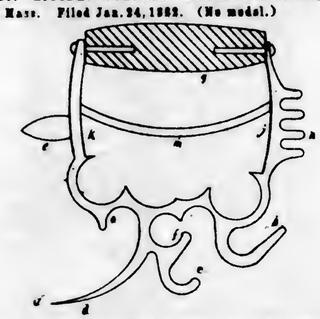
Claim.—The double-pointed nail herein described, constructed from plate metal, and having the points substantially in line with its lateral edges, from which points the prongs are beveled inward and backward, so as to nearly meet at the inner edge of the dividing slot or space, and having a wide flat head in the same plane with the prongs, substantially as described.

254,426. RAILWAY-SEMAPHORE. WILLIAM ZIMMERMAN, Chicago, Ill. Filed Aug. 16, 1881. (No model.)

Brief.—The signal-boards are pulled to "safety" through cable-connections on winding-drums having clutch-connection with a winch, the drums being held by pawls when the winding-clutch is disengaged, the signals going to "danger" by their own weight when the pawls are raised.

Claim.—1. A signal apparatus, M, in combination with an operating apparatus, N, consisting of a drum, *e*, clutch *r*, lever *f*, rope *m*, and feathered shaft *i*, operating substantially as specified.



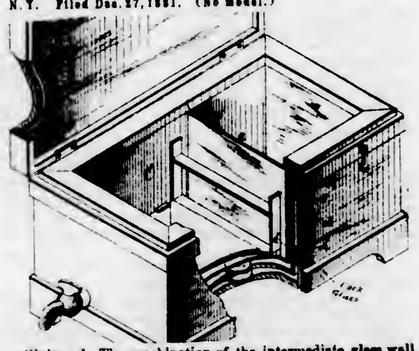
2. The shaft *i*, provided with feathers *n* and clutches *r*, operated by levers *f*, in combination with the drum *e*, ratchet-wheel *a*, pawl *k*, rope *m*, and signal apparatus M, substantially as specified.

3. The feathered shaft *i*, provided with clutch *r*, operated by lever *f*, spring *g'*, rod *p*, and cord *s'*, in combination with drum *e*, ratchet-wheel *a*, and pawls *k* and *c*, substantially as specified.

4. The combination of the drum *e*, ratchet-wheel *a*, pawl *k*, rod *r*, and cords *s*, substantially as specified.

5. In combination with a signaling apparatus consisting of a housing having an end opening, into and out of which pass colored signal-boards, and side openings to expose an interior light for the purpose of bringing before it screens attached to and forming a part of the signal-boards, and of the same color, arranged to fall automatically, the strand, and mechanism, substantially such as herein described, connected therewith, whereby said signals are held out of "danger," and by means of which any one or number of signals may be dropped into or removed from the position of "danger," and in which, by the breaking of said operating apparatus, the signal boards and lights will indicate "danger," all constructed to operate substantially as and for the purpose specified.

254,427. KITCHEN UTENSIL. BENJAMIN F. ADAMS, Springfield, Mass. Filed Jan. 24, 1882. (No model.)



Claim.—1. A kitchen utensil embracing in its construction a non-conducting handle, *g*, and the uprights *j* and *k*, having hooks *d* and *b*, substantially as shown.

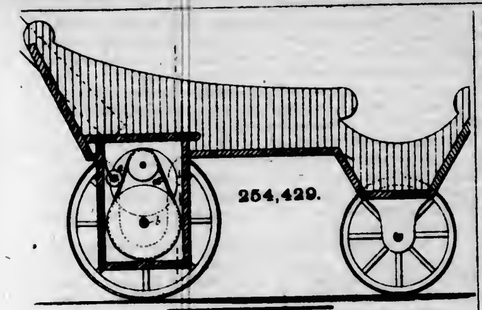
2. The upright *k*, having can-opener *c*, in combination with an upright, *j*, a handle, and one or more hooks, arranged for convenient use, substantially as shown, for the purposes stated.

3. In a kitchen implement having uprights *k* and *j* and a non-conducting handle, *g*, the stove-lid lifter *d*, notched for use as a nail-puller, substantially as shown.

4. In a kitchen utensil, the uprights having one or more hooks arranged at convenient points below, and having a non-conducting handle, substantially as shown.

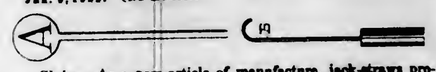
254,428. SICK-ROOM REFRIGERATOR. SAMUEL F. CRUSS, Brooklyn, assignor of one-half to Joseph J. Walton, New York, N. Y. Filed Dec. 27, 1881. (No model.)

Claim.—1. The combination of the intermediate glass wall, the elastic supports therefor, the air-spaces, and the external and internal walls of a refrigerating-chest, substantially as described.



2. The reversible ice stool or support with a glass plate affixed to its perforated bottom, substantially as described.

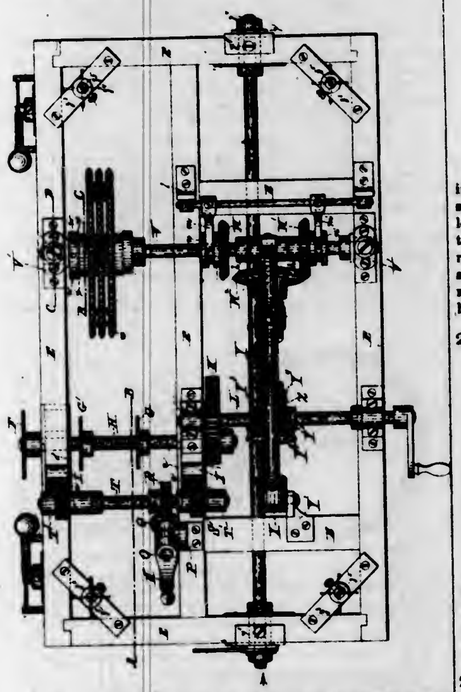
254,429. TOY OR CHILD'S CARRIAGE IN COMBINATION WITH A MUSICAL BOX. CHARLES H. CRANDALL, Montrose, Pa., assignor to the C. H. Crandall Company, same place. Filed Jan. 9, 1882. (No model.)



Claim.—1. A child's carriage in combination with a musical box, substantially as described.

2. In a child's carriage, one or more of its axles provided with a pulley-wheel, in combination with a musical box and pulley fixed thereto, and an endless belt, substantially as shown and described.

3. In a child's carriage, the combination, with a musical box and pulleys and endless belt, of a spring friction-pulley, as and for the purpose described.



254,430. JACK-STRAWS. CHARLES H. CRANDALL, Montrose, Pa., assignor to the C. H. Crandall Company, same place. Filed Jan. 9, 1882. (No model.)

Claim.—As a new article of manufacture, jack-straws provided with letters or numbers, or both, as and for the purpose described.

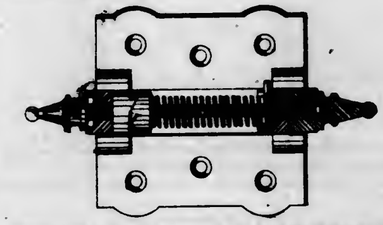
254,431. ICE-CUTTING MACHINE. CHARLES H. CUTTER, Worcester, Mass., assignor of one-half to Edmund Converse, same place. Filed July 23, 1879.

Claim.—1. In a machine for cutting ice, the combination, with shaft V and propelling-wheel U, of the eccentric hub-piece *v* and its head *x*, provided with holes *w*, substantially as and for the purposes set forth.

2. The combination, with frame E of the ice-cutting machine and shaft V, carrying propelling-wheels upon an eccentric hub, of adjustable shaft H, marking-saw G, and cutting-saw F, arranged in relation to each other substantially as and for the purposes set forth.

3. The combination, with marking-saw G and cutting-saw F, of a second marking-saw, G', and an adjustable shaft, H, operated by means of cog-wheels and worm-gears, substantially as and for the purposes set forth.

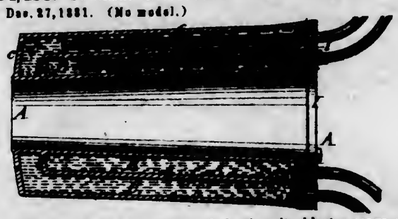
4. The combination, with shaft H and frame E, of curved socket-pieces *b b*, geared segment-pieces I I, shaft T, worm-gear R, spur-gears S S, operating-crank N, and its shaft O, provided with worm-gear Q, substantially as and for the purposes set forth.



5. The combination, with shafts H, X, and L, relatively arranged and supported as described, of gears W, W', W^2, Y^2, Y^3, Y^4, and Y^5, substantially as and for the purposes set forth.

6. In an ice-machine, a frame, Y, pivoted at one end upon the shaft V, carrying the propelling-wheels, and adjustable vertically at the other end, in combination with shaft X, supported thereby, worm gearing-wheels upon said shaft, and worm-wheel Y^4, whereby shafts X and L are supported in relation to each other as and for the purposes set forth.

7. The combination, with the frame E of the ice-cutting machine and cross-pieces z^2, of upright parts z^3, upright shafts z', trucks or wheels z, and adjusting-screws z^4 z^4, said parts being constructed and relatively arranged substantially as and for the purposes set forth.



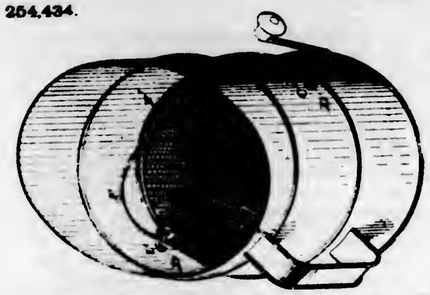
8. The combination, with the frame E, provided with stop-pins z^{12}, of guides z', fulcrumed at the point z^{13}, and provided with operating-handles z^{11} and downwardly-projecting parts or flanges z^5, substantially as and for the purposes set forth.

254,432. SPRING-HINGE. IRA S. DAVIS, Detroit, Mich., assignor to the Edwards Manufacturing Company, same place. Filed Dec. 5, 1881. (No model.)

Claim.—In a spring-hinge, an automatically-operating locking device acting by means of the longitudinal elasticity of a coiled spring, which also operates the hinge, and a pintle connecting the leaves of the hinge, and having thereon a shoulder or stop adapted to force open the locking device when the pintle is moved in a direction contrary to the longitudinal pressure of the spring, said said pintle being connected with the locking device, whereby neither can be rotated independent of the other, substantially as herein shown and described.

254,433. TUYERE. NICOLAS A. DIDIER, Pittsburg, Pa. Filed Dec. 27, 1881. (No model.)

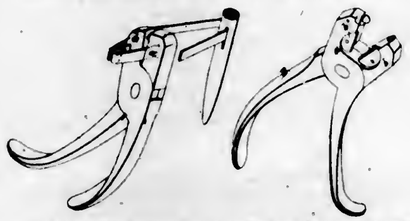
Claim.—A furnace-tuyere, A, having its blast-passage surrounded by two separate water-chambers, B and C, the outer chamber, C, extending over both the side wall and front end of the inner chamber, with a separate water supply and discharge for each chamber, substantially as and for the purposes set forth.



254,434. COMBINED FLOUR AND MEAL SIFTER. NAPOLEON DU HAIL, Cincinnati, Ohio, assignor to Brainerd T. Smith, Covington, Ky. Filed Dec. 10, 1879.

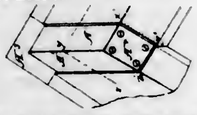
Claim.—1. In a sifter, the combination, with body A, hemispherical sieve B, and a suitable shaft, of the agitator, consisting of wires F F', collars E E', and short sleeves D D', projecting from the ends of the frame and journaled in the said body, as set forth.

2. The wire shaft G, having crank-handle *g'* and non-circular extremity *g*, in combination with the agitator, consisting of wires F F', collars E E', and short sleeves D D', the inner sleeve, D, being formed non-circular interiorly, as set forth.



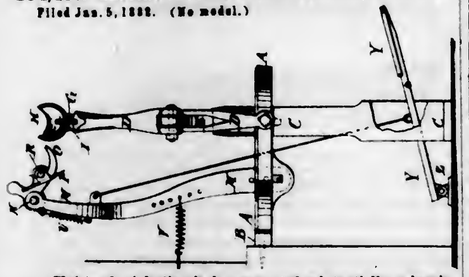
3. The combination of wire circles F F', having bent portions

254,434.



f at their mid-length, collars E E', having holes *e e*, adapted to receive the ends of the circular wires, the short sleeves D D', and shaft G, as set forth.

254,435. CAR-SEAL SET, CUTTER, AND EXTRACTOR. HEZEKIAH M. FOOTE, Lansing, Minn. Filed Dec. 31, 1881. (No model.)



Claim.—The hereinbefore-described tool for securing, cutting, and extracting seals, in which the clamping, cutting, and eyelet-setting jaws are combined, substantially as and for the purpose specified.

254,436. METALLIC CORNER FOR BOXES. DE LANCY FERRONE and RICHARD B. PERKINS, Horseheads, N. Y. Filed Dec. 13, 1881. (No model.)

Claim.—The corner-piece consisting of the outside and inside plates, A A', having, one, beads *a*, the web A^2, connecting these together, the top plate, A^3, and the base-plate A^4, all cast in one piece, as set forth and shown.

254,437. LASTING-JACK. GEORGE W. HUTCHINS, Dover, N. H. Filed Jan. 5, 1882. (No model.)

Claim.—1. A lasting-jack constructed substantially as herein shown and described, and consisting of the cam-frame A, having spindle F, the swiveled bar E, the hinged lever D, the hinged bar G, the hinged bar M, provided with the curved arm O, having prongs P and spring U, the spring V, and the treadle Y, as set forth.

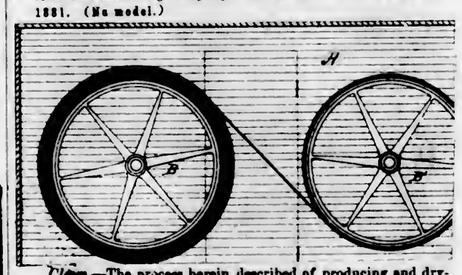
2. In a lasting-jack, the combination, with the frame A and the treadle Y, of the hinged bar M, the curved arm O, having prongs P and spring U, and the spring V, substantially as herein shown and described, whereby the upper can be drawn into place upon the last by operating the treadle, as set forth.

3. In a lasting-jack, the combination, with the frame A, having a cam edge, and the swiveled bar E, of the lever D, substantially as herein shown and described, whereby the last is guided as the swiveled bar is turned upon its pivot, as set forth.

4. In a lasting-jack, the combination, with the cam edge of the frame A and the lever D, of the set-screw J, substantially as herein shown and described, whereby the jack can be adjusted to receive lasts of different sizes, as set forth.

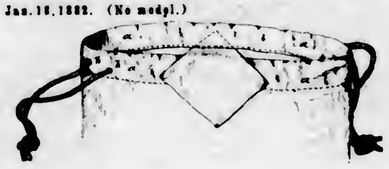
5. In a lasting-jack, the combination, with the spindle F, the lever D, and the arm G, of the swiveled bar E, having arm E', provided with a bearing, substantially as herein shown and described, whereby a firm and steady support is given to the said lever and arm, as set forth.

6. In a lasting-jack, the combination, with the swiveled bar E, provided with the projection L, of the arm G, pivoted to the said bar and provided with the concave head H, and the set-screw K, passing through a hole in the said lug, substantially as and for the purpose set forth.



254,438. PROCESS OF MAKING KEY-BOARDS FOR MUSICAL INSTRUMENTS. JOHN W. HYATT, Newark, N. J., assignor to the Bonsilatc Company, (Limited,) Albany, N. Y. Filed May 2, 1881. (No model.)

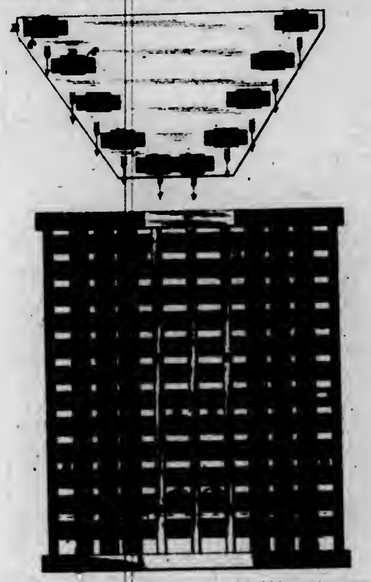
Claim.—1. The within-described process of forming a key-board for pianos or organs, which consists in, first, introducing the material out of which the black keys are to be formed in an appropriate die or mold; second, introducing in the mold the material out of which the white keys are intended to be formed; third, uniting the materials by means of heat and pressure to form a complete key-board or section thereof; fourth, securing the board or section thereof to the key-board blank; fifth, severing the keys by sawing or otherwise, substantially as set forth.



2. The process herein described of forming a complete key-board for pianos and organs, which consists in, first, forming an octave or section of both black and white keys by means of a die or mold; second, securing a number of the octaves or sections so formed to the key-board blank to form a complete key-board; third, severing the keys by sawing or otherwise.

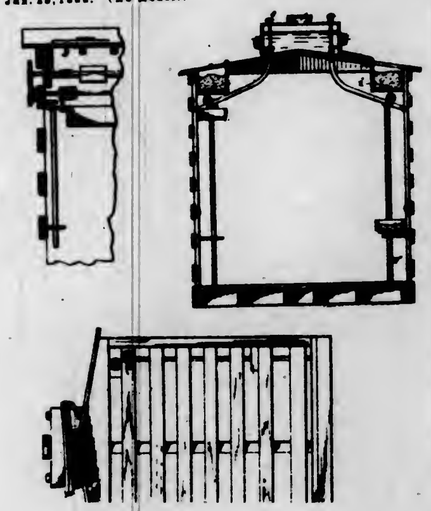
254,439. PROCESS OF DRYING SHEETS OF PLASTIC MATERIAL. JOHN W. HYATT, Newark, N. J., assignor to the Celluloid Manufacturing Company, New York, N. Y. Filed Aug. 23, 1881. (No model.)

Claim.—The process herein described of producing and drying a sheet or continuous piece of plastic material of the nature of pyroxyline, which consists in first cutting the sheet from a roll or slab, and, second, moving the same upon drums, the sheet being given a sufficient tension to cause it to dry with hard, smooth surfaces, and the movement being such as to permit the sheet or piece to dry before the tension is discontinued, substantially as set forth.



254,440. BAG-FASTENER. CHARLES W. KURTS, New York, N. Y., assignor to Bradley, Kurts & Co., same place. Filed Jan. 18, 1882. (No model.)

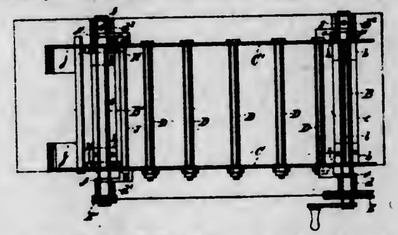
Claim.—A grain-bag provided with a hem, shirring-cords running in opposite direction to each other through the hem and closed by knots at their outer ends, and a small apron, which is attached at one corner to the lower inside edge of the hem, so as to extend diagonally below the mouth of the bag when the same is closed, substantially as and for the purpose set forth.



254,441. CREEL OR BOBBIN-RACK. JAS. O'NEILL, St. Louis, Mo., assignor of one-half to George H. Stewart, same place. Filed July 9, 1881. (No model.)

Brief.—The extra thread-guiding posts are omitted, and their function, when requisite, is transferred to the bobbin-posts.

Claim.—A creel having a series of bobbin-posts arranged in sets on parallel lines, the outer post of each set being arranged intermediate between the posts of the succeeding set and serving as thread-guides for the succeeding bobbins, whereby the thread is conducted to the loom in a direct line and undue friction avoided, substantially as described.

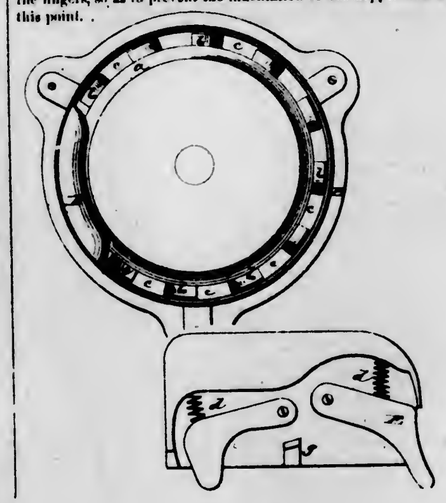


254,442. STOCK-CAR. ANNIE K. PERTS, Clearfield, Pa. Filed Jan. 25, 1882. (No model.)

Claim.—1. In a stock-car, a feed-bin arranged beneath the roof and having its bottom wall constructed with openings, in combination with a rod, *i*, extending longitudinally along the said feed-bin and journaled in bearings thereon, so as to be capable of rotation, and valves A, attached to said rod and rotated by the movement of the latter for opening and closing the openings in the bottom wall of the bin, substantially as described.

2. In a stock-car, the combination, with feed-bins arranged on each side beneath the roof, and provided with openings governed by valves adapted to be simultaneously operated, of adjustable troughs suspended beneath said bins and adapted to be secured at any desired elevation, substantially as shown and described.

254,443. WALL-PAPER-TRIMMING MACHINE. ROBERT STEEL, Philadelphia, Pa., assignor to Joseph E. Vanmeter, same place. Filed June 11, 1881. (No model.)



Claim.—1. In a wall-paper-trimming machine, in combination with the revolving shaft B, having a stationary knife, G, and an adjustable knife, G', the stationary guide C and adjustable guide C', having each a knife, H, and paper-roll rest *j*, whereby to adapt the trimming-machine to trim the paper to any desired width by simply adjusting the guide C' and the revolving knife or cutter G', substantially as described.

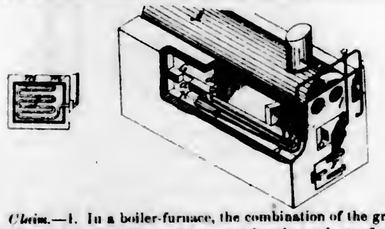
2. The combination of the series of supporting-rollers D, arranged in arch form, with the revolving cutter-shaft B', the guides C and C', and the winding-shaft B, having a longitudinal groove, *l*, substantially as and for the purpose set forth.

3. The combination of the revolving shaft B, having a pulley, E, provided with a hub, *d*, at one end, and a hub, d^2, at its other end, with the guides C and C', having arms *f* and *f'*, respectively, and with the cutter-shaft B', having a pulley, E', provided with a hub, *d'*, at one end, and a hub, d^3, at its other end, the hubs d^2 and d^3 being adjustable, substantially as described.

254,444. CORN-PLANTER. CHARLES W. VOGEL and HENRY BETTRELL, Centreville, Ind.; said Bettrell assignor to Anna M. Bettrell, same place. Filed Oct. 28, 1881. (No model.)

Brief.—Within the recessed shield are pivoted two spring-actuated fingers, one of which serves as a cut-off or clearer and the other as a discharger, and a lug is secured within the shield between the fingers, so as to prevent the indentation of the hopper-wall at this point.

Claim.—The combination of the shield D, the spring-actuated fingers therein, the hopper-flange, and the bracing-lug *g*, for the purpose specified.



254,445. SAFETY-PIN. EDWARD WILLIAMS, New York, assignor to Susan T. Williams, Brooklyn, N. Y. Filed Sept. 15, 1881. (No model.)

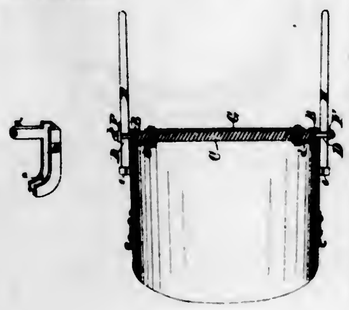
Claim.—A safety-pin formed of a tube having at one end a fixed pin-point, and within the tube, at the other end, a movable bent wire surrounded by a coiled spring, with a pin-point projecting from the wire and operating through a slot in the side of the tube, substantially as and for the purpose described.

REISSUES.

10,044. BOILER-FURNACE. JAMES ELLIOTT, Montreal, Quebec, Canada, assignor to himself, Hascal A. Hogel, Yonkers, N. Y., and Robert A. Kelland, Montreal, Quebec, Canada. Filed Nov. 23, 1881. Original No. 248,925, dated Nov. 1, 1881.

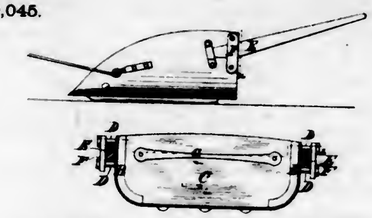
Claim.—1. In a boiler-furnace, the combination of the grate, the hollow side walls, side pipes for conveying the products of combustion, and steam-pipes communicating with such side pipes at or near the discharge-orifices, whereby the products of combustion are drawn back and discharged into the fire.

2. In a boiler-furnace, the grate and fire-place and the hollow side walls, in combination with smoke and steam pipes arranged, substantially as described, within such hollow side walls.



3. In a furnace for generating steam or other purposes, a fine or passage made in two divisions, one above the other, and connected by passages near the back, the upper flue or division receiving cold air from outside the furnace and the lower flue discharging same in a heated condition underneath the grate, in combination with and serving to hold pipes conducting smoke and steam to a point over the grate, substantially as described.

4. A hollow door for a furnace, inclosing a coil connected with a steam-supply, said door having openings for the admission of air and an exit-opening through which the air and steam are ejected into the furnace.

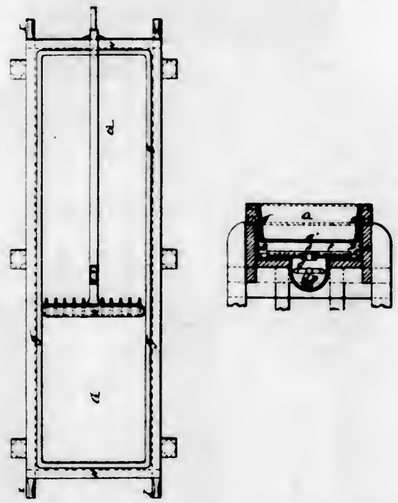


5. A hollow furnace-door inclosing a steam-coil and having inlet-openings, through which mingled air and steam are injected into the fire, and self-regulating steam-supply cock, substantially as described.

10,045. EARTH-SCRAPER. WILLIAM HASLUP, Sidney, Ohio. Filed Nov. 7, 1881. Original No. 234,882, dated Nov. 30, 1880.

Brief.—The ends of the back board rest in socket-plates bolted thereto and to a metallic strap across the back. The sides of the scraper-body and its handles are united to the socket-plates by bolts, between which the handles are inserted, and a strap and nuts on the outside of each handle.

10,045.



Claim.—1. The combination, with the side walls of a scraper, of a pair of socket-plates arranged inside the walls of the scraper, and adapted to receive and support the back board, the bolts D D, clamp-plates F, and the handles, whereby the socket-plates, side walls, and handles are firmly clamped, substantially as described.

2. In a scraper, the combination, with the scraper-body and back board, of a pair of socket-plates embracing the ends of the back board and extending from the top to the bottom edges thereof to form complete sheaths to the same, against which the side walls of the scraper rest, and devices, substantially as described, for confining the side walls of the scraper-body in proper position.

3. The combination, with the scraper-body and back board, of the curved socket-plates embracing the ends of the said board and extending from the top downward around the curved edges thereof, and devices, such substantially as described, for confining the socket-plates on the ends of the back board and retaining the scraper-body in proper position.

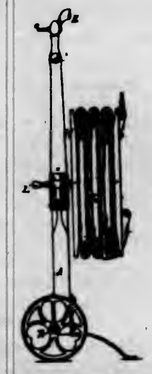
4. The combination, with the bent walls of the scraper and the back board, C, of the socket-plates B, the transverse bar G, the cross-bolts e, and devices, such substantially as described, for confining the bent walls in proper position relative to the socket-plates and the back board.

10,046. CHEESE-VAT. ALASCON SLAUGHTER, Middletown, assignor to Charles W. Thompson, Theresa, N. Y. Filed May 28, 1881. Original No. 61,359, dated Feb. 12, 1867.

Claim.—1. The herein-described cheese-vat, consisting of the combination of a milk-pan removably seated within a water-trough, said trough having steam-pipes entering below the water-line thereof, adapted to transmit steam-heat from a separate external generator through water contained in said trough to the aforesaid milk-pan, substantially as shown, and for the purpose specified.

2. The improved cheese-vat, consisting of a milk-vat removably seated within a water-trough, and having its vertical sides surrounded by the sides of said water-trough, having a water-space between them, and steam-pipes entering the water-trough below the water-line thereof, for the purpose of gradually and uniformly

heating the water surrounding the bottom and vertical sides of the milk-vat, substantially as set forth.



3. The combination, with the milk-vat G, of the water-trough A B, having projecting below its bottom the open segmental recess C, and the steam-pipes D, and drip-pipes E, arranged within said recess, substantially as set forth.

4. In combination with the milk-vat G, water-trough A B, and steam-pipes D *d*, arranged as described, the corrugated dissemminator F, having passages between it and the sides of the water-trough A, and provided in its depressed parts with apertures *f'*, substantially as and for the purpose specified.

5. The combination of the milk-vat G, hot-water trough A B, with its recess C, steam and drip pipes D E, arranged therein, the corrugated dissemminator F, and agitator K, substantially as and for the purpose herein specified.

10,047. FOUNTAIN-HOSE CARRIAGE. IVES W. MCGAFFEY, Chicago, Ill., assignor, by mesne assignments, to E. B. Preston, same place. Filed Jan. 21, 1882. Original No. 183,188, dated Oct. 10, 1876.

Brief.—The hose-nozzle can be held by clamp K in any position.

Claim.—1. The combined hose-carriage and fountain-standard, consisting in the combination of the following elements, viz: a wheeled carriage provided with a foot or brace by means of which it may be sustained in an upright vertical position, a nozzle-holding device, and a reel of large diameter to allow the water to flow through the hose when partially wound thereon, substantially as specified.

2. The combination of a hose-reel of large diameter to allow the water to flow through the hose wound thereon with a wheeled carriage for carrying said reel, provided with a foot or brace for sustaining it in an upright position, and devices for holding the nozzle both on the carriage and the reel, substantially as specified.

3. The reel pivoted in two ways to the standard, one pivot being its own axis for reeling and unreeling the hose, and the other pivot at right angles thereto, allowing the reel to swing around the standard, substantially as specified.

4. The combination, with a hose-reel of large diameter to permit the water to flow through the hose wound thereon and adapted to be fixed in position on its axle, of devices for holding the nozzle on the arms of the reel, substantially as specified.

5. The combination of the reel, the standard, and the sleeve which supports the former upon the latter, together with the steps upon the sleeve for locking it in several positions, substantially as specified.

6. The peculiarly-constructed clasp upon the top of the standard for holding the nozzle, consisting of two shell-like halves secured by a single bolt through the standard, which bolt serves as a pivot upon which the device may be adjusted, as a hinge upon which it may be opened, and as a means of locking it in the desired position when attained, substantially as specified.

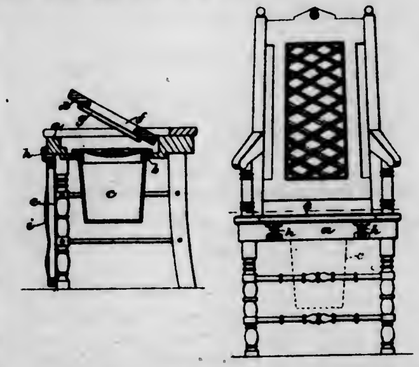
7. The wheeled reel-bearing standard having handles L L near the top and the handle L' near the middle, substantially as specified.

8. The reel carried upon a spindle having grooves cut around it, in combination with the set-screw through the reel-hub, substantially as specified.

9. The combination, with a fountain-standard provided with wheels, of a hose-reel of large diameter to allow the water to flow through the hose wound thereon, substantially as specified.

10,048. FORCE-PUMP. PHILIP A. HYNES, Ashland, Ohio, assignor of one-half to F. E. Myers, same place. Filed Dec. 23, 1881. Original No. 238,102, dated May 26, 1880.

Brief.—A tube fixed within the discharge-pipe is open to the water only at the bottom and communicates with an air-chamber at the top of the discharge-pipe.



Claim.—1. The combination, with the discharge-pipe of a pump, of an air-tube fixed within said pipe and open to the water at the bottom, whereby the water, when forced up said discharge-pipe, is reacted upon by the compressed air in the air-pipe, substantially as described.

2. The combination of the discharge-pipe connected to the pump as described, with the air-pipe located therein and open to the water at the lower part, and with the diaphragm *j* and air-chamber J, all the parts being adapted to operate in the pump substantially as described.

10,049. COMMODE-CHAIR. TRUE RUSSELL, Boston, Mass., assignor to Abbie J. Russell, same place. Filed Jan. 20, 1882. Original No. 250,396, dated Dec. 6, 1881.

Brief.—The device can be used as a chair or as a commode. The vessel is tightly sealed by the sheet *i*.

Claim.—1. In a commode-chair of the class described, the combination of the seat-frame *a*, having an orifice, *b*, a vessel, *c*, inserted in said orifice, and having a flange resting upon the portion of the frame surrounding said orifice, a secondary seat, *d*, hinged to the frame *a* and provided with a packing, *g*, adapted to rest on the flange of the vessel, said flange supporting the weight of the seat, which compresses the packing *g* and presses the flange upon the supporting-surface of the seat-frame, thereby preventing the escape of odors excepting through the orifice *f* of the secondary seat, and the primary open-work seat *e*, having on its under side

a flexible sheet, *i*, adapted to cover the aperture in the secondary seat and prevent the latter from being seen, and also prevent the escape of odors through the opening in the seat *d*, as set forth.

2. In a commode-chair of the class described, the combination of the seat-frame *a*, having an orifice, *b*, a vessel, *c*, inserted in said orifice, and having a flange resting on the portion of the frame surrounding said orifice, a removable cover for said vessel, a secondary seat, *d*, hinged to the frame *a* and provided with a packing, *g*, adapted to rest on the cover of the vessel, said cover supporting the weight of the seat, which compresses the packing *g* and presses the cover upon the flange of the vessel and the flange upon the supporting-surface of the seat-frame, thereby tightly closing the vessel and preventing the escape of odors therefrom, as set forth.

3. The combination, in a commode-chair, of the seat-frame *a*, having an unobstructed space under its forward edge, the movable seat *c*, adapted to rest on said frame, and the link-hinges *h h*, connecting the seat *c* to the front of the frame, whereby the seat is enabled to be entirely removed from the seat-frame and swung into the unobstructed space under the forward edge of said frame, as set forth.

E.H.G.
E·LIOTYPE·PRINTING·CO
BOSTON

DECISIONS
OF THE
COMMISSIONER OF PATENTS
AND OF
UNITED STATES COURTS IN PATENT CASES.

ACTING COMMISSIONER'S DECISIONS.

EX PARTE MARSTON.

Decided February 4, 1882.

1. INTERFERENCE *nunc pro tunc*—RULE 93.
Where one of two conflicting applicants has inadvertently obtained a patent without notice to the other an interference may then be declared *nunc pro tunc* between the application and the patent, under authority of the first clause of Rule 93.

2. CONFLICTING APPLICATIONS—PATENT PREMATURELY ISSUED.
Conflicting applications under the law and the rules sustain a hostile relation each to the other, irrespective of their relative dates of filing, and the premature issue of a patent to one applicant is not conclusive either for or against the right of the other.

3. MEANING OF "PATENT" IN RULE 93.
The second clause of Rule 93 has no application to such a case, the patent there referred to being one which was granted before the pending application was filed.

INTERLOCUTORY APPEAL.

ROLLING BEARINGS.

Application filed March 12, 1881.

Mr. A. H. Spencer for the applicant.

STOCKBRIDGE, *Acting Commissioner:*

It is claimed by the applicant in this case that during the pendency of his application a patent for substantially the same invention has wrongfully issued to a later applicant, and he now asks to be permitted to contest the question of priority with the existing patent.

The Examiner proposes to issue the patent forthwith, on the ground that the application has not been and should not be rejected upon reference to the patent of the subsequent applicant, and that the case therefore does not fall within the provisions of the second clause of Rule 93 governing interferences between pending applications and unexpired patents. I think, however, under the circumstances that an interference must be declared to enable the Office to judge whether a patent can, under the law, issue to the applicant for the invention. The error by which one of these rival claimants obtained his patent without controversy would be aggravated by now issuing a patent to the other without investigation. The necessity for ascertaining the applicant's right to a patent would seem to be increased rather than diminished by the fact that there is already an existing patent for the invention.

Conflicting applications under the law and rules sustain a hostile relation each to the other irrespective of their relative dates of filing. In such a case neither applicant is entitled to a patent, except as the prevailing party in an interference contest, and if by inadvertence a patent issues prematurely without investigation, it is clearly not conclusive either for or against the right of the other applicant. The applicant is then entitled to contest on equal terms the question of priority, and if he prove to be the prior inventor his right to a patent is unquestionable. The only effect of the granting of the first patent is that the Office is prevented by its own wrongful act from enforcing an unfavorable judgment against the patentee. This case then falls under the first rather than the second clause of Rule 93.

It is not as a "prior patentee" that one of two conflicting applicants who has inadvertently obtained a patent obstructs the application of the other, but as a rival claimant or conflicting applicant, necessitating an interference. The order of filing is an immaterial circumstance, a "prior patent" within the meaning of the law and rules being one which was not only filed but granted prior to the filing of the pending application. As against this applicant the grant of the patent was without authority of law and void, and if the Commissioner had as well the power to annul as to grant patents the patent would be canceled either in the premises or in the event of an unfavorable determination of the interference. But although Kaufman has by the error of the Office, and by reason of the limited power of the Commissioner over patents already issued, forestalled as to himself the result of the interference, the rights of Marston still remain undetermined, for the ascertainment of which an interference will be declared *nunc pro tunc* under the authority of the first clause of Rule 93.

The Examiner's decision is reversed.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—District of New Jersey.

SPRING *et al.* v. THE DOMESTIC SEWING MACHINE COMPANY.

Decided November 18, 1881.

1. SPRING'S PATENT—IMPROVEMENT IN LATHES FOR TURNING IRREGULAR FORMS—PATENT SUSTAINED.
The validity of the patent granted to Charles and Andrew Spring for an improvement in lathes for turning irregular forms not anticipated by the Pernot machine, the evidence showing that the devices for modifying the movement of the cutting-tool were added to the machine after the invention of the Springs, or that these devices, if originally present in the machine, accomplished their work so imperfectly that the inventor laid no stress upon them, and their existence was so fitful and uncertain that they must be put in the category of abandoned experiments. (*Spring* v. *Packard*, 7 O. G., 341.)

2. INFRINGEMENT—SINGLE WITNESS NOT REBUTTED SUFFICIENT.
The testimony of a single witness that defendant used machines substantially like complainants' not rebutted, *Held* to be sufficient proof of infringement upon authority. (*Bennett* v. *Fowler*, 8 Wall., 445.)

Mr. George E. Betton and *Mr. George S. Boutwell* for the complainants.

Mr. John Dane, Jr., for the defendant.

IN EQUITY—BEFORE M'KENNAN AND NIXON, JUDGES.

NIXON, *J.:*

The question of the validity of the patent on which this suit was brought was before the learned judges of the first circuit (Clifford and Lowell) at the term of October, 1874. It was there held that the complainants' patent was a valuable and ingenious improvement in lathes for turning irregular forms; that Charles and Andrew Spring were the original and meritorious inventors of the said improvement, but that the patent should be declared void in view of the fact that the testimony showed that they were not the first inventors; that the patent was for a combination, all the elements of which were old, and that the same was anticipated by the machine of one Pernot, proved to have been made in New York and operated there for several years in the manufacture of large quantities of sewing-machine needles. (*Spring* v. *Packard*, 7 O. G., 341.)

The great respect which we entertain for the opinion of that court, as well as interstate comity, would readily lead us to accept its decision as controlling this case if the truth of the facts on which it was based were not controverted and seriously questioned here.

It is insisted by the complainants, (1) that their proofs in the present case show the falsity of the testimony on which it is attempted to establish the existence of the Pernot machine, or, at least, that part of it embracing the mechanism which anticipates the Spring patent anterior to the date of the complainants' invention; (2) that even if its prior existence is admitted, the mechanism is not an anticipation of the specifications and claims of the Spring patent.

1. As to the first point, respecting the actual existence of the Pernot machine, it is a well-settled principle that the burden of proof is on the defendant. Pernot, the alleged inventor, testifies that he completed and used it as early as the year 1853 for turning needles, and that it was substantially in the same condition and contained the same mechanism of curving the shoulders and sharpening the points of the needles at the time of his examination as a witness in this case as when it was finished in 1853.

The claim of the Spring patent is for the combination of a griping-chuck, by which an article can be so held by one end as to present the other free to be operated upon with a rest preceding the cutting-tool, when it is combined with a guide-cam or its equivalent, which modifies the movement of the cutting-tool, all operating together for the purpose set forth.

The distinguishing features of the patent are the cams or formers for turning the curved shoulders and the points of the sewing-machine needles.

The patentees in their specifications state that the pattern *e'*, which is adjustable by means of the set-screw *s'*, is pivoted in *q* and serves to shape the shank, while the pattern *o'*, which is adjustable along the length of *q* as well as outward from it, serves to form and shape the point. Is there any mechanism found in the Pernot machine which produces either of these results; and if so, at what time do the proofs show that it was first attached? The curved or rounded shoulder to a needle made in this machine is doubtless formed by the wedge *a*, which operates to draw back the knife as it approaches the griping-chuck, and Pernot in his examination states that, although he never pointed the needles in the practical use of his lathe, the mechanism was capable of such adjustment that the points could be readily turned. We are then brought to the inquiry whether the wedge *a* and the bar *b* were in the Pernot lathe prior to the Spring invention in 1857. The first witness upon this point is the complainants' expert, Hoadley. He considers the wedge *a* and the bar *b* an evident afterthought, worked into the otherwise completed lathe at some time subsequent to its original completion and operation. This opinion is founded, first, upon the examination, under a glass, of the six needles marked "Pernot Needles, Exhibit 14," which had been exhibited by Pernot in a former suit as the product of his machine, and as proof that he had made upon the said machine needles with curved or rounded shoulders and sharp points, and which the witness thought gave unmistakable evidence of being finished by hand-tooling, both as to the shoulders and the points: and secondly, upon the striking differences in the execution of the work on different parts of the lathe, "all parts," says the witness, "being well formed, accurately fitted, and well finished, except the important bar *b* and its clamp-screws *c c*. These are coarse, rude, and devoid of finish, and have all the characteristics of a subsequent addition and of a temporary makeshift;" and thirdly, upon the conviction that the machine had been originally constructed for turning needles without points and to a square shoulder, as shown by the presence of the diagonal set-screw R, which could have no other purpose in connection with the organization of the lathe. He is strongly corroborated in all these particulars by the testimony of O. S. Hosmer and Edwin Strain, gentlemen of long experience in the manufacture of sewing-machine needles, and whose cautious methods of testifying have not failed to make a favorable impression upon the mind of the court. But the most remarkable evidence in regard to the Pernot machine came out in the final examination of Alonzo Taylor and Joseph Bellows. These were first offered by the defendant as witnesses to prove the product of the lathe previous to the date of the Spring invention. Taylor, in testifying for the defendant, said that he first saw the Pernot machine in 1855, and that needles were produced by it with rounded or tapering shanks; but when he was afterward recalled by the complainants he stated that his previous testimony had been given under a misapprehension of the matter in controversy; that he thought the suit had been brought for the infringement of a patent for a tapered shank-needle, and not for a machine which could make one; that he always supposed that the tapering shanks of the needles made on the Pernot machine were turned and formed by hand-tooling; that when he saw the machine in 1855 it had neither the wedge *a* nor bar *b*, nor any other device which could be used for forming a tapering shank or sharp point on the needle. He is confirmed by Bellows, who testifies to the alteration of and addition to the machine. He says that he went into the employ of Pernot in the fall of 1855 or spring of 1856, and continued with him for several years; that he was his foreman in 1858, and was married on the 17th of June of that year, and that the wedge and bar were added to the machine after that date; that before these were

attached Pernot made his needles by turning up to a square shoulder and then filing them and grinding them down on an emery-wheel. Such testimony throws serious doubts upon the truth of the statement of Pernot and his brother-in-law Dahis that as early as 1853 the former invented and used in connection with his lathe the mechanism needed to taper the shoulders and sharpen the points of needles produced by his machine. In view of the great commercial value of such a discovery in forming sewing-machine needles, it seems incredible that after making the invention he should so soon have abandoned it and returned to the old and more imperfect and costly methods of producing them.

2. In consequence of such improbability we have been led to carefully consider the evidence which induced the learned judges who decided the former suit to hold that the Pernot machine was in fact an anticipation of the Spring invention, and we are bound to say, although with great diffidence, that we question the correctness of their conclusions.

Springs' patent claims to be and is an organized mechanism capable of completely shaping sewing-machine needles throughout their entire length from point to hilt at one operation.

If Pernot's machine, under any of the proved circumstances of its organization and use, ever accomplished this, which we seriously doubt, it performed its work so imperfectly that the inventor laid no stress upon it, and preferred to sharpen his needles by hand, and soon laid aside the supplementary mechanism, which had reference to the forming of a tapering shank. If it existed at all, its life was so fitful and uncertain that it must be put in the category of abandoned experiments, and such a failure ought not to be regarded as an anticipation of the invention of the Springs, who, it is conceded, were original inventors, and who, in our judgment, were the first inventors of a successful machine which was capable of turning the barrel, point, and curved shoulder of a sewing-machine needle at one continuous movement of the cutting-tool.

It only remains to consider the question of infringement, in proving which the burden is upon the complainants. The evidence of infringement is slight. It rests mainly upon the testimony of John Armstrong, who commenced work with the inventors of the complainants' machine in 1858, continued in their employ until 1862; then went to the war; came back to them in 1865, and remained with them until 1869, during which times he worked and became well acquainted with the Spring machine. He afterward went into the employ of the defendant corporation in July, 1876, and remained there ten months. While with them he saw in use by the defendant company machines operating to turn sewing-machine needles having substantially the same parts or elements that he was familiar with in the Spring machines, to wit: a griping-chuck, which held one end of the wire, leaving the other end free to be operated upon, and the wire passing through the dies or rest, which was preceded by a knife that was governed by cams or a former.

In view of the decision of the Supreme Court in *Bennett* v. *Fowler*, (8 Wall., 445,) this proof, if not rebutted, would seem to be sufficient. In that case the proof of infringement was that the defendant used machines substantially like the complainant's, and the court held that if the defendant intended to contest the point he should have introduced proof to that effect.

Upon the whole case, we are of the opinion that a decree should be entered for the complainants.

U. S. Circuit Court—Northern District of Illinois.

NATIONAL FEATHER DUSTER COMPANY v. HIBBARD.

Decided November 26, 1881.

1. LETTERS PATENT—FEATHER DUSTERS—REV. STATS. SEC. 4918—INTERFERING PATENTS.
   Letters Patent No. 177,933, dated May 30, 1876, and issued to Susan M. Hibbard, for an improvement in feather dusters, *Held* to interfere with Letters Patent No. 154,985 and set aside.
2. ESTOPPEL.
   Under the circumstances Susan M. Hibbard is estopped to deny that her husband was the inventor of the device in controversy.
3. INVENTOR.
   One who made a valuable suggestion to the conceiver of the idea of substituting in a feather duster feathers of the common domestic fowls in place of ostrich-feathers while he was engaged in a series of experiments with a view to discover some means whereby such feathers might be made pliable, did not thereby become the inventor of the duster.

Messrs. Sleeper & Whiton for the complainant.

Messrs. West & Bond for the defendant.

BLODGETT, *D. J.:*

This is a bill in equity, framed under section 4918 of the Revised Statutes of the United States, for the purpose of setting aside and declaring void a patent issued by the United States to Susan M. Hibbard, for an improvement in feather dusters, dated May 30, 1876, and numbered 177,933, upon the ground that the patentee, Susan M. Hibbard, was not the inventor of the device described in and covered by the patent.

The complainant claims to be the owner of Patent No. 154,985, issued by the United States on the 15th of September, 1874, to William H. Curwin, Charles J. Sauter, and William W. Clark, as assignees of George W. Hibbard, for an improvement in feather dusters, and charges that George W. Hibbard is the husband of the defendant, Susan M. Hibbard, and that after the said George had made the invention described in the Letters Patent No. 154,985, and before the issue of his patent, he sold and assigned his invention and his right to a patent thereto to the parties named therein, to wit, Curwin, Sauter, and Clark, and the patent was duly issued to them as assignees of George W. Hibbard; and that after said George W. had made the invention described in his patent and sold the same, as stated, he and the said Susan M., his wife, colluded together to obtain the letters patent which were issued to said Susan upon the pretext and false assumption that said Susan was the real inventor of the device covered by the first-issued letters patent. And the bill prays that the patent so issued to said Susan M. in violation of the exclusive rights of the complainants in the invention therein described may be canceled and set aside.

The peculiar feature which characterizes both these patents is a feather duster made of turkey-feathers, or the feathers of our ordinary domestic fowls adapted to such purpose, made pliable by removing the pithy part or body from the stem of the feathers so as to adapt the feathers more perfectly to such use when combined with the other elements to form a duster or brush.

The proof in this case shows conclusively that Mrs. Susan M. Hibbard knew of the fact that her husband had applied for a patent upon this device; knew also that he was poor and unable to pay the expense of obtaining a patent, and that he made the bargain with Curwin and Sauter to advance the expenses and obtain the patent, on condition that they should become half-owners thereof. She also knew of the negotiations between her husband and Clark for the sale of the other half of the patent, and made no objection to the negotiation, and knew that her husband was to receive what was considered very liberal pay for the remaining half of the patent, and the only objection she ever made to the negotiation was that she insisted that the purchase-money to be paid by Clark should be given to her, not because she was the inventor or had anything to do with the invention of the duster to be covered by the patent, but because her husband, being an improvident man, would squander the money, which she wished to use in the purchase of a home for the family. During all the negotiations between her husband and Curwin and Sauter and her husband and Clark she never claimed or pretended, or by any conduct on her part insinuated, that the invention was in any degree her own, but allowed these men to invest their money in the procurement of the patent, and Clark pay for the unsold half of the patent, upon the understanding—to which she seems to have been as fully a party as her husband—that he was the inventor of the duster to be covered by the patent. It seems to me that the proof shows that Mrs. Hibbard, in allowing her husband to deal with Curwin, Sauter, and Clark as the original and first inventor of this device, has so far conceded or admitted him to be the original inventor thereof as that she should be estopped from now claiming otherwise, and especially claiming that she and not her husband was the inventor. If there were no other features in the case, therefore, than the conduct of Mrs. Hibbard toward the persons with whom her husband dealt I should think it enough to cancel this patent as against the patent previously issued to him.

But the case is perhaps susceptible of solution upon another ground. It appears from the proof that George W. Hibbard, for some time prior to the alleged invention described in his patent, had been engaged in the manufacture of dusters from turkey-feathers by setting them in their natural condition into a handle, so as to make a brush or duster; that some little time prior to the 10th of February, 1874, he conceived the idea of making a better duster by softening the stems of turkey-feathers and rendering them more pliable, so as to make a feather duster which would supersede or take the place of dusters then and theretofore made from ostrich-feathers, his idea being that if he could make turkey-feathers or the feathers of our common fowls pliable, he could use them in place of foreign feathers and make as good if not a better duster. He experimented some time in this direction with chemicals for the purpose of softening the stem or rib of these feathers, and, not succeeding to his satisfaction in any of these experiments, was discussing the subject on one occasion with his wife, when she suggested to try cutting or shaving down the stem of the feathers, so as to make them pliable and limber. The suggestion was at once acted upon and a duster made which proved satisfactory, and the patent issued to his assignees was obtained for this device as the invention of George W. Hibbard.

Mrs. Hibbard's sole claim to the invention covered by her patent, which is the same as that covered by the patent of her husband, is that the suggestion or idea of cutting or trimming these feathers down so as to make them limber first came from her, and upon this fact she claimed and obtained the patent in controversy.

The specifications and claims in the two patents are substantially the same, and are for—

> As an improved article of manufacture, a feather duster having the stems of the feathers split longitudinally, and a part thereof severed from the remaining part, substantially as specified.

The patent, it will be seen, is for this new article of manufacture—namely, a feather duster made of split feathers. It is not upon split feathers as such or upon the process of splitting feathers, but upon a combination of the split feathers with the other elements by which a duster is made. The idea of a feather duster, to be made of feathers of the common turkey or other domestic fowls seems clearly to have originated with George W. Hibbard. The *desideratum* was to make those feathers pliable. He was seeking to accomplish this when the suggestion was made to him by Mrs. Hibbard to try cutting or splitting them. The proof on the part of Mrs. Hibbard fails to show, indeed it falls far short of showing, that she ever made a feather duster or thought of making one from turkey-feathers made pliable by splitting them until after her husband had been for some time at work in that direction. The most the proof does show is that she suggested the mode of making feathers limber and pliable which were used for the purpose of making the feather dusters described in this patent. The successful feather duster covered by both these patents was, it seems to me from the proof, the invention of George W. Hibbard. While he was experimenting—I may say, perhaps, groping—for some method of rendering his feathers pliable, Mrs. Hibbard suggested the experiment of splitting the feathers. He acted upon that suggestion, and finding that the feathers were thereby made pliable, combined them with the other material and made the feather duster which before that time had only had existence in his mind. Although Mrs. Hibbard may have made a valuable suggestion in the progress of the experiment, yet that does not make her the inventor. (*Agawam Company* v. *Jordan*, 7 Wall., 602; *Pitts* v. *Hall*, 2 Blatchf., 229.)

For these reasons, but mainly upon the ground of the estoppel, which I think the most cogent, the bill of the complainant will be sustained and a decree entered setting aside the patent issued to Susan M. Hibbard.

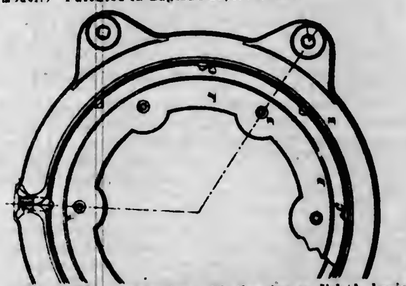
PATENTS

GRANTED MARCH 7, 1882.

254,446. CLEANER FOR STEAM-BOILERS. EDWARD H. ANCHORY, Lynn, Mass. Filed Jan. 13, 1883. (No model.)



Claim.—1. The combination, in a steam-boiler, of the mud or scum pipe located near the surface of the water therein, said mud-pipe being capable of reciprocating longitudinally in hollow plugs inserted in the boiler-heads, and provided with scum-collecting cups, in the manner shown and described.

2. The combination, in a steam-boiler, of the mud or scum pipe and its end bearings, one end of said pipe being rigidly fixed in one of its bearings and the other end adapted to loosely slide in the opposite bearing, said bearings being inserted in the boiler-heads to allow lengthwise expansion, said pipe being provided with scum-collecting cups, in the manner set forth.

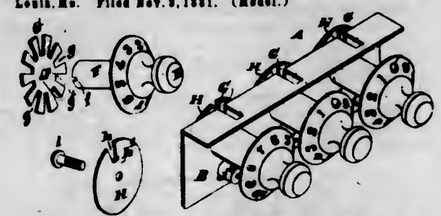
3. An article of manufacture, consisting of the blow-off, its tight and loose bearings, consisting of hollow plugs adapted to be inserted in boiler-heads, and its scum-collecting cups constructed in such manner that as a device it may be adapted to any boiler to which it is capable of being attached, substantially as described.

254,447. CARRIAGE-TOP JOINT. GEORGE ADDIS, Birmingham, County of Warwick, England. Filed Dec. 14, 1881. (No model.) Patented in England Sept. 14, 1881.

Claim.—The combination, with the ring or disk A, having upwardly-inclined edge B extending outwardly to form circumferential horizontal flange B', of the outer annular ring, E, provided along its inner circumference with a vertical flange or shoulder, F, abutting against the edge of flange B' and extending outwardly at its lower inner end to form a horizontal flange, G, having its edge G' inclined or beveled so as to fit against the inclined edge B and form a bearing for the same in turning, substantially as set forth.

254,448. MEDICAL COMPOUND. JACINTO AVERHOFF, Havana, Cuba. Filed Nov. 5, 1881. (No specimens.)

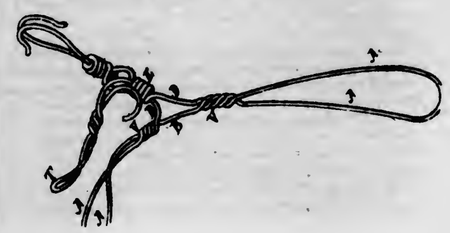
Brief.—To gum frankincense, gum myrrh, and gum mastic, one-half ounce each, and Socotrine aloes one and one-half ounce, adds twenty-four ounces of alcohol, to be used as an embrocation.



Claim.—The herein-described composition of matter to be used principally as a medicament or embrocation to cure wounds, headache, megrim, neuralgia, rheumatism, ulcers, sores, bruises, swellings, burns, and other similar complaints, consisting of frankincense, mastic drops, myrrh, aloes, and alcohol in the proportions specified.

254,449. KITCHEN-SAFE. RUBEN B. AYRES, St. Louis, Mo. Filed July 11, 1881. (No model.)

Claim.—In a knockdown safe, one portion provided with a slot, c, and pin c', in combination with the other portion provided with a plate, D, having slot d, a lower portion, z, provided with straight edge y and curve e, coming to the point f of the slot d, and the hook u, the point p of which projects beyond the mouth of the slot d, all constructed and arranged substantially as set forth, whereby is formed a certain and efficient means of uniting the parts.



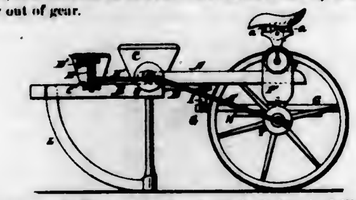
254,450. PERMUTATION-LOCK. FRANK S. BALDWIN, St. Louis, Mo. Filed Nov. 9, 1881. (Model.)

Claim.—1. A permutation-lock having, in combination, the spindle F, having the notches *f*, the disks G, having the projections *g'*, and the slots *g*, the disk H, having the projection *h'*, and the screw I, substantially as described.

2. The combination of the disk G, having the notches *g*, the disk H, having the slot *h*, the spindle F, the plate B, and the stop J, substantially as described.

254,451. COAT-HANGER. WILBUR B. BIDDER, Lowell, Mass., assignor of one-half to Frederick Taylor, same place. Filed Sept. 16, 1880. (No model.)

Claim.—1. A coat-yoke formed of wire, as shown and described, and provided with a socket, E, formed in said wire, to receive and sustain a hat-hook, T, in combination with said hat-hook, as and for the purpose specified.



2. A wire coat-yoke having its shoulder-pieces formed of separate loops A A, each of the inner ends of said loops being twisted to and with the other inner end of the same loop, as and for the purpose specified.

3. A wire coat-yoke having its shoulder pieces formed of loops A A, the inner ends of each loop being twisted together, at V, and said loops being held apart from each other by a stiffening bar or brace, B, as and for the purpose specified.

4. A coat-yoke provided with shoulder-pieces consisting of loops A A, extended from front to back to form a broad bearing for garments suspended thereon, and provided with a brace, B, as and for the purpose specified.

254,452. GRAIN-DRILL. George G. Blunt, Chicago, Ill. Filed Oct. 3, 1881. (No model.)

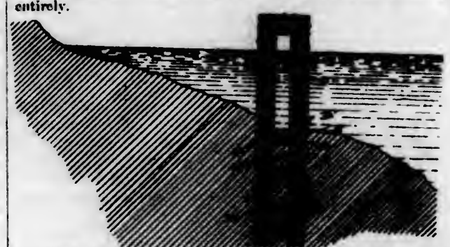
Brief.—Two pairs of treadles linked together. One pair is rigid to the drill-frame and the other to the axle-frame. Either may be depressed by the foot to press down or lift the cutters and seed-tubes. Hinged seat with rocking bearings and springs at top and bottom of the standard. The feed-shaft has covers at each outlet, and both are removable. The feed-shafts may be thrown in or out of gear.

Claim.—1. The combination, in a wheeled grain-drill, of the tilting frame B, carrying the grain tubes and drills, the horizontal bars or treadles D D, rigidly connected at their forward ends to the said tilting parts, the horizontal tilting bars or treadles G G, jointed at their forward ends to the rear ends of the treadles D D, and the driver's seat mounted on a tilting or vibrating standard having feet adapted and arranged for tilting the treadles G G vertically as the said standard is moved back and forth, substantially as and for the purposes specified.

2. The combination of the removable feed-shaft N, detachably connected to its driver, and the removable interior covers or boxes O O, substantially as and for the purposes specified.

3. The combination of the laterally-yielding driving-shaft J', the rotary post N', and the hook-shaped connecting-rod O', connecting the said shaft and post, substantially as and for the purposes specified.

254,453. MAGAZINE FOR FIRE-ARMS. Hugo Borchardt, Bridgeport, Conn., assignor to Joseph W. Frazier, New York, N. Y. Filed Nov. 18, 1881. (No model.)

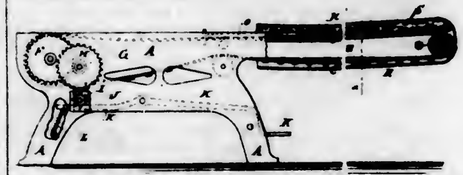


Claim.—1. A trapezoidally-shaped magazine substantially such as described, for holding laterally-superposed cartridges, made of two pieces of sheet metal, each flanged upon three sides, the two pieces being united by inserting the flange of one piece within the flange of another piece, and brazing or otherwise fastening the lapped flanges, the projecting rib or joint composed of the lapped flanges upon the rear wall of the magazine being cut away to form the notch for the reception of the spring-latch by which the magazine is detachably secured to the gun, substantially as described.

2. In a cartridge-magazine substantially such as described, a movable lock or yoke near the forward end of the mouth of the magazine for holding down the point of the uppermost cartridge, and thus preventing the cartridges contained in the magazine from being tilted upward by the outward thrust of the magazine-spring.

3. In combination with a cartridge-magazine substantially such as described, a suitably-tempered zigzag spring composed of sinusoidally-curved metallic strips or leaves, laterally superposed with their curves alternating in direction and successively riveted to each other at the ends where their convex surfaces are in contact.

254,454. SEA-WALL. David H. Burleen, St. Louis, Mo. Filed Jan. 11, 1882. (No model.)



Brief.—Boxes or troughs formed with two parallel walls of cement, and the outer spaces between the walls filled with cement in a plastic state. The air inclosed in the upper part of the intervening space between the walls prevents the section from sinking entirely.

Claim.—1. The improved sea-wall or similar structure, composed of boxes or troughs constructed of hydraulic or other cement, or artificial stone, with double walls, the spaces between the outer walls being adapted to be filled with cement to sink the said troughs, the whole being surmounted by a suitable cap to confine the air in the central space, substantially as specified.

2. A sea-wall constructed of two parallel double walls provided with suitable bottoms and an intervening inclosed space adapted to contain air to arrest the sinking of the structure, substantially as and for the purpose specified.

254,455. MACHINE FOR FILLING MATTRESSES, BED-QUILTS, &c. Alvin L. Burley, Westville, Conn. Filed July 30, 1881. (No model.)

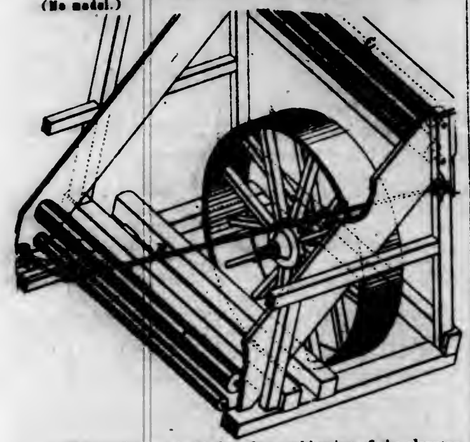
Claim.—1. A machine for filling bed-quilts, mattresses, and other articles, containing the following elements, viz: a pair of projecting arms on which the bag or case that is to receive the filling is held, and an endless belt suitably mounted upon the said arms and adjacent frame, said belt being adapted to carry the filling material into and deposit the same within the bag or case, when the latter is placed upon the said arms, substantially as herein shown and described.

2. In a machine for filling bed-quilts, mattresses, and other articles, the combination, with the frame A, having a forwardly-projecting part or arms, B, of the endless apron C, the rollers D E, the gear-wheels F G H I, and the drive-shaft J, substantially as herein shown and described, whereby the filling will be carried forward into the cover or case, as set forth.

3. In a machine for filling bed-quilts, mattresses, and other articles, the combination, with the frame A B, the endless apron C and its driving-gearing, and the drive-shaft J, of the lever K and spring L, substantially as herein shown and described, whereby the said drive-shaft and endless apron can be thrown into and out of gear with each other, as set forth.

4. In a machine for filling bed-quilts, mattresses, and other articles, the combination, with the endless apron C, of the guide-bars O, having heads Q, and the lap-bars P, substantially as herein shown and described, whereby the folded or lapped edges of the filling can be kept in place while the said filling is being introduced into the cover or case, as set forth.

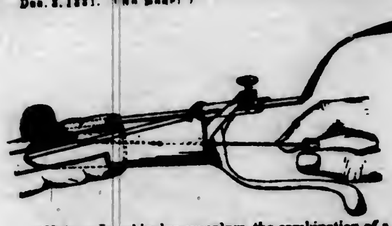
5. In a machine for filling bed-quilts, mattresses, and other articles, the endless belt or apron C, constructed substantially as herein shown and described, consisting of two or more belts, C', and the cross slats or cleats C², the said cleats having their ends bent into U form to receive and clamp the side belts, C', as set forth.



6. In a machine for filling bed-quilts, mattresses, and other articles, the cross-cleats C', made substantially as herein shown and described, with their ends bent into U form to receive and clamp the endless belts that carry the said cleats, as set forth.

7. The method herein described of filling bed-quilts, mattresses, and other articles, which consists in drawing the casing over the arms of a frame that carries an endless belt, there depositing the filling material upon the belt and giving motion thereto, so as to begin the deposit of the filling material in the bottom of the casing and pushing off from the arms the casing as fast as it is filled, substantially as herein set forth.

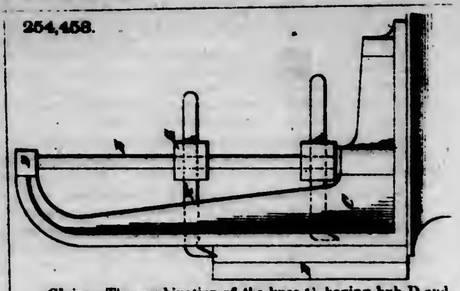
8. The method herein described of folding over the edges of the filling material to allow it to be readily passed into the case, which consists in laying the guide-bars O upon the filling at the edges of the endless apron C, turning the edges of the filling material over the said guide-bars O, and laying the lap-bars P upon the lapped or folded edges of the said filling material, substantially as herein set forth.



9. The method herein described of unfolding and smoothing out the folded edges of the filling material after the said material has been introduced into the case, which consists in withdrawing the lap-bars P and turning the folds of the filling material outward to fill out the edges of the case by moving the guide-bars laterally, substantially as set forth.

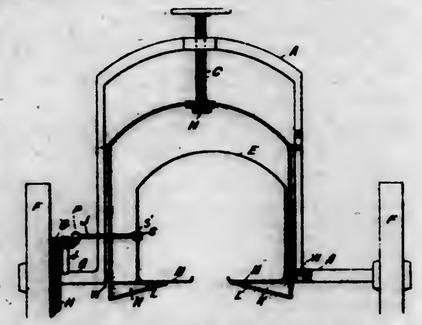
254,456. ELEVATOR-FRAME OF GRAIN-BINDERS. Isaac P. Cadman, Beloit, Wis., assignor of one-half to L. Holden Parker and Fred. A. Bennett, same place. Filed Nov. 14, 1881. (No model.)

Claim.—In a grain-binder, the combination of the elevator-frame, the canvas-carrying rollers mounted thereon, and an adjustable diagonal tie rod or brace extending from the lower inner forward corner to the upper and outer rear corner of said elevator-frame, whereby said canvas-carrying rollers may be adjusted and maintained in adjustment, thus allowing the canvas moving thereon to run perfectly true, substantially as specified.



254,457. SPECULUM. John E. Cape, Cincinnati, Ohio. Filed Dec. 8, 1881. (No model.)

Claim.—In a bivalve-speculum, the combination of a hinged sleeve, an upper blade-shank sliding in the same, and a set-screw working in a bracket extending upward from the lower blade for depressing the shank and elevating the sliding blade, all for the purpose set forth.



254,458. SAW-MILL DOG. Timothy L. Carley, Syracuse, N. Y. Filed Dec. 16, 1881. (No model.)

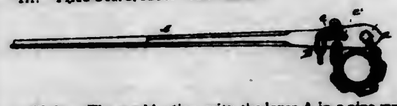
254,458.

Claim.—The combination of the knee C, having hub D and recess J, with the standard E, the hooked dog H, and sliding carriage G, as and for the purpose set forth.

254,459. POTATO-BUG-CATCHING MACHINE. Frederick D. Casey, West Door Park, N. Y. Filed Apr. 19, 1881. (No model.)

Claim.—1. The frame D, mounted on wheels, as described, and provided with the pans K and the perforated plates L, substantially as and for the purpose specified.

2. The frame D, provided with the pans K, in combination with the sliding frame E, shakers M, and means, substantially as described, for giving said shakers a reciprocating movement, as and for the purpose specified.



3. The frame D, pans K, and perforated plates L, in combination with the perforated shakers M, and means, substantially as described, for giving said shakers a reciprocating movement, as and for the purpose specified.

4. The axle A, provided with a screw, C, in combination with the frame D, the pans K, and the reciprocating shakers M, as and for the purpose specified.

5. In combination with the axle A, the frame D, provided with pins W, moving between the lateral arms of said axle, and with pans K, the frame E, carrying the reciprocating shakers M, and the screw C, substantially as and for the purpose specified.

6. The axle A, supporting the vertically-adjustable frame D and pans K, in combination with the shakers M, the frame E, provided with the slot S', the rod J, gearing G H, and the wheel F, as and for the purpose specified.

254,460. PIPE-WRENCH. Matthew T. Chapman, Aurora, Ill. Filed Dec. 8, 1880. (No model.)

Claim.—The combination, with the lever A in a pipe-wrench, of the two independent chains secured one on each side of the gripping end of the lever by means of a common bolt, and the pins c', projecting in pairs from opposite sides of the lever at a point in rear of said bolt, as herein shown and described, and for the purpose specified.

254,461. WATER-PROOF COMPOSITION. John D. Chesver, New York, N. Y. Filed Jan. 24, 1882. (Specimens.)

Claim.—1. The herein-described compound for waterproof-

ing, consisting of a strong vegetable fiber, finely-powdered minerals —such as pagodite—finely-powdered bark, earthy minerals—such as chalk, oxide of iron, or the like—and caoutchouc treated with vaseline or other product of petroleum, with or without coal-tar or bitumen, all substantially as set forth.

2. Powdered bark in combination with short fibers cemented together by caoutchouc, substantially as described.

3. The mixture of jute fiber, prepared as described, with powdered bark in compounds, of which caoutchouc is the cementing ingredient.

4. The use of vaseline in compounds of caoutchouc.

5. The process of preparing burlaps to receive a compound coating, consisting in applying to the same by hot calendering a composition of glue, yellow soap, and alum, all substantially as described.

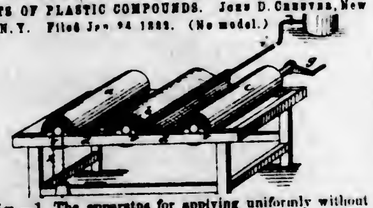
254,462. WATER-PROOF AND PLASTIC COMPOSITION. J. D. CHEEVER, New York, N. Y. Filed Jan. 24, 1882. (Specimens.)

Claim.—1. The composition herein described, consisting of jute, waste rubber rendered plastic by means of vaseline, or equivalent product of petroleum and sulphur, the whole treated substantially as described.

2. Jute, in combination with old waste vulcanized rubber which has been made plastic, as described.

3. The combining of powdered bark, with or without jute, with old waste rubber which has been made plastic by the process described.

4. The method of converting old waste rubber into a plastic condition by the use of vaseline, as set forth.



254,463. WATER-PROOF AND PLASTIC COMPOUND. JOHN D. CHEEVER, New York, N. Y. Filed Jan. 24, 1882. (Specimens.)

Claim.—1. The compound herein described for forming water-proof and plastic compounds, consisting of disintegrated fibrous materials, earthy materials such as described, sulphur, vaseline, and siccative oil treated with chloride of sulphur, all substantially as described.

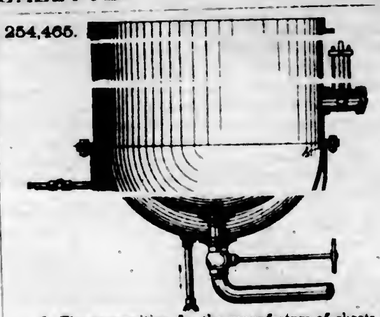
2. The use of vaseline with either or any of the products derived from the siccative or drying oils, substantially as and for the purposes described.

3. The use of the products derived from the siccative or drying oils, in combination with the plastic products obtained by heating waste vulcanized rubber with vaseline or petroleum-oil, for cementing pigments and fibers separately or together in the manufacture of water-proof compositions and fabrics, as described.

254,464. APPARATUS FOR APPLYING SOLUTIONS OF CHLORIDE OF SULPHUR IN BISULPHIDE OF CARBON TO SHEETS OF PLASTIC COMPOUNDS. JOHN D. CHEEVER, New York, N. Y. Filed Jan. 24, 1882. (No model.)

Claim.—1. The apparatus for applying uniformly without waste solutions of chloride of sulphur in carbon disulphide and other liquids to sheets formed of plastic materials and to cloth, consisting of a roll to hold the fabric to be coated, a supporting-roll, and a liquid-distributing pipe, constructed substantially as described.

2. In a machine for coating fabrics with volatile liquids, a brush of bristles, fibers, felt, or cloth, with a tube or channel connected with a reservoir for holding liquids, having small apertures for supplying fluids to the brush, substantially as described, and for the purposes set forth.



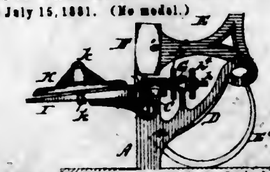
3. The combination, in a machine for coating fabrics with materials in volatile solvents, of the rollers *a*, *b*, and *c* with a pipe, *i*, provided with a brush, all substantially as set forth.

254,465. WATER-PROOF AND PLASTIC COMPOUND. JOHN D. CHEEVER, New York, N. Y. Filed Jan. 24, 1882. (Model.)

Claim.—1. The product obtained by mixing the siccative oils and vaseline and treating the mixture with chloride of sulphur in the manner described.

2. The product obtained by mixing the siccative oils, vaseline, and plekum gum and treating the mixture in the manner described.

254,465.

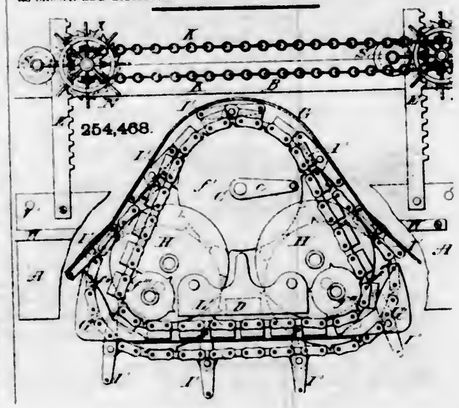


3. The composition for the manufacture of sheets for floor-coverings, embossing artificial leather, and for articles obtained from molds, consisting of the product obtained from the mixture of the siccative oils, vaseline, and pickum gum with powdered cork, tan-bark, short fibers, and coloring-matter, substantially as described.

254,466. VEHICLE-AXLE. CHARLES COOK, Winsted, Conn. Filed Nov. 12, 1881. (No model.)

Claim.—The flange F, in combination with the axle provided with the flanges D and E, and the axle-box B, closely surrounding said flanges, whereby the two inclosed grooves or channels G H are formed, substantially as described.

254,467. SAW-SET. JOHN M. DRAPER, Philadelphia, Pa. Filed July 15, 1881. (No model.)



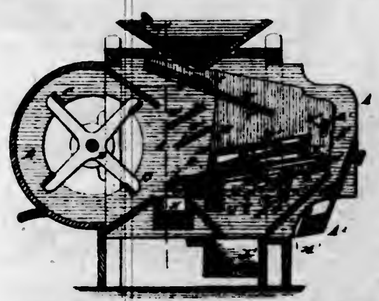
Claim.—1. In combination with stock A, having projecting arm D, the three-armed lever E, one arm of said lever being pivoted and the other two arms respectively forming a handle and carrying a die-head, substantially as shown and described.

2. In combination with the stock A, having arm D, the pivoted three-armed lever E, the curved spring E', operating to move said lever forwardly and downwardly, as shown and described.

3. In a saw-set, a clamp composed of a platform, I, and a disk, K, secured thereto by a screw, *k*, said disk being extended over the platform I and free to rotate on the screw *k*, substantially as shown and described.

4. The combination of stock A, arm D, three-armed lever E, spring E', gage H, platform I, disk K, and screw *k*, substantially as shown and described.

254,468.



254,468. CHAIN-PROPELLER. JAMES T. DRUMMOND, Mount Pleasant, Iowa. Filed Jan. 17, 1880.

Brief.—An endless adjusting-chain, together with its system of cams and revolving idlers, is arranged beside and operates in connection with a series of revolving paddles, pivoted at regular intervals to the links of a pair of endless chains, which chains are so operated by sprocket-wheels as to give said paddles a long horizontal stroke in the water. By means of connections made between appendages of the paddles and the adjusting-chain and cams the paddles are made to assume a vertical position during their immersion in the water.

Claim.—An endless chain-propeller for boats, consisting of the chains L, chain L', pivoted paddles I, being provided with arms I', having pins *e* attached thereto, cam G, cams G', idlers H, sprocket-wheels *f*, *f'*, *f''*, and *f'''*, shaft C, shafts C', and crank *c*, in combination with the frame-work A, D, D', and D', all substantially as herein arranged, and for the purposes specified.

254,469. PANNING-MILL. CARROLL C. RUDY and AMBROSE A. LUVAS, Pekin, N. Y. Filed Dec. 21, 1881. (No model.)

Claim.—1. The combination of the casing A, the reversible chute or spout N, having studs M M, the T-lever H, having slot l, and suitable operating mechanism, substantially as and for the purpose set forth.

2. The combination of the casing A, the reversible chute or spout N, the shoe, the T-lever H, and suitable operating mechanism, all constructed and arranged substantially as herein set forth.

3. The combination, with the shoe having a cross-piece, E', of a set or gang of sieves suitably secured or connected to each other, the lower one extending beyond the others, so as to pass under the said cross-piece E', which thereby serves to hold the entire set in position, as set forth.

4. The combination of the shoe having cross-piece E' and slots in which a screw-threaded rod, F', having a tightening-nut, G', is vertically adjustable, with the set or gang of sieves C' D', which are suitably secured together, the lower one extending under the cross-piece E', which serves to hold the front end of said set of sieves in position, their rear ends being clamped between the sides of the shoe by means of the rod F' and nut G', as set forth.

5. The combination, with the shoe, of the rock-shaft, suitable bearings therefor, the arms or cranks N' O', lever P', pivoted upon the side of the casing, and a hammer on crank N', adapted to strike the sieves, as set forth.

6. The combination, with the shoe, of the rock-shaft M' and crank N', provided with a threaded opening, Q', and an adjustable screw-threaded hammer, R', and mechanism for operating said rock-shaft, as set forth.

254,470. CLOTHES-RACK. DAVID A. EPPENBER, Haubstadt, Ind. Filed Dec. 21, 1881. (No model.)

Claim.—As an improvement in clothes-drying racks, the lazy-tongs sides A A, connected by cross-pieces C C, having projecting ends D F, provided with hinged rods E, and hinged arms G, having notches H, substantially as herein described, for the purpose shown and specified.

254,471. BLEACHING CANE-JUICE, SIRUP, AND OTHER MATERIALS WITH SULPHUROUS ACID, &c. ANDREW S. FULL, New York, N. Y., assignor to William H. Smith, Urbana, Ill. Filed Oct. 8, 1881. (No specimens.)

Claim.—1. The method of treating cane-juice, sirups, or other materials, solid or liquid, with sulphurous acid by subjecting the same to the action of the sulphurous acid under pressure, substantially as described.

2. The method of bleaching cane-juice, sirups, or other materials, liquid or solid, by subjecting the same in a close vessel to the action of compressed sulphurous acid under a high degree of pressure, and using agitation to bring the acid-gas in contact with all parts of said cane-juice or other materials, substantially as described.

3. The method of obtaining compressed sulphurous acid for storage or for immediate use by burning sulphur, or a compound of the same, in a close vessel, forcing compressed air or oxygen into said vessel to support combustion, and conveying the products (sulphurous-acid gas) into a close vessel, wherein the pressure is allowed to accumulate to the desired degree, substantially as described.

4. The method of producing sulphurous acid by burning sulphur, or a compound thereof, in compressed air or oxygen in a revolving cylindrical vessel or chamber, so as to expose to the oxidising action a large and thin area of sulphur, substantially as described.

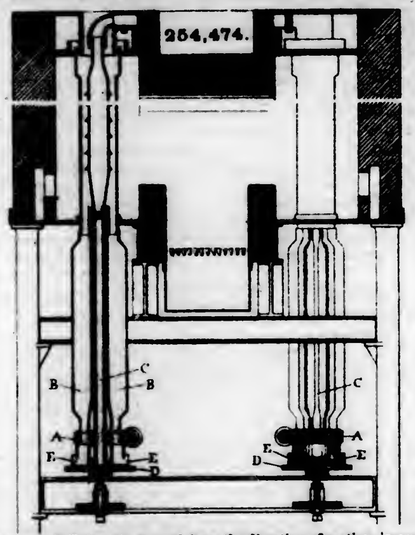
5. The improvement in treating cane-juice or other materials, solid or liquid, with sulphurous acid, consisting in burning sulphur, or compound thereof, in compressed air or oxygen, so as to obtain sulphurous acid under pressure, and subjecting the cane-juice or other material to the action of the compressed sulphurous acid, substantially as described.

6. The improvement in clarifying or bleaching cane-juice or other sirup, consisting in treating the dark-colored sirup with sulphurous acid under pressure, substantially as described.

7. The method of producing sulphurous acid for use in the arts by burning sulphur, or a compound thereof, in compressed air or oxygen in a vessel or chamber, and using the pressure in the chamber to force the sulphurous acid, whether gaseous or liquid, into close and strong storage-vessels, substantially as described.

254,472. CAR-COUPLING. DAVID FETTERS, Baltimore, Md. Filed Dec. 8, 1881. (No model.)

Claim.—In combination with the draw-head having recess *b*, the gravity-catch C, of shape conforming thereto, pivoted at its upper end, and provided with an arm, *c*, for sustaining the pin, a recess, *c'*, for holding the link, and a slot, *d*, through which the pivot-pin passes, substantially as set forth.

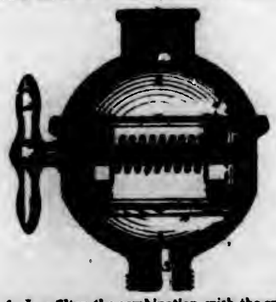


254,473. ROPE-CLAMP. JOHN GAYER, Portland, Oreg. Filed May 26, 1881. (No model.)

Claim.—A rope-holder having an eye enlarged at one end and reduced at the other, combined with a screw-follower adapted to press the rope into the contracted portion of the eye, substantially as described.

254,474. AUTOMATIC DISCHARGING APPARATUS FOR BONE-BLACK KILNS, &c. AUGUSTE A. GOUBERT, Jersey City, N. J. Filed July 9, 1881. (No model.)

Claim.—1. In an automatic discharging apparatus, the wings



or arms E E, bent backward from the direction of motion, in combination with the disk D and the revolving shaft C, substantially as herein specified.

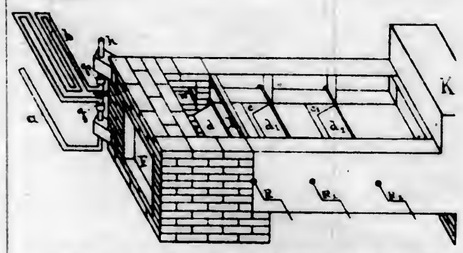
2. The arms E E, substantially as herein described, in combination with the wheel A, the disk D, and the coolers B B of a revolving charcoal-kiln.

254,475. FILTER. JOTT GRANT, Boston, Mass. Filed May 16, 1881. Renewed Jan. 11, 1882. (Model.)

Brief.—The filter is adapted to turn in its case, so as to allow the water to pass by in either a filtered or unfiltered condition. Leather washers serve as a packing to prevent the escape of unfiltered water when the device is arranged to operate as a filter.

Claim.—1. In a filter, the combination, with the outer casing, of a filtering-receptacle therein, and washer connected with the said receptacle and projecting laterally outward therefrom, and adapted to be seated upon the inside of the said outer casing, substantially as described.

2. The outer casing and the filtering-receptacle therein, combined with its operating rod or stem pivoted in the outer casing and passing through slots in the receptacle, as described, whereby the said receptacle is caused to rotate with the said rod, but has an independent movement transverse thereto, substantially as and for the purpose described.



3. The receptacle and its operating-rod passing through slots therein, combined with washers fitting the said rod and covering the said slots, substantially as and for the purpose described.

4. The filtering receptacle and its operating-rod passing through slots therein, combined with washers fitting the said rod, and a spring to press them against the slotted portion of the receptacle, substantially as and for the purpose described.

5. The spherical outer casing, combined with the movable receptacle therein, and its operating-rod, extending loosely through the said receptacle and pivoted in the casing, substantially as described.

6. The outer casing having an internal seat portion and the receptacle therein having openings on opposite sides, combined with washers surrounding the said openings, and the operating-rod adapted to positively rotate the said receptacle and to permit it to have an independent transverse movement, whereby the said washers are pressed into tight contact with the said seat portion of the casing, substantially as and for the purpose set forth.

254,476. SUGAR-EVAPORATOR. GUSTAVE H. GRIMM and ISAAC H. CLARK, Hudson, Ohio. Filed Nov. 21, 1881. (No model.)

Claim.—1. In an evaporating apparatus, the combination therewith of the sap-supply pipe *a*, having the coiled section *b* passing through the furnace of such apparatus before leading to and discharging into the evaporator-pan, substantially in the manner and for the purpose set forth in the foregoing drawings and specifications.

2. In an evaporating apparatus, the combination, with the sap-supply pipe thereof, of a coiled section, *b*, movable into and out of the furnace of such apparatus without detaching from the adjoining sections of such pipe, substantially as set forth in the foregoing drawings and specifications.

3. In a system of evaporator-pans, the combination therewith of the pockets P P' P² P³ P⁴, &c., the siphon *l p l*, and the siphon-cups *k k'*, substantially in the manner and for the purpose set forth in the foregoing drawings and specifications.

4. As a means of communicating between the successive pans of an evaporator system, the siphon *l p l*, opening at the receiving end at or near the bottom of and within the cup K, attached to such siphon for the purpose of excluding sediment therefrom and from succeeding pans, substantially as and for the purpose set forth.

5. The combination, with a siphon employed as a movable means of communication between evaporating-pans, of the cups *k* and *k'*, whose sides extend above the ports *o*, through which the siphon-limbs communicate with such cups, for the purpose of rendering such siphon easily portable without inverting, substantially as set forth.

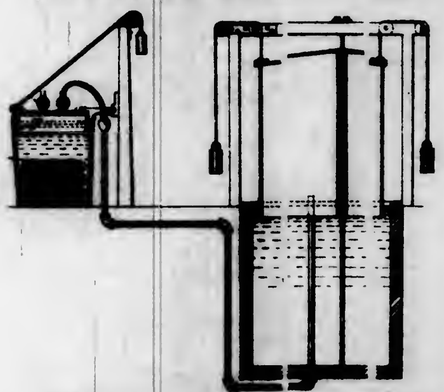
6. The trough J, exterior to and separably attached to the system of evaporator-pans, and communicating therewith by removable siphons, substantially as and for the purpose set forth.

7. In a system of evaporator-pans heated by furnace or flue beneath such system, the chair I, comprising the horizontal flanges *y* and *y'* and the vertical diaphragm or cross-strips *x*, substantially in the manner and for the purpose set forth in the foregoing drawings and specifications.

254,477. COUPLING FOR DRILL-RODS. EMERY E. HARDY, Kendall Creek, Pa. Filed July 7, 1881. (Model)

Claim.—1. The combination of the rod A, having threaded neck *b*, tool B, having the external thread, packing F, and sleeve H.

2. The combination of the rod A, having threaded neck *b*, the tool B, having thread *f*, the sleeve H, and packing E.



3. In combination with the rod A, tool B, and connecting-sleeve H, the collar C and packing E, applied as shown.

4. In a drill-rod coupling, the combination of an external connecting sleeve and elastic packings, applied at the ends of said sleeve, substantially as shown, to exclude water from the interior of the coupling.

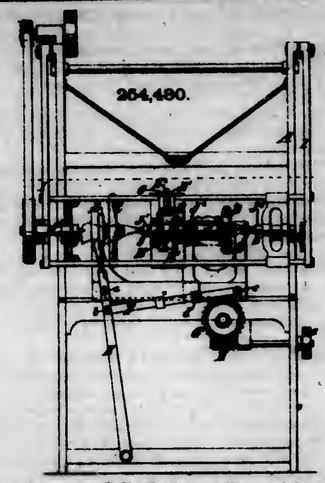
5. In combination with the rod A, having neck *b*, the externally-threaded tool B, having the cylindrical portion *a*, and the external connecting-sleeve, H, arranged to bear closely upon the exterior of the portion, *a*, substantially as shown.

6. The combination of the rod A, tool B, sleeve H, and packings E and F.

254,478. APPARATUS FOR CLEANING IRON WIRE AND COLLECTING THE WASTE HYDROGEN GAS. WILLIAM NEWITT, Trenton, N. J., assignor to the Trenton Iron Company, same place. Filed Oct. 3, 1880. (No model.)

Claim.—An apparatus for cleaning wire and such articles and for collecting the waste hydrogen gas evolved in such process, which consists in an acid-proof tub provided with an air-tight cover, having a flange extending downwardly within said tub into the liquid contained in the same, which cover is likewise provided with air and gas cocks and is hinged at a point horizontally remote from the edge of the tub, substantially as specified.

254,479. BASKET. JOSEPH HIBBARD, South Butler, N. Y. Filed Dec. 6, 1881. (No model.)

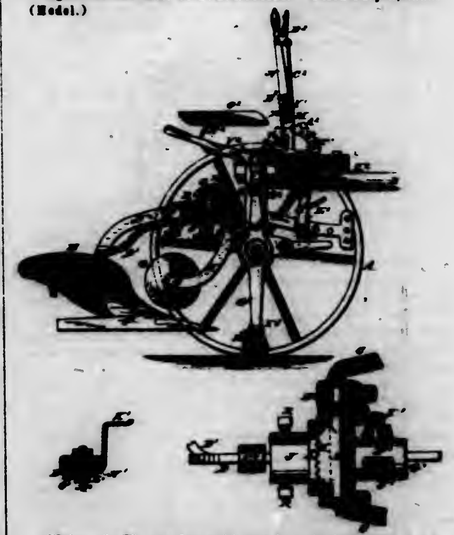


Claim.—1. In a stave basket, the combination of the concave-convex plate C and rivet-plate D, each perforated as shown, and the rivet or bolt E, combined with inclined perforated staves, and adapted to serve as set forth.

2. The combination of the staves A *a*, re-enforcing plates B *b b'*, filling-staves F, and hoops with the concave-convex plate C *c*, rivet-plate D *d*, and securing-bolt E, as and for the purposes set forth.

254,480. LATHE FOR TURNING IRREGULAR FORMS. WILLIAM S. HUNTINGTON, Brooklyn, N. Y. Filed Nov. 18, 1881. (No model.)

Brief.—The spindles carrying the pattern may be locked to those carrying the work, so as to revolve in the same direction therewith, or unlocked and connected by gearing, so as to revolve in the opposite direction.



Claim.—1. The combination, in a lathe, of a shaft or spindle comprising sections J J', for carrying a pattern, and sections J² J³ in line therewith, for carrying the work, means for locking the sections J' J² together, so that all the sections will rotate together, and gear-wheels which may be engaged when the sections J' J² are unlocked from each other, to cause the sections J J' to rotate reversely to the sections J² J³, all substantially as and for the purpose herein described.

2. The combination, in a lathe, of a shaft or spindle for supporting a pattern and the material to be turned, comprising sections J' and J², the pin L, the bevel-gear wheels M M', the pinion N, and its adjustable shaft N', substantially as and for the purpose specified.

3. The combination, in a lathe, of a shaft or spindle for supporting a pattern and the material to be turned, comprising sections J' J², the pin L, the bevel-gear wheels M M', the pinion N, the shaft N', screw N², and lever O, substantially as and for the purpose specified.

254,481. SULEY-PLOW. FRANKLIN B. HUNT, Richmond, Ind., assignor of one-half to D. B. Robbins. Filed July 8, 1881. (Model.)

Claim.—1. The quadrant A', cast in a single piece and provided with notches in its periphery, holes P', and integral bearing U' for the lever, in combination with said lever and the adjustable pin S', for the purpose specified.

2. The quadrant A', cast in a single piece and provided with notches in its periphery, holes P', and integral stud or bearing U' for the lever M.

3. The quadrant A', cast in a single piece and provided with notches in its periphery, holes P' for the pin S', stud U', cleats V' V', and hold onto the timber A'' by means of bolt W', in combi-

nation with levers M N, clamp X', and pawl Y', substantially as set forth.

4. The quadrant A', cast in one piece and provided with notches in its periphery, holes P', and integral stud U', in combination with levers M N, clamp X', pawl Y', and pin S', substantially as set forth.

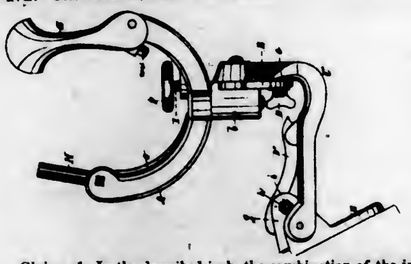
5. The stop K', attached to the plow-beam D, and made adjustable by means of clamp L', incline N', lip O', and bolt M', substantially as set forth.

6. In a wheel-plow, the combination, with the plow-beam, of the oscillating or vibrating leveling device J, through which the plow-beam passes, said device being provided with a wedge-shaped hole and set-screws for the oblique adjustment of the beam, substantially as set forth.

7. In a wheel-plow, the combination of the seat-arch, the stationary furrow-wheel axle, and the land-wheel axle, attached to the slide V², and both connected to and by said seat-arch, and each operating independent of the other, the slide carrying the land-wheel being locked to the seat-arch by means of cam-lever C² and block D².

8. In combination with the axle of a wheel-plow, the pendant G², suspended from said axle and carrying a conical roller the axis of which is turned outward, substantially as set forth.

9. The pendant G², attached to the axle and provided with the shield I², in combination with a conical roller arranged with the side next the land perpendicular, substantially as set forth.



10. In combination with lever M, clamp X', and pawl Y', the set-screw Z', for the purpose specified.

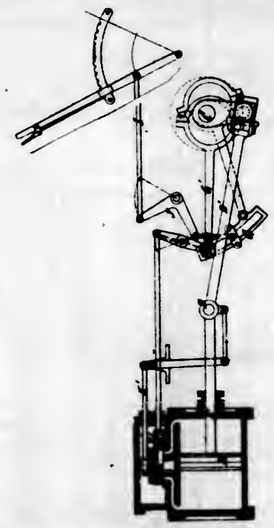
11. The seat-arch B, provided with integral double socketed bearings Z Z, in combination with the tongue-timbers A' A'', permanently fixed therein, for the purpose specified.

12. In combination with the seat-arch provided with bearing Z, and tongue-timber A', the foot-rest L² and seat-spring, the whole being held together by means of the bolts M².

13. In a wheel-plow, the combination, with the plow-beam D and ball C, of the pivoted hanger I and oscillator J, forming a direct connection between said plow-beam and ball, the beam passing through the hanger and oscillator, the said hanger and oscillator being provided with corrugations X, and being held together by means of the bolts W and U, substantially as set forth.

254,482. SHOE-MAKER'S JACK. GEO. W. HUTCHINS, Dover, N. H. Filed Jan. 23, 1882. (No model.)

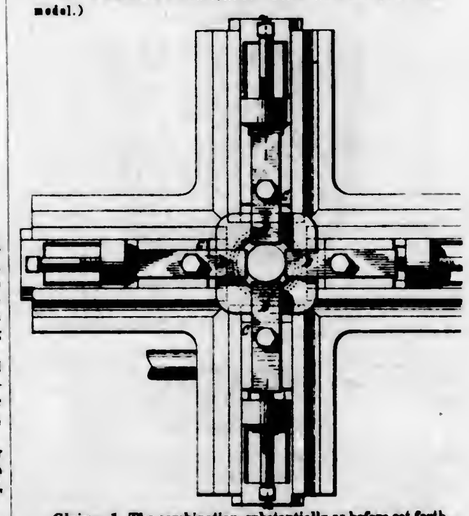
Claim.—1. In the described jack, the combination of the inverted-arched body A, and the heel-spindle H, fulcrumed thereto, with the elastic arm or carved spring e, extending down from such spindle and within the segment of said body in manner as represented, and with the adjusting-screw I, having its head *p* arranged within the said segment and projected over the spring, all being substantially as set forth.



2. The toe-rest clamp-screw *m*, arranged so that its head shall be on or project from the inner side of the arched body A, in manner substantially as shown and described, while the end of the shank of the screw may be against the lower part of the toe-rest, as represented.

3. The combination of the base E, its standards *g g*, and their connecting catch or bolt *h* with the bent arm C, hinged to such base, and with the leg F, having the catches *h* and back stop, *l*, and hinged to the bent arm, all being substantially as set forth.

4. The slotted sector B, its clamp-screw D, pivot *c*, and journal-bearing *b*, in combination with the bent arm C and with the arched body A and its journal *a*, all arranged as specified and represented.



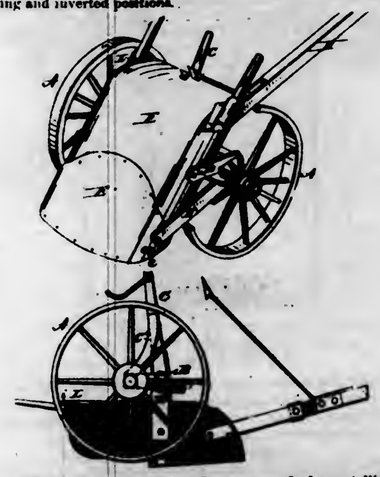
5. The combination of the base E, having the standards *g g*, and cross catch or bolt, *h*, with the bent arm C and catch-leg F, and with the adjustable sector B and its clamp-screw D, pivot *c*, and journal-bearing *b*, and the inverted-arched body A, provided with foot-supporting devices and applied to such bearing, substantially as described.

254,483. CUT-OFF-VALVE GEAR FOR STEAM-ENGINES. JOHN JAMES, New York, N. Y. Filed Apr. 9, 1881. (No model.)

Claim.—In an engine, the combination, with a main or distribution slide-valve, and an ordinary link-motion for varying the motion thereof, of a cut-off slide-valve consisting of a single plate driven by a connection with the piston-rod or cross-head of the engine, so that it has an invariable travel and an invariable motion relatively to the piston, substantially as and for the purpose specified.

254,484. BOLT-HEADING MACHINE. HENRY J. JOHNSON, Providence, R. I., assignor, by mesne assignments, to Plumb, Burdict & Barnard, Buffalo, N. Y. Filed Nov. 29, 1881. (No model.)

Claim.—1. The combination, substantially as before set forth, of the die-slides and the tubular shield.



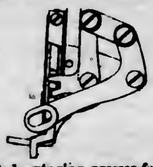
2. The combination, substantially as before set forth, of the die-slides and the shield-plate.

3. The combination, substantially as before set forth, of the die-slides, the tubular shield, and the frame of the machine, fitted with the receiver for the scale and water.

4. The combination, substantially as before set forth, of the die-slides, constructed with recessed ends, and the shield-plate, extended to overlap said recessed ends.

254,485. DIRT-SCRAPER. JEREMIAH JOHNSON, Mount Pleasant, Iowa, assignor of one-third to Waldo A. Stearns, same place. Filed Nov. 7, 1881. (No model.)

Brief.—The bottom of the scraper has a supplementary steel plate fitted underneath and up the sides of the forward part of the scoop. The scraper is suspended by pendants from the horizontal portion of a bent axle, and a horizontal lever projects at right angles from the horizontal portion of the axle, forming, with the upright parts of the axle, a bell-crank lever, and is strengthened by braces connecting with the lower part of the vertical portions of the bent axle. Suitable catches retain the box in its carrying and inverted positions.



Claim.—1. A scraper-box, E, constructed of a metallic plate constituting the inner or principal dirt-holding device, in combination with a supplementary steel plate, E', fitted underneath and up the sides of the forward part of the box E, and fastened thereto, constituting both the wearing part and a stiffening device to a scraper-box, and forming its cutting-edge, substantially as herein shown, and for the purposes specified.

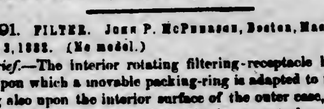
2. The combination of an arched or double-elbow crooked axle, B, wheels A, lever C, with braces C', pendants D, and box E, all formed and arranged substantially as herein shown, and for the purposes specified.

254,486. SEWING-MACHINE. WILLIAM JOHNSON, Haverhill, Mass. Filed Nov. 19, 1881. (Model.)

Brief.—The swinging presser-foot moves forward with the feed, and is then raised by the lifting-bar and returned to its first position by a spring.

Claim.—1. The pivoted swinging presser-foot and the vertically-movable lifting-bar, adapted to descend upon the material being sewed near the needle-hole of the plate which supports the material to lift the presser-foot above the material, combined with an under feeder, adapted to engage the under side of and feed the material for each stitch, the presser-foot moving with the said feeder and cloth as the cloth is being fed forward, substantially as and for the purpose described.

2. The under feeder to engage the under side of the material and carry it forward, and a swinging presser-foot above the material and moving with it, combined with a vertically-movable lifting-bar adapted to be thrown down upon the material while at rest to lift the presser-foot, and with a spring to move the said presser-foot toward the operator, substantially as and for the purpose set forth.



3. The bracket A, the swinging presser-foot pivoted thereon, and the spring to throw it toward the operator, combined with the short lifting-bar guided by the said frame and reciprocated vertically therein, substantially as described.

4. The bracket A, swinging presser-foot pivoted thereon, and the lifting-bar guided by the bracket, combined with the system of levers carried by the said bracket, and adapted to be actuated by the needle-bar, substantially as described.

254,487. COMPOSITION FOR BLEACHING AND WASHING LINEN, &c. CERF MAYER LEVY and GUSTAVE ALEXANDRE, Paris, France. Filed Sept. 30, 1881. (No specimens.) Patented in France Feb. 11, 1880.

Claim.—The composition of a mixture of water, *Fucus crispus*, resin, and liquid caustic soda, with silicate of soda, and with liquid caustic soda, and with a mixture of oleic acid and carbonate of soda, in about the proportions specified, all compounded to produce a solid lye, substantially as set forth.

254,488. CAN-OPENER. ARTHUR W. LYMAN, Brooklyn, N. Y. Filed Dec. 15, 1880. (No model.)

Claim.—The can-opener described, consisting of the handle and body A, the puncturer B, cutter D, riding-plate C, having stop and fulcrum portion *e*, and the gage E, all formed of one piece of steel, and adapted to serve as set forth.

254,489. FOUNDATION-BLOCK FOR BUILDINGS. MATTHEW R. MARKS, Orlando, Fla. Filed Oct. 18, 1881. (No model.)

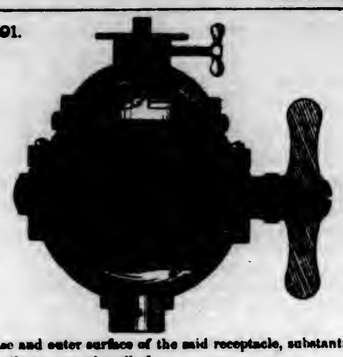
Claim.—1. A hollow building-block having ornamental openings E and openings or slots F, as described, for the purpose set forth.

2. A building-block provided near its upper and lower ends with grooves or gutters D, as and for the purpose set forth.

3. The herein-described improved building-block A, having flange B, projection C, grooves or gutters D, and openings E F, as and for the purpose herein shown and specified.

254,490. PITMAN-CONNECTION FOR HARVESTERS. OLIVER H. MCMILLAN and MOSES C. MCMILLAN, Clinton County, Ohio. Filed July 27, 1881. (No model.)

Claim.—1. The self-fastening head *a*, having the two parts *a' a''*, hinged together at their extreme outer ends and provided with the self-fastening bolt *d*, substantially as shown and specified, for the purpose set forth.



2. In a pitman-rod head divided in two sections hinged together as shown, a self-fastening bolt by which said sections are united, and a thin metallic reversible and interchangeable packing having central transverse lugs fitting in slots in the two opposite sections of the head, substantially as hereinbefore set forth.

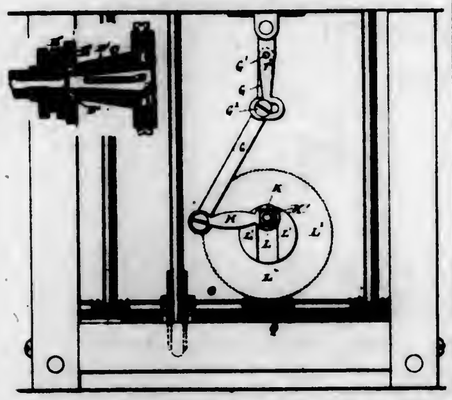
254,491. FILTER. JOHN P. MCPHERSON, Boston, Mass. Filed Jan. 3, 1882. (No model.)

Brief.—The interior rotating filtering-receptacle has plane seats, upon which a movable packing-ring is adapted to rest, and, bearing also upon the interior surface of the outer case, prevents the water from passing around the filtering-receptacle.

Claim.—1. In a filter, the combination, with the external case and filtering-receptacle therein, of the independent movable packing-ring having a tight fit on a portion of the inner surface of the

254,491.

said case and outer surface of the said receptacle, substantially as and for the purpose described.



2. The external case and filtering-receptacle therein, provided with a plane seat, combined with the independent packing-ring, having a tight fit on a portion of the inner surface of the said case and being movable toward and from the said seat, whereby it can obstruct the flow of water between the said case and receptacle or not, substantially as and for the purpose set forth.

3. The case provided with inlet and outlet passages and an internal cylindrical portion and the filtering-receptacle mounted to rotate therein and provided with plane seat portions, combined with the packing-ring having a circumferential tight bearing in the cylindrical portion of the case, and means to move it longitudinally therein onto or off from the said seat portions of the filtering-receptacle, substantially as described.

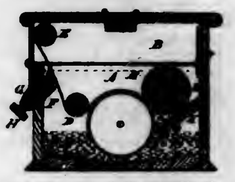
254,492. MACHINE FOR TURNING CYLINDRICAL OR TAPERING HANDLES. NATHAN T. MELVIN, Lodi, Ohio, assignor to himself and Albert B. Taylor, same place. Filed Apr. 26, 1880. (No model.)

Brief.—The cutter in the revolving hollow mandrel can be expanded or contracted by means of the train of mechanism leading to the shaft which controls the feed of the blanks.

Claim.—1. The combination, with the cutter-head, of tapering knife-holders pivoted therein, and a sliding collar having internal bosses adapted to bear on said knife-holders, and provided with means for sliding said collar to turn articles of tapering form and for holding said collar stationary when articles of cylindrical form are to be turned, substantially as described.

2. The combination, with the sliding collar and cutter-head having pivoted knife-holders, of the adjustable wrist-pin, worm-wheel, and suitable connecting levers and links, substantially as described.

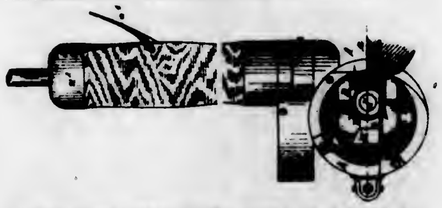
3. The combination, with the shafts B and O, the cutter-head, and annularly-grooved collar, of the worm-wheel, lever F, having a boss-bearing in the groove of the collar, an adjustable wrist-pin, K, and suitable connections, said wrist-pin being adapted to be adjusted both concentrically and eccentrically to said wheel, substantially as set forth.



4. The combination, with the shafts B and O, the collar E, the cutter-head provided with pivoted knife-holders and knives, of worm-gear Q L', the adjustable wrist-pin K, link H, lever G, pivoted, as described, to the slotted lever F', and the latter provided with the boss F, the whole constructed to cause the knives to approach and recede from each other, substantially as described.

254,493. EVAPORATOR FOR REGISTERS. JOHN F. MEYER, Baltimore, Md. Filed Dec. 9, 1881. (No model.)

Claim.—The device herein described, consisting of the wire frame having catches to engage with the register and formed to support the device upright when not in use, and provided with the inclined front plate and a water-pan, as set forth.

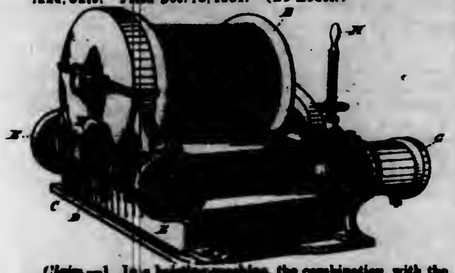


254,494. PAPER-HANGING MACHINE. RUSSELL H. HIBBS, Elk City, Pa. Filed June 8, 1881. (Model.)

Claim.—1. The slide-rests G G and adjusting thumb-screws H H, in combination with the brush F, constructed and arranged substantially as shown and described, and for the purpose set forth.

2. A paper-hanging machine composed of the case A, cover B, paste-roller C, pressure-roller D, parallel roller E, and inclined table K, in combination with the adjustable brush F, substantially as described.

254,495. SOLE-EDGE-TRIMMING MACHINE. JOHN R. HOFFITT, Boston, Mass. Filed Jan. 31, 1882. (No model.)



Claim.—1. The improved edge-trimmer, consisting of the holder A, provided with a handle, the knife *b* and its carrier B, and mechanism, substantially such as is described, for revolving the carrier B, the whole device adapted to be moved about the sole-edge, substantially as described.

2. In combination, the cylindrical knife *b*, carrier B, follower *b'*, and holder A, the follower screwing into the carrier and the carrier mounted in the holder, as described.

3. In combination, the cylindrical knife *b*, carrier B, holder A, feed-frame D, feed-wheel *d*, shaft F, and spring *f*, substantially as described.

4. In combination, holder A, carrier B, knife *b*, frame D, post *d'*, feed-wheel *f*, and sleeve-gear *g*, substantially as described.

254,496. HOISTING-MACHINE. FRANK HERGARDEN, Cleveland, Ohio. Filed Dec. 13, 1881. (No model.)

Claim.—1. In a hoisting-machine, the combination, with the eccentric of a horizontal engine, of a shaft adapted to be revolved by said eccentric, worm-gearing C, and a revolving drum provided with a gear-wheel adapted to mesh with and be revolved by said worm-gear, substantially as set forth.

2. In a hoisting-machine, the combination, with the frame or stand A, of the drum B, provided with gear-wheel B', shaft D, worm-gear C, and the eccentric E, the latter being adapted to revolve the shaft D, and connected directly to the pitman of a horizontal engine, substantially as set forth.

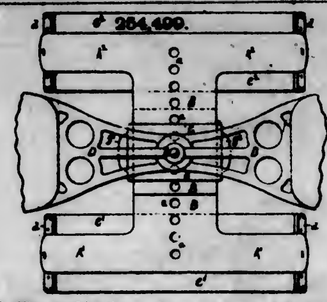
254,497. NECK-YOKE CLIP. JAMES HELLIS, Ypsilanti, Mich., assignor of one-half to George W. Voorhees, same place. Filed Dec. 1, 1881. (No model.)

Claim.—1. A neck-yoke consisting of two semi-cylindrical parts, A F, provided with overlapping rear edges, C G, with interlocking front edges, H' E E, and with ears I, by which they are secured together, substantially as and for the purpose specified.

2. In a neck-yoke clip, the section A, provided with a flange, C, and with opening B D, in combination with the section F, provided with a flange, G, and with a lip, H', to fit the opening D, and suitable devices for securing the two together, substantially as and for the purpose specified.

3. In a neck-yoke clip, the section A, provided with a flange, C, opening B, and with the lips E E, in combination with the section F, provided with a lip, H', to fit between the lips E E and a flange, G, a loop, J, and fastening-ears I, substantially as and for the purpose specified.

254,498. APPARATUS FOR FILLING RUBBER-MOLDS. EDWARD NELSON, Frederick, Md. Filed Aug. 31, 1881. (No model.)



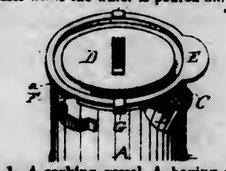
Claim.—In combination with the mold having a tapering opening, the tank provided with the cylinder B, having conical nozzle, the forcing mechanism, and the clamping-screw E, as set forth.

254,499. COLLAR-PAD. JACOB H. HESSER, Ayr, Miss. Filed Aug. 6, 1881. (No model.)

Claim.—1. The combination, with a horse-collar, of the adjustable auxiliary pads A' A' and plate C, clasping the pads, substantially as set forth.

2. The combination and arrangement of the pads A' A', bars B' B', provided with perforations *a* or other suitable means for adjusting them, and plate C, pin *b*, and swivel-cap D, substantially as set forth.

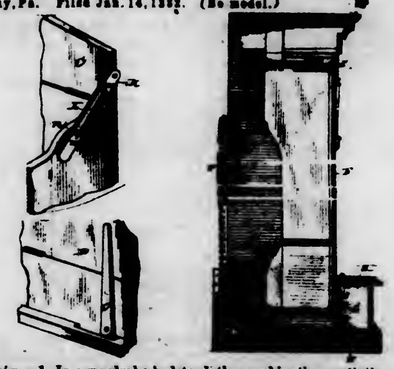
254,499.



3. The combination and arrangement of the plates A' A', straps *c' c'*, and connecting-bars B' B', substantially as set forth.

4. The combination and arrangement of the curved plates A' A', straps *c' c'*, and swivel-plates *d*, substantially as set forth.

254,500. COOKING-VESSEL. AUGUST W. OSENBAUM, Chicago, Ill. Filed Nov. 18, 1880. Renewed July 20, 1881. (No model.)

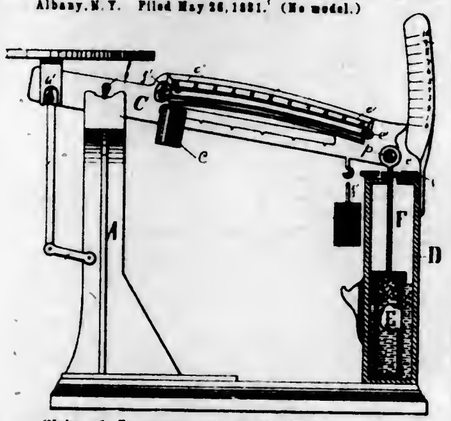


Brief.—The vessel is provided with a notched flange. The lid has two hooks for embracing the flange and a projection for covering the nozzle of the vessel. The lid is secured to the vessel by passing the hooks through the notches and twisting. By further twisting the lid the nozzle is uncovered, the lid being firmly held to the vessel while the water is poured off.

Claim.—1. A cooking-vessel, A, having a lip, B, provided with a strainer, C, in combination with the cover D, having the flap E projecting therefrom, whereby the lip can be opened and closed by twisting the cover on the vessel without removing it therefrom, substantially as described and shown.

2. A cooking-vessel having lip B, perforated plate C, flange *a*, and notches F, in combination with the cover D, provided with a flap projecting therefrom for closing the lip, the cover being locked to and unlocked from the vessel and the lip being closed and unclosed by the twisting of the cover on the vessel, substantially as described and shown.

254,501. WARDROBE-BEDSTEAD. ANTON ORTLIEB, Allegheny, Pa. Filed Jan. 14, 1882. (No model.)



Claim.—1. In a wardrobe-bedstead, the combination, with the case A, of the bedstead B, pivoted and journaled therein, and having folding head-board C and securing devices consisting of slotted arm K, having recesses *n* and pin *n*, and foot-board D, and securing devices *c'* and *f'*, and pivoted bar *c'*, and folding or hinged rail *d'*, having feet E, the several parts constructed and relatively arranged substantially in the manner as herein described.

2. In a wardrobe-bedstead, the case A and the bedstead pivoted and adapted to fold therein, the spiral springs P R, arranged in the rear of and connected with the case, and chains T V, passing under rollers and connecting said springs with the head and

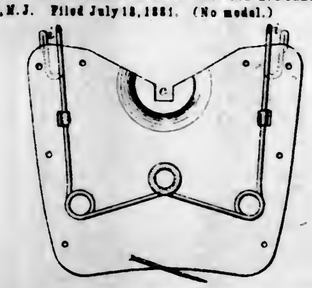
of the bedstead, in combination with the spring Q and chain U, arranged substantially in the manner herein shown and described, whereby tension is first brought upon the outer springs, P R, and subsequently upon the spring Q, in the operation of lowering the bedstead, substantially in the manner as and for the purpose specified.

254,502. AUTOMATIC WEIGHING-SCALE. FRANK D. PAYS, Albany, N. Y. Filed May 26, 1881. (No model.)

Claim.—1. In an automatic or self-adjusting weighing-scale, the combination, with a pivoted beam or arm, of a scale-pan and an equipoise-plunger, substantially as described.

2. In an automatic weighing-scale, the combination, with a pivoted beam or arm, of a scale-pan, an equipoise-plunger, and a dash-pot, substantially as set forth.

3. In a weighing-scale, the combination of the beam C with the stem F, the cup E, and the dash-pot D, substantially as herein described.



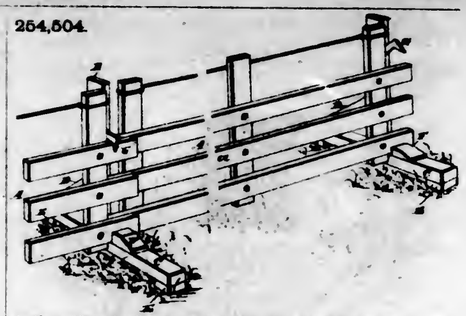
4. The combination, in a weighing-scale, of the beam C, the stem F, having disk *e*, and the dash-pot D, provided with turn-buttons *f f*, substantially as described.

5. In a weighing-scale, the combination, with a slotted beam or arm, of a measuring-tube set therein, substantially as described.

6. In a weighing-scale, the combination, with a slotted beam or arm provided with projecting flanges, of a measuring-tube set in said slot and protected by said flanges, substantially as set forth.

7. In a weighing-scale, the combination, with the measuring-tube, of an index float or pointer which shifts with each change in poise of the beam, substantially as herein described.

254,503. CRAVAT-FASTENING. GEORGE E. POLAND, Hasbrouck, N. J. Filed July 18, 1881. (No model.)

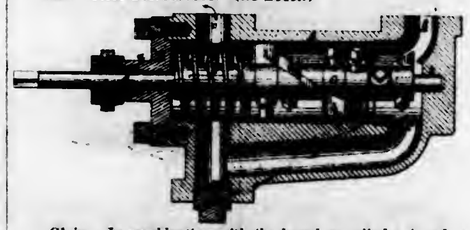


Claim.—1. The combination, with the base-plate having a notched upper edge to set below the collar-button, of spring-hooks to hook over the collar-band, substantially as set forth.

2. The spring-hooks for a cravat or bow, formed of one piece of wire with coils, in combination with the plate and the guides thereon, through which the wire slides, and the attachment for the center of the wire, as set forth.

254,504. PORTABLE FENCE. WILLIAM H. RANDALL, Ypsilanti, Mich. Filed Dec. 8, 1881. (No model.)

Claim.—1. The combination, with the base C, having the post B and block F rigidly secured thereto, and a hook pivotally secured

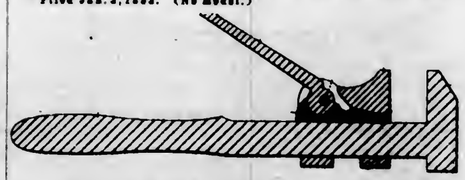


254,504.

to the said post, of fence-panels the adjacent edges of the lower boards of which are adapted to rest on the base between the block F and the post B, while the adjacent edges of the upper board of the panel are adapted to be secured by the said hook G, substantially as set forth.

2. The combination, with the fence posts and panels, of hooks pivotally secured to the fence-posts and adapted to clasp the panels and hold them against the posts, the outer ends or clasping-arms of said hooks being provided on their inner faces with bevels to accommodate the hooks to panels of different thicknesses, substantially as set forth.

254,505. ORE-SEPARATOR. SAMUEL G. ROLLINS, Boston, Mass. Filed Dec. 15, 1881. (No model.)



Claim.—In combination with the barrel or cylinder A and its rotary propeller and agitator, arranged therein and to operate therewith as described, the separate chamber D, inclined and extended along beneath the cylinder, as represented, and opening out of such at or near one end only of it, (the said chamber D,) and having a discharge-opening at its lower part or opposite end, all substantially as set forth.

254,506. MEN'S DRAWERS. ISAAC SCHEUER, New York, N. Y. Filed Dec. 21, 1881. (No model.)

Claim.—In men's drawers, the edgings or linings *b* and *c* of the front slit, carried down and crossed on the crotch, substantially as specified.

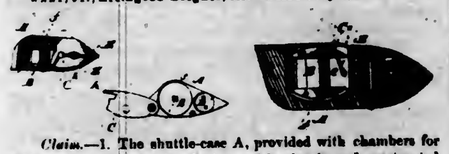
254,507. WRENCH. GEORGE P. SCHNEIDER, Cleveland, Ohio. Filed Jan. 3, 1882. (No model.)

Claim.—1. In a wrench, the combination of a fixed arm and movable jaw, said movable jaw being secured in any desired position on said arm by means of a wedge and cam-lever, said cam-lever operating at the same time to drive the wedge and clamp the

movable jaw against the said arm, substantially as and for the purpose shown and described.

2. In a wrench, the combination of a fixed arm, said arm made V-shaped at its rear portion, with a movable jaw, said jaw being provided with a socket, which is also made V-shaped and held in place on said arm by means of a cam and wedge, substantially as shown and described.

254,508. PROCESS OF TREATING IRON AND STEEL. ALEXANDER H. SIEGFRIED, Selin's Grove, assignor of one-half to Truman H. Purdy, Sunbury, Pa. Filed Feb. 1, 1881. (No specimens.)



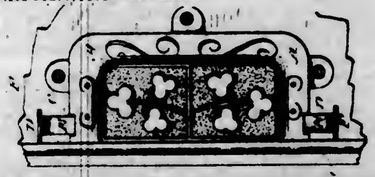
Claim.—1. The process of treating molten cast iron or steel containing phosphorus or sulphur to remove said elements therefrom, the same consisting in incorporating with the molten metal a compound composed of sulphate of copper and carbonate of soda, in proportions substantially such as herein specified.

2. As an improvement in the art of eliminating phosphorus and sulphur from iron or steel, incorporating therewith while it is in a molten condition sulphate of copper and carbonate of soda in substantially the proportion of one and a half ounce to each hundred pounds of metal.

3. The herein-described method of treating iron and steel for the removal of sulphur, phosphorus, and silicon, consisting in incorporating therewith while it is in a molten condition carbonate of soda and sulphate of copper, substantially as described.

4. As an improvement in the art of treating iron and steel to purify and strengthen it, the process consisting in repeatedly melting the metal and incorporating therewith during each of its molten periods a compound consisting of sulphate of copper and carbonate of soda.

254,509. SHUTTLE FOR SEWING-MACHINES. JOHN S. CRAWALT, Jr., Arlington Heights, Ill. Filed July 2, 1879.

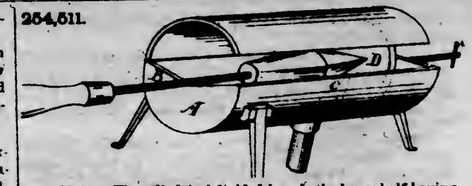


Claim.—1. The shuttle-case A, provided with chambers for the bobbin and the tension device, and having its end constructed with a slit, E, which extends inwardly a short distance in a straight line, and thence passes in a slanting direction through the shuttle-case into the chamber containing the tension device, substantially as and for the purpose described.

2. The combination, with the case A, provided with a slit, E, and cover C, of the tension device and bobbin B, as and for the purposes set forth.

3. The combination, with the case A, provided with a slit, E, and cover C, of the bobbin B, having a yielding bearing, *f*, and a tension mechanism, as and for the purposes set forth.

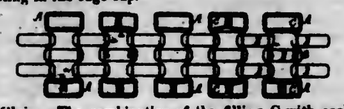
254,510. SASH-HOLDER. JACOB G. SLAYER, Wyandotte, Kans. Filed Jan. 7, 1882. (No model.)



Claim.—As an article of manufacture, the herein-described improved sash-holder, consisting of the casing A, having recess B, and a longitudinal groove or recess, C, at right angles to the latter and on the under side of the casing, the operating-slide D, adapted to work in said groove C, consisting of a flat plate, E, having its ends bent or turned upwardly to form ears or thumb-pieces F, and the cage or holder G, consisting of a flat plate, J, having its ends struck up to form walls H I, between which the elastic ball or roller K is to be held, the cage being secured to the face of plate E, substantially in the manner and for the purpose herein shown and specified.

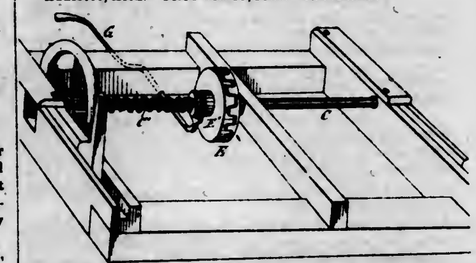
254,511. VAPOR-BURNING SOLDERING-FURNACE. LUCIUS B. SHAW, Cleveland, Ohio. Filed Jan. 13, 1882. (No model.)

Brief.—The web or support C is notched similar to the end B, so that the irons to be heated may be held in position over the flame.



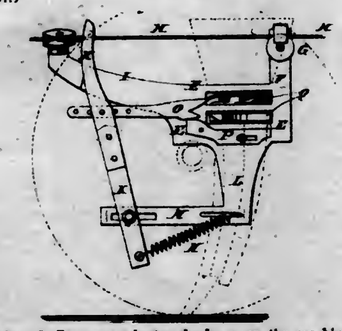
254,511.

Claim.—The cylindrical divided box A, the lower half having the inclined webs B C and provided with the adjustable stop D, in combination with the burner E, provided with the wire-gauze cap *f*, substantially as described.



254,512. NECK OR BRACELET CHAIN. OLIVER S. SPAULDING, Mansfield, Mass. Filed Jan. 9, 1882. (No model.)

Brief.—The filling-cup closes the edge cup and hides the connecting-wires therein from view. It also prevents foreign matter collecting in the edge cup.



Claim.—The combination of the filling C with each fellow pair of edge cups A and their connection or connections and immediately-intervening links or units B, such fillings being arranged within the edge cups, substantially as specified and represented.

254,513. HEAD-BLOCK FOR SAW-MILLS. JOHN W. STORER, Manistee, Mich. Filed Oct. 12, 1881. (No model.)

Claim.—In a circular-saw-mill carriage, the two shafts C C', provided at their outer ends with gears for operating the knees, in combination with the clutch-section E E', the section E being rigidly secured to the shaft C and provided with an internal bearing for the inner end of the shaft C I, and the section E' constructed to slide on the shaft C', and the spring E and lever G, for sliding the clutch-section E' on its shaft, substantially as shown, and for the purpose specified.

254,514. CHECK-ROW ATTACHMENT FOR CORN-PLANTERS. CHARLES E. SWEENY, Geneseo, Ill., assignor to Mary E. Swaney and George G. Mowry, same place. Filed July 13, 1881. (No model.)

Claim.—1. In a corn-planter check-rower, the combination, with the frame E, adjustably secured to the seed-box, and the bent levers O, connected to the seed-slide, of the forked lever K, the

pivoted finger O, and the spring N, substantially as and for the purpose set forth.

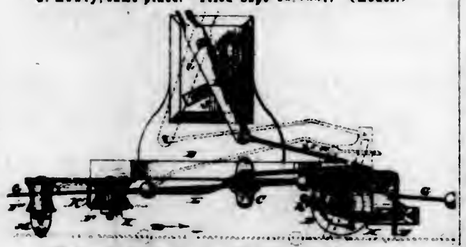
2. In a corn-planter check-rower, the combination, with seed-slide-connecting bar B, the forked lever K, the pivoted finger O, and spring N, of the bent levers Q and the bar B, having its inner end perforated and its outer end slotted, substantially as and for the purpose specified.

3. In a corn-planter check-rower, the combination, with the plate C, adjustably secured to the seed-box, of the plate E, adjustably secured to the plate C, and provided with the arms I F, carrying pulleys G J, and the slotted arm M, the forked lever K, and the spring N, substantially as and for the purpose specified.

4. In a corn-planter check-rower, the combination, with the plate E and the finger O, of the adjustable guide P, substantially as and for the purpose specified.

5. In a corn-planter check-rower, the combination, with the forked finger O, pivoted to the forked lever K, of the bent levers Q, connected to the seed-slide, and having their forward ends concaved on their edges, whereby they may hold the finger O in contact therewith, substantially as and for the purpose specified.

6. In a corn-planter check-rower, the combination, with oscillating bent levers adapted to actuate the planter seed-slides by means of suitable connection therewith, of a forked push-bar which acts alternately on said bent levers and receives motion from an ordinary forked lever and tappet-wire, substantially as and for the purpose specified.



7. In a corn-planter check-rower, in combination with bent levers pivoted to a base-plate and connected by a bar, whereby the movement of one of said bent levers in one direction imparts a simultaneous movement to the other bent lever in an opposite direction, a forked push-bar adapted to act alternately on said bent levers, substantially as and for the purpose specified.

8. In a corn-planter check-rower, in combination with a push-bar forked at its free end and pivoted at its other end to an ordinary forked lever, oscillating bent levers beveled at their sides to adapt them to coact with the forked push-bar and guide it while in contact with one bent lever so that it may pass the outer end of the other bent lever without coming in contact therewith, substantially as and for the purpose specified.

9. In a corn-planter check-rower, bent levers pivoted at their bends and connected, one arm of one lever with an arm of the other lever, by a slotted bar, in combination with suitable connection with the planter seed-slides, whereby the oscillations of the levers will impart movement to the seed-slides, substantially as and for the purpose specified.

10. In a corn-planter check-rower, in combination with oscillating bent levers, a slotted bar connecting said levers by one end of each, and a pivoted forked push-bar adapted to act on the other ends of said levers, substantially as and for the purpose specified.

254,515. CORN-PLANTER CHECK-ROWER. CHARLES E. SWEENY, Geneseo, Ill., assignor to Mary E. Sweeny and George G. Newry, same place. Filed Sept 29, 1881. (Model.)

Claim.—1. In a check-rower, in combination with a tappet-wire and check-row devices, a tripper adapted to be swung to engage with and release the wire from the check-row devices, substantially as and for the purpose specified.

2. In a check-rower, in combination with the tappet-wire and pulley for guiding the tappet-wire to the check-row devices, a swinging tripper adapted to force the tappet-wire out of the groove of said guide-pulley, and having an incline plane, over which the wire may rise and pass over the pulley, substantially as and for the purpose specified.

3. In combination with the tappet-wire and check-row devices, a swinging tripper, H, having the ordinary guard-arm, E, attached thereto so that it will swing therewith, substantially as and for the purpose set forth.

4. In combination with a tappet-wire and with the check-row devices, a swinging tripper, H, journaled on the same shaft as the guide-pulley D, substantially as and for the purpose specified.

5. In a check-rower, the combination, with a tappet-wire, of a cam-shaped tripper adapted to be swung to engage with and release said wire from the check-row devices, substantially as and for the purpose specified.

6. In combination with the tappet-wire, check-row devices, and tripper for engaging with and throwing the tappet-wire, the lever and connecting-rod for operating the tripper, substantially as and for the purpose specified.

7. In combination with the tripper H, for engaging with and throwing the tappet-wire, and lever I, a step, J, for holding the lever I, and thereby the tripper H, in working position, substantially as and for the purpose specified.

8. In a check-rower, in combination with the swinging tripper, a swinging guard adapted to swing to allow the tappet-wire to pass off the rear guide-pulley, substantially as and for the purpose specified.

9. In combination with the swinging tripper H, a swinging guard, K, for the pulley F, connected with the tripper by a connecting-rod, so as to have simultaneous movement therewith, substantially as and for the purpose specified.

10. In combination with the tappet-wire and check-row devices, a tripper, H, and lever I for actuating the same, and a swinging guard, K, actuated through the movement of said tripper, substantially as and for the purpose specified.

11. In combination with the tappet-wire, check-row devices, and rear pulley, F, a guard, M, projecting outwardly from the lower side of the pulley F, substantially as and for the purpose specified.

12. In combination with a swinging tripper, H, a swinging arm, K', for raising the tappet-wire from the pulley F, substantially as and for the purpose specified.

13. In a check-rower, a swinging arm adapted to raise the tappet-wire from the rear guide-pulley, F, and a swinging guard adapted to swing to allow the tappet-wire to pass off from said pulley, substantially as and for the purpose specified.

14. In combination with the swinging tripper H, a swinging arm, K', and guard K, substantially as and for the purpose specified.

15. In combination with the swinging tripper H, a swinging arm, K', connected with the tripper by a connecting-rod, so as to have simultaneous movement therewith, substantially as and for the purpose specified.

16. In combination with the swinging tripper H, a swinging guard, K, and arm K' for the pulley F, connected with the tripper by a connecting-rod, so as to have simultaneous movements therewith, substantially as and for the purpose specified.

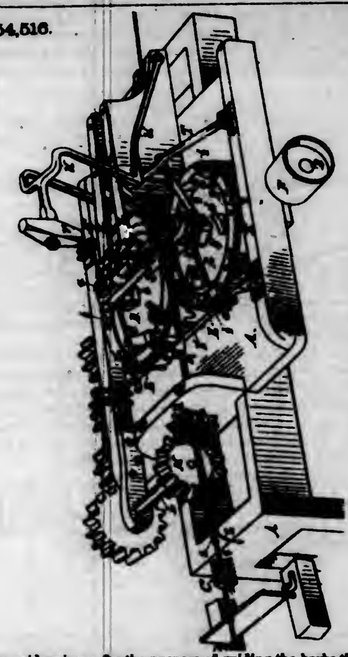
17. In combination with the tappet-wire and check-row devices, a tripper, H, and lever I for actuating same, and a swinging guard, K, and swinging arm K', actuated through the movement of said tripper, substantially as and for the purpose specified.

254,516. MACHINE FOR MAKING BARBED-WIRE FENCING. SALMON THOMPSON and WILLIAM E. FARRELL, Mooreville, Iowa. Filed Aug. 26, 1881. (No model.)

Claim.—1. In a machine for making barbed-wire fencing, wherein the barbs to be placed upon each wire are strung upon the wire in a body, the divider R, by means of which the barbs are separated or picked up and passed to the operating parts of the machine, substantially as specified.

2. In a machine for making barbed-wire fencing, the wheels D, rotating toward each other, and provided with the recesses b and channel E, for the purpose of embracing the wire and barb and holding the same while it is being operated upon, substantially as and for the purposes set forth.

3. In a machine for securing barbs upon wire, constructed as described, the trip-hammer V and double knife W, in combination with and actuated by the wheels D and intermediate mechanism for the purpose of forming a spur in the wire upon each side of the barb, substantially as set forth.



4. In a machine for securing barbs on wire, the step-bar B', in combination with the trip-rods A' and devices, substantially as described, for alternately raising said trip-rods, as and for the purpose specified.

5. In a machine for barbing wire, the divider R, consisting of two intermeshing plates, *r r*, in combination with the hollow shaft P, to which it is secured, substantially as and for the purpose specified.

6. In a machine for barbing wire, a rotating spiral divider provided with a central opening for allowing the passage of the fence-wire, and adapted to separate one barb at a time from a series of barbs on said wire, substantially as described.

7. In a machine for barbing wire, and in combination with the divider R, stop-bar B', and the grooved and recessed wheels D,

254,516.

the guide-wire c, for the purpose of guiding the barbs through the machine, substantially as described.

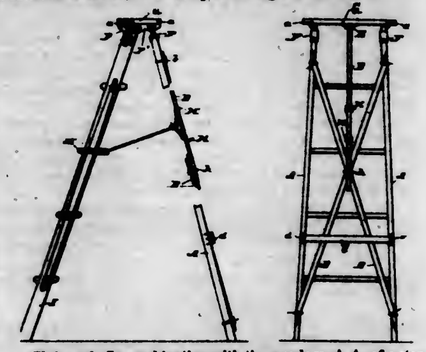
8. In a machine for barbing wire, and in combination with mechanism, substantially as described, for feeding the barbs and wire, the double knife W, mounted on springs X X, and suitable means for striking said knife, as and for the purpose specified.

9. In a machine for barbing wire, the wheels D, provided with grooves E, recesses b, and cams *d*, in combination with the trip-rods *c* A', step-bar B', rods T', hammer-yoke U, and mechanism, substantially as described, for imparting movement to the several parts, as and for the purpose specified.

10. In a machine for barbing wire, the step-bar B', in combination with the trip-rods A', the wheels D, provided with cams *d* for alternately operating the trip-rods, and mechanism, substantially as described, for producing spurs on the fence-wire, as and for the purpose specified.

11. The wheels D D, rotating toward each other, and provided with recesses b and grooves E, in combination with the cams *d*, secured to said wheels, the trip-rods A' *c*, the step-bar B', the rods T, hammer-yoke U, hammer Y, double knife W, divider R, and connections, substantially as described, between the divider R and the wheels D, as and for the purpose specified.

254,517. RAG-CARRIER. NELSON F. TIPTON, Colony, Kans. Filed Nov. 28, 1881. (No model.)



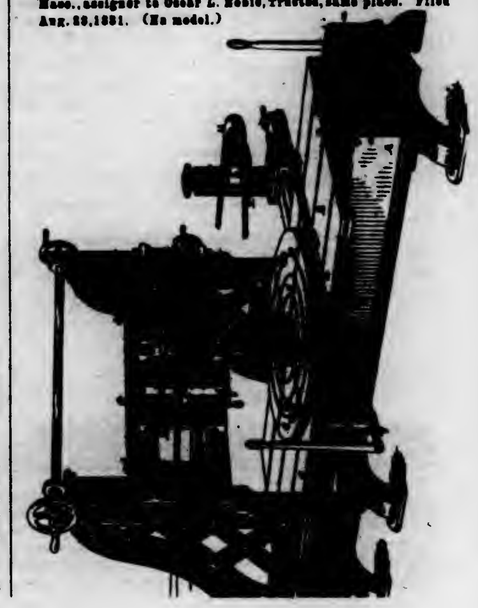
Claim.—1. The combination of shelves having rows of perforations adapted to receive an egg at the middle of its length with bent, notched, and interlocked strips E, secured to said shelves between the rows of perforations, so as to have a portion of their edge project in the way of said perforations, substantially as and for the purpose set forth.

2. The combination of shelves having rows of perforations adapted to receive an egg at the middle of its length with bent strips E, secured on edge to said shelves, and a sheet of pasteboard, F, provided with waves, and perforations *f* in the top of each wave, substantially as and for the purpose described.

254,518. STEP-LADDER. CALVIN G. UDELL, North Indianapolis, Ind. Filed Aug. 16, 1881. (No model.)

Brief.—Clamps of peculiar construction fasten the cross-braces and cross-bars to the legs of the ladder. One end of a sliding brace is connected to a vertical bar on the back side of the ladder and the other end secured to the center of a step. The hinge-bracket is fastened to the top steps by spurs taking into the wood.

Claim.—1. In combination with the rear legs, A A, of a step-ladder and the cross-braces B B, the hand-fastenings *i*, substantially as shown and described.



2. In combination with the rear legs, A A, of a step-ladder and the cross-bar C, the staple-fastenings *d*, substantially as specified.

3. In combination with the rear legs, A A, of a step-ladder, the bar D, with slide H, and the brace J, pivoted to the step M of the ladder and to said slide, substantially as specified.

4. In combination with the step-ladder I, the hinge-bracket P P', or its equivalent, as shown, with spurs *a a*, fastening-pin *f*, and hole *f'*, and the top step, G, substantially as shown and described.

5. In a step-ladder, the upright bar D, having its lower end made flat to the cross-braces B B and its upper end pivoted to the top step, G, substantially as specified.

254,519. STONE-CUTTING MACHINE. JOHN WARREN, Boston, Mass., assignor to Oscar L. Noble, Trustee, same place. Filed Aug. 29, 1881. (No model.)

Claim.—1. In a stone-dressing machine, the combination of

254,522. SUPPORTER FOR ELECTRIC-LIGHT REFLECTORS.

into said trough, the parallel steam-boxes G, supported at each end

bushings loosely encircling different portions of the spindle and

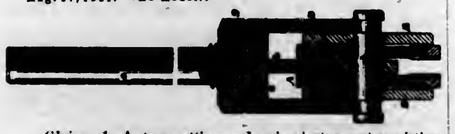
Claim.—1. In a stone-dressing machine, the combination of a longitudinally-movable carrier, an independently-revolving table, a vertically-adjustable cross-slide, and a slide-rest laterally adjustable on such cross-slide and carrying an adjustable tool-holder.

2. The combination, with the slide-rest and cross-slide, of the stops *d d* and graduated scale, substantially as described.

3. The combination of the revolving table mounted on a longitudinally-moving carriage with shaft K, adapted to carry a side cutter.

4. The combination, with the revolving table and carriage B, of the pin 24 and adjustable bar 25, substantially as described.

5. The combination of the cross-slide and the slide-rest with the adjustable stops *d d* and threaded rods, whereby the stops may be adjusted and held in any position, substantially as described.



6. The combination of the slide-rest, the vertically-adjustable tool-holding frame, and the cam-lever pivoted upon said slide-rest and adapted to impinge upon the back of the tool-holding frame and lock it in position, substantially as described.

7. The bed A, provided with the V-grooves *u u* and the inwardly-curved flanges or lips *t t*, in combination with the carriage B, provided with the downwardly and outwardly projecting guide-rails *v v*, fitted to and adapted to slide in said V-grooves *u u*, substantially as and for the purpose described.

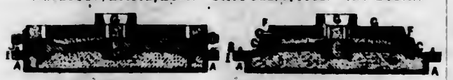
8. In combination with the reciprocating carriage B, the independently-revolving table provided with radial and concentric T-shaped grooves, substantially as and for the purpose described.

9. In a stone cutting or dressing machine, the combination of two sets of tool-operating mechanisms arranged to operate upon different faces of the stone, substantially as described.

254,520. STONE-CUTTING TOOL. JOHN WARREN, Boston, Mass., assignor to Oscar L. Noble, Trustee, same place. Filed Aug. 17, 1881. (No model.)

Claim.—1. A stone cutting or dressing instrument consisting of one or more disks having plain cylindrical peripheries and mounted loosely upon and adapted to be revolved about a pin or shaft placed at right angles to the spindle and adapted to be revolved in its bearings, said disk or disks being arranged upon one or both sides of the axial line of said spindle, substantially as described.

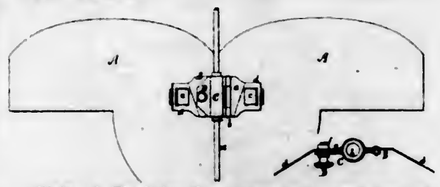
2. A stone cutting or dressing instrument consisting of disks corrugated on both sides and mounted on and adapted to be revolved about a pin or shaft placed at right angles to the spindle and adapted to be revolved in its bearings, said disks being arranged symmetrically on each side of the axial line of the said spindle, substantially as described.



3. In combination with the yoke D, having slotted ends, the perforated central plate, *b*, of the spindle *c*, and disks having smooth cylindrical peripheries, the pin *d*, having enlarged center and reduced bearings near its ends, substantially as described.

4. In a stone-cutting tool, a head composed of the spindle *c*, provided with the plate *b*, having a transverse opening, the collar *e*, and male screw-thread, the yoke D, provided with central hole to receive the spindle *c*, and slots to receive the disk-bearing pin, and the nut *g*, all arranged and adapted to operate substantially as described.

5. The central perforated plate, *b*, integral with the spindle, in combination with the pin *d*, one or more cutting-disks, and the yoke D, said yoke having a central perforation for the spindle and slots for the pin, substantially as described.

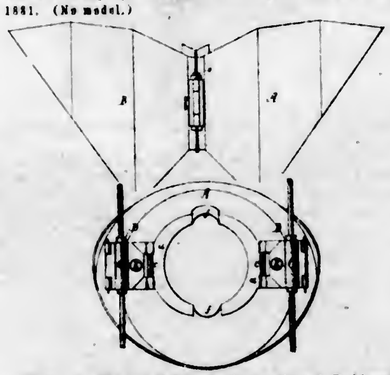


6. The combination of the pin *d*, plate *b*, yoke D, disks A, and collars B B, substantially as described.

254,521. MOLD FOR CASTING CAR-WHEELS. LUCIUS W. WASHBURN, Boston, Mass. Filed Jan. 9, 1882. (No model.)

Claim.—The combination, with the base A and cope G of the mold, of the stop-ring consisting of the horizontal flange B and internal incline faces F and C, united by the horizontal face or shoulder D, all being formed of one continuous piece of metal, substantially as shown and described, as and for the purposes set forth.

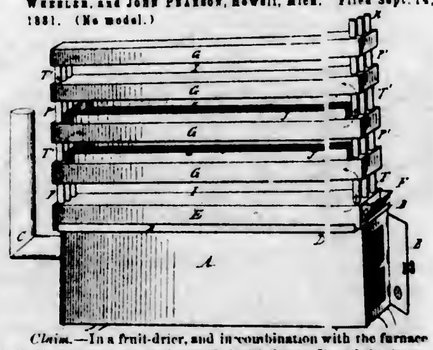
254,522. SUPPORTER FOR ELECTRIC-LIGHT REFLECTORS. WILLIAM WHEELER, Concord, Mass., assignor to the Wheeler Reflector Company, of Boston, Massachusetts. Filed Dec. 8, 1881. (No model.)



Claim.—1. The light-reflector supporter or attachment substantially as set forth, consisting of the recessed plate, and hinged clamp, and its set-screw, and provided with an insulator, all combined and arranged in the manner and to operate essentially as shown and described.

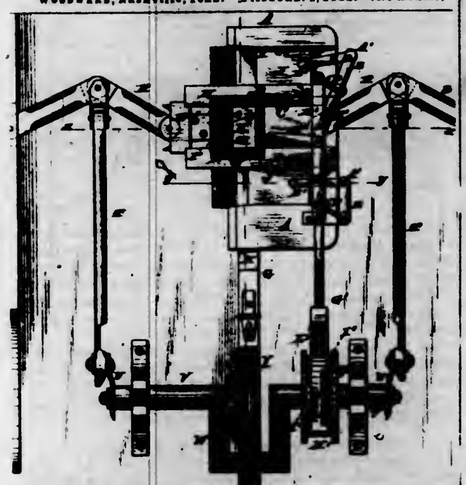
2. The light-reflector supporter as set forth, having wings, each being provided with an opening, *g*, and an elastic tongue, *h*, arranged to operate therein substantially and for use as explained.

3. The light-reflector A, provided with the clasps *e e*, in combination with the supporter and insulator-carrier, substantially as described, having its wings provided with openings *g*, and elastic tongues *h*, to engage with such clasps, as set forth.



254,523. ELECTRIC-LIGHT REFLECTOR AND ITS SUPPORT. WILLIAM WHEELER, Concord, Mass., assignor to the Wheeler Reflector Company, of Boston, Massachusetts. Filed Dec. 8, 1881. (No model.)

Claim.—1. The two light-reflecting sections A B, hinged to each other, and provided with ears and clamps for holding insulating-tubes and confining them to rods, all being substantially as set forth.



2. A reflector provided with laterally-projecting ears and with clamps hinged thereto and furnished with screws, all being substantially and to operate as and for the purpose set forth.

254,524. FRUIT-DRIER. LESLIE E. WOODRUFF, HARRY P. WHEELER, and JOHN PEARSON, Howell, Mich. Filed Sept. 14, 1881. (No model.)

Claim.—In a fruit-drier, and in combination with the furnace A, having an open top, and provided with flanges D, and the water-receptacle E, provided with a trough, F, and perforations leading into said trough, the parallel steam-boxes G, supported at each end by alternate steam-pipes T and posts P, arranged in superposed vertical series, and the drawers J, having perforated bottoms, and adapted to rest on the steam-boxes between the pipes T and posts P, as and for the purpose specified.

254,525. BRICK-MACHINE. WILLIAM WOODWARD and ABEL B. WOODWARD, Nashville, Tenn. Filed Jan. 4, 1882. (No model.)

Claim.—1. In a brick-machine, the combination of the bench or table A, having transverse recess C, intersected at right angles by a longitudinal recess, F, the plungers E E, the slide G, having recesses H, the sliding cap-plate K, and suitable operating mechanism, substantially as set forth.

2. In a brick-machine, the combination of the bench or table A, having transverse recesses C I I, and intersecting longitudinal recess F, the plungers E E J J, the slide G, having recesses H, the sliding cap-plate K, the hopper N, and suitable operating mechanism, substantially as set forth.

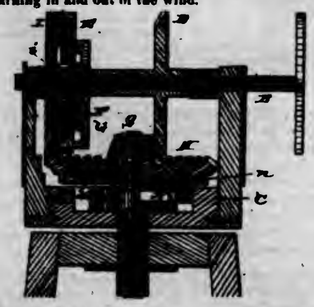
3. The combination of the plungers E, connecting-rods R, levers S, shaft V, having cranks U, and the pitmen T T, having their rear ends connected adjustably to the cranks U and their front ends to the connecting-points of rods R and levers S, substantially as set forth.

4. The combination, with the plungers J J and cap-plate K, arranged as herein described, of the bell-crank levers Z Z, one of which has an arm, E', the connecting-rods B' F' D', and mechanism for imparting to the latter an intermittent reciprocating motion, substantially as set forth.

5. The combination, with the flanged disk H', having studs I' I' J' J', arranged as herein described, of the forked pitman G', the prongs of which, L', have slots K' M', substantially as and for the purpose set forth.

254,526. BEARING FOR SPINNING-SPINDLES. GEORGE H. ALLEN, Ayer, Mass. Filed Mar. 18, 1881. (No model.)

Brief.—A movable magazine is located in the well formed in the lower part of the bolster-case. The lower end of the spindle is conical or pointed, and rests and turns upon the flat surface of a plug of hardened metal in the bottom of the magazine. The said plug, which extends through the bottom of the magazine, is likewise pointed at its lower end and rests upon the plane surface of the bottom of the well. The spindle is also provided with independently-movable bushings, the whole being designed to relieve the lateral bearing of the spindle and lessen friction and wear.



Claim.—1. The combination, with a spindle and a step for supporting the spindle, of separate and independently-movable bushings loosely encircling different portions of the spindle and constructed and adapted to be rotated thereby, and supports for retaining the movable bushings in proper adjustment, substantially as set forth.

2. The combination, with a spindle, a magazine located on the lower portion of the spindle, and a step for supporting the spindle, of independently-movable bushings located between the spindle and upper and lower ends of the magazines, substantially as set forth.

3. The combination, with a spindle bolster-case having a well formed therein, a magazine located in said well, and a spindle having its lower portion situated in the magazine, of independently-movable bushings situated between the spindle and upper and lower ends of the magazine, substantially as set forth.

254,527. WINDMILL. GEORGE H. ANDREW, Brooklyn, Wis. Filed Dec. 14, 1881. (Model.)

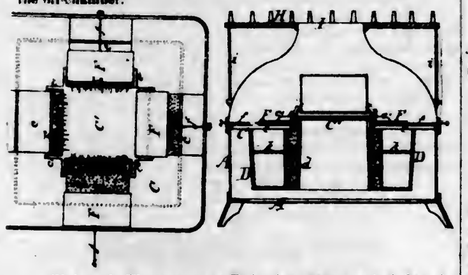
Brief.—By means of the gearing illustrated, motion is transmitted to the rod L from the wheel, and provision is made for the wheels turning in and out of the wind.

Claim.—1. The combination, in a windmill, of bevel-gear and the miter-gear upon the wind-wheel shaft, with the bevel-gear and the miter-gear rotating about the axis of the vertical shaft and driven in opposite directions, one of said last two mentioned gears being rigid upon the vertical shaft, and the other being loosely arranged and connected by a spur-wheel with a spur-gear upon the vertical shaft, substantially as described.

2. The combination, with the horizontal wind-wheel shaft, of the loose bevel-gear D, connected with an internally-toothed gear, E, and engaging with a bevel-gear that is rigid upon the vertical shaft, the miter-gear I, engaging with the miter-gear K, the arm upon the horizontal shaft carrying a loose spur-gear engaging the internally-toothed wind-gear E and the spur-gear *i*, the spur-gear a upon a stationary arm, N, and the gears O and Q upon the vertical shaft, said members being combined and organized for operation substantially as described.

3. The combination of the horizontal shaft B with the bevel-gear D, the bevel-gear Q upon the vertical shaft, the miter-gears I and K, the spur-gears a O, and the internal gear, M, constructed and organized for operation substantially as specified.

254,528. BOTTLE-STOPPER. CHARLES BENCHER, Meriden, Conn. Filed Jan. 23, 1882. (No model.)



Claim.—1. The combination of a stopper having a cap-piece with vertically-slotted lugs, of a bail or yoke passing through the slotted lugs and being applied to supporting devices on the bottle-neck, and of a toggle-joint interposed between the yoke and cap-piece of the stopper, and provided with an operating and locking lever applied to one member of the toggle-joint, substantially as set forth.

2. The combination of a stopper having vertically-slotted lugs and a recess or indentation between the lugs, of a bail or yoke passing through the slotted lugs and being applied to supporting

devices on the bottle-neck, and of a toggle-joint the upper member of which is pivoted to the yoke and provided with an operating and locking lever, while the lower member is pivoted into the recess of the cap-piece, substantially as set forth.

254,529. COAL-OIL STOVE. GEORGE W. BILLINGS, Cleveland, Ohio. Filed Jan. 11, 1882. (No model.)

Brief.—The oil-chamber has a vertical perforated and removable partition, behind which is placed ashes or other porous material in lieu of wicking. The flame is regulated by slides over the oil-chamber.

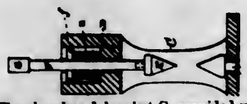
Claim.—1. The square pot D, having square central flue, *d*, and provided with the perforated ash-chambers E, and the diaphragm *b*, comprising the oil-fount of an oil-stove, substantially as described.

2. The combination, with the pot D, comprising the oil-fount above described, of the plate C, having the openings *c c* over the ash-chambers E, and also having the raised central plate, C', over the flue *d*, and provided with the sliding plates F, for regulating the flames, substantially as described.

254,530. MANUFACTURE OF ARTIFICIAL STONE AND MARBLE. DAVID H. BURLESS, St. Louis, Mo. Filed Jan. 11, 1882. (No specimens.)

Claim.—1. The compound herein described for the manufacture of artificial stone or marble, in connection with sharp silicious sand or gravel, quartz-tailings, coal-screenings, and cement or other similar material, substantially as specified.

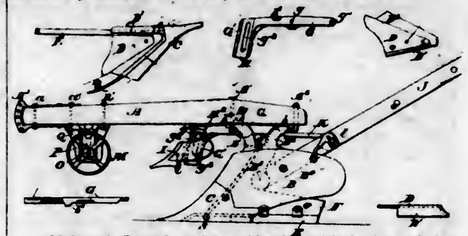
2. The process herein described of producing a variegated surface upon the blocks of artificial stone or marble, the same consisting in first pouring the composition of proper consistency into a mold or form, then placing upon the same the compound in different colors, then blending the same by stirring, and finally forming the surface by turning the partially-hardened block out upon a suitable surface, substantially as specified.



254,531. HORSESHOE. JOHN R. CANCIO, New York, N.Y. Filed Nov. 23, 1881. (No model.)

Claim.—1. The combination of a shoe, A, and detachable front and side straps, C D, with articulated fastening-bands B B, which are detachably connected to the straps, substantially as set forth.

2. The combination of the shoe A, having socket-recesses *g'*, detachable front and side straps, C D, having angular and T-shaped ends *g*, and fastening-bands B B, the latter being connected with said front strap by a transverse screw-bolt and pivot-eyes, substantially as set forth.

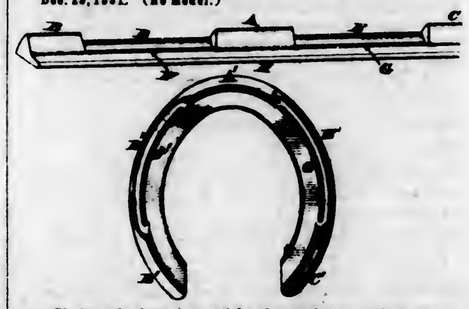


254,532. CUTTER AND PUNCH ATTACHMENT FOR ANVILS. OSMER T. CHILDS, Lookout, Cal. Filed Aug. 5, 1881. (No model.)

Claim.—The chambered bracket C, provided with the cross-head *f* and springs *e*, the removable plate D, and tool-stock F, all constructed, arranged, and operated substantially as described.

254,533. PLOW. AUGUSTUS G. CHRISTMAN, Reading, Pa. Filed June 16, 1881. (Model.)

Brief.—Mold-board cast integrally with two standards and seats for the attachment of the landside, point, special shoe, and handles. A straight jointer-bar bolted to both standards, and having a lug which engages a recess in the front standard. Construction of caster-wheel support and its connections, whereby the wheel may be adjusted vertically or at an angle to the beam.



Claim.—1. In a plow, the combination, with the beam A, of the double standards B' B', cast with and forming an integral part of the mold-board B, said mold-board being provided with a seat for the point C, landside F, and special shoe D, and with a reverse face having an ear, B', and a pad, B', forming fulcrum-points for the handles J J', substantially as shown, and for the purpose set forth.

2. The combination, with the double-standard mold-board B B' B', of the straight jointer-bar G, secured by bolts *g g'* to the stands B' B', said bar being further provided with a lug, *b'*, adapted to engage a recess, *b'*, in the standard B', substantially as shown, and for the purpose specified.

3. The straight jointer-bar G, provided with jointer-head (I', in combination with the double-standard mold-board B B' B', said jointer-bar being attached to the standards B' B' by bolts *g g'*, lug *b'*, and recess *b'*, substantially as shown, and for the purpose described.

4. The caster-wheel pedestal Q, having a vertical guide-recess, Q', oblong bolt-slot *q*, fulcrum-foot Q', and adjustable foot Q', provided with circumferential slot R, in combination with the beam A, bolt B', clevis A', bolt *s'*, caster-wheel M, and sliding head P, having bolt P', and shaft O, substantially as shown, and for the purpose herein set forth.

254,534. HORSESHOE. JOHN M. CLARKE, Cincinnati, Ohio, assignor of one-half to Henry McNicoll, same place. Filed Dec. 29, 1881. (No model.)

Claim.—1. As a new article of manufacture, a horseshoe-blank bar consisting of the web or sole H, armed with a central elevation, A, and end elevations, B C, united by uninterrupted ridges D E, of less height than said elevations, continuous grooves F G being located between said ridges and the inner margin of the blank, as herein described.

2. A bent horseshoe having side calks, D' E', extending uninterruptedly from the toe-piece A' to the heel-pieces B' C', the apices of said calks being situated in a different horizontal plane to the bearing-surface of said members A' B' C', and continuous grooves F' G' being located between said side calks and the inner margin of the shoe, substantially as herein described.

254,535. METHOD OF AND MACHINE FOR ORNAMENTING RODS OF WOOD. OSBORN CLEVELAND, Jersey City, N.J., assignor to E. F. C. Young, Receiver of the Joseph Dixon Crucible Company, same place. Filed Apr. 16, 1881. (No model.)

254,535.

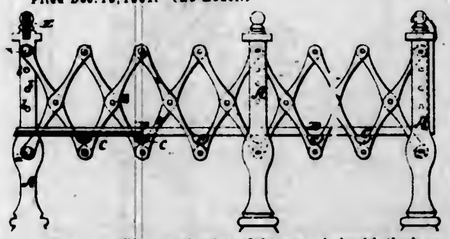
Claim.—1. The herein-described method of impressing designs upon rods of wood, the same consisting in rolling said rods, while subjected to a yielding pressure, across the face of a die bearing the desired design, substantially as described.

2. The combination, with the roller and die or pattern, one of which is elastically seated, of the bed D and overhanging guides 3 4, substantially as described.

254,536. PLAITING ATTACHMENT FOR SEWING-MACHINES. JACOB L. CHLDS, Newark, N.J. Filed Dec. 2, 1881. (No model.)

Claim.—1. In a plaiting attachment for sewing-machines, the blade R, carried by the swing-arm H, pivoted at K to the frame A, in combination with the cam F on the shaft B, said cam working within a slot in the said arm, and the spring L, together with the gear-wheels C and D, by which a rotary motion is transmitted from the main shaft E to the shaft B, substantially as shown and described.

2. In combination with the blade R, arm H, spring L, cam F, and frame A, the shaft B and gear-wheels C and D, substantially as and for the purpose set forth.



3. In combination with the blade R, arm H, spring L, frame A, and cam F, the spring G and screw I, substantially as and for the purpose set forth.

4. In combination with the blade R, arm H, spring L, frame A, and cam F, the stub P and screw O, substantially as and for the purpose named.

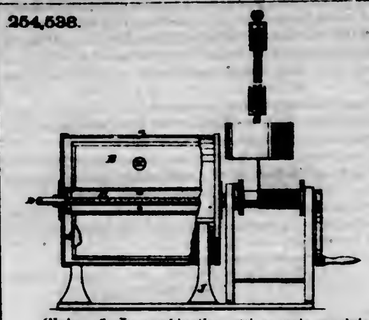
5. The blade R, carried by the slotted arm H, said arm being moved in one direction by the cam F on the shaft B and in the other by the spring L, in combination with the separator-blade T, secured to the frame A, substantially as set forth.

6. The combination of the blade R, arm H, spring L, frame A, cam F, and blade T and the extended end of stub P, substantially as and for the purposes specified.

254,537. TOY ELEVATED RAILROAD. JESSE A. CRANDALL, Brooklyn, assignor to Edward I. Horsman, New York, N.Y. Filed Dec. 16, 1881. (No model.)

Claim.—1. The combination of the posts A A with the lazy-tongs B B to constitute a toy elevated railroad, substantially as described.

2. The posts A A, having series of sockets or holes *b b*, in combination with the pins *a* and adjustable lazy-tongs B B, substantially as specified.



3. The combination of posts A and lazy-tongs B with the sleepers C, having notches *d*, substantially as specified.

4. The combination of the posts A, lazy-tongs B, sleepers C, and rails D, substantially as specified.

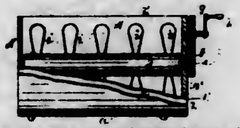
5. The combination of the posts A, lazy-tongs B, sleepers C, rails D, and cross-ties E, substantially as specified.

254,538. AIR-BLOWER. OSSIAN C. DAVIS, Racine, Wis., assignor to himself and Parker Grace, Chicago, Ill. Filed Oct. 28, 1880. (No model.)

254,538.

Claim.—1. In combination with a main receiving and discharging reservoir of an air-blower, one or more self-compressible buckets or receivers, located and operating within each main reservoir and having a continuous rotation therein, by which they are made to ascend and descend and automatically open and close, and self-acting in respect to receiving and discharging air for producing a more uniform, reliable, and efficient current, substantially as and for the purposes specified.

2. The combination, in a stationary air receiving and discharging reservoir, of a hollow revolving cylinder arranged horizontally within the reservoir, one or more automatically compressible or expansible buckets or receptacles connected and rotating with the cylinder, and an inlet pipe or tube extending into the cylinder for supplying air to the same and to the buckets or receptacles, all substantially as and for the purpose described.



3. The main receiver or reservoir A and buckets B, constructed to be self-compressible, and having an outlet-valve, *e*, in combination with the cylinder or air-conduit C, having an inlet-valve, *f*, leading to each receiver B, and a mechanism for revolving the cylinder, whereby the receivers B will be caused to ascend and descend and to receive and discharge air, substantially as and for the purposes specified.

254,539. BARBED WIRE. ALEXANDER C. DUCKER, Highwood, Ill., assignor to the Washburn & Moen Manufacturing Company, Worcester, Mass., and Isaac L. Ellwood, De Kalb, Ill. Filed Jan. 18, 1882. (No model.)

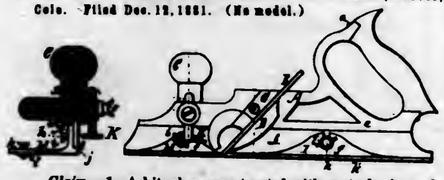
Claim.—The combination, with the main wires A A, of the sheet-metal barb C, inserted between the main wires, and the barb-wire B, encircling the main wires and supporting the sheet-metal barb C, substantially as shown and described.

254,540. EGG AND SUGAR BEATER. CHARLES DUIS, Buffalo, N.Y. Filed Jan. 13, 1882. (No model.)

Claim.—In a baker's egg and sugar beater, the combination of the shaft *d*, having the wire whips *i i i* thereon operated by cog-wheels *f g* and crank *h*, with the box A A' A', having the rounded bottom *a* and double walls *b b'*, (and bottom,) all arranged and operating substantially as specified.

254,541. STAMP-CANCELER. C. CALVERT RIXEYON, Baltimore, Md., assignor of one-fifth to George P. Gunther, Louisville, Ky. Filed Oct. 17, 1881. (No model.)

Claim.—1. A revenue-stamp canceler consisting essentially of two plates hinged and pivoted together, and provided with pins or projections for perforating the stamp, and a locking device which prevents any movement of the upper plate with reference to the lower, except laterally, whereby the stamp is torn and defaced, as set forth.



2. In a revenue-stamp canceler, a plate or disk for permanent attachment to the head of the cask, provided with an aperture to register with the head-bung, and with a series of pins and ribs, in combination with a second plate having a similar series of pins and ribs, the said plates being hinged together and pivoted at the hinge, as set forth.

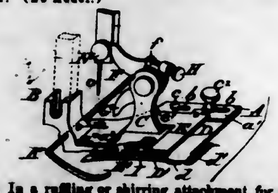
3. In combination with the permanent plate, the hinged plate pivoted at the hinge and a locking device for defeating other than lateral movement of the upper plate, as set forth.

4. In combination with the stationary or permanent plate, the plate H, hinged and pivoted thereto, and having openings through which the stamp is visible, as set forth.

5. In combination with the plates hinged and pivoted together, the registering ribs *b c*, adapted to clamp the stamp and insure its perforation by the pins, as set forth.

254,542. VARIABLE BENCH-PLANE. AMOS PALEN, Denver, Colo. Filed Dec. 12, 1881. (No model.)

Claim.—1. A bit-plane constructed with a stock, A, as described, changeable cutter E, and separate changeable front and back form-plates, H I, the said form-plates being independently attached to the stock, substantially as and for the purpose herein specified.



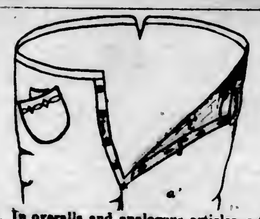
2. The stock A, constructed with a ledge or bracket, D, projecting from one side thereof, and of sufficient width to support all the different widths of cutters used, with the laterally-acting wedge G to clamp the cutters on the ledge, and with the vertical flange *f*, to one side of which the front and back form-plates are attached, substantially as and for the purpose herein specified.

3. The separate form-plates or molds H I, each constructed with the horizontally-extended body or form *h*, the vertical flange *g*, for attaching to the stock-flange *f*, and the ledge or shoulder *j*, for holding them accurately in line under the flange *f*, substantially as and for the purpose herein specified.

4. The combination, with the stock A, of the cross-bar J and gage-stop K, the former being horizontally adjustable in the stock and the latter mounted and vertically adjustable in the cross-bar, substantially as and for the purpose herein specified.

5. The auxiliary stock L and its removable cutter-holder O and mold-forms P, in combination with the main instrument, substantially as and for the purpose herein specified.

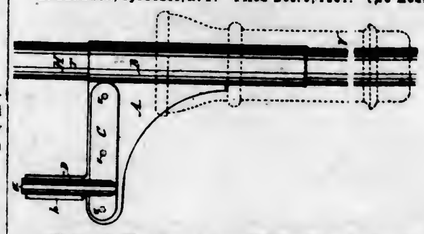
254,543. RUFFLING AND SHIRRING ATTACHMENT FOR SEWING-MACHINES. ISAAC O. FARWELL, Cresco, Iowa. Filed Dec. 30, 1881. (No model.)



Claim.—1. In a ruffling or shirring attachment for sewing-machines, the combination, with the base-plate A, having projection *a'* and slots *b b*, of the withdrawing shield-support D, having rivet *c*, screw *c'*, and nut *c²*, substantially as shown and described.

2. In a ruffling and shirring attachment for sewing-machines, the angular sliding plate E, having projection *h*, shoulder *i*, and nut or ring *i'*, in combination with the base-plate A, levers F G, and blade E', substantially as shown and described.

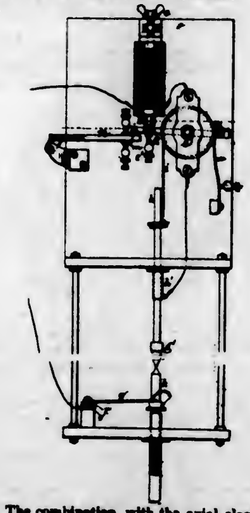
3. In a ruffling and shirring attachment for sewing-machines, the combination of the base-plate A, presser-foot B, provided with gage-rod K, sliding plate E, having ruffling-blade E', actuated by cam-levers F G, adjusting-screw H, for regulating the throw of said ruffling-blade, withdrawing shield-support D, having guide *d'* and blade D', and the guide I on ruffling-blade, all constructed and arranged substantially as shown and described.



254,544. OVERALLS, PANTALOONS, &c. SIMON FEDER, Buffalo, N. Y., assignor to Augusta Feder, Lee S. Warner, Ludwig A. Warner, Edmund Jellinek, and Ludg. A. Warner, Jr., all of same place. Filed Jan. 5, 1882. (No model.)

Claim.—1. In overalls and analogous articles, a fly and the front portion of the said overalls made integral or all cut from one and the same piece, thereby forming a continuous fly and a seamless crotch, substantially as shown and described.

2. In overalls, the leg portions *a* and *a'* and the continuous strip portions *f f'*, all cut from one and the same piece of material, and adapted to be folded as shown and described, and for the purpose stated.



254,545. REIN-HOLDER. CHARLES H. GRANNIS and JUDSON L. THOMSON, Syracuse, N. Y. Filed Dec. 9, 1881. (No model.)

Claim.—1. The plate A, provided with suitable devices for holding the rein, and having the concavo-convex shank B inserted between the whip-socket and dash-board frame, and clamped in position by the clamp which attaches the whip-socket, substantially as described and shown.

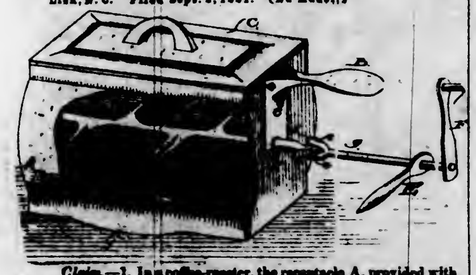
2. In combination with the plate C, provided with the post *a*, the plate A, having the arm *b*, provided with side flanges, *c c*, and the block D, having the dovetailed end *d*, clamped between the flanges *c c*, substantially as described and shown.

254,546. REGULATOR FOR ELECTRIC LIGHTS. J. H. GURLEY, Brooklyn, N. Y. Filed Aug. 30, 1880. (Model.)

Claim.—1. The combination, with the axial electro-magnet, the lever, pawl, and feed-wheel, of an armature on the lever, and a permanent magnet, and the circuit-connections and electrodes of an electric light, substantially as set forth.

2. The combination, with a thermostat, of a block of carbon or similar material and electric-circuit connections passing through

the carbon, substantially as set forth, whereby the thermostat is heated by conduction from the carbon.



3. The combination, in an electric lamp, of two electrodes, a thermostat operated by the heat developed from the current and acting to separate the electrodes, an axial electro-magnet, a lever and pawl, a feed-wheel, and a connection from the same to one electrode for feeding the carbon, substantially as set forth.

4. The thermostat-bars *q*, carbon block *r*, and circuit plate or ring *q'* at the opposite side of the carbon block, in combination with the clamping screw or screws to bind the parts together, substantially as set forth.

5. The combination, with an electric lamp, of a resistance and a thermostat in a shunt around the lamp, and a circuit-closing device operated by the thermostat to short-circuit the current, substantially as set forth.

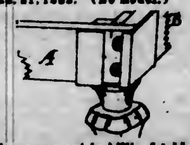
6. The combination, in an electric lamp, of an axial magnet, a permanent magnet, a lever, a wheel, a pawl, the carbon and carbon-holder, a connection from the latter to the wheel, and a friction device applied to the wheel, substantially as set forth.

254,547. COFFEE-ROASTER. EPHRAIM A. HARVEGAL, Big Lick, N. C. Filed Sept. 6, 1881. (No model.)

Claim.—1. In a coffee-roaster, the receptacle A, provided with the flanges S S and the slot P, in combination with a plate, *i*, cast integral with the handle S and fastened to the receptacle over the slot P, substantially as set forth.

2. The coffee-roaster A and its stirrer-shaft D, provided with a projecting end, *b*, and legs *c c*, in combination with shaft *g*, provided with the twisted prongs *f f*, holding-support E, and crank F, all constructed, arranged, and operated as set forth.

254,548. IRON BED. AUGUSTE HERBET, Paris, France. Filed Mar. 16, 1881. (No model.) Patented in France Aug. 16, 1880.



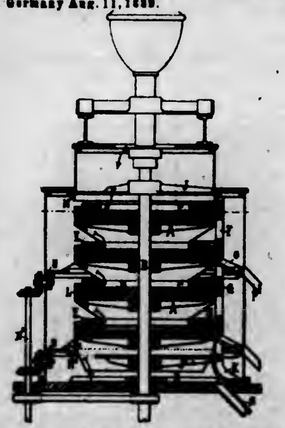
Claim.—1. A mattress or elastic frame composed of spring-plates, as C D, suitably connected together, and provided with means for suspending it to allow its expansion or contraction, substantially as described.

2. The combination, in a cot-bed, of the spring-plates C D, connected together by end bands, F, with trestles A B, arm *b*, connecting-arm *c*, and pivot *a*, substantially as described.

3. The combination, in a cot-bed, of a trestle, as B, provided with a seat, P, and table T, said table being capable of vertical adjustment, substantially as described.

254,549. BILLIARD-TABLE. RUDOLPH HERMAN, Cleveland, Ohio. Filed Jan. 21, 1882. (No model.)

Claim.—The improvement in billiard-tables consisting of the side rail, A, having the holes *a* and nuts *a'*, and provided with the block *d'*, and half of plate C, the end rail, B, having bolt-holes *a*, block *d'*, pin *b*, and half-plate C, and the leg having screw D and nut *d*, all constructed and combined as shown and described.

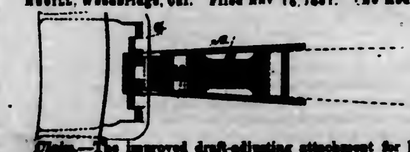


254,550. PROCESS OF DYEING COLORS ON TEXTILE FABRICS. THOMAS HOLLIDAY and ROBERT HOLLIDAY, Huddersfield, County of York, England. Filed Aug. 30, 1881. (No specimens.) Patented in England July 9, 1880.

Claim.—1. The direct production of the within-described azo colors upon cotton or other textile fibers by the action of naphthols upon diazo-azo compounds of benzole or its equivalent, substantially as described.

2. The within-described process for forming the within-described azo color directly in or upon a textile fiber, yarn, or cloth by impregnating the same with a solution of naphthol or naphthols and with a solution of a diazo-azo compound, substantially as described.

3. The within-described process for the direct production of the within-described azo color on cotton or other fiber by the action of beta-naphthol on the diazo compounds of amidoazo-benzole, or on combinations or mixtures of them, substantially as described.

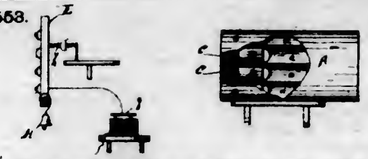


254,551. GRAIN-MILL. LOUIS HOFFMANN, Grunbach, Wurtemberg, Germany. Filed Dec. 28, 1881. (No model.) Patented in Germany Aug. 14, 1880.

Claim.—1. In a mill for reducing grain to flour by a series of grindings and separations at one continuous operation, the combination, substantially as hereinbefore specified, of a vertical power-shaft carrying a series of horizontal disks, a series of rotary grinding-rings carried concentrically by said disks, a like series of non-rotary grinding-rings supported adjustably above the former, wire cages surrounding the respective rings to permit the flour produced at each grinding to escape from the residue of the grain by centrifugal force, means for conducting said residue downward for the succeeding grindings and final discharge, and means for collecting and carrying off the flour from outside each of said wire cages, for the purposes set forth.

2. The annular tables N and means for rotating the same, in combination with stationary scrapers O and means for receiving and carrying off the removed flour, substantially as hereinbefore specified, for the purpose set forth.

254,552. DRAFT-ADJUSTING DEVICE FOR HARNESS. JAS. HOGILL, Woodbridge, Cal. Filed Nov 18, 1881. (No model.)

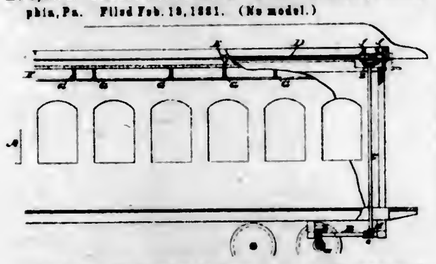


Claim.—The improved draft-adjusting attachment for harness, consisting of the box A, containing the spring-actuated block B, in combination with the notched or corrugated bar C, secured to the hames and passing through an opening in the front of the box A, substantially as and for the purpose herein described.

254,553. AUTOMATIC FIRE-ALARM. ISTVAN KITONS, Cincinnati, Ohio. Filed Dec. 13, 1881. (No model.)

Claim.—1. In an automatic fire-alarm, a chambered gun provided with cartridges held retracted by springs compressed by fusible keys, in combination with a target provided with detonating-nipples, substantially as described.

254,553.



2. In an automatic fire-alarm operated by melting of fusible connections, the target E, having fulminating nipples *e*, in combination with a sounding alarm, substantially as described.

3. In an automatic fire-alarm, the chambered gun A, provided with retracted ejectible cartridge B and spring C, anchored in fusible keys, substantially as described.

4. An operating mechanism for fire-alarms, having a series of fusible connections composed of substances which melt at different degrees of temperature, whereby a succession of alarms is given, as and for the purpose intended, substantially as described.

254,554. STATION-INDICATOR. DANIEL H. KLOTZ, Philadelphia, Pa. Filed Feb. 10, 1881. (No model.)

Claim.—1. In a station-indicator, the index E, conveyer D, and shaft C, in combination with the reversing-wheels *f*, connected to each other by the sliding sleeve *f'*, the gear-wheel *e*, and suitable gearing, whereby the motion of the driving-wheel is transferred to said shaft C, substantially as and for the purpose set forth.

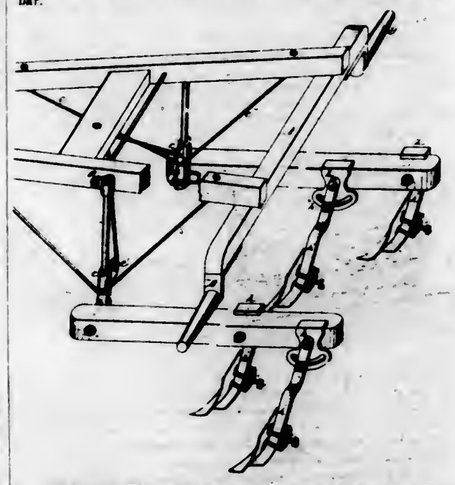
2. The index, conveyer, and sign-board frame, in combination with the gear-wheel *e*, shaft C, shaft C'', and removable timing-wheels C' C'', and with the driving-wheel and gearing, substantially as and for the purpose set forth.

3. In a station-indicator, the index E, conveyer D, sign-board frame F, having movable name-blocks G, shaft C, the removable timing-wheels C' C'', and the driving-wheel and connecting-gearing, combined and operating substantially as and for the purpose set forth.

254,555. SULKY-PLOW. CHARLES E. KENDALL, Moline, Ill., assignor of two-thirds to the Moline Plow Company, same place. Filed Jan. 3, 1882. (No model.)

Brief.—The locking-bolt of the main lever has two slotted connecting-rods engaging one on each side of the pivotal point of the right-angled finger lever or latch. When this latch is moved outward the bolt is withdrawn from the rack and the pawl thrown forward to engage the wheel-ratchet, causing the team to raise the plow. If the latch is pressed inward, only the locking-bolt is withdrawn and the hand-lever used.

Claim.—1. In a plow, the combination, with the hand-lever, of a pawl, a locking device for the lever, and a finger-lever attached to the hand-lever and connected with the pawl and locking devices, substantially as described, so that upon being moved in one direction the finger-lever operates the locking device only, and upon being moved in the opposite direction it operates both the locking device and the pawl.



2. In combination with the hand-lever, its locking device and pawl, the pivoted finger-lever connected at one end with the pawl and at both ends with the locking device, substantially as described, whereby the finger-lever is adapted to operate the pawl alone or both the pawl and the locking device, according as it is moved in one direction or the other.

3. In combination with the hand-lever, a finger-lever adapted to swing in opposite directions from its normal position, a locking device for the lever, a lifting-pawl attached to the lever, a connection, substantially such as described, extending from the finger-lever to the pawl, and double connection from the finger-lever to the locking device.

4. In combination with the stationary rack-bar, the hand-lever, its pawl, the locking device mounted upon the lever and engaging with the rack-bar, the central pivoted finger, the lever, the rod *b*, and the slotted rods *c d*.

254,556. CULTIVATOR. WILLIAM A. KNOWLTON, Rockford, Ill. Filed Dec. 15, 1881. (No model.)

Brief.—A socket on the pendant having at one side a tubular stud-journal, which passes through the drag-bar, and a hook-bolt clasps the grooved pendant and is passed the stud and drag-bar.

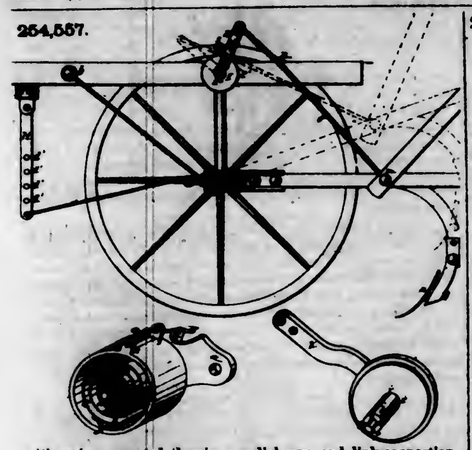
Claim.—1. The combination, with the main frame of a cultivator, of pendant E, having a suitable connection therewith, the truss-braces *c''*, connecting its dependent portion with the tongue-beam both in front and rear of said pendant, the collar *c*, and brace *c''*, said parts being constructed and arranged substantially as described.

2. The combination, with a pendant provided with an annular groove, of a socket to receive the pendant and a bolt to engage the annular groove in the pendant, said bolt also serving to secure the shovel-beam to the socket-piece, said parts being arranged and operating substantially as described.

3. The combination, with the pendant and with the socket provided with a lateral tubular stud-journal, of a shovel-beam journaled on the stud-journal and a bolt to connect the parts, substantially as and for the purpose hereinbefore set forth.

4. The combination, substantially as hereinbefore set forth, of the shovel, the skeleton-socket fixed to the shovel, the grooved or slotted screw-nut and set-screw, and the shovel-standard, the several parts constructed and operating substantially as and for the purpose hereinbefore set forth.

254,557. CULTIVATOR. WILLIAM A. KNOWLTON, Rockford, Ill. Filed Dec. 17, 1881. (No model.)



Brief.—A coiled or volute spring in a drum upon the arch. One end of the spring is secured to the drum and the other to a slitted stud upon the head-piece, both of which turn, allowing the spring to exert a lifting force upon the drag-bars through an arm rigid upon the drum-head and a connecting-rod. The device supports the drag-bars by a pin passed over the rod and through the ears.

Claim.—1. The combination, with the mounted frame of a cultivator and the shovel-beams having a suitable connection therewith, of the volute spring provided with the cap I and radial arm *h*, and link-connection *e*, substantially as and for the purpose described.

2. The combination, with the volute spring mounted upon the supporting-frame of a cultivator and a supporting link-connection with the shovel-beams, of the uprising-ears or other equivalent, to receive the supporting-link when the shovel-beams are elevated, substantially as and for the purpose hereinbefore set forth.

3. The combination, substantially as herein described, of the axle, the tongue-beams, and the herein-described spring-support

254,557.

with spring mounted thereon, a radial arm, and link-connection with the shovel-beams, substantially as and for the purpose hereinbefore set forth.

4. The combination, substantially as hereinbefore set forth, with the cultivator-frame, drag-bar, and connecting-rod, of the drum-like portion of the spring-case, a removable cap with radial arms attached, and a volute spring, the said parts being constructed and arranged substantially as described.

5. The herein-described spring-case, consisting of the drum-like portion fitted to engage the outer end portion of the spring, and provided with an axial shaft, a cap provided with an axial tubular shaft to receive the axial shaft of the drum-like portion of the case, and fitted to engage the inner end of the spring, substantially as and for the purpose hereinbefore set forth.

254,558. SULKY-PLOW. AUGUST LINDGREN, Moline, Ill., assignor of two-thirds to the Moline Plow Company, same place. Filed Jan. 18, 1882. (No model.)

Brief.—Devices whereby the pivotal point of the finger-lever is changed as the said lever is moved in opposite directions. When it is drawn toward the main lever it will only unlock and allow the use of the hand-lever; but if pushed away from the main lever it will both unlock it and engage the pawl with the wheel-ratchet, causing the draft to lift the plow.

Claim.—1. In combination with the hand-lever, the arm *b*, pivoted thereto, and the finger-lever *d*, pivoted to said arm, substantially as described and shown.

2. In combination with the hand-lever, the arm pivoted thereto, and the finger-lever pivoted to the arm, connecting devices, substantially such as shown, extending to the pawl, and the locking device.

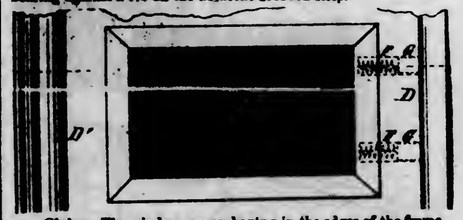
3. In a sulky-plow, the combination, with the rack-bar and the ratchet-wheel or equivalent lifting device, of a hand-lever, the arm pivoted to said lever, the finger-levers pivoted to the arm, and the two rods extending from the finger-lever to the pawl, and the locking device, substantially as shown.

4. In a sulky-plow, the combination of the hand-lever, its locking device, a pawl, a finger-lever mounted upon the hand-lever, and arranged, substantially as described, to swing upon different centers, according as it is moved to one side or the other of its normal position.

5. The combination of the hand-lever, its pawl, and a locking device, the pivoted arm, the finger-lever pivoted to said arm, the connecting-rods, and a spring, substantially as described and shown.

6. In combination with a hand-lever and two co-operating rods, a finger-lever pivoted to the hand-lever, and arranged to swing from different centers, according as it is moved to one side or the other of its normal position, substantially as described and shown.

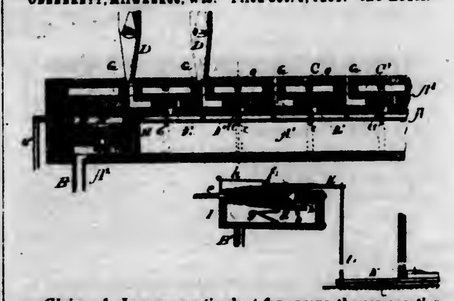
254,559. WIRE FERRULE. HENRY O. LOTHROP, Boston, Mass., assignor to himself and William H. Lothrop, same place. Filed Nov. 21, 1881. (No model.)



Claim.—As an improved article of manufacture, a ferrule made of wire wound spirally on a cylinder, and having the coils covered and connected by solder, and subsequently with the solder expanded, as described, so as to cause the ferrule to taper between its ends, as set forth.

254,560. FIRE-EXTINGUISHING COMPOUND. MICHAEL MAYNE, Jersey City, N. J., assignor to himself and Gustav Stoup, same place. Filed Dec. 22, 1881. (No specimens.)

Claim.—A fire-extinguishing compound made by the direct mixture of soda, alum, borax, and potash with liquid water-glass, in or about the proportions set forth, to form a solid cake, readily dissolvable in water, substantially as specified.

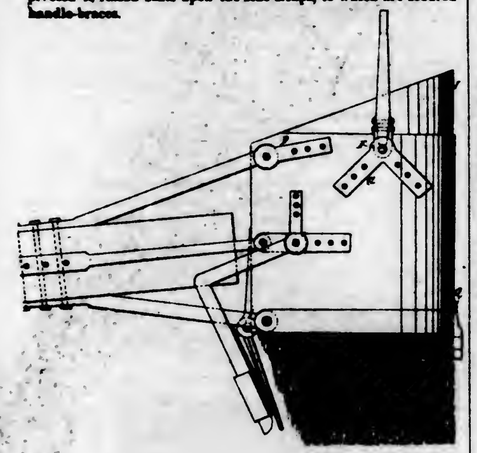


254,561. WINDOW-SCREEN. SILAS HEAD, Newark, N. J. Filed Apr. 20, 1881. (No model.)

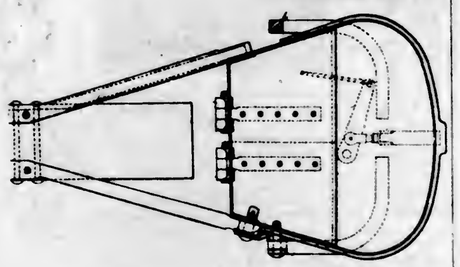
Brief.—A grooved frame is fitted to grooved side strips having overlapping flanges, and has spring-blocks in one of its grooves bearing against a rib on the adjacent grooved strip.

Claim.—The window-screen having in the edges of the frame the grooves and in one of said grooves the contact-sections G, actuated by the spiral springs F, in combination with the detachable strips D D', having the ribs H and flange-stops K, substantially as and for the purpose specified.

254,562. PNEUMATIC CHEST FOR PIPE-ORGANS. PHILIP ODENBRETT, Milwaukee, Wis. Filed Oct. 4, 1881. (No model.)



Claim.—1. In a pneumatic chest for organs, the combination of the main air-chambers A', pallet-chests A^2, having air-passages *a* G, upper air-chambers C', key-pallets E, arranged above the air-passages *a*, pallet-covers *d'*, top board, C, and frame having air-passages H and *e*, all arranged as shown and described, and for the purpose set forth.



2. In a pneumatic chest for organs, the combination of the auxiliary air-chamber A^2, having upper air-chamber, *d''*, step-pallet E', air-pipe *d'*, wind-trunk B, and main air-chamber A', connected to the auxiliary air-chamber by the air-passage H, all arranged as shown and described, and for the purpose set forth.

3. The pneumatic chest for organs described, consisting of the main air-chambers A', auxiliary air-chambers A^2, upper air-chambers, C' *d''*, pallet-chests A^2, pallets E E', with flexible air-tight covers and guides, top board, C, and frame, with air-passages *a*, G, *e*, *d'*, H, and B, all combined and operating as shown and described, and for the purpose set forth.

254,563. DREDGE-DIPPER. RALPH R. GOSSON, Troy, assignor to Gosson & MacNaughton, Albany, N. Y. Filed Dec 12, 1881. (No model.)

Brief.—A two-part dipper-bottom, the lower front section secured by an adjustable catch and being pivoted to the opposite sides of the dipper, the other or top section being capable of swinging in as well as out, and when hooked resting against the upper edge of the lower section. The arms of the bottom section are pivoted to raised seats upon the side straps, to which are secured handle-braces.

Claim.—1. In a dipper of the character herein set forth, the door or bottom composed of two independently-hinged sections made to swing or open in the same direction, the hinges for the front section being located on opposite sides of the dipper, substantially as shown and described.

2. In a dipper of the character herein set forth, the door or bottom composed of two hinged sections, one supported in place by a suitable latch, the free end of the other supported upon the latched section, and the latched section hinged upon opposite sides of the dipper, substantially as shown and described.

3. In combination with a dipper of the character herein set forth, the two-part door or bottom, one section of which is arranged to swing inwardly as well as outwardly, and the other section hinged upon opposite walls of the dipper, substantially as and for the purposes set forth.

4. In combination with the dipper door or bottom, the latch, the operating-lever, and the adjustable coupling-bar uniting the two, substantially as shown and described.

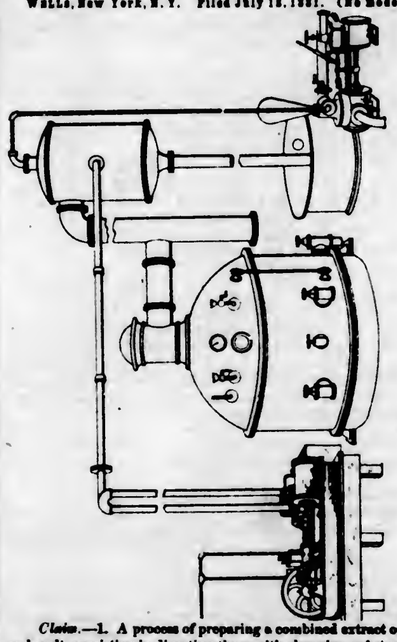
5. In combination with the dipper having flaring side walls and side bars or braces for connecting it with the handle, the hinge-strap provided with raised seat and perforated for the reception of the bolt, the same being arranged substantially as shown, so as to allow the hinge-arms to swing outside of the side bars or braces, for the purposes set forth.

6. In combination with the dipper, the hinged door composed of two parts, one part hinged upon the rear of the dipper-shell and the other part hinged upon opposite sides of said shell at points removed from the bottom and back, substantially as shown and described.

254,564. SELF-GENERATING VAPOR-BURNER. WM. P. PATTON, Harrisburg, Pa., assignor of three-eighths to David Luther Jauss, same place. Filed Jan. 27, 1882. (No model.)

Claim.—1. The combination of the vapor-gas-generating

254,564.



chamber A, thin-slitted burner-tip J, heat-deflecting cone O, and feed-screw E, substantially as is herein set forth, and for the purpose specified.

2. The combination of the gas-generating chamber A, in which carbon vapor or gas is evolved by heat unmixed with air, with the thin-slitted burner-tip J, hot-air jacket L, heat-deflecting cone O, and feed-screw E, the whole being constructed and operating substantially as is herein shown, and for the purpose set forth.

3. The combination of the carbon-vapor-gas-generating chamber A, heat-deflecting cone O, hot-air jacket L, burner-tip J, feed-screw E, charging-valve G, and receiving-cup F, the whole being made and operating substantially in the manner and for the purpose specified.

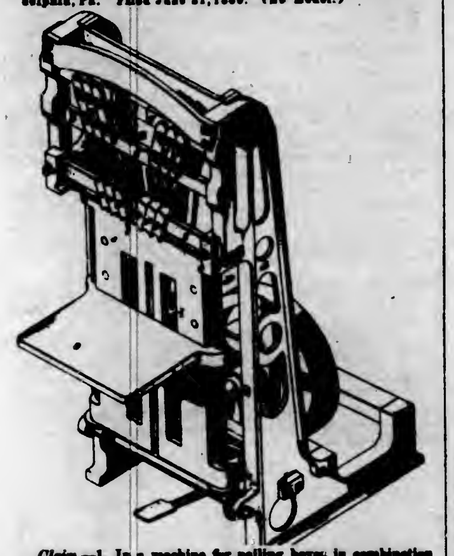
254,565. BREWING. SAMUEL R. PERCY and WALTER S. WELLS, New York, N. Y. Filed July 18, 1881. (No model.)

Claim.—1. A process of preparing a combined extract of hops and malt, consisting in digesting them with glycerine, substantially as described.

2. A process of preparing a combined extract of hops and malt, consisting in digesting them with glycerine and alcohol, as described.

3. A process of preparing a combined extract of hops and malt, consisting in digesting them with glycerine, alcohol, and an alkali, as described.

4. A process of preparing a combined extract of hops and malt, consisting in digesting them with glycerine and alcohol, substantially in the proportions of one gallon each of glycerine and alcohol to one hundred pounds of combined hops and malt.



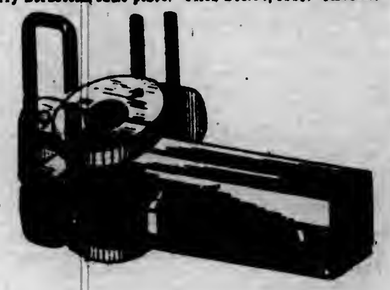
5. A process of preparing a combined extract of hops and malt, consisting in digesting them with glycerine, alcohol, and an alkali, substantially in the proportion of one gallon each of glycerine and alcohol and one pound of alkali to one hundred pounds of combined hops and malt.

6. A process of preparing a combined extract of hops and malt, consisting in digesting them with alcohol and glycerine, the alcohol and glycerine being used in the proportion of one gallon each of glycerine and alcohol to one hundred pounds of combined

hops and malt, and in evaporating the products of digestion with a saccharine substance in the proportion of one gallon, or its weight equivalent thereof, to one hundred pounds of combined hops and malt, substantially as set forth.

7. A process of preparing a combined extract of hops and malt, consisting in digesting them with alcohol, glycerine, and an alkali, the alcohol, glycerine, and alkali being used in the proportions of one gallon each of glycerine and alcohol and one pound of alkali to one hundred pounds of combined hops and malt, and in evaporating the products of digestion with a saccharine substance in the proportion of one gallon, or the weight equivalent thereof, to one hundred pounds of hops and malt, substantially as set forth.

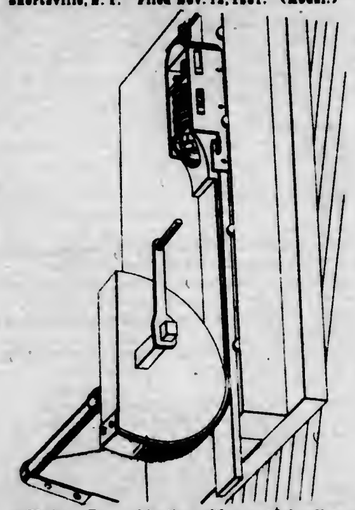
254,566. NAILING-MACHINE. GEORGE H. PERKINS, Philadelphia, Pa. Filed June 21, 1880. (No model.)



Claim.—1. In a machine for nailing boxes, in combination with a series of separately and angularly adjustable nail-driving plungers adapted to be simultaneously operated in whatever positions they have been placed, a corresponding series of separately and angularly adjustable nail-holders, each provided with separable jaws constituting their nail-emerging orifices, and each adapted to assume and to be operative when they have assumed angles correspondent with those of the plungers, substantially as set forth.

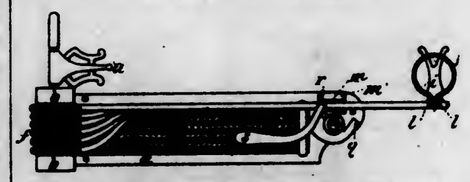
2. In a machine for nailing boxes, a series of independent and angularly adjustable nail holders, each provided with a pair of separable jaws to constitute the nail-emerging orifice, substantially as described.

3. In a machine for nailing boxes, the combination of a fixed cross-bar or kindred supporting device in the frame-work, a series of separate and angularly adjustable nail-holders, and means, substantially as set forth, for connecting and adjusting said holders upon said bar.



254,567. TUBING-CLAMP. JUSTUS PERRETTE, Titusville, Pa., assignor of one-half to E. C. TATT, A. A. Schiene, and Harry Bernstein, same place. Filed Dec. 10, 1881. (Model.)

Claim.—1. In a tubing-clamp, the herein-described jaws, hinged together and having forward-extending arms beveled upon their inner or adjoining front ends, so as to admit a prying-tool, as set forth.



2. In a tubing-clamp having semi-cylindrical jaws, the combination, with said jaws, of the semi-cylindrical reducing-shells having flanges at their upper and lower ends, to enable the device to be used with either side uppermost, as set forth.

254,568. WOOD-BENDING MACHINE. GEORGE H. PERKINS, Shortsville, N. Y. Filed Nov. 18, 1881. (Model.)

Claim.—In combination with a wood-bending machine, a spring-follower constructed with a spring having two compressing-heads connected together and adjustable by means of one or more bolts having nuts, whereby said spring may be compressed or relaxed, as desired, and movable upon ways or guides on the bending-lever, said spring-follower also compressible by means of a stationary screw in the end of said bending-lever, all substantially as described.

254,569. MUSIC-LEAF TURNER. EDWARD B. ROBINSON, Deering, Me. Filed Dec. 12, 1881. (No model.)

Claim.—1. The double-pointed spring-pivoted catch *g r*, with its arm, helix, and standard *a*, as herein set forth.

2. In combination with the double-pointed spring-pivoted catch *g*, its arm, helix, and standard *a*, the grooved wheels *d*, arms *e*, spiral springs *f*, and socket *m*, as herein set forth.

254,570. NAIL-FEED ATTACHMENT FOR NAILING-MACHINES. FERDINAND ROSSOW, Brooklyn, N. Y. Filed Dec. 22, 1881. (No model.)

Claim.—1. The combination of the hopper A with the scatterer D and one or more feed-troughs or channels, B, between which and the hopper the scatterer is operative, substantially as described.

2. The scatterer D, having inwardly-projecting wires *h*, attached to a fixed board or frame, in combination with the feed-hopper A and feed-trough B, substantially as described.

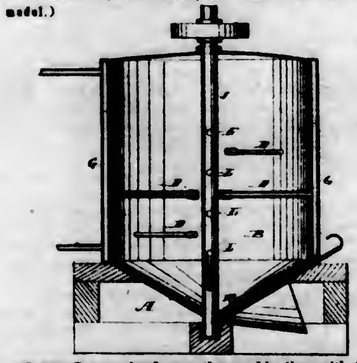
3. The combination of the feed-wheel C and its ratchet-wheel *d* with the actuating-pawl *e*, with mechanism for vibrating said pawl, and with a spring, *i*, which will yield to the resistance of a nail clogging the feed-wheel, substantially as described.

4. The combination of the feed-wheel C and its ratchet-wheel *d* with the pawl *e*, link *f*, having pin *g*, slotted rod A, and spring *i*,

254,570

and with mechanism, substantially as described, for imparting up-and-down motion to said rod, substantially as specified.

5. In a nail-feed machine, the laterally-reciprocating conveyer F, combined by a link and lever, n and o, with the spring H, and reciprocating bar or mechanism E, substantially as described, and for the purpose specified.

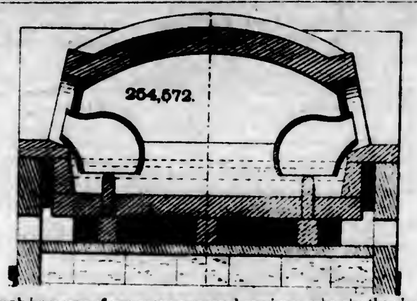


6. In a nailing-machine having an intermittently-rotating feed-wheel, the combination thereof with mechanism for turning it, and with a spring, i, which is connected to said mechanism and placed between the parts thereof, for permitting the moving mechanism to continue in its operation without moving the wheel when the latter is clogged by a nail, substantially as specified.

7. In a nail-feed machine having a notched nail-conveyer, the combination thereof with mechanism for moving it and with an interposed spring, H, which is placed between the parts of said mechanism, and will allow said mechanism to continue in its motion if the conveyer is clogged, substantially as specified.

8. In a nail-feed machine, the combination of the movable conveyer F with the stationary wiper G, said wiper being placed below the upper face of the conveyer, substantially as described.

9. The movable conveyer F, grooved on its inner face, combined with the wiper G, which is placed in said groove, substantially as described.

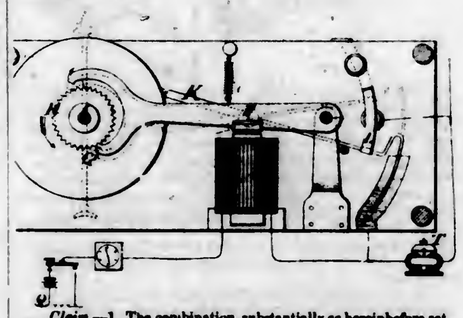


254,571. GRAIN-CLEANER. JACK H. SHACKELFORD and JOHN W. K. MCCLURE, Blue Mound, Ill. Filed June 21, 1881. (No model.)

Claim.—In a grain-cleaner, the combination, with the grain vessel or receptacle B, the central shaft, J, having stirrer-arms L, and the steam jacket or chamber G, of the hollow arms D, connecting at the open end with said steam-chamber, and having the closed end extended toward but not to the central agitator-shaft, as shown and described.

254,572. MELTING, REFINING, AND WORKING OUT GLASS. CHARLES WILLIAM SIEMENS, Westminster, County of Middlesex, England. Filed June 16, 1880. (No model.) Patented in England Nov. 21, 1873.

Claim.—1. The process of continuously melting, fining, and working out glass in a regenerative gas-furnace having a single



tank by means of one or more covered receivers, whereby the glass is freed from the impurities floating on the surface of the metal and protected from the action of the flame.

2. The combination, with a continuous glass-melting furnace having a single tank, of one or more covered receivers having an opening or openings at the bottom for the inflow of the glass, and an opening or openings at or near the top, where the glass is worked out, as and for the purposes described.

3. The combination, with a continuous glass-melting regenerative gas-furnace having a single compartment, of one or more receivers having an opening or openings at the bottom for the inflow of the glass, and an opening or openings at or near the top, where the glass is worked out, as and for the purposes described.

254,573. INDIVIDUAL SIGNALING APPARATUS FOR TELEPHONE-LINES. HENRY D. SIBLEY, Mill River, Mass. Filed Mar. 28, 1881. (No model.)

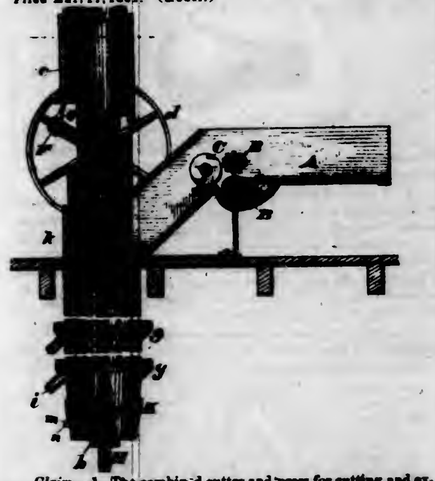
Brief.—A disk is rotated step by step. On the face of the disk and near the edge are projecting pins, on which rests a weighted end of a pivoted contact-lever. At each station one of the pins is nearer the center of the disk and out of line, so that when that pin, by the revolution of the disk, comes to the lever, a pause in the revolution allows the lever to fall and close the branch circuit containing the bell.

Claim.—1. The combination, substantially as hereinbefore set forth, of the alarm-bell placed in the loop of the main line, the electro-magnet, its armature, the step-by-step escapement actuated thereby, the disk rotated by said escapement, the series of pins thereon, (all concentric save one, this one being placed nearer the center of said disk,) the pivoted circuit-breaking lever controlled by said pins, and the circuit-closer carried by said lever for shunting said loop, and thus preventing the action of the alarm-bell.

2. The individual signaling apparatus for telephone-lines hereinbefore described, consisting of the combination at each station of an electric circuit of the alarm-bell placed in the loop of the main line, an electro-magnet included in the main circuit, its armature, the step-by-step escapement actuated thereby, the disk rotated by said escapement, the series of pins on each disk, (one for each station and all concentric, save the one at each station corresponding to that station, this one being situated nearer the center of said disk than the remaining ones,) the pivoted circuit-breaking lever controlled by said pins, and the circuit-closer carried by said lever for shunting said loop, and thus preventing the action of the alarm-bell.

254,574. GRAIN-SEPARATOR. ROBBINS A. SMITH and GEORGE CRABB, Okoboji, Iowa. Filed June 28, 1881. (No model.)

Claim.—1. In a grain-separator, the combination, with the



254,574.

pitted rollers, of wires i, stretched parallel to the faces of the rollers, substantially as and for the purpose set forth.

2. The combination of the inclined pitted rollers A A, wires i i, and receptacles D and E, substantially as set forth.

254,575. CANE-MILL AND PROCESS OF EXTRACTING SACCHARINE SUBSTANCES. SPENCER W. SOULE, Meridian, Miss. Filed Mar. 17, 1881. (Model.)

Claim.—1. The combined cutter and press for cutting and expressing the juices of cane or other material, consisting essentially in the combination, with a cutting device or apparatus, of a chambered press and a conduit for conveying the cut cane or other material into the upper portion of the press-chamber, the latter being perforated for the escape of the juice, and having a discharge-outlet at the lower end for the intermittent expulsion of bagasse, whereby the operation of cutting and pressing is rendered continuous, substantially as set forth.

2. In a machine for extracting the juice from cane or other material, the combination, with a perforated press-chamber, the lower end of which is constructed to be contracted or expanded in size to regulate the discharge of the cane after the juice has been expressed therefrom, and a feed-opening located in the side of the press-chamber, near its upper end, and an inclined conduit leading to said feed-opening, of a plunger of sufficient length to close the feed-opening and cut off the supply of cane to the press-chamber while pressure is being imparted to the cane, substantially as set forth.

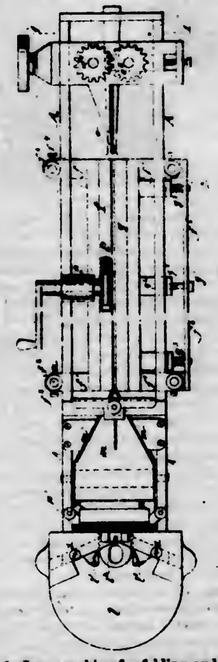
3. In a machine for extracting the juice from cane or other material, the combination, with a plunger, of a perforated press-chamber provided with a discharge-opening constructed to be expanded or contracted to regulate the discharge of the cane after the juice has been expressed therefrom, substantially as set forth.

4. In a machine for extracting the juice from cane or other material, a perforated press-chamber provided with two or more annular troughs and with an adjustable discharge-opening, substantially as set forth.

5. In a machine for extracting the juice from cane or other material, the combination, with a perforated press-chamber having a feed-opening in its side, near its upper end, and an inclined conduit connecting with said feed-opening, of a plunger of sufficient length to open and close said feed-opening, substantially as set forth.

6. In a machine for extracting the juice from cane or other material, the combination, with a perforated press-chamber, of a plunger located in a suitable guide or extension of the press-chamber, a crank-shaft, and a link, substantially as set forth.

7. In a machine for cutting and extracting the juice from cane or other material, the combination, with a perforated press-chamber and a plunger, of a cutting device arranged to allow the cut cane or other material to be fed to the press-chamber below the plunger, substantially as set forth.



8. In a machine for extracting the juice from cane or other material, the combination, with a perforated press-chamber and a plunger, of a steam-pipe, rod, or shaft passing centrally through the same, said chamber and pipe, rod, or shaft constructed to prevent the pressed material from rising after the plunger has ascended, substantially as set forth.

9. In a machine for cutting and extracting the juice from cane or other material, the combination, with a perforated press-chamber and a plunger, of a steam or water pipe passing through the same for the purpose of introducing steam, water, or other liquid into the interior of the compressed mass while the same is under pressure, substantially as set forth.

10. In a machine for cutting and extracting the juice from cane or other material, the combination, with a perforated pressing-chamber and a steam or water pipe passing centrally through the same, of a rod secured to the lower end of the steam-pipe and a cone adapted to increase or diminish the size of the exit-opening of the chamber, substantially as set forth.

11. The process of extracting saccharine substances, consisting in compressing the material, and, while the material is under compression, forcing steam or liquid outwardly and through the mass of compressed material, substantially as set forth.

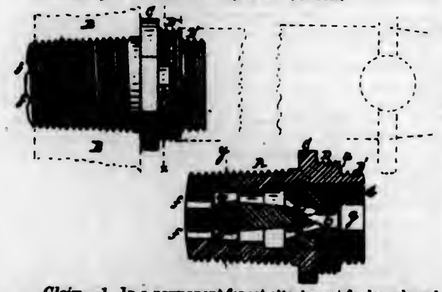
254,576. MACHINE FOR FOLDING AND PRESSING NECKTIES. MORRIS STRIPECK, New York, N.Y. Filed Apr. 7, 1880. Renewed Dec. 21, 1881. (Model.)

Claim.—1. In a machine for folding and hot-pressing neckties, the herein-described mechanism for carrying the four quarter-turn belts or bands, consisting of the two horizontal rollers b and c, with their tension-rollers b' and c', and the two vertical rollers d and e, substantially as specified.

2. In a machine for folding and hot-pressing neckties, the feed-board l, in combination with two adjustable gages, l' l', and the zinc-blade l², for the purpose of turning over the edges of the strip, as described.

3. In a machine for folding and hot-pressing neckties, the feed-board l, with its side gages and zinc-blade, in combination with the mechanism for lateral adjustment, consisting of the two descending arms l³, the screw l⁴, and the rod l⁵, substantially as and for the purpose specified.

4. In a machine for folding and hot-pressing necktie, the middle folder, consisting of an upper convex piece, *m*, and a lower concave piece, *m'*, by which the four bands, in passing through, are converted from a horizontal position to a vertical one, or quarter-turned, and the strip of material is doubled up and receives its last fold.



5. In a machine for folding and hot-pressing necktie, a pair of stationary heated irons, *f* and *g*, between which the bands carry through the necktie for the purpose of hot-pressing it or ironing the same, one of the irons so arranged as to give a yielding and adjustable pressure to the other one, substantially as described.

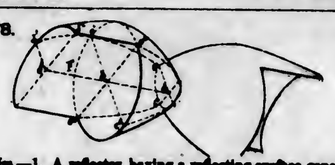
6. In a machine for folding and hot-pressing necktie, the heated irons *f g*, substantially as shown and described, horizontal arms *f'*, vertical rod *f*², frame A, eccentric P, and crank and shaft P², as and for the purpose set forth.

7. In a machine for folding and hot-pressing necktie, the discharging-blade *e*, which enters the necktie in its center as the said necktie leaves the heating-irons and gradually forces it downward and from between the bands and deposits it in a discharge-funnel, from where it leaves the machine.

8. In a machine for folding and hot-pressing necktie, two or more endless bands for carrying the necktie-strip through the operation of folding and ironing, and protecting the said necktie from stretching and from receiving a gloss by rubbing.

254,577. FAUCET ATTACHMENT. WILLIAM W. SWEENEY, Middlebury, Vt. Filed Mar. 7, 1881. (Model.)

Claim.—1. In a permanent faucet attachment for barrels and kegs, the combination, with an outer hollow shell having end perforations, of a rotating core inclosed entirely within the shell, and provided with slots or channels at each end and with attached devices controllable from the exterior of the shell for rotating the core without manipulating the faucet, which is applied to the outer end of said shell, substantially as described.



2. In a faucet attachment for barrels and kegs, the combination, with an exterior hollow shell having perforations in its rear end, of a channeled rotating core having cylindrical end portions, and inclosed within the shell, and provided with means controllable from the exterior of the shell for rotating the core independent of any movement of the faucet applied to the outer end of said shell, substantially as and for the purpose described.

3. In a faucet attachment for barrels and kegs, the combination, with an exterior hollow shell having end perforations and a rotating channeled core entirely inclosed within the shell, and provided with means to rotate it from the exterior of the shell independent of any movement of the faucet attached to the latter, of a nut screwed within the outer end of said shell, and provided with a perforation registering with the channel in the forward end of the core, substantially as described.

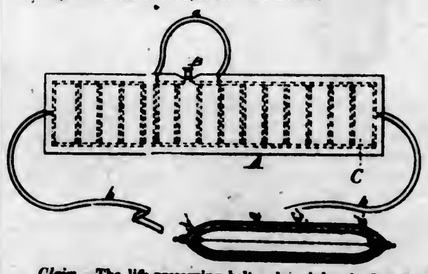
4. The combination, with the shell A, constructed in the manner set forth, of the core B and nut G, said core being provided with pins I I, lying in slots *i i* in the shell A, and adapted to be turned to open the communication between the faucet and keg, or to close the same, substantially in the manner and for the purpose set forth.

5. As a new article of manufacture, a permanent faucet attachment, consisting of a shell, A, having threaded surfaces, a nut, C, and two differently-sized portions, D and D', both threaded, a core, E, having the cylindrical ends F and F', channeled and slotted as shown, the perforated nut G, and the detachable cap L, the said core being provided with pins I I, lying in slots *i i* in the part D of the shell, and said shell being perforated at *f f*, all substantially as and for the purpose set forth.

254,578. REFLECTOR. WILLIAM WHEELER, Concord, assignor to the Wheeler Reflector Company, Boston, Mass. Filed Sept. 9, 1881. (No model.)

Claim.—1. A reflector having a reflecting-surface generated by the revolution about its principal axis of a curve which is constantly variable throughout the said revolution, all being substantially as described.

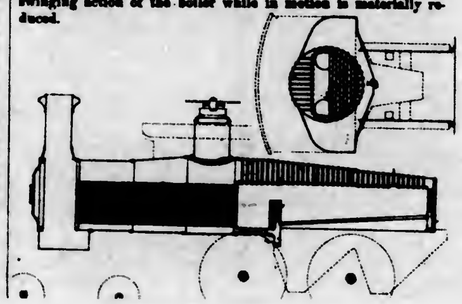
2. A reflector having a reflecting-surface generated by the revolution about two or more axes, successively, of a curve which is constantly variable throughout its revolution about one or more of the said axes, all being substantially as set forth.



254,579. URETHRAL SYRINGE. FRANZ WILHOFT, New York, N.Y. Filed Dec. 12, 1881. (Model.)

Claim.—1. A urethral syringe consisting of a flexible bulb, a nozzle made conical to enter the urethra, and an intermediate screw-threaded neck, all of soft rubber, in one piece, and adapted to receive a cap, substantially as described.

2. A urethral syringe consisting of a flexible bulb, a conical nozzle adapted to enter the urethra, and an intermediate screw-threaded neck, all of soft rubber, in one piece, in combination with a screw-threaded cap composed of hard rubber or other suitable material, and slightly shorter in length than the combined lengths of the nozzle and neck, whereby said cap is adapted to press upon the point and close the orifice of the nozzle when in position on the syringe, substantially as described.

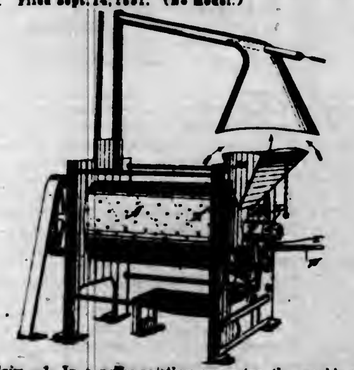


254,580. LIFE-PRESERVER. BENJAMIN J. WILLARD, Portland, Me. Filed Jan. 14, 1882. (No model.)

Claim.—The life-preserving belt or bag A herein described, having walls C, inflating-cock B, neck-string *a*, body-strings *b*, folds *c*, and air-passages *d*, the said bag or belt being shaped as set forth.

254,581. LOCOMOTIVE-BOILER. JOHN B. WOOTTEN, Philadelphia, Pa. Filed Dec. 26, 1881. (No model.)

Brief.—The fire-box extends laterally over the drivers. The cylindrical body of the boiler is below the fire-box and the top of the said drivers, lowering the weight of the boiler, by which the swinging action of the boiler while in motion is materially reduced.

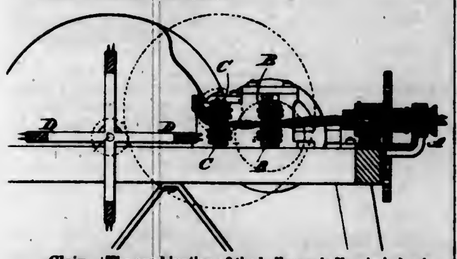


Claim.—1. In a locomotive-boiler, the combination, substantially as set forth, of a waist or barrel and a fire-box extended laterally beyond and located entirely above the bottom line of said waist.

2. In a locomotive-boiler, the combination, substantially as set forth, of a laterally-extended fire-box, a waist or barrel having its bottom line in a plane below the bottom of the fire-box, and a water-connection formed by a curved or inclined bottomed downward extension of the forward water-space of the fire-box.

3. In a locomotive-boiler, a laterally-extended fire-box having its outer forward sheet flanged outwardly for connection to the waist and extended downwardly below the waist for a sufficient distance to serve as a flange for the reception of the rivets of the bottom water-space sheet or bar, substantially as set forth.

254,582. COPPER-ROASTER. CHRISTIAN ADELB, New York, N.Y. Filed Sept. 14, 1881. (No model.)

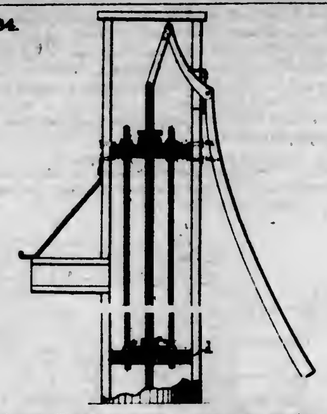


Claim.—1. In a coffee-roasting apparatus, the combination of the cylinder, its supporting-rim and journal, with the bearing or hub upon the front plate, E, as hereinbefore set forth.

2. The combination of the roasting-cylinder having a supporting-rim, C, arms C', and journal supported in a hub with the front plate, E, the outer edge of which is flanged to receive the end of the cylinder or its supporting-rim C, as hereinbefore set forth.

3. The combination of the plate E with the front plate of the furnace, provided with bearings for the cylinder and having a space around its outer edge to permit the escape of the gases and smoke, as hereinbefore set forth.

4. The plate E, outlet-opening, and door, and the link and levers T and W, all combined and arranged as and for the purposes hereinbefore set forth.



254,583. MACHINERY FOR UNTWISTING AND CARDING CURLED HORSE-HAIR. THOMAS ANCOCK, Adelaide, South Australia. Filed Jan. 5, 1882. (No model.) Patented in South Australia Mar. 1, 1880.

Claim.—The combination of the hollow spindles A A, having serrated springs *a*, the fluted feed-rolls B B, the rolls C C, revolved at greater speed than the rolls B, and the beater D, said beater consisting of arms and bars provided with small spikes at their ends, whereby the hair rope, after being untwisted and the fibers loosened, is carded and finished, as described.

254,584. PUMP. WINSLOW ALDERDICE and RICHARD B. WILLIAMS, Baltimore, Md. Filed Jan. 16, 1882. (No model.)

Brief.—The partitions are expanded in an ordinary cucumber-pump stock to form an air-chamber, and thereby change the lift into a force pump.

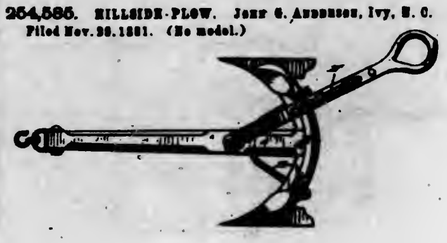
Claim.—1. The device herein described for attachment to an ordinary sucking or lifting pump to convert it into a forcing-pump, consisting essentially of a pair of partitions adapted to be secured within the barrel respectively above and below the spout or outlet, the said partitions being perforated for the passage of the piston-rod, and the lower one being provided with an upwardly-opening valve, as and for the purpose set forth.

2. The device herein described, for the purpose set forth, consisting of a pair of partitions adapted to close the barrel of the pump at each side of the spout, the said partitions being arranged to be expanded against the inner walls of the pump, as described.

3. The device herein described, for the purpose set forth, consisting of a pair of partitions, each of said partitions being composed of two disks having an interposed expansible gasket and means for compressing the disks of each pair together, whereby the gaskets are expanded against the inner walls of the pump, as described.

4. The device herein described, for the purpose set forth, consisting of two connected partitions arranged to be secured within the pump-barrel respectively above and below the spout, as described.

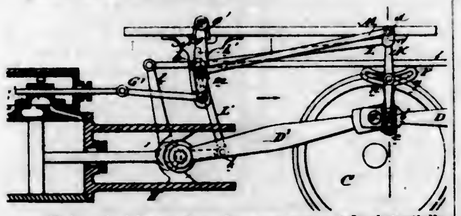
5. In a sucking and forcing pump, a pair of partitions, one on each side of the spout, in combination with mechanism, substantially as described, for expanding said partitions after insertion within the pump.



6. In a sucking and forcing pump, a pair of partitions, each consisting of a pair of disks having expansible gaskets, in combination with two or more rods having shoulders, against which the inner faces of the partitions rest, the said rods being at one end threaded for engagement with an exterior disk, and having nuts on their opposite ends, whereby upon turning the rods and nuts the disks of each pair are brought together and the gaskets are expanded, as set forth.

7. In a sucking and forcing pump, a partition above the spout, having a stuffing-box, through which the piston-rod passes, and an expansible gasket, in combination with a second partition below the spout, having an upwardly-opening valve, whereby the said partitions are adapted for the purpose set forth.

8. In combination with the partitions, each composed of a pair of disks having beveled edges, and the expansible gaskets, the shouldered rods connecting the partitions, squared at the upper and threaded at both ends, as set forth.



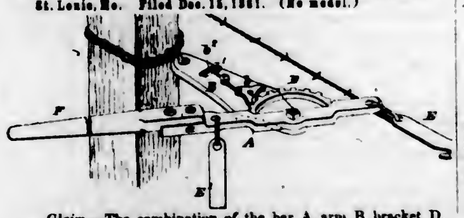
9. The combination, with the partitions connected by means of the rods E, and having respectively a valve and stuffing-box, of the bolts *m*, for securing the partitions in place, as set forth.

254,585. HILLSIDE-PLOW. JOHN G. ANDERSON, Ivy, N. C. Filed Nov. 26, 1881. (No model.)

Claim.—In a hillside-plow, the combination of the beam, the curved double standard attached to the rear end thereof, the handles pivoted to the beam, the curved rack-bars E, secured to the double standard, and the sliding latches F, adapted to engage the rack-bars and to move on the plow-handles, and having their ends extended rearwardly adjacent to the outer end of said handles, said parts being constructed and arranged to operate as and for the purposes set forth.

254,586. LOCOMOTIVE VALVE-GEAR. LEONARD ANDERSON, Painesville, Ohio, assignor to himself and Edgar Jenkins, same place. Filed July 26, 1881. (Model.)

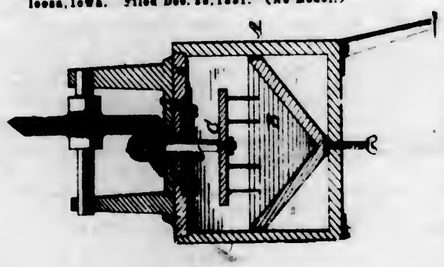
Claim.—1. A locomotive valve-gear constructed substantially as herein shown and described, consisting of lever K, rods L M, stud h, slotted arc N, rocking-arm O, and slotted quadrant-lever P, arranged as set forth.



2. In a locomotive, the combination, with the parallel rod D, of the quadrant-lever P, lever K, provided with stud n and pins *d d*, rod L, carrying stud h, fixed slotted arc N, rod M, stud *m*, lug O', rocking arm O, and valve-stem and valve G² G', arranged and operated substantially as herein shown and described, whereby the admission of steam into the steam-cylinder is regulated, as set forth.

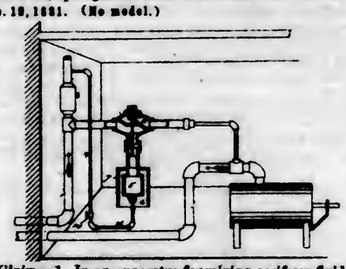
3. In a locomotive valve-gear, the combination, with the lever K, rod L, carrying stud h, and slotted arc N, of the rocking bar H', provided with cranks *k l*, connecting-rod L' I', and lever L², substantially as herein shown and described, whereby said gear may be reversed, as set forth.

4. In a locomotive valve-gear, the combination, with the parallel rod D and rods L M, of the connecting-lever K, provided with conical horns *d* and annular channels *f*, substantially as and for the purpose set forth.



5. In a locomotive valve-gear, the combination, with the parallel rod D, of the slotted quadrant-lever P, lever K, provided with stud *n*, rod M, stud *m*, lug O', rocking arm O, and valve-stem G², substantially as herein shown and described, whereby the steam-cylinder valve is reciprocated, as set forth.

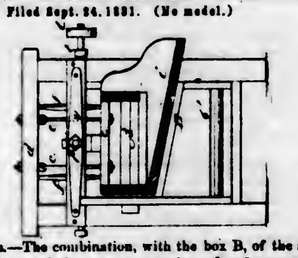
254,587. FENCE-WIRE STRETCHER. GEORGE ARROWSMITH, St. Louis, Mo. Filed Dec. 15, 1881. (No model.)



Claim.—The combination of the bar A, arm B, bracket D, pawl *b*, or its equivalent, claws E and E', and lever F, substantially as and for the purpose set forth.

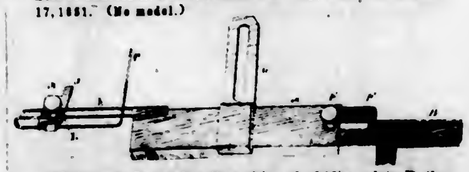
254,588. WASHING-MACHINE. RANSOM G. BALDWIN, Ocaloosa, Iowa. Filed Dec. 29, 1881. (No model.)

Claim.—In a washing-machine, the combination, with the rude-box A, agitator C, and mechanism for operating the same, of the removable and adjustable funnel-shaped hopper B, substantially as and for the purpose set forth.



254,589. APPARATUS FOR MIXING ARRIFORM FLUID. J. F. BARNES, Springfield, Mass. Filed Mar. 26, 1881. Renewed Dec. 19, 1881. (No model.)

Claim.—1. In an apparatus for mixing aeriform fluids, a pipe through which one of the fluids passes to the mixing-pipe, provided with a valve-orifice, in combination with a valve to increase or diminish the opening of said orifice, and connected with a suitable medium susceptible of being expanded and contracted by the variable heat of a flame applied thereto, whereby the said valve is operated by the expansion and contraction of said medium, according as the heat in said flame is increased or diminished by any variation in the conditions of the fluids in the pipe after being mixed, substantially as described.

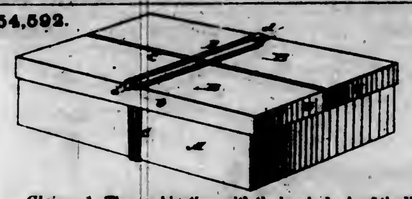


2. The combination, in an apparatus for mixing aeriform fluids, of a pipe through which one of the fluids passes to the mixing-pipe, provided with a valve-orifice, in combination with a valve to increase or diminish the opening of said orifice, and connected with a suitable medium susceptible of being expanded and contracted by the application of different degrees of heat, a vessel to contain said medium, a chamber surrounding said vessel to equalize the heat, and a burner attached to a branch from the pipe containing the mixed fluids, and adapted by its location to have the heat of its jet applied to said vessel, substantially as described.

254,590. FLAXSEED-CLEANER. GEORGE BEAL, Gilman, Iowa. Filed Sept. 24, 1881. (No model.)

Claim.—The combination, with the box B, of the suspended screen A, bars *c*, links *e*, upper cross-bars, *d*, and prop-sticks *f*, arranged substantially as shown and described.

254,591. COMBINED HEMMER AND TUCKER FOR SEWING-MACHINES. JOSEPH H. BEAN, Cincinnati, assignor of one-half to Charles M. Davis, Hamilton County, Ohio. Filed Nov. 17, 1881. (No model.)



Claim.—1. In combination with tuck-folding plate B, the flanged plate A, and the hem and scroll guide H, as and for the purpose described.

2. As a combination, the tuck-guide B, flanged plate A, holdfast G, hem and scroll guide H, scroll J, guiding-tongue I, and binding-screw N, substantially as and for the purpose set forth.

254,592. PAPER AND OTHER BOXES. CHARLES BRIGGS, Toledo, Ohio. Filed Jan. 11, 1882. (Model.)

254,592.

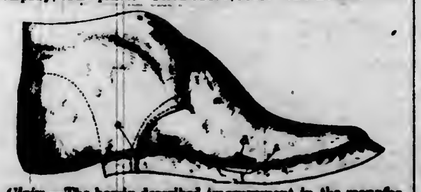
Claim.—1. The combination, with the box-body A, of the lid-sections B B, having respectively the hooks *d d'* and the elastic band D, as and for the purpose specified.

2. A paper or other box the body of which has combined with it a slip lid or cover formed of two halves or sections arranged to meet intermediately over said body, and united or drawn together by an elastic strap or band attached to the lid-sections, and arranged over or outside of said lid and capable of detachment from either of said sections when required to uncover the box, essentially as described, and whereby said strap or band also serves as a handle for the box.

3. The combination, with the body A of the box and its two-part slip lid or cover B B, of one or more elastic connections, C, secured to the lid parts on opposite sides of the box, and uniting said lid parts or sections with the bottom or lower portion of the box, whereby the lid-sections are made self-opening, and are retained against the sides of the box when the latter is uncovered, substantially as specified.

4. The combination, with the body A of the box, of the two-part slip lid or cover B B, the elastic strap or band D, applied to said lid to hold said sections together, and to provide for their separation when required, and one or more elastic connections, C, uniting the two sections of the divided lid on opposite sides of the box with the body thereof, essentially as and for the purpose or purposes herein set forth.

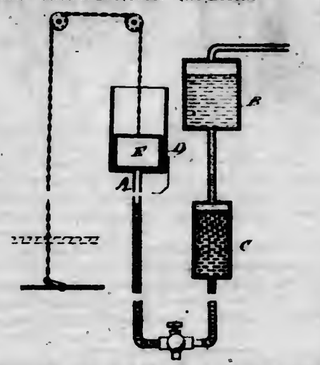
254,593. RAKE. OLOF BENGTSSON, Finshyttan, Sweden. Filed Dec. 3, 1881. (No model.) Patented in Sweden Oct. 5, 1881.



Claim.—1. A rake constructed, substantially as herein shown and described, with a metal plate provided with apertures, through which the teeth are passed, the outer longitudinal edge of this plate being bent over the upper transverse pieces of the teeth, as set forth.

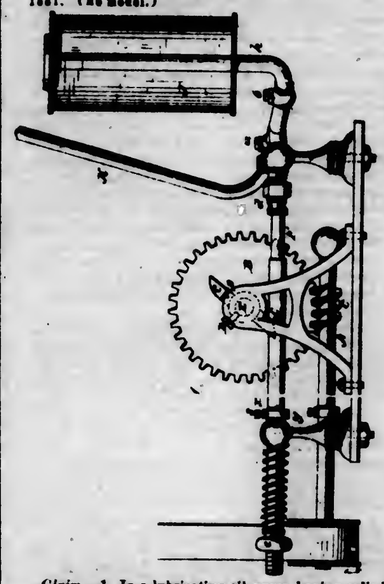
2. In a rake, the combination, with the plate A, bent to form a hollow bead, E, at the outer longitudinal edge, of the teeth B, passed through apertures in the plate A, substantially as herein shown and described.

3. In a rake, the combination, with the plate A, bent to form a hollow bead, E, at the outer longitudinal edge, of the teeth B, passed through apertures in the plate A, and of the filling-pieces D, substantially as herein shown and described.



4. In a rake, the combination, with the plate A and teeth B, of the socket F, formed of two U-shaped bent strips, G, and a bent strip, J, all these parts being riveted to the plate A, substantially as herein shown and described.

254,594. METHOD OF LASTING AND UNITING THE UPPER AND SOLES OF BOOTS AND SHOES. ELI BERTRAND, Boston, Mass., assignor to the Goodyear & McKay Sewing Machine Company, same place. Filed Jan. 7, 1882. (No model.)

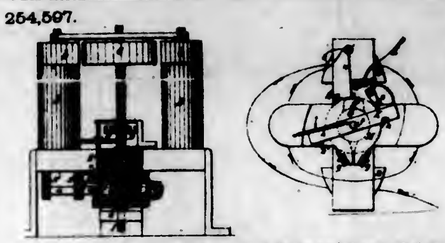


Claim.—The herein-described improvement in the manufacture of that class of boots and shoes in which the upper is turned outward and secured to the top surface of the outer sole, the same consisting in drawing the upper over the last and securing it thereto by fastenings at or near the bottom edge of the last, then turning the edge of the upper outwardly on a line with the said fastenings, and stitching such outturned upper to the top surface of the outer sole, substantially as and for the purpose set forth.

254,595. DRAFT-REGULATOR. HIPPOLYTE BIBEAU, Henderson, Minn. Filed June 3, 1881. (No model.)

Claim.—In a draft-regulator, the combination, with the reservoir D and float E, of the siphon-pipe A, connecting with the boiler by extension *a*, the mercury-reservoir C, and the condenser B, whereby a body of water is interposed between the steam and mercury, as described.

254,596. LUBRICATING-PUMP. JOHN BOWIN and WILLIAM C. BROWN, Manistee, Mich., assignors, by direct and mesne assignments, to Denville & Sleeman, same place. Filed April 2, 1881. (No model.)

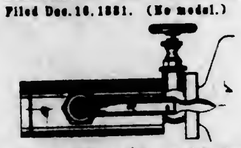


Claim.—1. In a lubricating-oil pump having cylinder *d* and piston F, the spring G, cam C, worm *e*, worm-wheel B, and shaft A, all combined for operation substantially as herein shown and described.

2. In a lubricating-oil pump having cylinder *d* and piston F, shaft A, the adjustable cam C, movable collar *s* on piston F, and adjusting-nut E.

254,597. ELECTRIC METER. CHARLES V. BOYS, Wing, near Oakham, County of Rutland, England. Filed Dec. 3, 1881. (No model.) Patented in England Oct. 18, 1881, and in France Nov. 11, 1881.

Claim.—1. In an electric meter, the combination of clock-

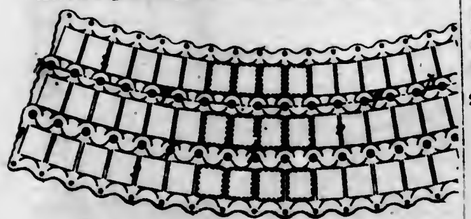


254,597.

work having an escapement governed by a pendulum or balance of magnetic metal, with an electro-magnet the poles of which are arranged to determine the movements or oscillations of the pendulum or balance, said magnet being in the electrical circuit the current through which is to be measured, substantially as and for the purpose described.

2. In an electric meter, the combination of a spring-actuated train of gears, a pendulum or balance of magnetic metal arranged between the poles of an electro-magnet, said magnet being included in the electric circuit the current through which is to be measured, and a rewinding mechanism, all substantially as shown and described.

254,598. LUBRICATOR. HENRY R. A. HOVE, Barrie, Ontario, Canada. Filed Dec. 16, 1881. (No model.)

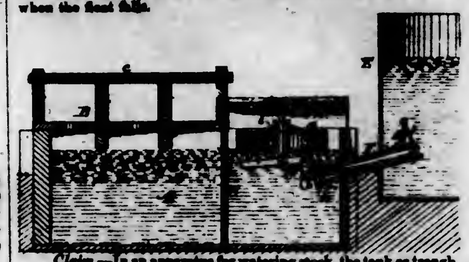


Claim.—1. In a lubricator, the combination, with the condensing-chamber and steam-pipe, of an air and gas passage leading from the upper part of the condensing-chamber to the steam-pipe above the steam-passage, and communicating with the said steam-passage at its inner end, substantially as herein shown and described, whereby the air and gas are ejected from the condenser into the steam-pipe, as set forth.

2. In a lubricator, the combination, with the condensing-chamber B, provided with the slot G and the steam-pipe D, of the connection H, provided with the steam-passage A, having the projection L on its lower part extending into the steam-pipe, and the air and gas passage J above said steam-passage and communicating therewith at its inner end, substantially as herein shown and described, whereby steam will be admitted faster than required and the air and gas thereby ejected, as set forth.

3. In a lubricator, the combination, with the condensing-chamber B, internally screw-threaded and provided with the slot G, of the apertured and externally screw-threaded plug C, substantially as and for the purpose set forth.

4. In a lubricator, the combination, with the condensing-chamber B, of the supplementary condensing-chamber X, pivoted to the side of the main chamber B, to adapt it to be swung in a horizontal position, to empty its contents into the said main chamber, substantially as herein shown and described.

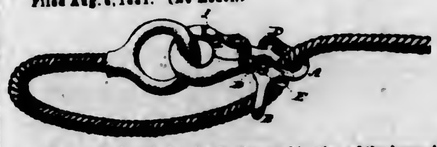


254,599. LIFE-PRESERVER. FRANCIS W. BENWELL, Westminster, England. Filed Jan. 19, 1882. (No model.) Patented in England May 10, 1881, and in France Oct. 14, 1881.

Claim.—As a new article of manufacture, buoyant devices for life-preserving garments, consisting of a series of strips of fabric or material stitched across to form pockets, inclosing rows of corks or similar buoyant material, the series of each separately-inclosed rows or strips being connected by eyelets, all substantially as and for the purpose set forth.

254,600. APPARATUS FOR WATERING STOCK. DAN DALEMAN, Chatsworth, Ill. Filed Dec. 15, 1881. (No model.)

Brief.—The operating-rod is not connected to the valve, and the latter is kept closed by the spring *f*, and is opened by said rod when the float falls.



Claim.—In an apparatus for watering stock, the tank or trough A and tank E, connected thereto by pipe F, said pipe having the valve *c* and spring, in combination with the float G, lever H, and rod *h*, the latter being disconnected or independent of the valve, and constructed to operate substantially as and for the purpose set forth.

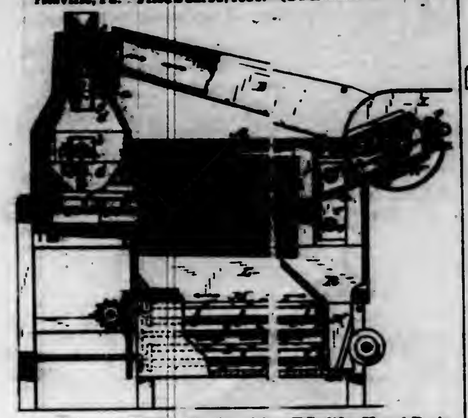
254,601. SEALING-PRESS. EDWARD J. BROOKS, East Orange, N. J., assignor to E. J. Brooks & Co., New York, N. Y. Filed Oct. 31, 1881. (No model.)

Claim.—In a sealing-press composed principally of two main parts, E F, having lever-handles integral therewith, and a head on one of said parts containing a pair of seal-dies substantially at right angles to said handles, the combination, with said head, of a hammer attachment, *h*, formed on the lower edge of said head in line with said dies, substantially as herein specified, for the purpose set forth.

254,602. HALTER-HOOK. F. BARTON BROWN, Boston, Mass. Filed Aug. 6, 1881. (No model.)

Claim.—1. In a halter-hook, the combination of the loops A B, connected to form ears D D, with a cam, E, hung between said ears, the said cam extending from the bearing and terminating in device for engagement therewith, substantially as described.

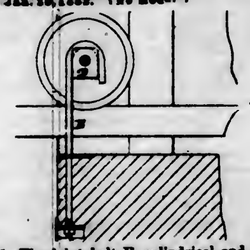
2. The combination of the loops A B, connected to form ears D D, with a cam, E, hung between said ears, the said cam extending from the bearing and terminating in a snap-hook, substantially as described.



3. A snap-hook having the tongue hinged to its shank by a pivot parallel with the plane of the hook, and so that the tongue will swing in a plane at right angles to the hook, the said tongue provided with the stud *f* at the point of the tongue and on the side opposite that toward which the tongue swings, projecting from the tongue in a plane parallel with the plane in which the tongue swings, substantially as described

254,603. TENSION DEVICE FOR SEWING-MACHINES. DANIEL W. BROWN, Providence, R. I., assignor to John B. Anthony, same place. Filed May 2, 1881. (No model.)

Claim.—The intermediate or needle-bar tension device consisting of the needle-clamp bolt having a head grooved or recessed vertically and laterally, in combination with a lateral thread-pin occupying said lateral recess in said head, substantially as described.

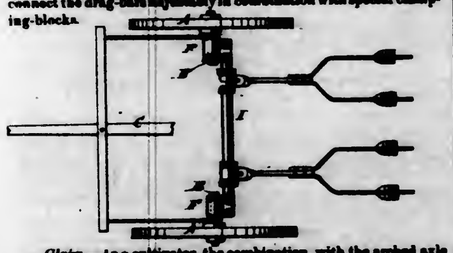


254,604. NEEDLING-PURIFIER. P. STUCKER BROWN, Gethricsville, Pa. Filed Jan. 23, 1882. (No model.)

Claim.—1. The combination of frame E I, slides K, reel B, air-conductor C, and the chest A, having openings *b l* and slides *m*, substantially as and for the purpose set forth.

2. The adjustable steel-spout consisting of the sections *c d e*, constructed as described, in combination with the conical spreader F, adapted to be adjusted vertically, as and for the purpose specified.

254,605. DOOR-HANGER. CHARLES W. BULLARD, Chicago, Ill. Filed Jan. 30, 1882. (No model.)

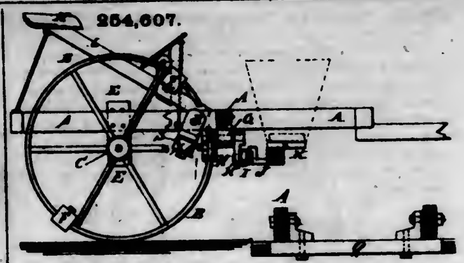


Claim.—1. The joint-bolt E, cylindrical and hooked at its upper end, in combination with the sheave C C', substantially as and for the purpose described.

2. The joint-bolt E, in combination with the box D and sheave C C', substantially as and for the purpose described.

254,606. CULTIVATOR. JOHN W. BUNCH, Commercial Point, Ohio. Filed Jan. 6, 1882. (No model.)

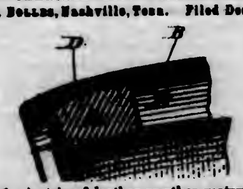
Brief.—A removable cross-bar to span the arch at its base to connect the drag-bars adjustably in combination with special clamping-blocks.



Claim.—In a cultivator, the combination, with the arched axle B, of the couplings H and the cross-bar I, substantially as herein shown and described, whereby the plow-beams can be adjusted close together for cultivating small plants, as set forth.

254,607. SEED-PLANTER. JOHN W. BUNCH, Commercial Point, Ohio. Filed Oct. 24, 1881. (No model.)

Brief.—Two-part marking-blocks, one on each wheel, being also a tripping-block, which, by means of cranks, reciprocate the pitman and seed-slide. A loosely-hung brake-bar which, by foot-lever and connections, engages the inside of the wheel-felloe.

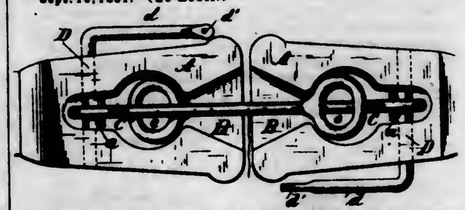


254,607.

Claim.—1. In a seed-planter, the combination, with the wheels B, of the blocks F, made in two parts, secured to each other and to the wheel-rim by set-screws, substantially as herein shown and described, whereby the hills will be marked and the seed-dropping mechanism operated, as set forth.

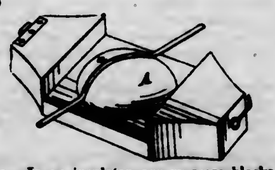
2. In a seed-planter, the combination, with the wheels B and the frame A, of the two-part blocks F, the cranks H, having cams H', the reciprocating-bar I, and the pitman J, having arm K, substantially as herein shown and described, whereby the revolution of the transporting-wheels will vibrate the said connecting-bar to operate the seed-dropping slide, as set forth.

254,608. CARRIAGE-TOP. ROBERT BUTTERWORTH and REUBEN S. BOLLES, Nashville, Tenn. Filed Dec. 8, 1881. (No model.)



Claim.—1. A strip of leather or other material, D or D', secured to the top of a vehicle at the front or rear, substantially as and for the purpose set forth.

2. The combination of the strip D, roof-piece B, facing *c*, welt *b*, and the bow A of a vehicle-top, substantially as shown and described, and for the purpose set forth.



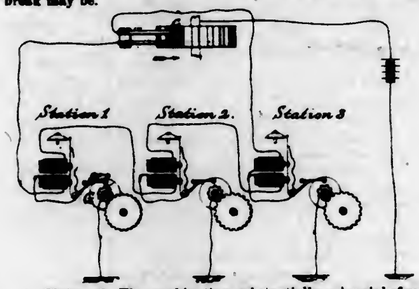
3. The herein-described improvement in the trimming of vehicle-tops, consisting in securing to the bows at front and rear a strip of leather or other material, whereby a hood is formed in line with the top or roof-piece, substantially as shown and described.

254,609. CAR-COUPLING. GEORGE CADE, Milan, Tenn. Filed Sept. 16, 1881. (No model.)

Claim.—In a car-coupler, the draw-head A, having recesses B C and slot *a'*, in combination with the link or draw-bar E *e*, and the shaft D, having the dog *a* and crank *d*, substantially as and for the purpose set forth.

254,610. INSULATOR FOR TELEGRAPH-WIRES. WILLIAM E. CAPEWELL, Philadelphia, Pa. Filed June 23, 1881. (No model.)

Claim.—In an insulator, one or more blocks, A, having a rounding surface and a concave surface, *c*, and provided with groove *a*, substantially as and for the purpose described.



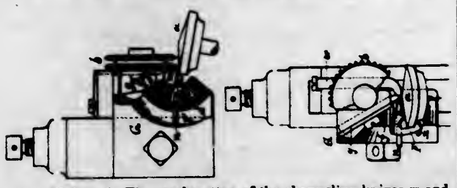
254,611. CIRCUIT FOR FIRE-ALARM TELEGRAPHS. ROBERT

4. The combination of the bracket G, the knife *a* and an adjustable knife-supporting block, F, having two slots arranged at an

254,617.

264,611. CIRCUIT FOR FIRE-ALARM TELEGRAPHS. ROBERT CARTER, New York, N. Y. Filed Nov. 21, 1881. (No model.)

Brief.—A device whereby signals are transmitted from a central station to all outlying sub-stations, even though the circuit be broken between any two of said sub-stations. Normally no circuit exists on line, but when the transmitter is set in motion the battery-current divides at the transmitter and passes by different routes to the first sub-stations at each end of the line, whereby mechanism is set in motion which automatically repeats the signal to each succeeding sub-station until all have received it, no matter where the break may be.



Claim.—1. The combination, substantially as hereinbefore set forth, of a battery one pole of which is electrically connected with the earth, mechanism for transmitting electrical impulses from the opposite pole of said battery to the terminals of a system of signal-boxes connected together in series, a ground-connection for each of said signal-boxes, and mechanism, substantially such as described, for automatically breaking the earth-connection of each signal-box in succession upon the operation of the same commencing at either or both ends of the system.

2. The combination, substantially as hereinbefore set forth, of an electro-magnet for operating a signal, a conductor attached to an intermediate point in the wire constituting the helices of said magnet and normally connected with the earth, and a circuit-breaker for automatically severing such connection upon the operation of the signaling mechanism.

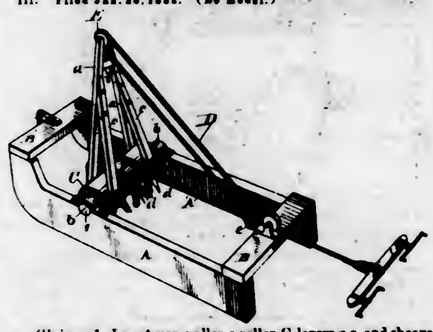
3. The combination, substantially as hereinbefore set forth, of two or more electro-magnets for operating an equal number of signals electrically connected with each other in series, an earth-connection from the central point of the wire constituting the helices of each of said magnets, and automatic mechanism for breaking said earth-connections successively upon the operation of the corresponding signal.

4. The combination, substantially as hereinbefore set forth, of a series of electro-magnets included in the same circuit, a normally-open shunt-circuit around each of said electro-magnets, an earth-connection for each of said magnets, and mechanism for automatically breaking said earth-connection and closing said shunt-circuit upon the magnetization of said electro-magnet.

264,612. SHOE-SOLE-CHANNELING MACHINE. CYPRIEN CHABOT, Philadelphia, Pa. Filed Jan. 24, 1881. (No model.)

Claim.—1. The combination of the channeling-knives *m* and *n*, the latter of which is adjustable to different angles, the work-supporting bed occupying during the operation of the machine a fixed vertical position, and feeding devices carried by a frame capable of moving vertically as the sole varies in thickness, as set forth.

2. The combination of the bracket G, having a segmental recess, *f*, and segmental slot *i*, with the knife-carrying block F, adapted to the recess, and the confining-screw A, adapted to the slot *i*, as specified.



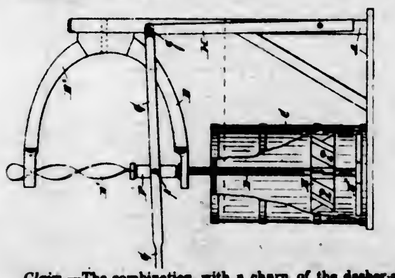
3. The combination of the bracket G, having a segmental recess, *f*, segmental slot *i*, and a segmental groove, *i'*, with the knife-carrying block F, adapted to the recess and having lugs or projections *s*, and the securing-bolt A, as set forth.

4. The combination of the bracket G, the knife *n* and an adjustable knife-carrying block, F, having two slots arranged at an angle in respect to each other, and each adapted for the reception of the knife, as specified.

5. The combination of the bracket G, the block F, adjustable thereon, and having two slots, as described, the knife *n*, the filling-piece *x*, and the clamping-plate *p*, as set forth.

6. The combination of the work supporting and feeding devices, substantially as described, with the edge-channeling knives and the spring presser-bar *w*, adapted to bear upon the upper face of the sole, adjacent to the edge thereof, and immediately in advance of the channeling-knives, as set forth.

264,613. STUMP-EXTRACTOR. JAMES D. CRESSWELL, Alvin, Ill. Filed Jan. 26, 1882. (No model.)



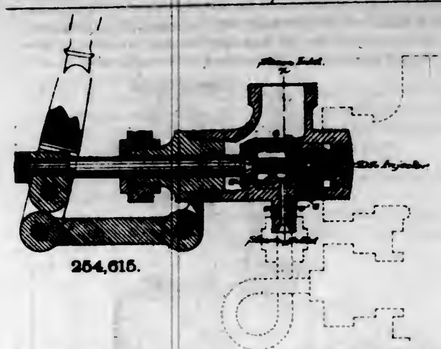
Claim.—1. In a stump-puller, a roller, C, levers *a a*, and sheave E, in combination with chains F and rope D, substantially as and for the purpose set forth.

2. The combination of the roller C, levers *a a*, braces *c c*, and sheave E, substantially as shown and described.

3. A stump-puller, substantially as set forth, having a roller, C, journaled in bearings *b b* in side pieces, A A', with levers *a a* attached thereto, and provided at their upper ends with a sheave, E, in combination with chains F and ropes, substantially as shown and described.

4. The combination of the rollers C, having trunnions *t*, side pieces, A A', rounded off in front and provided with bearings *b b*, cross-pieces B and B', levers *a a*, braces *c c*, sheave E, rope D, pulley H, and chains F, substantially as and for the purpose set forth.

264,614. CHURN. GEO. H. CLEVELAND, Oaktown, Ind. Filed Dec. 5, 1881. (No model.)



Claim.—The combination, with a churn, of the dasher-shaft composed of the dash-rod D, bearing the dashes, and the spiral rod D', and passing through bearings in the arms B B', the block F, the lever G, and link or rod H, all substantially as shown and described, and for the purposes specified.

264,615. STEAM-VALVE FOR INJECTORS. HENRY F. COLVIN, Philadelphia, Pa. Filed Oct. 4, 1881. (Model.)

Claim.—1. A steam-valve consisting of a shell having two discharge-passages and two valves connected to a common stem, one of said valves being fixed on the stem and provided with a seat and the other valve loosely connected to said stem and provided with two seats, the latter valve being surrounded by a steam-passage leading to its end seat, substantially as and for the purpose set forth.

2. The valve-stem, in combination with the lever and pivoted block, substantially as and for the purpose set forth.

264,615.

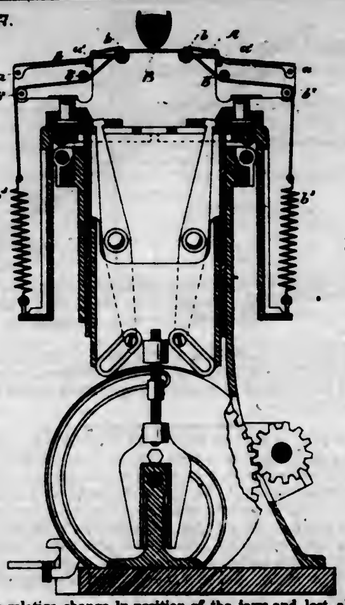
3. The shell and valve-stem, in combination with the lever, pivoted block, link, and ring, substantially as and for the purpose set forth.

264,616. ASH-SIFTER. JAMES F. GORDON, Detroit, Mich. Filed Jan. 26, 1882. (No model.)

Claim.—1. An ash-sifter consisting of a proper body provided with a partially-grated partition, and adapted to be entirely closed by suitable covers and slides, substantially as described.

2. In an ash-sifter, the combination, with the body A thereof, provided with the covers B C D, of the partition F, grating or screen G, and slide H, substantially as specified.

3. In an ash-sifter, the combination, with the body A thereof, provided with the covers B C D, of the partition F, screen G, slide H, and a bottom provided with the slide J, substantially as and for the purposes set forth.



264,617. BOOT AND SHOE LASTING MACHINE. GEORGE W. COPELAND, Malden, and MATTHIAS BRUCK, Boston, Mass., assignors to the Copeland Lasting Machine Company, Hartford, Conn. Filed Jan. 28, 1882. (No model.)

Brief.—The girth is attached to springs at each of its ends and is passed over rolls on the end of the lasting-fingers.

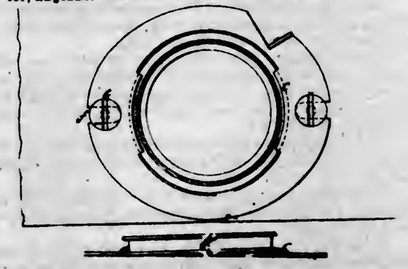
Claim.—1. In a machine for lasting the uppers of boots and shoes, a vamp-lasting device comprising one or more straps or bands, constructed and supported substantially as specified, and adapted to be brought in contact with the vamp at or near the median line of the last, and from that line or section to conform to the surface of the last and fit the vamp thereto and hold it thereon, all substantially as described.

2. In a lasting-machine, the combination of one or more vamp-lasting straps or bands, and supports for the same, and means, substantially as specified, for providing it or them with automatic yielding and take-up movements at their upper ends upon or over said supports, all substantially as and for the purpose described.

3. In a lasting-machine, the combination of side supports or fingers, having the movements in relation to the last substantially as specified, and a series of vamp-lasting straps or bands carried or supported by said supports or fingers, and movable in relation thereto during the operation of lasting, whereby they automatically conform to the surface of the last from or near its median line to the inside without being drawn or advanced thereon during the relative change in position of the jaws and last, all substantially as and for the purpose described.

264,617.

4. In a lasting-machine, the combination of a series of continuous straps or bands, having elastic yielding end connections, a last, and means, substantially as specified, for causing the straps or bands to conform to the surface of the last without causing them to be dragged thereon, all substantially as and for the purpose described.

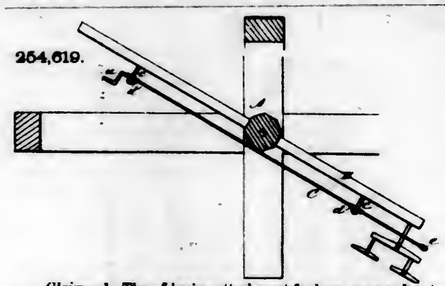


5. In a lasting-machine, a shank-lasting device consisting of the yielding fingers *c*, the straps *c'*, and the springs *c''*, all substantially as described.

6. The combination of the fingers A, rolls *b*, and straps or bands B.

7. The combination of the strap or band with the shield or guard *d'*.

8. The combination of the straps or bands B, the fingers A, the guiding-rolls *b' b'*, and springs *b''*, all substantially as described.

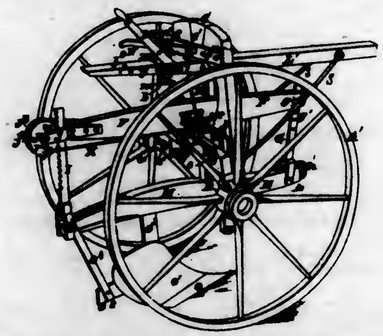


264,618. RING-HOLDER FOR SPINNING AND TWISTING MACHINES. THOMAS COULTHARD, Preston, County of Lancaster, England. Filed Nov. 26, 1881. (No model.)

Claim.—A ring-holder for ring spinning and doubling machines, consisting of a thin metal annulus provided with a round central opening and two inner extending lips or projections, constructed and arranged substantially as herein described, whereby the lower flange of the ring is, without springing the holder, passed freely through said opening, overlapped by said lips or projections, and its periphery surrounded by the annulus when the holder is fastened in place.

264,619. WHIP ATTACHMENT FOR HORSE-POWERS. JOHN L. CRAWFORD, Pine Grove, Miss. Filed Dec. 6, 1881. (No model.)

254,619.



Claim.—1. The whipping attachment for horse-powers herein shown and described, consisting of the rod C, formed with the crank *a*, and adapted to carry the whip *b*, substantially as described.

2. The lever B, provided with the yokes *c c*, which carry the wheels *d d*, in combination with the crank-rod C and the whip *b*, the rod being adapted to be moved longitudinally, as and for the purposes set forth.

254,620. COMBINED PLOW AND CULTIVATOR. FRANCIS GRUBER, St. Louis, Mo. Filed Sept. 19, 1881. (Model.)

Brief.—The plow-beam is attached at front and rear to a beam that rocks upon the axle. The devices for elevating are a rack-bar pressed by a spring against a rack-pulley, from which a cord passes around sheaves to a lever-pulley, and, after being wound around it, returns to the rack-pulley. The lever is loose and works its pulley with a ratchet held by a drop-pawl. The central hangers slide in the beam-clamp. The plow is convertible into a straddle-row cultivator.

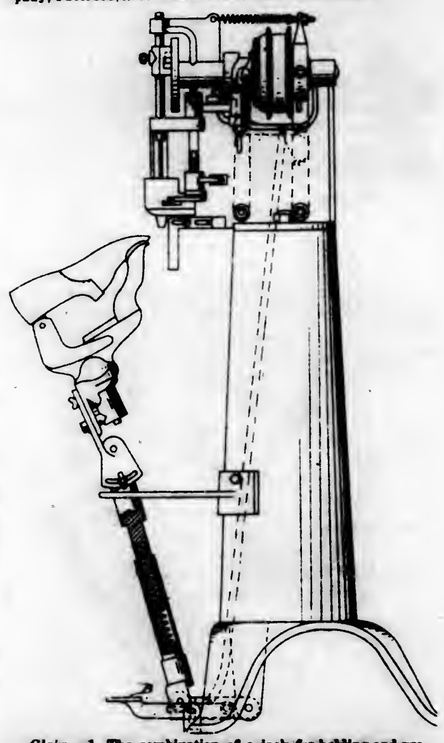
Claim.—1. An arch-axle in which are combined wooden vertical side pieces, *a a*, wedge-shaped or key piece *a'*, metal plate *a²*, angle-iron *c'*, and short axles B B, as set forth.

2. The combination, with the carriage and plow, made substantially as set forth, of the uprights P P, connected by their upper and lower ends to the carriage and plow, respectively, and furthermore connected to the former by a coupling, Q Q' Q², as and for the purpose set forth.

3. The rocking beam F, connected to the cross-beam E, substantially as set forth, and forming support to the forward and rear ends of the plow-beam.

4. The adjustable connections G I, in combination with the plow-beam H, rocking beam F, and cross-beam E, substantially as shown and described.

5. The wheel J, connected to the rear end of the beam F, and made, substantially as set forth, with grooves on each side for receiving the adjusting-rope K, and a central groove having cogs engaging with the rack I to raise the plow.



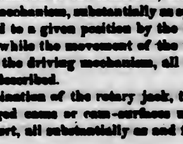
6. The combination of the rope K, wheel J, beam F, having pulleys *b'*, and pulley L, as set forth.

7. The combination of pulley L, sliding lever M, locking-lever N, rope K, wheel J, rack-bar I, and plow-beam H, as set forth.

8. The combination, with the carriage and plow, made substantially as set forth, of the uprights P P, connected by their upper and lower ends to the carriage and plow, respectively.

9. The combination of angle-iron *c²*, yoke C, tongue L', and uprights P P, adjustable in said angle-iron, as set forth.

254,621. TACKING-MACHINE. JOSEPH E. CRISP, Boston, Mass., assignor to the Copeland Tacking and Lasting Company, Paterson, N. J. Filed Jan. 6, 1882. (No model.)



Claim.—1. The combination of a jack for holding and presenting the last to an automatic fastening-driving device, and means, substantially as specified, for setting said fastening-driving device in operation, arranged or located to be moved after the placing in position of the last to receive the fastening by a further movement of the treadle used in placing the work in position to receive the fastening, all substantially as and for the purpose described.

2. The combination of the start-and-stop-motion mechanism of a fastening-driving machine, a jack for holding and presenting the last to said fastening-driving device, a treadle, and intermediate connecting mechanism, substantially as specified, whereby upon the movement of the treadle the work is presented to the nozzle of the fastening-driving device, and upon its further movement the start-motion mechanism of the machine is actuated, all substantially as and for the purpose described.

3. The combination of the treadle B, the jack, and intermediate supporting mechanism, substantially as specified, whereby the jack may be lifted to a given position by the treadle and then become stationary, while the movement of the treadle may be continued to actuate the driving mechanism, all substantially as and for the purpose described.

4. The combination of the rotary jack, the jack-support, and conversely-arranged cams or cam-surfaces upon or between the jack and its support, all substantially as and for the purpose described

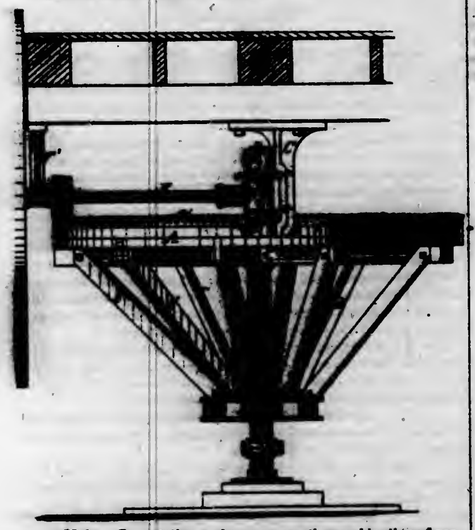
254,622. ART OF PREPARING VULCANIZED RUBBER FOR ERASIVE PURPOSES. HENRY T. CUSHMAN, North Bennington, Vt. Filed Jan. 27, 1882. (No model.)

Claim.—1. The herein-described process of rendering vulcanized erasive rubber available for use without removing the external hardened coating or skin resultant from the vulcanizing process, consisting of combination or abrasion of such skin and the filling of such abrasion or combinations with a powdered material capable of effecting further abrasion of the rubber by attrition when used substantially as specified.

2. As a new article of abstinency, a rubber erasive tablet having its toughened external vulcanized surface ramified or abraded, and such abrasions filled with a powdered material capable of effecting the purposes described in the manner set forth.

254,623. VAPOR-BURNER. SIMEON DAVIS, Canton, Ohio. Filed Jan. 11, 1882. (No model.)

Brief.—The air passes through the groove O to the flame, before reaching which it is heated by contact with the hot metal.

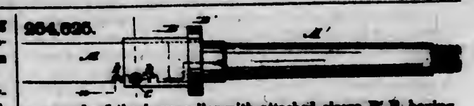


Claim.—1. In a vapor-burner, a vertically-adjustable tip provided with a guard-plate upon its inner side, in combination with a recessed, flaring, curved deflector-plate, substantially as shown.

2. In a vapor-burner, the casting A, having an air-channel formed in its inner end just under the outer edge of the guard-plate, and having a suitable depression or opening formed between the base of the tip and the inner end of the curved deflector-plate, to allow the air to flow freely in and to become heated before it is made to commingle with the vapor, substantially as described.

3. In a vapor-burner, the combination of the casting A, having the curved deflector-plate, socket for the inlet-tube, the vertical tube in which is placed a screw-valve, the vertically-adjustable tip having a guard-plate upon its inner side, and the deflector-plate having a depressed air-channel formed in the top of its inner end, substantially as set forth.

254,624. HORSE-POWER. WILLIAM DURBIN, Louisville, Ky. Filed Dec. 16, 1881. (No model.)



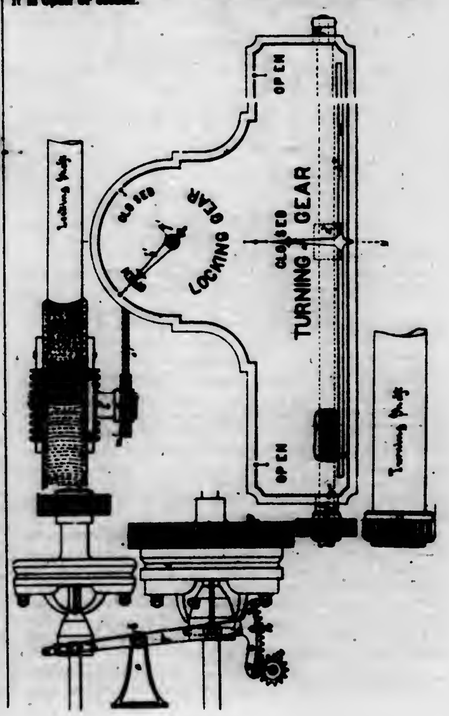
Claim.—In a stationary horse-power, the combination of vertical shaft B, master-wheel A, counter-shaft F, geared with the master-wheel, cut-off journal-block E, having free pivot-connection with shaft A, central hanger, C, for supporting the upper end of such shaft, and adjustable bearings *e f* on this shaft above and below the journal-block, substantially as described, whereby provision is made for separate adjustment of the journal-block and central hanger.

254,625. VEHICLE-AXLE. ALFRED BRIDSON and WILLIAM H. ADAM, Fleetwood, Pa. Filed Aug. 15, 1881. (Model.)

Claim.—1. The combination, with the axle A, of the loose collar B', provided with the sleeve B, and adjustably secured to the axle by the bolt C, substantially as and for the purpose set forth.

2. The combination, with the axle A, provided with groove *b*, of the loose collar with attached sleeve B' B, having bolt-holes *f* and bolt C, substantially as herein shown and described, whereby said collar is adjusted and held in position, as set forth.

254,626. BOOT OR SHOE. SILAS C. DIXON, Brookline, Mass. Filed Feb. 6, 1881. (No model.)



Claim.—1. As an improved article of manufacture, a boot or shoe composed of an upper, inner sole, and slip-sole, all connected by stitches extended completely through and through them from side to side, as shown, and of an outer sole attached to the slip-sole, upper, and inner sole by stitches which at the shank of the boot or shoe extend through the outer sole, upper, and inner sole, and are covered by a channel-flap, while the stitches made about the fore part of the outer sole are left fully exposed at the top of the slip-sole and upon the bottom of the outer sole, as shown and described, instead of being covered by a channel-flap, as heretofore common, substantially as described.

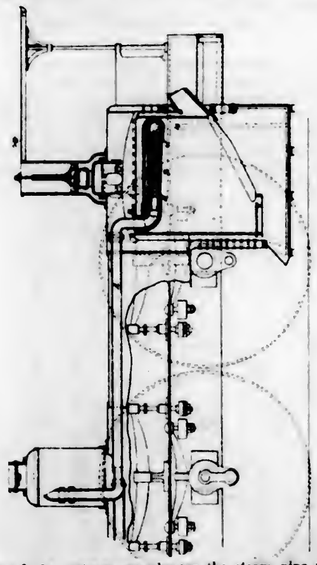
2. In a boot or shoe having an upper, inner sole, slip-sole, and outer sole united together, as described, a row or series of stitches made therein through the flap of the channel, the outer sole, and the edge of the slip-sole, substantially as described.

254,627. DRAW-BRIDGE. JOSEPH EDWARDS and JAMES E. F. KELLY, Brooklyn, N. Y. Filed Dec. 17, 1881. (No model.)

Brief.—The turning-shaft and locking-shaft are provided each with a clutch. A lever operates said clutches oppositely, one out of engagement when the other is in. A hand-wheel operates said lever. Each shaft operates an indicator at the operator's stand to show, the one when the draw is locked or unlocked, the other when it is open or closed.

Claim.—1. The combination, substantially as hereinbefore described, of the draw, the turning-shaft and its clutch mechanism, the locking-shaft and its clutch mechanism, and the clutch-lever common to both clutch mechanisms, but acting on them in an opposite sense.

2. The combination, substantially as hereinbefore described, of the draw, the turning-shaft and its clutch mechanism, the locking-shaft and its clutch mechanism, and the hand-wheel which is geared together with both clutch mechanisms, so as to actuate them in an opposite sense.



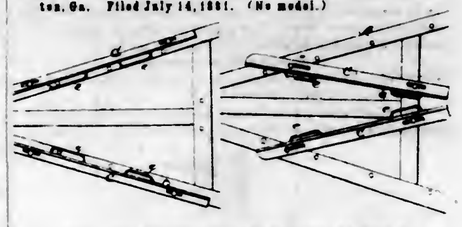
3. The combination, substantially as hereinbefore described, of the draw, its turning-shaft, and the index *a'*, geared together with the turning-shaft and serving to indicate the position of the draw.

4. The combination, substantially as hereinbefore described, of the draw, its locking-shaft, and the index *b'*, geared together with the locking-shaft and serving to indicate the position of the locking mechanism.

5. The combination, substantially as hereinbefore described, of the draw, its turning-shaft, its locking-shaft, and the indexes *a' b'*, geared together with said shaft, one to indicate the position of the draw and the other that of the locking-gear.

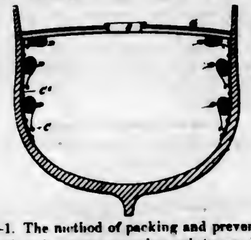
6. The combination, substantially as hereinbefore described, of the draw, the turning-shaft, its clutch mechanism and index, the locking-shaft, its clutch mechanism and index, and the clutch-lever common to both clutch mechanisms, but acting on them in opposite directions.

264,628. APPARATUS FOR SUPERHEATING STEAM. AUGUSTE ESTRADE, Perpignan, France. Filed Nov. 21, 1881. (No model.) Patented in France Sept. 10, 1880, and in England Sept. 28, 1881.



Claim.—1. In a steam-superheater, the steam-pipe passing through the roof of the fire-box, extended horizontally therein, and thence passing upward through the roof of said fire-box for connecting with the cylinders of the engine, in combination with a tube inclosing that part of the steam-pipe located within the fire-box to create an intervening water-space between the two, said tube having its ends secured in the roof of the fire-box and in communication with the water-space of the boiler, all substantially as shown, for the purpose described.

2. In a steam-superheater, the steam-pipe passing through the roof of the fire-box, extended horizontally therein, and thence passing upward through the roof of said fire-box to connect with the cylinders of the engine, in combination with a series of wire-gauze or foraminous plates located within that part of the steam-pipe within the fire-box, and a tube inclosing said steam-pipe and having its ends secured within the roof of the fire-box, all substantially as shown, and for the purposes described.



3. In a steam-generator, the steam-pipe extended into the fire-box, in combination with a series of wire-gauze or perforated disks arranged transversely within said extended part of the steam-pipe, and a water-jacket or tube surrounding the latter, substantially as and for the purpose described.

264,629. COTTON-SCRAPER. JAMES L. FARNSWORTH, Dalton, Ga. Filed July 14, 1881. (No model.)

Claim.—The combination, with the frame and teeth of a harrow or cultivator, of the coverers C C, provided with staples *c c* and slots *b b*, whereby the said coverers are adapted to be adjusted and secured upon the teeth in the several positions specified, substantially as and for the purpose set forth.

264,630. DEVICE FOR SECURING GRAIN, GUANO, COAL, &c., FROM SHIFTING IN VESSELS. EDGAR H. FARRAR, New Orleans, La. Filed Nov. 28, 1881. (No model.)

Claim.—1. The method of packing and preventing the shifting of bulks of grain, guano, or other substances in a ship, consisting in pressing and holding down the grain or other article in successive layers by stretching flexible diaphragms upon the layers as they are formed.

2. The combination, with a ship, of the flexible flaps or semi-diaphragms connected with the sides of the ship's hold, and means for drawing said diaphragms together so as to form a series of horizontal partitions for pressing upon and holding down the grain or other articles to be transported, substantially as described.

3. The combination of the horizontal rows of hooks secured to the inner side of the vessel with the flexible diaphragms adapted to be connected with said hooks, substantially as described.

4. The combination, with the flaps arranged for forming horizontal partitions in the ship's hold, of the side curtains adapted to prevent the passage of grain between the outer edges of the flaps and the sides of the vessel, substantially as described.

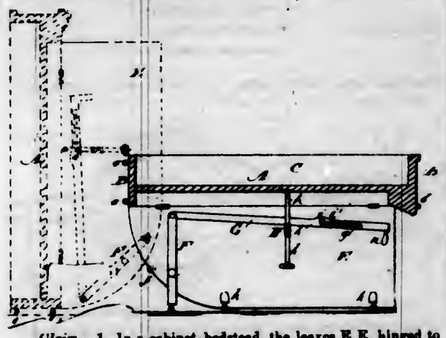
5. The combination, with the flaps or semi-diaphragms arranged for forming horizontal partitions in the ship's hold, of the strip F, adapted to close the space between the inner opposing edges of the semi-diaphragms, substantially as described.

6. The combination, with the semi-diaphragms arranged for forming horizontal partitions in a ship's hold, of the head and foot strips N, substantially as described.

7. The combination, with the flaps or semi-diaphragms D, adapted to be connected to the sides of the ship's hold, and having the stiffening-rod *d'*, of the sheave E, the pulleys upon the stanchions, and the tightening-rope passing over the sheaves and pulleys and up through the decks, substantially as described.

8. The combination, with the flexible flaps and the tightening-rope arranged to tighten the flaps within a ship's hold, of the clamp for securing the rope after it has been tightened, substantially as described.

9. The combination, with the metal strips secured to the sides of the hold of a vessel and provided with hooks, of the flexible semi-diaphragms adapted to engage with said hooks, and devices for drawing the inner edges of said diaphragms together, substantially as described.



264,631. COMBINATION-TOOL. HENRY FISHER, Canton, Ohio. Filed May 3, 1881. Renewed Jan. 30, 1882. (No model.)

Claim.—1. In a corn-sheller of the character described the arms A' A', each being cast with a spur, C, to form a stop or bearing for the operator's hand, with a stud, *a*, to hold the end of a spiral spring, with the shelling-plate E, with the pivot-ear B, and with the teeth F F', as set forth.

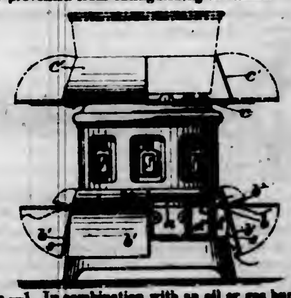
2. In an implement of the character herein described, the arm A', having the pivot-ear B, the wrench-jaw *b* on one side of said pivot-ear, the corn-sheller plate E on the other side of the pivot-ear, and the grooved pincher-plate H at the outer edge of the sheller-plate, as set forth.

264,632. FOLDING CABINET-BED. JOSEPH FOURNIER, Jr., New York, N. Y. Filed Jan. 23, 1882. (No model.)

Claim.—1. In a cabinet-bedstead, the leaves E E, hinged to the end rails, C, and adapted to support the bedstead in horizontal position, and to be folded in against the bottom of the bedstead when the same is in vertical position, substantially as described.

2. In a cabinet-bedstead, the leaves E E, hinged to the end rails, C, and having lower rounded ends, *f f*, whereby the bedstead may be easily raised and lowered to its different positions, substantially as set forth.

3. The hinged leaves E E, in combination with the sliding panel J, as and for the purposes set forth.



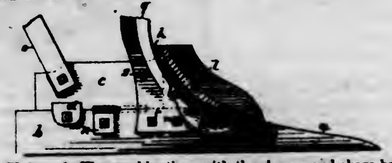
4. The hinged leaves E E, in combination with the jointed braces H H and the sliding sleeves *h'*, substantially as described.

5. In combination with the hinged and rounded leaves E E, the pivoted legs F F, slotted rods G G, and pins *i*, substantially as described.

6. The body of the bedstead formed with the molding *b* and the panels L L, in combination with the hinged leaves E E and sliding panel J, the leaves being rounded at the lower inner corners, substantially as and for the purposes set forth.

264,633. AUTOMATIC DRAFT-REGULATOR FOR OIL AND GAS STOVES. ROBERT A. GARDNER, Providence, R. I. Filed Jan. 13, 1881. (No model.)

Brief.—The currents of air tend to close the deflectors, and are thereby prevented from extinguishing the flame.



Claim.—1. In combination with an oil or gas burning stove, the series of hinged deflectors *b'*, provided with springs *c*, arranged to control the action of air-currents upon the burners, substantially as shown and described.

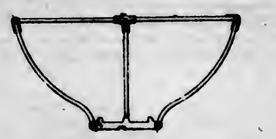
2. In combination with the top portion of an oil or gas burning stove, a series of deflectors, *c'*, arranged to close against the cooking-vessel, substantially as and for the purpose specified.

3. In combination with an oil or gas burning stove the top portion of which is provided with deflectors *c'*, the deflectors *b'* and *b'*, the latter provided with springs *c*, the whole constructed and arranged substantially as and for the purpose specified.

264,634. PLOW. JOSEPH GREEN, Fayetteville, Ark. Filed Aug. 6, 1881. (Model.)

Claim.—1. The combination, with the share *a* and share-bar *b*, made in one piece, and mold-board *k*, of the landside *c*, having the wing *h*, and a plow-standard secured to the share-bar and landside, and abutting against the wing *h*, substantially as described.

2. The combination of the share *a* and share-bar *b*, made in one piece, mold-board *k*, landside *c*, provided with the wing *h*, and beam *w*, having a central hole, standard *u*, provided with a circular recess, *x*, having a central hole, and beam *t*, substantially as described, and for the purpose set forth.



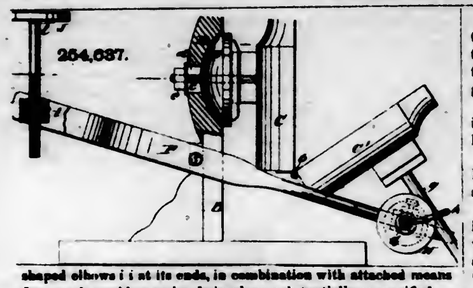
264,635. PACKING-BAND. JOHN E. GIFFORD, New York, N. Y. Filed Aug. 30, 1881. (No model.)

Claim.—1. A packing-band constructed with the double hook B B, the longitudinal slots C C, the re-enforce hooks D D, (one or more,) and the eyes E E, substantially as shown and described, for the purpose set forth.

2. A packing-band constructed with the double hook B B, the longitudinal slots C C, the re-enforce hooks D D, (one or more,) the eyes E E, and the cavities *f f'*, substantially as shown and described, for the purpose set forth.

264,636. LAMP-SHADE HOLDER. EDWIRE H. GÖTSCHIUS, Greenville, N. J. Filed Nov. 8, 1881. (No model.)

Claim.—1. A shade-holder having the top or shade-receiving ring and the connecting-arms formed of the compound bent-wire sections, in combination with the T-couplings and lower or attaching ring, for the purpose specified.



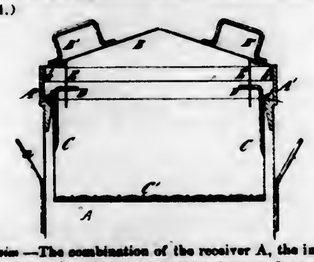
2. The combination, in a shade-holder, of the shade-receiving ring, the connecting-arms formed of the compound bent-wire sections, the lower attaching-ring, the T-couplings, and the hooks *f*, or the bent-wire sections, to form a firm connection with the T-couplings.

264,637. FRAME AND TREADLE FOR GLASS-MOLDS. MILAS GRAVES, Saratoga Springs, N. Y. Filed Jan. 24, 1882. (No model.)

Claim.—1. The divided mold hinged at its base to provide for the opening and closing of it, and having one of its sections supported in its rear by a ball-and-socket joint, in combination with means for holding it when adjusted by said joint, whereby provision is made for adjusting or setting the mold in an upright position, substantially as specified.

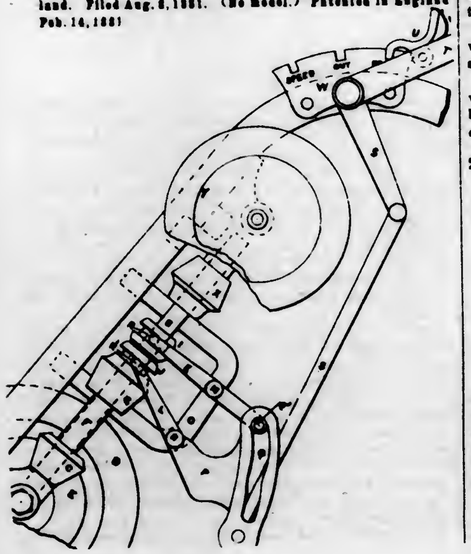
2. The combination, with the opening and closing hinged section C of the mold, having a projection or stem, *g*, on its back, and the side arms, F F, of the treadle, of the cross-head G, made adjustable along said arms for closing and holding the mold, and whereby provision is made for working different-sized molds, essentially as described.

3. The cross-head G, constructed of a pipe, A, and hollow T-



shaped elbows *i i* at its ends, in combination with attached means for securing said cross-heads in place, substantially as specified.

4. The combination, with the opening and closing hinged mold-section C' and its stem *g*, of the cross-head G of the treadle, and the loose grooved wheel or roller H on said cross-head, for operation on the stem *g*, essentially as described.



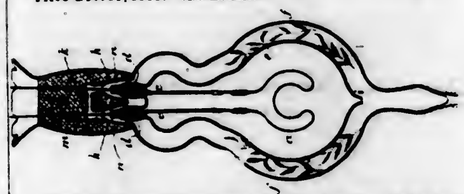
5. The combination, with the side arms, F F, of the treadle, of the pivoted and rocking nut or foot-rest block I, the foot-rest J, and the stem *l* of said rest, adjustable within and through said nut, substantially as specified.

254,638. ASH-SIFTER. JOHN GRAVES, Green Point, assignor to Herman Miller, New York, N. Y. Filed July 23, 1881. (No model.)

Claim.—The combination of the receiver A, the imperforate cover B, the sifter or sieve C, adapted to be turned or rotated, the loops or sockets D, projecting inward from the said sifter or sieve and forming convenient handles whereby it may be lifted, and the lugs E, projecting downward from the under side of said cover and engaging with said loops or sockets, all substantially as herein specified.

254,639. DIFFERENTIAL GEAR FOR VELOCIPEDES. WILLIAM H. J. GREEN, South Hornsey, County of Middlesex, England. Filed Aug. 6, 1881. (No model.) Patented in England Feb. 14, 1881.

Claim.—1. The combination, with the driving-shaft and treadle, of the sliding feather, the pinions and clutches thereon, the rod on which the feather slides, the pinion fixed to the end of the rod, the gear fixed to the driving-shaft, and the differential gears, substantially as described.



2. In a velocipede, the segmental gage-plate and spring-pawl, in combination with the handle T, lever S, cam Q, bell-crank P, levers K and L, bracket, and clutches, substantially as described.

3. In combination with the bevel-pinions C G, the forked rod K, and cam-slotted bell-crank P, the bell-crank lever S operating such, substantially as set forth.

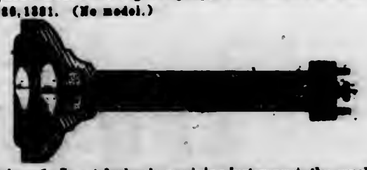
4. In velocipede differential gear, the double-pitched cam-slot in the bell-crank for moving the lever E, in combination with lever L, both moved by lever S, so that different sliding velocities are imparted to the pinions in changing the gear from "power" to "speed," and vice versa, or throwing it out to insure the pinions instantly engaging with or being freed from the large bevel-wheels, substantially as specified.

254,640. WITHDRAWN.

254,641. ELECTRIC LAMP. JOHN H. GENET, Brooklyn, N. Y. Filed Nov. 19, 1881. (No model.)

Claim.—1. In an electric lamp, the combination, with the incandescing filament and conducting-wires, of the glass *e*, surrounding the filament, and the glass shade *f* around the glass *e*, there being a vacuum in both the shade *f* and glass *e*, substantially as set forth.

2. The combination, with the glass *e*, tubes *d*, incandescing filament, conducting-wires, and lead packing between the glass tubes and wires, of the outer ornamental glass shade, *f*, hermetically sealed at the conducting-wires, substantially as set forth.



3. The combination, in an electric lamp, of the incandescing filament, its wires, the inner glass, *e*, the outer glass shade, *f*, the tubes *h*, cap *m*, and the plaster uniting the tubes *h* and shade *f* with the cap *m*, substantially as set forth.

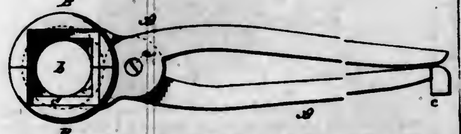
4. In combination with the conducting-wires, incandescing filament, and glass shade, a cap, *m*, a packing of fibrous material between the cap and the parts of the glass shade, and plaster within the cap, for the purposes and as set forth.

5. In combination with the tubes and hermetically-sealed wires in an incandescing electric lamp, the bridge of glass between said tubes, for the purposes and as substantially set forth.

6. The semi-cylindrical clips for the carbon, made of flattened wire, and the twisted portion to hold the parts together, in combination with the carbon having thickened ends and the plating of metal upon the parts, as set forth.

254,642. TELEPHONIC RECEIVING-INSTRUMENT. WILLIAM E. HALL, Washington, D. C., assignor to the United States Telephone Manufacturing Company, New York, N. Y. Filed July 26, 1881. (No model.)

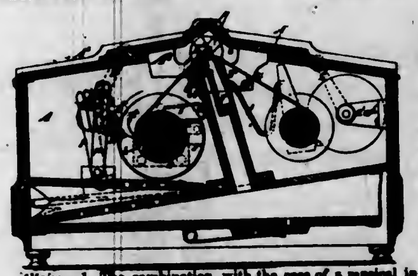
Claim.—1. In a telephonic receiving-instrument, the combination, with a diaphragm which is fixed at its center, but capable of vibrating at its perimeter and between its perimeter and center, of an electro-magnet having its core fixed at one end, and mechanical means for transmitting motion from the other end of said core to the margin of the diaphragm when said core is caused to expand by the influence of electric currents, substantially as described.



2. In a telephonic receiving-instrument, the combination, with a vibratory diaphragm having its center confined, of an electro-magnet having its core provided with an extension impinging against the margin of said diaphragm and arranged to cause the same to vibrate in response to the action of the core under the influence of electric currents traversing the coil of the magnet, substantially as described.

3. In a telephonic receiving-instrument, the combination, with the vibratory diaphragm, of an electro-magnet having a tubular core provided with an extension impinging against the margin of said diaphragm, a rod having one end secured to the center of said diaphragm and passing through the tubular core of the magnet, its other end being fixed, and a suitable stop for the end of the core opposite to that next the diaphragm.

4. The combination, with a suitably-supported concave diaphragm, of the tubular core of an electro-magnet arranged to bear against said diaphragm, a rod extending from the apex of said diaphragm through the core of the magnet, and arranged to hold the center of the diphragm in a fixed position with relation to the core, substantially as described.



5. The combination, with the vibratory diaphragm, of an electro-magnet having a tubular core, one end of which is provided with an extension bearing against the margin of said diaphragm and the other end resting against a magnetically inert support, a rod secured to the center of said diaphragm and extending through the tubular core of the magnet and arranged to hold the center of the diaphragm in a fixed position with relation to the core, substantially as described.

254,643. COMBINED AXLE CLEANER AND WRENCH. CHAS. H. HAMILTON, Three Mile Bay, N. Y. Filed Jan. 23, 1882. (No model.)

Claim.—An axle wrench and cleaner consisting of the arms A A, pivoted across each other at *a*, and having a hollow semicircular jaw, B, upon each arm, said jaws having formed in one end an annular groove, *b'*, and in the other end rectangular grooves *c'*, adapted to clinch an axle-nut, substantially as set forth.

254,644. MECHANICAL MUSICAL INSTRUMENT. ANDREW H. HAMMOND, Worcester, Mass. Filed Jan. 31, 1881. (No model.)

Claim.—1. The combination, with the case of a musical instrument wherein the operation of reeds is controlled by a traveling perforated music-sheet, of a reed-board inclining foward and extending nearly to the center portion of the cover of the case, substantially as specified.

2. The combination, with a musical instrument, of a cover composed of two portions, A' A², and a bridge-piece or bridge-pieces, A², connecting them.

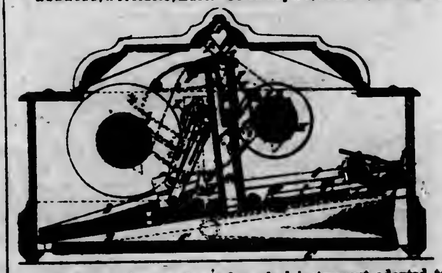
3. The combination, in a musical instrument, of a swell-opening, two slats for controlling the same, and means whereby said slats are enabled to work outward and inward through the cover of the instrument to approach and recede from each other.

4. The combination, in a musical instrument, of a swell-opening, two slats for controlling the same, and means whereby said slats are enabled to work outward and inward through the cover of the instrument to approach and recede from each other, and to form, when moved inward, a conduit adjacent to the openings of the reed-cells for directing the sound from the instrument.

5. The combination, in a musical instrument, of a swell-opening and two slats for controlling the same, working outward and inward through the cover of the instrument to approach and recede from each other, and connected so that both may be moved or adjusted by manipulating one only.

6. The combination, in a musical instrument, of a swell-opening, two slats for controlling the same, working outward and inward through the cover of the instrument to approach and recede from each other, and levers whereby said slats are pivoted in place.

7. The combination, in a musical instrument, of a swell-opening, slats for controlling the same, pivoted by levers so as to work outward and inward through the cover of the instrument to approach and recede from each other, links for connecting said levers, and a spring applied to said links.



8. The combination, in a musical instrument, of a receiver arranged at the bottom thereof, bellows mounted on the top board of said receiver near one end, and a wind-chest and reed-board mounted on the top board of the receiver opposite said bellows, and extending nearly to the top of the central portion of the case of such instrument, substantially as specified.

9. The combination, in a musical instrument, of a receiver arranged at the bottom thereof and having an inclined top board, and a wind-chest and reed-board mounted on the top board of said receiver, and also being inclined, substantially as specified.

10. The combination, in a musical instrument, with a top board for a receiver grooved or recessed to form shoulders or shoulder-like portions, of bellows-leather, india-rubber, or like flexible material having its edges fitting over said shoulders or shoulder-like portions, and cleats or strips fitted to the grooved or recessed portions and against the bellows-leather, india-rubber, or like material, and serving to aid in securing the latter in place, as also to brace and stay said top board.

11. The combination, with a roller provided with a peripherical recess and a hook or analogous device arranged therein, of a music-sheet provided at one end with a ring or loop secured to it by a tape or strip, and extending beyond the music-sheet, and adapted to be engaged with the said hook or device for securing the music-sheet to said roller, substantially as specified.

254,645. MECHANICAL MUSICAL INSTRUMENT. ANDREW H. HAMMOND, Worcester, Mass. Filed Sept. 6, 1881. (No model.)

Claim.—1. In a mechanical musical instrument adapted to be operated by a traveling music-sheet, the combination, with a roller around which the sheet is wound or passes, and a driving-shaft for imparting motion thereto, of a rest for the traveling music-sheet overhanging said shaft, substantially as specified.

2. In a mechanical musical instrument, the combination, with a music-roller and a take-up roller, of a driving-shaft arranged between them, a bearing-block for one end of said shaft fulcrumed or pivoted above or at one side of said shaft, and mechanism connected with said block below or at an opposite side of said shaft for moving said block to cause the shaft to impart motion to either of said rollers and simultaneously release it from the other roller, substantially as specified.

3. In a mechanical musical instrument, the combination of music and take-up rollers, a driving-shaft arranged between them, a bearing-block for said shaft capable of adjustment to cause said shaft to impart motion to one of said rollers and simultaneously release the other, an elastic arm, and means for actuating said arm to adjust said bearing-block, and at the same time put such a tension on the arm as to cause it to exert a spring force, whereby it holds said shaft with a yielding pressure in position to transmit the desired motion, substantially as specified.

4. The combination of the music and take-up rollers H H', the driving-shaft E, the pivoted bearing-block I, having the elastic arm or tail-piece I', and mechanism connected with said arm or tail-piece for moving said block, substantially as specified.

5. In a mechanical musical instrument, the combination, with music and take-up rollers, and a driving-shaft arranged between them, of a crank connected with the bearing supporting one end of said shaft, and serving to adjust said shaft transversely and hold it in the position to which it is adjusted, substantially as and for the purpose specified.

6. The combination of the music and take-up rollers H H', the driving-shaft E, the pivoted bearing-block L, the crank *h*, and rod *g*, all substantially as specified.

7. In a mechanical musical instrument, the combination of a wind-chest or receiver, a relief-valve, a rock-shaft provided with two arms, to one of which said valve is connected, and means for acting upon the other arm to raise said valve, substantially as and for the purpose specified.

8. The combination of the driving-shaft E, the bearing-block L, the rod *g* and crank *h*, the relief-valve *j*, and the rock-shaft *k*, having the arm k^2, which is acted upon by the rod *g* to open said valve, substantially as specified.

9. In a wind musical instrument, the combination, with an expansible wind-chest or receiver, of a valve and means deriving motion from the movable board of the wind-chest or receiver, and serving to impart to the valve a slower and more gradual motion than it would derive if operated directly from the movable board of the wind-chest or receiver, substantially as and for the purpose specified.

10. In a wind musical instrument, the combination, with an expansible wind-chest or receiver, of a valve and means comprising a lever deriving motion from the movable board of the wind-chest or receiver, and imparting to the valve a slower and more gradual motion than the said board would impart to the valve if it acted directly on the valve, substantially as and for the purpose specified.

11. In a wind musical instrument, the combination, with an expansible wind-chest or receiver, of a valve, a lever extending beyond the valve, and a pin projecting into the wind-chest or receiver through the fixed board thereof, and adapted to be operated by the movable board to slowly and gradually open the valve, substantially as and for the purpose specified.

12. The combination of the wind-chest or receiver C, the valve *j*, having a projection, *n*, the lever *l*, arranged below said projection *n*, and carrying the pin *m*, which is acted upon by the movable board C', substantially as specified.

254,646. WATCH-CASE. C. WESLEY HANNAH, Cincinnati, Ohio. Filed Nov. 5, 1881. (No model.)

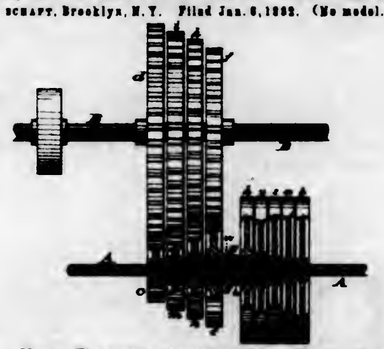
Claim.—1. A watch-case in which the central frame and the bezel are spun or struck up in a single piece and the crystal is secured in the immovable bezel, the back of the case being composed of a single piece of metal detachably secured in place on the frame of the case, having winding and setting mechanism adapted to be operated without opening the case, all substantially as shown and described.

2. The band or ring containing the movement, which rests within said band or ring on an annular shoulder formed thereon, the dial of the movement seating upon a rim on the inside of the bezel, and a flange on the band or ring seating upon a flange on the shell or casing and detachably connected thereto by a screw, said parts being constructed and combined substantially as shown and described.

3. The body of the case spun or struck up in a single piece with the bezel which receives the crystal, and at its rear side with the rim *d''* and flange *d'*, in combination with the ring D, containing the movement C, and provided with the flange *d*, detachably secured to the flange *d'* on the body of the case, substantially as described.

4. The body A of the case, formed in a single piece with the bezel which receives the crystal, and at its rear side with the threaded rim *d''* and interior flange, *d'*, in combination with the solid back plate, the ring D, containing the movement C, and formed with the flange *d*, and the screw E, detachably securing the flange *d* of the ring to the flange *d'* of the case, all substantially as and for the purpose described.

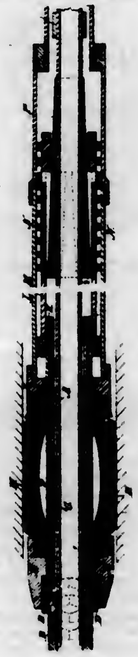
5. In a stem-winding watch, the winding-arbor H, provided on its outer end with a crown, H', and between its ends with right and left handed screw-threads engaging corresponding screw-threads on the inside of the hollow stem or pendant, substantially as and for the purpose specified.



6. In a stem-winding watch, a device for operating the setting mechanism, composed of a hollow cap, K L, within which the hooked end *i* of the setting-lever I is sustained and operates, substantially in the manner and for the purpose herein set forth.

254,647. CALCIMINE. C. EDWARD HUCHY, Easton, and WALTER S. DAVIS, Reading, Pa. Filed Aug. 2, 1881. (No specimens.)

Claim.—1. A water-proof calcimine ready mixed for application, composed of pure zinc oxide or other pigment, linseed-oil, caustic soda, rosin, soda-carbonate, water, glue, wax, soap, and lime, mixed together substantially as specified.

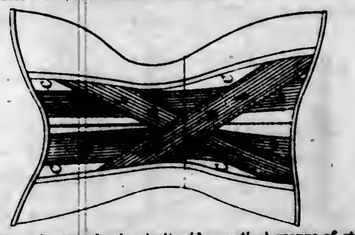


2. The process of compounding a water-proof liquid calcimine, consisting of the following steps: first, mixing zinc oxide or other pigment and linseed-oil with a solution of caustic soda to form a stiff mass; second, adding to said mass a compound mixture composed of a compound (A) of rosin, glue, and soda carbonate mixed in rain-water, and a compound (B) of white wax, white soap, and glue, also mixed in rain-water; and, third, adding to the whole a cream of fresh lime slaked in hot water, all in about the proportions specified, substantially as described.

254,648. MECHANICAL MOVEMENT. CHRISTOPHER HEBBSCHAFT, Brooklyn, N.Y. Filed Jan. 6, 1882. (No model.)

Claim.—The combination of the idler-pinions *m n*, idler spur-wheels *i k*, and the pulleys *s x* and sleeves *w r* with the driving-shaft A, carrying the pulleys *a h*, sleeve *g*, and pinions *o c*, and the driven shaft B, carrying the spur-wheels *f d*, the idler-pinions *m n* being placed between the pinions *o c*, and the several parts being constructed, combined, and arranged substantially as described, to effect the purpose herein set forth.

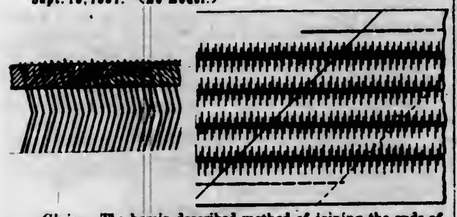
254,649. PACKING FOR OIL-WELLS. JESSE A. HEYDRICK, Barnhart's Mills, Pa. Filed Sept. 27, 1881. (No model.)



Claim.—1. In a well-packing, the combination, with the packer H and the tubing A, of the internally-threaded casing P, the screw-sections N, and the conoidal wedge O, all arranged and adapted to operate substantially as specified.

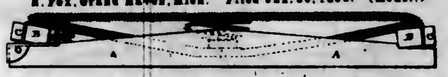
2. In a well-packing, the combination, with the packer H, the tubing A, having knocker S, an outer casing having an internal screw-thread, and an inner casing having longitudinal slots therein, of the screw-sections N N and the conoidal wedge O, adapted to move longitudinally between the said sections, substantially as shown and described.

3. In a well-packing, the combination, with the packer H, the outer casing, M P, and the tubing A, of the thimble B, having two quadrantal recesses in its lower end, and the thimble C, having quadrantal projections on its upper end, whereby the casing L G may be rotated, as shown and described.



4. In a well-packing, the combination, with the packer H, the outer casing, M P, and the tubing A, of the thimble E, screwing on the said packer, the lining F, the thimble C, held in engagement with the thimble E by the packer D, and the thimble B, screwed on the said tubing and meshing with thimble C, substantially as shown and described.

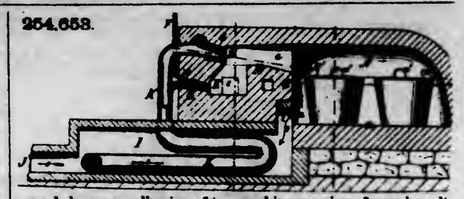
254,650. CORSET. JULIUS HILDEBR, New York, N.Y., assignor to Moritz Cohn, same place. Filed Dec. 8, 1881. (Model.)



Claim.—A corset having in its sides vertical groups of stays and groups of stays arranged diagonally in opposite directions, the said diagonally-arranged groups of stays crossing each other, and also crossing the said vertical groups of stays, substantially as herein described.

254,651. METHOD OF JOINING DOFFER-RINGS FOR CARD-SETTING MACHINES. JOHN J. HOEY, Lawrence, Mass. Filed Sept. 19, 1881. (No model.)

Claim.—The herein-described method of joining the ends of doffer-rings for card-setting machines, consisting in beveling the obliquely-cut ends and joining them together by cement and stitching, substantially as shown and described.

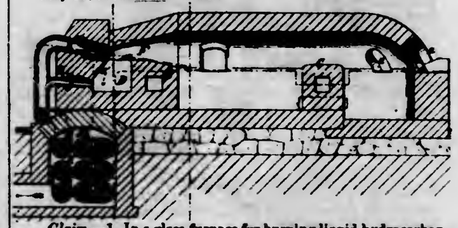


254,652. SPRING BED-BOTTOM. LORRIN H. HOOD and GEORGE H. FOX, Grand Haven, Mich. Filed Jan. 30, 1882. (Model.)

Claim.—The combination of the side supporting-bars, A, the clamping-pieces B C, the cross-bar, the spiral springs placed upon the bar, the longitudinal springs, the castings which are applied to the ends of the side supporting-bars, and the set-screws, whereby the tension of the fabric and longitudinal springs can be increased or decreased at will.

254,653. GLASS-FURNACE. JOSHUA W. HOUCHIN and JOSHUA R. HOUCHIN, Brooklyn, N.Y. Filed July 20, 1881. (No model.)

254,653.



rounded corners, allowing of two working-openings for each melting-pot, substantially as specified.

2. In a glass-melting furnace provided with a liquid-fuel atomizer, G F, and superjacent air-blast nozzle D, the tapering blast and fire flue *e*, widening into the upper part of the furnace proper, A, in combination with the return-flue *i*, issuing through the wall C at the furnace-floor, the oblong heating-chamber I, terminating into the chimney-flue J, and the coiled blast-pipe K, placed in the said chamber and leading thence up to the said nozzles, all constructed and arranged substantially as shown and set forth.

3. In a glass-melting furnace using liquid-hydrocarbon fuel, the upper blast and fire entering flue, *e*, and the lower returning discharge-flue, *i*, both arranged in the front wall, C, of the furnace proper, A, in combination with the heating-chamber I, the coiled blast-pipe K, the atomizing-nozzle G F, and the superjacent air-blast nozzle D, substantially as specified.

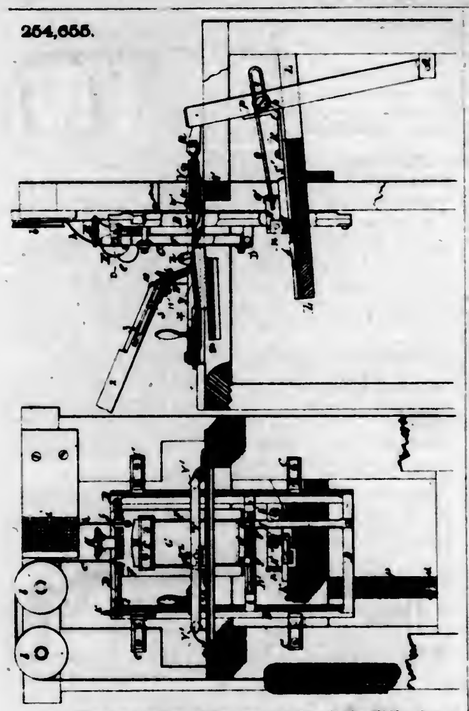
254,654. CONTINUOUS GLASS-MELTING FURNACE. JOSHUA W. HOUCHIN and JOSHUA R. HOUCHIN, Brooklyn, N.Y. Filed July 20, 1881. (No model.)

Claim.—1. In a glass-furnace for burning liquid hydrocarbon, the kindling-box provided with upward-flaring side walls diverging from a narrow bottom to about the width of the blast-nozzle G and flue F, and having overhanging front wall, *d*, causing upward-diminishing length, in combination with the atomizer H I and superjacent blast-nozzle G, arranged substantially as shown and described.

2. In a continuous glass-furnace having atomizer H I and superjacent blast-nozzle G, the combination of the central entering-flue, F, melting-trough A, and lateral return-flues N with the blast heating chamber M, placed across and underneath the front end of the furnace, substantially as specified.

254,655. WIRE-BRUSH MACHINE. JOHN E. HOWARD, Reading, Mass., for himself and as Administrator of Clarence E. Howard, deceased. Filed Aug. 26, 1878.

Brief.—Headed pins are fed automatically one by one from a hopper to the inserting-plunger. Power is applied (it may be by the handle shown) to a horizontally-reciprocating frame carrying the pricker and pin-inserting plunger. To the reciprocating frame is attached a lever operating a sliding wedge, said wedge operating a pawl, which engages with a rack attached to a vertically-sliding frame, which indirectly carries the rubber backing. This moves the backing step by step vertically between the pricker and plunger. In this vertically-sliding frame is mounted a frame carrying the backing, and adjusted horizontally by a hand-wheel to shift the backing for each successive row of pins.



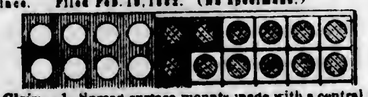
Claim.—1. The combination, with the sliding carriage F, of the adjustable sliding clamp *g* and thumb-screw H, as and for the purpose set forth.

2. In a wire-brush machine, the combination of the needle W and the driver *x*, each attached to opposite ends of a moving carriage, the shoe or guide 22, and the trough *y*, all arranged and operating as and for the purpose set forth.

3. The combination, with the movable frame F, carrying the rubber back G, of the screw-rod D, provided with the wheel E and spring-catch *e*, the index *i*, and the pointer *h*, as and for the purpose described.

4. The combination, in a wire-brush machine, of the carriage B, the ratchet-bar I, and the pawls *l* and T, as set forth.

254,655.



5. The combination of the recessed plate S, the sliding bar *s*, the angular plate M N, the rod O, and the rocking bar P, all arranged for operating the intermittently-elevating pawl *l*, as set forth.

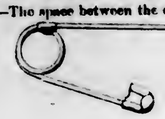
6. The combination, with the finger 4, of the bar 11, the shipping-block 12, and the slotted bar 13 14, operated by the sliding frame V, as and for the purpose specified.

7. In a wire-brush machine, the combination, with the hopper *k* and raceway 2 3, of the standards 16 18, the bar 20, and the angularly-slotted bar 21, operated by the carriage V, for imparting an oscillating motion to the hopper and raceway, as set forth.

254,656. ILLUMINATING-GRATING. THADDEUS HYATT, New York, N. Y., assignor to Elizabeth Adelaide Lake Hyatt, same place. Filed Feb. 10, 1882. (No specimens.)

Claim.—1. Spread-surface mounts made with a central opening formed with practically straight sides, substantially as and for the purposes herein set forth and illustrated.

2. Spread-surface mounts combined with glasses, substantially as and for the purposes herein set forth and illustrated.



3. Spread-surface mounts formed of soft metals, hardened rubber, asphaltum, bituminous mastic, natural and artificial stone, plastic materials, concretes, baked clay, and their equivalents, substantially as and for the purposes herein set forth and illustrated.

4. Metal-banded spread-surface mounts, substantially as and for the purposes herein set forth and illustrated.

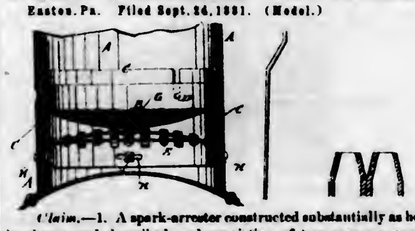
5. Illuminating-gratings faced with spread-surface mounts, substantially as and for the purposes herein set forth and illustrated.

254,657. SAFETY-PIN. JOEL JENKINS, Montclair, N. J., assignor of one-half to George P. Farmer, same place. Filed Jan. 9, 1882. (No model.)

Brief.—The space between the coils is closed by soldering.

Claim.—A spring or safety pin with a portion of the front of the coils of its spring soldered together, as and for the purpose described.

254,658. SAFETY-PIN GUARD. JOEL JENKINS, Montclair, N. J., assignor of one-half to George P. Farmer, same place. Filed Jan. 3, 1882. (No model.)

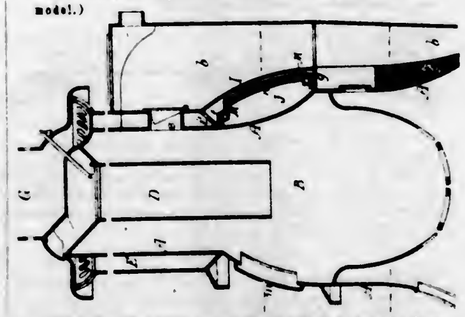


Brief.—The hood covers the inner side of the coil and fills the space between the limbs of the pin.

Claim.—1. The guard B, provided with the pin-hole *e* and lugs *b b*, and adapted to be applied upon the pointed member of a safety-pin and cover the inner part of its coil, substantially as shown and described.

2. The safety-pin provided with a coil, *d*, combined with the hood B, having lugs *b b* clamped over the inner part of said coil to cover said part and fill the space *g* between the limbs of the pin, substantially as shown and described.

254,659. SPARK-ARRESTER. JOHN L. KASTNER, South Easton, Pa. Filed Sept. 26, 1881. (Model.)



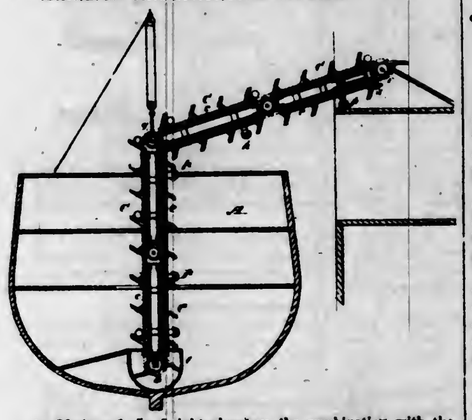
Claim.—1. A spark-arrester constructed substantially as herein shown and described, and consisting of two concavo-convex grates made with parallel bars and connected at their centers by a bolt and at their rims by an interposed rim, C, as set forth.

2. In a spark-arrester, the combination, with the smoke-stack A, of the two concavo-convex grates B E, the central bolt, G, and the interposed rim C, substantially as herein shown and described, whereby sparks will be broken up before escaping from the smoke-stack, as set forth.

3. In a spark-arrester, the concavo-convex grate E, made of parallel curved bars attached at their centers to a curved cross-bar, and having the ends of the alternate parallel bars attached to a rim, the ends of the other bars being at a little distance from the said rim, substantially as herein shown and described, whereby large sparks that pass through the said grate can fall back into the smoke-chamber, as set forth.

4. The combination, with the grate B, of the grate E, provided with horizontal slots H in its rim, substantially as herein shown and described, whereby the relative position of the two grates can be readily adjusted, as set forth.

254,660. HEATING-STOVE. OLIVER B. KEELEY, Spring City, Pa., (Joseph Keeley and Mary E. Keeley, Administrators of said Oliver B. Keeley, deceased.) Filed Nov. 28, 1881. (No model.)



Claim.—1. The combination of the casing A, hot-air chamber E, flue-casing I, and the heating-chamber made in two parts, J J', separated by the flange *g*, as set forth.

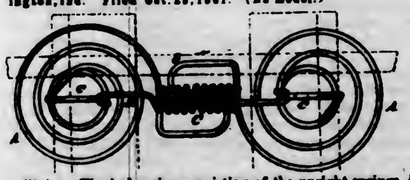
2. The combination of the hot-air chamber E, the combustion-chamber B, the flue-casing I, the air-heating chamber J between the flue-casing and the casing of the combustion-chamber, and the shields M, adapted to form with the stove-casing air-heating chambers communicating with the chamber J, as set forth.

3. The combination of the stove-casing having illuminating doors or windows *m*, with the sliding shields M, having mica-covered openings *n* formed therein, as and for the purpose specified.

254,661. FREIGHT ELEVATOR AND CONVEYER. THOMAS KEITH, New York, assignor to Charles B. Mesereau, New Rochelle, N. Y. Filed Nov. 15, 1881. (No model.)

Claim.—1. In freight-elevators, the combination, with the endless chain *a*, provided with tables *m*, and the sprocket-wheels *h*, of the sections *c*, provided with the apertured plates *d*, hinged together, and cross-bar *f*, substantially as shown and described, whereby the said sections are held at any desired angle, as set forth.

2. In freight-elevators, the jointed sections composed of rails *c*, united by joint-plates *d* and rods *g*, and the endless chains *a*, carrying tables *m*, substantially as shown, described, and combined, for operation as set forth.



3. The endless chains *a a*, provided with eyes *g'*, and connected by rods *g*, and the V-shaped bars *m*, held by braces *n*, in combination with the jointed sections C, forming a supporting-frame, substantially as shown and described.

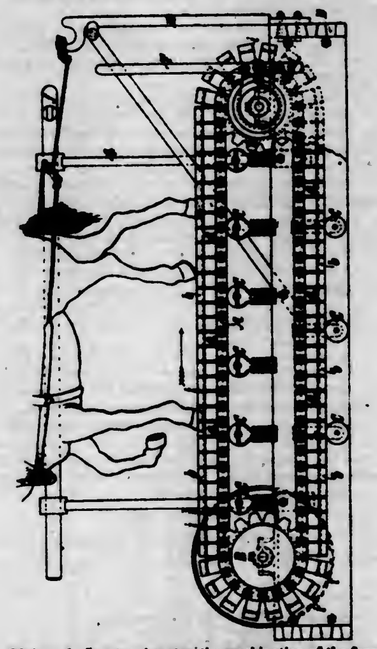
254,662. FENCE-POST. CYRUS KIDDEY, Windsor, Ontario, Canada. Filed Jan. 11, 1882. (No model.)

Claim.—The post A, in combination with the inverted cup B, having a downward-projecting flange tapering inwardly from the lower to the upper edge, both post and cup being constructed to allow the cup to be driven into the ground after the post has been driven, whereby the tapering inner surface of the cup serves to compact the earth about the foot of the post, substantially as set forth.

254,663. SPRING BED-BOTTOM. THOMAS B. LAYCOCK, Washington, Ind. Filed Oct. 28, 1881. (No model.)

Claim.—The bed-spring consisting of the upright springs A, with their upper ends connected together to enable the varying of the distance between them, and their lower ends provided with hooks or eyes, combined with the spring C, connected to the lower ends of the springs A, substantially as and for the purpose described.

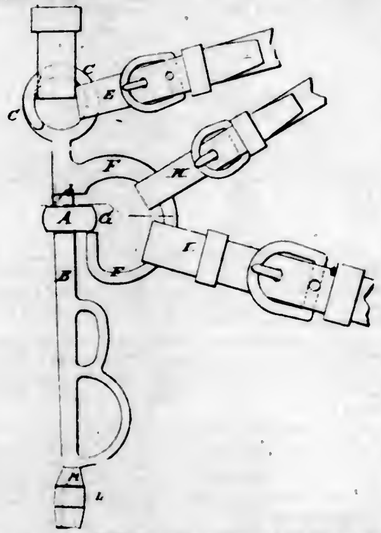
254,664. SIDE-BAR VEHICLE. CHARLES E. LEE, Louisville, Ky., assignor to James L. Clark and Herbert H. Clark, Oshkosh, Wis. Filed Dec. 19, 1881. (No model.)



Claim.—1. The combination, with the side bars, *a*, of the side springs, *h*, secured thereto, near their ends, and provided with ears *h' h'*, secured to the head-block or front bolster, *e*, and hind-axle bed, *g*, by bolts *x*, substantially as described, and for the purpose set forth.

2. The combination, with the side bars, *a*, and side springs, *h*, secured thereto near their ends, and provided with ears *h' h'*, secured to the front bolster and hind-axle bed, of the braces *n*, couplings *o*, and cross-springs *p*, substantially as described, and for the purpose set forth.

3. The combination, with the side bars, *a*, and rear side springs, *h*, secured thereto by the clips *l*, and provided with the ears *h' h'*, secured to the axle-bed *g* of the hind axle by the bolts *x*, of the braces *n*, and clips *w*, provided with four prongs and straddling the hind axle, substantially as described, and for the purpose set forth.



254,665. TREAD-MOTOR. OSKAR LEINHAGEN, Gottleuba, near Dresden, Saxony, Germany. Filed Oct. 26, 1881. (No model.)

Claim.—1. In a tread-motor, the combination of the four pulleys B with the endless band A, consisting of two endless chains, *c*, to the links of which the cross-laths *a* and the ledges *b* are secured, the plates *i*, attached to the heads of the ledges *b*, the frame D, surrounding and supporting the entire machine, the guiding-wheels C, and the post E, to which the horses or cattle for draft are attached, the whole being arranged in the manner and for the purpose substantially as described.

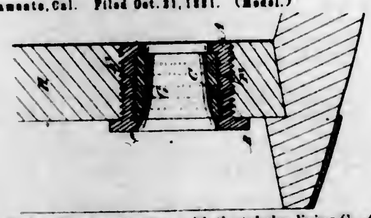
2. The ledges *b*, having small plates *f* attached to their heads as described, for the purpose specified.

254,666. BRIDLE-BIT. ELLIS LITTLE, New York, N. Y. Filed Jan. 9, 1882. (Model.)

Claim.—1. In a bridle-bit, the combination, with the mouth-piece A, of the side bars, B, provided with curved hooks F, adapted to be swung under the ends of the mouth-piece, substantially as and for the purpose set forth.

2. An improved bridle-bit having its side bars provided with split rings at their upper ends, and with curved hooks adapted to swing under the ends of the mouth-piece, substantially as and for the purpose set forth.

3. In a harness-bit, the combination, with the mouth-piece A, of the side bars, B, provided with the curved hooks F, having their free ends bent up under the ends of the mouth-piece and parallel with the said side bars, substantially as and for the purpose set forth.

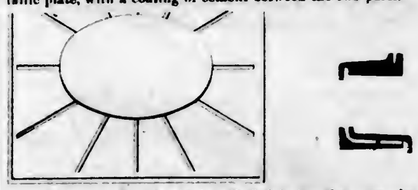


4. In a harness-bit, the combination, with the mouth-piece A, having projections G upon the rear side of its ends, of the side pieces, B, having curved hooks F, substantially as herein shown and described, whereby the check-strap and the reins will be kept in place and can be readily attached and detached, as set forth.

5. In a harness-bit, the combination, with the mouth-piece A, provided with the projections G, of the side bars, B, provided with the curved hooks F, and the journals b, longer than the thickness of the said mouth-piece, substantially as and for the purpose set forth.

6. In a harness-bit, the combination of the side bars, B, provided with the mouth-piece A, made of two parts secured together by screws, one of the said parts being provided with the projections G on its ends, substantially as and for the purpose set forth.

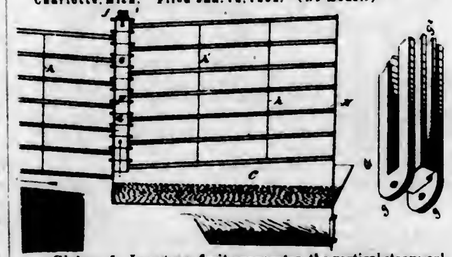
7. In a harness-bit, the combination, with the lower ends of the side bars, B, having journals M, of the cross-bar K, having eyes L, and the washers or nuts N, substantially as herein shown and described, whereby the side bars are kept parallel while being allowed to turn freely, as set forth.



254,667. BUSHING FOR BARRELS. THOMAS J. LOFTUS, Sacramento, Cal. Filed Oct. 31, 1881. (Model.)

Claim.—The combination, with the tubular lining G, of the bushing A, provided with the flange B at its outer end, and the annular recess C, beveled from the outer toward the inner end, and having a series of annular teeth projecting toward the rear end of the said bushing, whereby the lining will be retained in the bushing, substantially as shown and described.

254,668. DRIP-TRAY FOR WATER-CLOSETS. HENRY S. LOMB and ROBERT E. DAY, Hartford, Conn., assignors to the Hartford Sanitary Plumbing Company, same place. Filed Nov. 25, 1881. (No model.)



Brief.—The drip-tray is made of glass and rests upon a metallic plate, with a coating of cement between the two parts.

Claim.—1. The herein-described drip-tray for water-closets, as made from glass, constructed with the upwardly-projecting flange *a* and the downwardly-projecting flange *b*, substantially as specified.

2. A drip-tray for water-closets, consisting of the tray A, as made from glass, with the metal plate C beneath it, with a coating of cement between the glass tray and the metal plate, substantially as described.

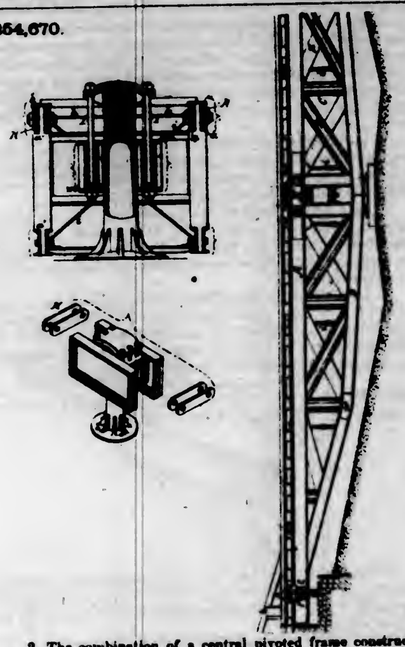
254,669. STEAM-HEAT EVAPORATOR. SETH W. LOWELL, Hume, N. Y., assignor to the Steam Heat Evaporator Company, Charlotte, Mich. Filed Jan. 16, 1882. (No model.)

Claim.—1. In a steam fruit-evaporator, the vertical steam-column F, communicating with boiler C, and consisting of the castings G, arranged one above the other, and adapted to convey the steam to the sections H, substantially as shown and described.

2. In a steam fruit-evaporator, the castings G, having horizontal flanges *g g* formed around their upper and lower edges, and provided with recessed projections g^3, extending the entire length of the castings, and adapted to convey the steam from the column F to the sections H, substantially as shown and set forth.

3. In a steam fruit-evaporator, in combination with the boiler and steam-sections, the steam-column F, formed of the separate castings G, provided with recessed projections g^3, adapted to afford means of connection with said steam-sections, substantially as shown and described.

4. In a steam fruit-evaporator, the steam-sections H, formed of the sheets A' A', each bent into the form of a rectangular pipe, A^3, having flaps A extending from them and secured to the opposite ends of the rectangular pipes A^3, substantially as shown and described.



5. In a steam fruit-evaporator, the steam-sections H, provided with partitions A^4, formed of the bent ends of the rectangular boxes, said partitions having their ends turned up and riveted to the horizontal portion of the sections, and adapted to give additional strength to the sections, substantially as shown and described.

254,670. TURN-TABLE. FRANCIS C. LOWTHORP, Chambersburg, N. J. Filed Sept. 27, 1881. (No model.)

Brief.—Each girder of the turn-table is composed of two trusses abutting end to end at the center of the table and strong links connecting said abutting ends. From a cap on the center pivot are suspended by bolts two short longitudinal beams. These support transverse vertical beams, which in turn are secured to and support the girders.

Claim.—1. The combination, in a turn-table, of two wrought-iron or steel truss-frames, the upper and lower chords of one abutting against those of the other, with links N for connecting the upper chords of both frames together, substantially as described.

254,670.

2. The combination of a central pivoted frame constructed substantially in the manner described with the two truss-frames and connecting-links.

254,671. LOG-ROLLER FOR SAW-MILLS. JOEL LUCIA, Little Suamico, Wis. Filed Apr. 6, 1881. Renewed Jan. 25, 1882. (No model.)

Claim.—1. In a log-roller, the combination of a driving-shaft and pinions with the rack-bars G and cross-heads, and the pivoted weighted levers H, provided with the spur-wheels I, substantially as shown.

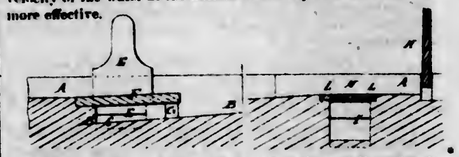
2. The combination of the driving-shaft provided with pinions, the rack-bars, cross-heads, pivoted weighted levers provided with the spur-wheels I, and the spring-catches J, substantially as described.

254,672. CARBON FOR ELECTRIC LAMPS. HIRAM S. MAXIM, Brooklyn, assignor to the United States Electric Lighting Company, New York, N. Y. Filed Apr. 25, 1881. (No specimens.)

Claim.—The process of manufacturing carbon conductors for incandescent lamps by first carbonizing at a high temperature in a flask sheets of proper material, then cutting or punching from these the conductors in any desired shape, and lastly heating the said conductors in a carbonaceous gas or vapor, substantially as set forth and described.

254,673. UNITING AND SEPARATING FROG. HOSTUS McDONALD, Nashville, Tenn. Filed Nov. 16, 1881. (No model.)

Brief.—Broad and narrow gage cars are directed to and from their respective lines onto a "compromise gage" on a hoist, so their tracks will be centered on a common line, through guards and a point which directs the cars from the two gages onto a three-railed track, from whence they are directed into the compromise gage at the point end of the inner rail of said three-railed line by a contraction in the outer rails next said point and guard-rails arranged opposite said contraction and extending through the length of said compromise line or gage.

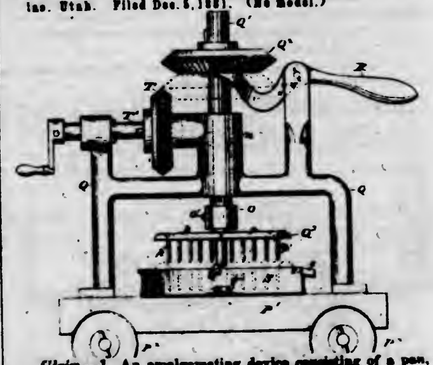


Claim.—1. An automatically-acting switch for joining standard and broad gage cars upon a compromise track and to separate the same upon their respective tracks, consisting of the rails C C C, the point *y* of the rail B, guards *b* and *x*, point-rails *v z*, and the hoist guard-rails F F, all arranged to operate substantially as shown and described.

2. The guard-rails F F of the hoist, in combination with the point-rails *v* and *z*, and the rails C C C, substantially as and for the purposes set forth.

254,674. IRRIGATING-DITCH. DENNIS D. MCILVOY, Golden, Colo. Filed Nov. 19, 1881. (No model.)

Brief.—At intervals in an irrigating-ditch A are formed traps I and depressions B, having side exits to collect the sediment from the water and prevent it settling on the arable land. The depression B has a contracted passage formed by plate F, to increase the velocity of the water at the bottom of the depression and make it more effective.

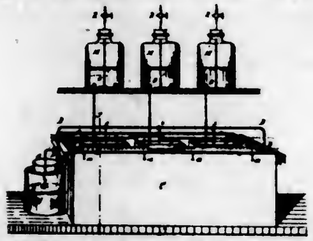


Claim.—1. An irrigating-ditch made, substantially as herein shown and described, with a depression, B, in its bottom and a discharge-opening, C, closed by a gate, E, at the side of the said depression, whereby the ditch can be cleared of sediment by the action of the water passing through the said ditch and the sediment kept from being spread over the land, as set forth.

2. In an irrigating-ditch, the combination, with the ditch A, and the depression B, having side discharge-opening, C, of the plate F, substantially as herein shown and described, whereby the action of the outflowing water is made more effective in clearing the said depression of sediment, as set forth.

3. In an irrigating-ditch, the combination, with the ditch A, of the well-hole I, having side opening, J, and covered with a slotted plate, L, substantially as herein shown and described, whereby the heavier sediment is drawn out and is thus kept from passing down the ditch, as set forth.

254,675. AMALGAMATOR. ANDUS MCKELLAR, Fort Douglas, Utah. Filed Dec. 5, 1881. (No model.)



Claim.—1. An amalgamating device consisting of a pan, a frame-work carrying a horizontal shaft, with rigid vertical gear-

wheel T, and adjustable vertical shaft O, with a rake at its lower end and single gear-wheel Q^2 at the top, resting above the wheel T, and means, substantially as described, for simultaneously raising the rake and disconnecting the gears by one and the same movement, as set forth.

2. The combination of the platform P', the detachable pan S, frame Q, horizontal shaft T', with rigid vertical gear-wheel T, vertically-adjustable shaft O, with rake Q^2 at its lower end and a gear-wheel, Q^2, at the top, resting above gear-wheel T, and the lever R, fulcrumed on a standard from the frame Q, and having its end arranged beneath the wheel Q^2, for simultaneously disconnecting the gears and raising the rake, substantially as shown and described.

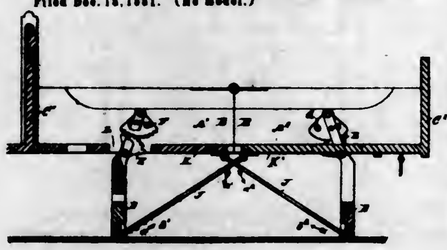
254,676. GALVANIC BATTERY. ALFRED MICHAUD, Paris, France. Filed Sept. 8, 1881. (No model.) Patented in France Apr. 19, 1880, and July 11, 1881, and in England Aug. 26, 1881.

Claim.—1. In a galvanic vat, the combination, with the vat C and the porous vessels P, of the bar B, the metallic plates D, the wooden blocks *n*, and the hooks *s*, substantially as shown and described, whereby the zinc plates are suspended in the said porous vessels, as set forth.

2. In a galvanic vat, the combination, with the flasks M and the porous vessels P, of the siphons *t*, provided with the india-rubber pipe *a'*, having a glass tube on its inner end, substantially as and for the purpose set forth.

3. In a galvanic vat, the combination, with the vat C, provided with the overflow-pipe G, the flasks M, and the porous vessels P, of siphons *t*, provided with india-rubber pipes *a'*, having glass tubes on their inner ends, substantially as and for the purpose set forth.

254,677. HAMMOCK OR BED. CHARLES HOGER, Lowell, Mass., assignor of one-half to John Sherey, same place. Filed Dec. 10, 1881. (No model.)



Claim.—1. The combination of the slats A A', provided with holes C, and the ropes B, crossing each other in said holes and between said slats, as and for the purpose specified.

2. The combination of slats A A', flexibly connected together, and the spiral springs D, as and for the purpose specified.

3. The combination of the spiral spring D and the elastic covering E, as and for the purpose specified.

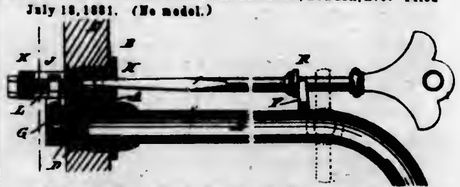
4. The combination of the spiral spring D and the rubber covering E, as and for the purpose specified.

254,678. FOLDING BED. CHARLES H. MORRISON, New York, N. Y., assignor to himself and RHEA H. NORTON, Chicago, Ill. Filed Dec. 16, 1881. (No model.)

Claim.—1. In a folding bedstead, the combination, with the hinged sections A' A^3, of the bars H, pivoted to the upper ends of the legs D and to the inner surfaces of the rails B, the segmental racks E, attached to the upper ends of the legs D and engaging with the racks F, attached to the inner sides of the rails B, substantially as herein shown and described, and for the purpose set forth.

2. In a folding bedstead, the combination, with the hinged sections A' A^3, of the legs D, the pivoted bars H, the segmental racks E and F, and the covering-plates G, substantially as herein shown and described, and for the purpose set forth.

3. In a folding bedstead, the combination, with the hinged sections A' A^3, of the bottoms K K', provided with slots or recesses L, the pivoted bars H, the segmental racks E and F, and the legs D, substantially as herein shown and described, and for the purpose set forth.



4. In a folding bedstead, the combination, with the hinged sections A' A^3, of the legs D, the pivoted bars H, the segmental racks E and F, and the braces J, attached to the inner ends of the sections A' A^3 and to the lower ends of the legs D, substantially as herein shown and described, and for the purpose set forth.

254,679. FOLDING PACKING-BOX. ALONZO P. HASH, Weymouth, Mass. Filed Jan. 23, 1882. (Model.)

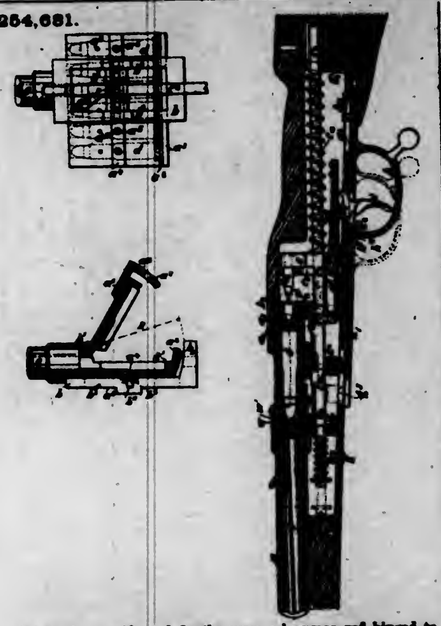
Claim.—The herein-described folding packing-box, consisting essentially of the creased sides *a a a a* and hinged ends B B, having lips B' B' and inwardly-projecting parts B'' B'', as and for the purpose set forth.

254,680. FAUCET. GUSTAV A. HAUHARD, Newark, N. J. Filed July 18, 1881. (No model.)

Claim.—1. In a faucet, the combination, with the valve G and screw L, of the apertured plug A, provided with the guide-bars J, united at their outer ends by the cross-piece K, substantially as and for the purpose set forth.

2. In a faucet, the combination, with the apertured plug A, provided with the guide-bars J, of the valve G, the screw L, having an aperture in its head, and the key P, substantially as and for the purpose set forth.

3. In a faucet, the combination, with the apertured plug A, of the valve G on the inner side of the same, the screw L, with a head, N, having an aperture, O, the guide-bars J, the key P, and the tube E, substantially as herein shown and described, and for the purpose set forth.



4. In a faucet, the combination, with the apertured plug A, of the valve G on the inner side of the same, the screw L, with a head, N, having an aperture, O, the key P, having a shoulder, R, and the tube E, having a recessed projection, F, substantially as herein shown and described, and for the purpose set forth.

254,681. BREECH-LOADING FIRE-ARM. JOSEF NAGUSY, Vienna, Austria-Hungary. Filed Aug. 26, 1881. (No model.) Patented in Italy July 30, 1881, in Belgium Aug. 10, 1881, in Sweden Oct. 3, 1881, in France Oct. 28, 1881, in Austria Nov. 10, 1881, and in Hungary Nov. 18, 1881.

Claim.—1. In a magazine fire-arm, the combination, with the barrel, a laterally-movable cartridge-magazine, a hammer provided with a firing-pin, a guide-rod for the same, and a hammer-rod hinged to said firing-pin, of a sliding trigger-guard, and means, substantially as set forth, whereby a lateral movement is imparted to the magazine, and the firing-pin, through the medium of its hammer-rod, is locked into position for firing by the operation of the trigger-guard, substantially as and for the purpose specified.

2. In a magazine fire-arm, the combination, with the barrel, a laterally-movable cartridge-magazine, a hammer provided with

254,681.

a firing-pin, a guide-rod for the same, a hammer-rod hinged to said firing-pin, a sliding trigger-guard, and means, substantially as set forth, whereby a lateral movement is imparted to the magazine, and the firing-pin, through the medium of its hammer-rod, is locked into position for firing, of the trigger and the actuating-spring c^{10}, substantially as and for the purpose specified.

3. The magazine herein before described, composed of the parts *a*, carrying the hinged locking-plate a^2, and having a dovetailed projection, a^3, and guide-pins a^4, and the part a', hinged to part *a*, and having the locking-plate a^5, said parts *a* a' being constructed to form chambers for the reception of a series of cartridges, substantially as described.

4. In a magazine fire-arm, a hammer or firing-pin, a hammer-rod to which said hammer is hinged, and a sliding trigger-guard, in combination with a guide-rod upon which said firing-pin is mounted, the parts being arranged to move together in one direction, while the hammer and its rod are capable of independent motion in a reverse direction, substantially as and for the purpose specified.

5. The combination, with the magazine *a* a', constructed as set forth, of its casing or inclosing-frame *b*, provided with a dovetailed groove, b^2, and a prism-shaped slot, (in cross-section,) b^3, formed in the bottom of said groove b^2, for the reception of the dovetailed projection a^3, and the guide-pins a^4 of the magazine, substantially as described, for the purpose specified.

6. The inclosing case or frame *b*, composed of two side pieces, b^1, united in front by a screw-threaded tubular head for the reception of the barrel *c*, said head having a rearwardly-projecting ledge or flange, b^7, and in rear by a breech-block, b^4, perforated for the passage of the firing-pin, the cross-bar b^5, provided with a dovetailed groove, b^6, and a prism-shaped slot, (in cross-section,) b^3, formed in the bottom of said groove b^6, substantially as described, for the purpose specified.

7. The hammer *e*, provided with guide-cheeks e^2 and a firing-pin, e', a sliding trigger-guard, and mechanism to retract the hammer into position for firing, in combination with the guide-rod c^2, upon which said hammer slides, an actuating-spring, c^{10}, to throw the hammer and firing-pin forward, after being retracted into position for firing, through the medium of said trigger-guard by pressure upon the trigger, substantially as described.

8. The combination, with the hammer, its guide-rod c^2, its actuating-spring c^{10}, the hammer-rod e^3, hinged to the hammer, as described, and having the stop e^4, the spring e^5, and the plate or strap *g*, having stop g^2, of the trigger *l*, substantially as described, for the purpose specified.

9. The combination, with the hammer, its guide-rod c^2, carrying the plate c^3 and the actuating-spring c^{10}, the hammer-rod e^3, hinged to the hammer, as described, and having the stop e^4, the spring e^5, and the plate or strap *g*, having stop g^2, of the trigger-guard and plate *h h'*, all arranged and operating substantially as and for the purpose specified.

10. The combination, with the guide-rod c^2, the hammer *e*, mounted upon said rod, and mechanism to retract the rod and hammer into position for firing and lock said hammer into such position, of the spring c^{10}, to move the rod c^2 forward independently of the hammer, substantially as and for the purpose specified.

11. The combination, with the plate *g*, having recess g^3, of the guide-rod c^2, its spring c^{10}, the trigger-guard plate h', carrying a spring, h^2, provided with a lug or pin adapted to engage the recess g^3, and the trigger *l*, having the nose P, adapted to engage the free end of the spring to release the lug from the recess, substantially as described, for the purpose specified.

12. The combination of the breech-block b^4, the magazine-casing, the magazine, the guide-rod c^2, carrying the plate c^3, the hammer *e*, and actuating-spring c^{10}, the hammer-rod e^3, having stops e^4, and the strap *g*, having stop g^2, with the trigger-guard plate *h* and the spring c^{10}, all arranged and operating substantially as and for the purpose specified.

13. The combination of the hammer guide-rod c^2 and the safety-plate c^3, carrying the pins c^4, with the breech-block b^4 and the outer locking-plate, a^5, of the magazine, both the breech-block and plate being perforated for the passage of said pins c^4 and the firing-pin, substantially as and for the purpose specified.

14. The combination, with the outer plate, a^5, of the magazine, provided with a recess, a^6, and the breech-block b^4, of the pin *i* and spring i^2, substantially as and for the purpose specified.

15. The combination of the breech-block b^4, the plate a^5 of the magazine, and pin *i*, having an arm, i^3, and the spring i^2, with the guide-rod c^2, having the abutment c^{10}, all arranged and operating substantially as and for the purpose specified.

16. The combination, with the outer locking-plate, a^5, of the magazine, the breech-block b^4, and the hammer and its firing-pin *e*, of the rod c^2, its safety-plate c^3, and the springs c^{10} c^{11}, all arranged and operating substantially as and for the purpose specified.

17. The combination, with the magazine carrying-pins c^4 and its casing or frame, of the guide-rod c^2, its actuating-plate c^{10}, and the trigger guard and plate *h h'*, all arranged and operating substantially as and for the purpose specified.

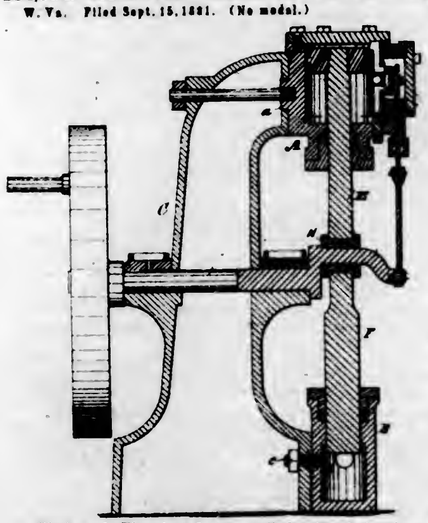
254,682. CORN-HUSKING IMPLEMENT. JASON HIXON, Winfield, Kans. Filed Jan. 17, 1882. (No model.)

Claim.—1. In a corn-husking implement, a shank bent to form a hook for its attachment to the hand, and provided with a spirally-twisted husking-pin so arranged in relation to the shank that its cutting-edge will be presented in a line with the grain of the husk, in combination with an auxiliary hook adapted to receive the second finger of the hand, substantially as set forth.

2. In a corn-husking implement, a shank bent to form a hook, and provided with a spirally-twisted husking-pin whose point is bent outwardly, in combination with an adjustable hook secured to said shank, substantially as set forth.

3. In a corn-husking implement, the combination, with the shank A, provided with the spirally-twisted pin B, of the slotted and hooked strip C, the screw D, and guiding-stud *d*, substantially as set forth.

254,683. HAME-TUG. ISAAC W. HUMAN, Canton, Ohio. Filed Dec. 31, 1881. (No model.)



Claim.—1. The combination, with the hames and the hame-tug, of a frame adapted to receive the end of the tug, a screw-rod

for adjusting the tug, and devices, substantially such as set forth, for engaging said rod with the tug and the frame.

2. The combination, with the tug and the hame, of the frame A B C, the screw-rod mounted therein, the thumb-wheel engaging therewith, and the nut attached to the tug, substantially as set forth.

3. The combination, with the hame and the tug, of the metal frame A B, carrying the tug and provided with a screw-threaded socket, and the eyebolt I, having the bolt portion divided, substantially as set forth.

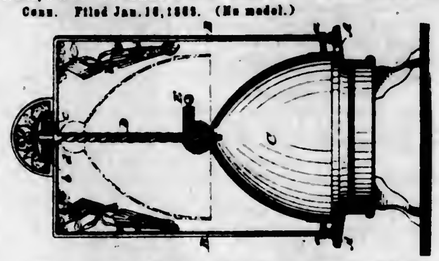
254,684. STEAM-PUMP. CAMPBELL H. OSBORN, Clarksburg, W. Va. Filed Sept. 15, 1881. (No model.)

Claim.—1. The pivoted steam-cylinder A and the pivoted pump-cylinder B, in combination with the rigidly-joined piston-rod E and plunger-rod F, as and for the purposes set forth.

2. The rigidly-joined rods E and F, in combination with the cross-head H and the pivoted or swiveled cylinders A and B, substantially as and for the purposes set forth.

254,685. NUT-LOCK. WILLIAM H. PAIGE, Springfield, Mass. Filed Nov. 14, 1881. (No model.)

Claim.—1. The nut A, comprehending the narrow flange or fillet 1, made on one of its faces and provided with transverse openings, as 2, the interior of said flange or fillet being made on the same plane as the bore of the nut and its exterior made smooth and inclined or beveled with reference to its interior, substantially as and for the purpose described.

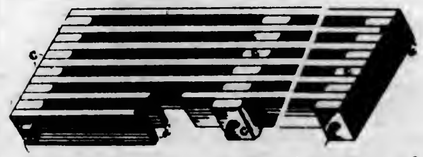


2. In an improved lock-nut, a sectional fillet made on one of its faces, with openings, as 2, between the sections, with the inner side of the sections on the same plane with the bore of the nut, and the exterior side of each section inclined to the interior side, and with one end of each section made thicker than the adjacent end of the next section, substantially as described.

254,686. STRAW-CONVEYER BELT. ALTON J. PAGE, Jr., Virginia, Ills. Filed July 19, 1881. (No model.)

Claim.—The combination, with a straw-conveyer belt, of cross-slats, metallic end sockets or caps for said slats, and the metallic fastening passing through the edges of the belt, as shown and described, whereby the edges of the belt will be held so closely to the end and sides of the caps as to prevent the straw from catching between the caps or sockets and the belt.

254,687. COVERED DISH. EDMUND A. PARKER, Meriden, Conn. Filed Jan. 16, 1882. (No model.)

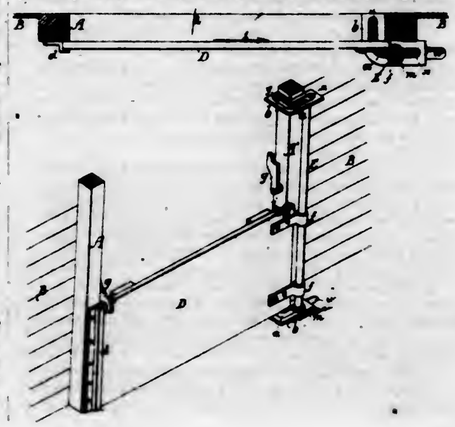


Claim.—1. The dish A, provided with a cover-support, B, and lifting cover C, in combination with means for automatically lifting and holding the cover, as hereinbefore set forth.

2. The dish A, provided with cover-support B, and means, substantially as described, for raising and holding the cover, in combination with a latch or locking-bolt, E, substantially as and for the purpose set forth.

3. The cover C, connected with the frame B by guide-arms *a a*, in combination with a coil-spring, *c*, having a hub, *d*, and a rotary quick-screw shaft, D, adapted to travel in a female thread in the apex of the cover, whereby the latter is raised, substantially as described.

254,688. GRATE AND GRATE-BAR. ALLEN R. PARKISON, Monongahela City, Pa. Filed Dec. 30, 1881. (No model.)



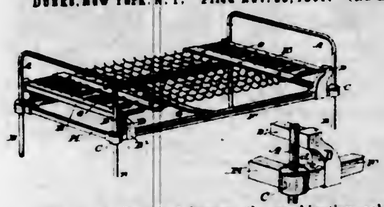
Claim.—1. The steel or wrought-metal grate-bar herein described, of the shape set forth, and cut without waste from a straight-rolled strip of steel or wrought metal.

2. The combination of the grate-bars formed, as set forth, of sections of straight-rolled steel or wrought metal, spacing-washers which are flush with the upper and lower faces of the bars and brace them their entire width, and the securing-bolts, substantially as and for the purpose set forth.

254,689. GRAIN-CAR DOOR. ALBERT E. PEPPER, Philadelphia, Pa. Filed Nov. 21, 1881. (No model.)

Brief.—The inner end of the door is secured by straps, so as to swing or slide on a vertical rod. The ends of the rod move in curved slotted plates, so as to permit the front edge of the door to be withdrawn from a retaining-plate and swung outward. Pivoted catches on the door-posts engage notched plates in the upper edge of the door. The slot, into which the lower end of the rod projects, is provided with an inclined outlet for the escape of grain.

Claim.—1. The combination of the door D and its pivot-rod E with the plates *b*, having curved or angular slots *a*, to which the ends of said pivot-rod are adapted, and in which they can slide, as set forth.



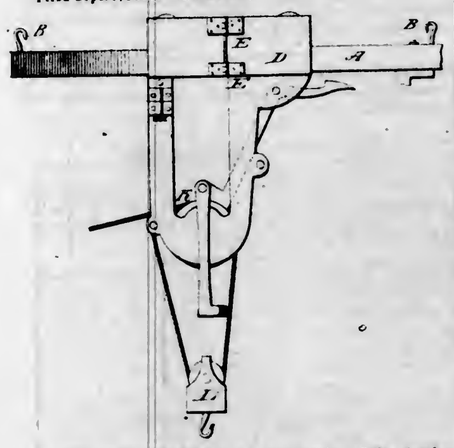
2. The combination of the door D, the plates *b*, having curved or angular slots *a*, and the pivot-rod E, on which the door is free to slide vertically, as set forth.

3. The combination of the door D, having a notched plate, *i*, with a pivoted retaining-catch adapted to said notched plate, as described, whereby the door is retained in position both vertically and longitudinally, as specified.

4. The combination of the door D, the pivot-rod E, the plates *b*, with curved or angular slots *a*, and the retaining-plate *d*, as set forth.

5. The combination of the pivot-rod E of the door, the lower slotted plate, *b*, and the floor of the car, having an inclined passage, *x*, at the end of the plate, as set forth.

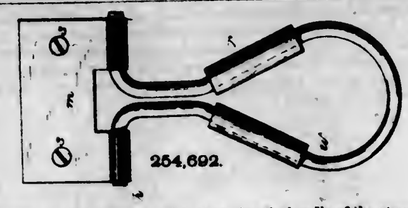
254,690. BEDSTEAD. WILLIAM R. PITT and CHARLES H. DUNKS, New York, N. Y. Filed Nov. 23, 1881. (No model.)



Claim.—1. In a bed-bottom, the combination, substantially as herein set forth, with the side rails and the end rails, of the metallic corner-pieces, constituting a frame adapted to support a flexible fabric, each corner-piece being provided with one member of a detachable socket-fastening device, adapted to be connected with and rest upon a corresponding member of a socket-fastening device of an iron bedstead, substantially as set forth.

2. In a bedstead, the combination, with the posts, of the socket-pieces C, having the end bars, H, permanently attached thereto, the corner-pieces D, detachably connected with the socket-pieces, the end rails, E, and side rails, F, substantially as described.

3. In a bed-bottom, the herein-described cast-metal corner-piece D, supporting one end of an end rail and one end of a side rail, and provided with one member of a detachable socket-fastening device, substantially as set forth.



254,691. HAY-CARRIER. JOSEPH E. PORTER, Ottawa, Ill. Filed Sept. 5, 1881. (No model.)

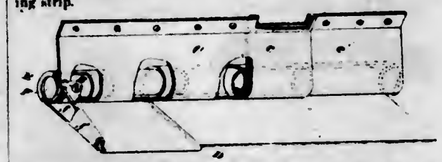
Claim.—The combination, in a hay-carrier, of the circular way A, having hooks B B, with the frame D, hinged at E in such a manner as and for the purpose described.

254,692. BROOM-HANGER. JOSEPH RATH, Columbus, Ohio. Filed July 30, 1881. (Model.)

Claim.—The broom-holder herein described, consisting of the combination of a metal hinge, *m*, having a flat back, provided with eyes formed on the side opposite to the wall, with the wire loop *w*, having an oval-shaped opening to receive the handle of the utensil to be suspended, and bent outwardly, as shown, and also having ears *h h*, which enter the eyes of the said metal hinge, substantially as set forth.

254,692.

254,693. FROG OR BLOCK FOR RAILWAY-CROSSINGS. JAS. RUSH, Cochran, Ind. Filed Sept. 24, 1881. (No model.)



Brief.—The blocks have sockets to receive the ends of the track-rails, and are grooved across their length for the passage of wheel-flanges, said grooves having flaring entrances.

Claim.—A railway frog or block the same height and flush with the rails to be connected, formed with sockets S, fitting the vertical sides, and adapted to receive the ends of the rails which rest on the sleepers, and having grooves or channels C, extending the whole length of the block and terminating in downwardly and laterally flaring openings or entrances C′ and *c*′, as set forth.

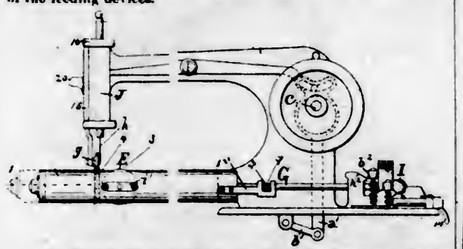
254,694. DOOR-STRIP. CLARENCE E. RICE, Sedgwick, Kans. Filed May 25, 1881. (No model.)

Brief.—An extensible metallic swinging strip is hinged to a fixed metallic extensible piece on the door by their adjacent rolled edges overlapping. A spring actuating the hinged strip is secured to a plug fastened in the tubular portion of the hinged strip at one end and has its outer end secured by a lip on the end of the swinging strip.

Claim.—1. In combination with a door-strip consisting of members C D, extensible in length, as described, and cam G, the spring F, having an arm, *f*, whose end is inclosed by a lip, *f*′, of the member D, the spiral part of said spring surrounding the plug E, to which its other end is secured, and which is itself inclosed by the tubular-formed edge of the member D, and held securely from turning by a screw, *e*, attaching it to the member C, all substantially as described.

2. The plug E and spring F, having arm *f*, the former connected to the member C of the door-strip, and the latter surrounding and secured to the former and operating to raise the free edge of the member D, as and for the purpose set forth.

3. The combination of the member C, having the plug E, with the member D, hinged to the member C, spring S, supported on the plug E, and having its ends bearing respectively on the two strips, and a cam, G.



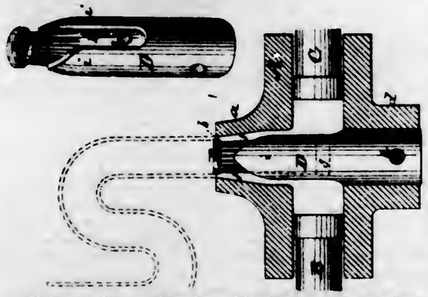
254,695. PRESERVING FORAGE BY STORAGE IN SILOS. CHARLES H. ROBERTS, Lloyd, N. Y. Filed Jan. 27, 1882. (No specimens.)

Claim.—The method, substantially as herein shown and described, of preserving dry or partly-dried cornstalks for forage, consisting in wetting the stalks with water or steam before or after they are placed in the silo and compressing and packing them in the silo in this wet or moistened state, as set forth.

254,696. SEWING-MACHINE. WILLIAM ROBERTS, Baltimore, Md. Filed Aug. 31, 1881. (Model.)

Brief.—Upon a cylindrical work-supporting arm are mounted two rotary feed devices arranged at right angles to each other and

adapted to be moved longitudinally upon said arm, so that either may be brought into working position for the purpose of feeding the goods being sewed either around said arm or longitudinally thereof, at the pleasure of the operator. The roller-presser is adapted to be placed in such positions as properly to co-operate with either of the feeding devices.



Claim.—1. In a sewing-machine, the combination, substantially as set forth, of a needle-bar and two rotary feed devices movable with respect to the needle-bar, one of said feed devices being arranged to rotate in a plane at a right angle to the plane in which the other rotates.

2. In a sewing-machine, the combination, substantially as set forth, of a needle-bar, a cylinder adapted to have a sliding movement and provided with a feed device, and a cylinder adapted to have both a sliding and a rotary movement and provided with a feed device.

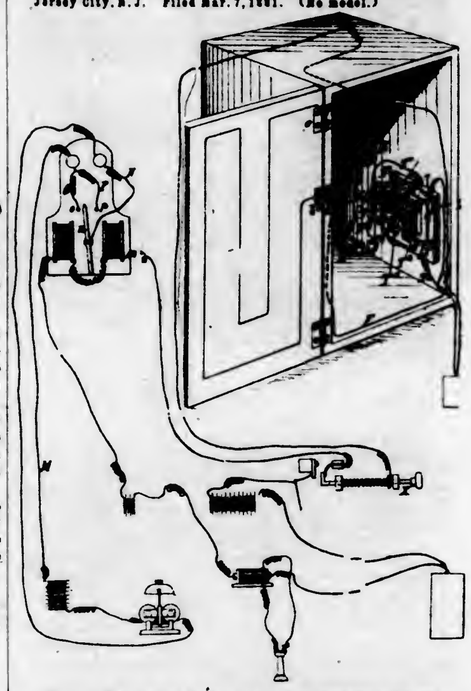
3. In a sewing-machine, the combination, substantially as set forth, of a needle-bar, a stationary arm, two movable cylinders mounted upon the arm, each cylinder carrying a rotary feed device, and two needle-holes so placed in the cylinders that one hole will be used in connection with each rotary feed device.

4. The combination, substantially as set forth, of a head, a needle-bar to play vertically through the head, a presser movably secured to and capable of moving partly around the head, and two rotary feed devices, each of which rotates in a plane at right angle with respect to the plane of the other.

254,697. MACHINE FOR MAKING LEAD TRAPS. JOHN ROBARTSON, Brooklyn, N. Y., assignor to E. W. Blatchford & Co., Chicago, Ill. Filed Aug. 29, 1881. (Model.)

Claim.—1. In a machine for making lead traps, the combination of the cylinder A, containing two plungers, B C, with the perforated or reduced core D and outlet-nozzle *a*, all constructed to leave a passage in line with the plungers from one end of the cylinder to the other, past or through the core, so that when one plunger is moved the lead will be ejected from the cylinder on both sides of the core, substantially as specified.

2. In combination with the cylinder A, having two plungers, B C, the core D, having aperture *g*, substantially as specified.



3. In combination with the cylinder A, having two plungers, B C, the core D, having aperture *g* and staying-ribs *i i*, substantially as specified.

254,698. BOILER-CLEANER. ARTHUR ROGERS, Barnesville, Ohio. Filed Jan. 4, 1882. (No model.)

Claim.—The combination, within the shell of a steam-boiler, of the imperforated pipe C, one or more perforated pipes running parallel thereto and communicating therewith, a blow-off pipe, and a cock applied to this pipe, substantially as described.

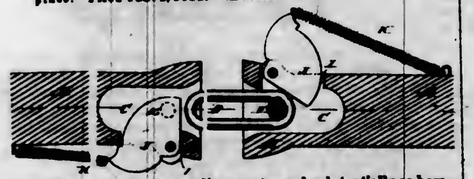
254,699. ELECTRIC BURGLAR-ALARM. HENRY C. ROGERS, Jersey City, N. J. Filed Mar. 7, 1881. (No model.)

Claim.—In an electric burglar-alarm, a telephonic transmitter connected with the electric circuit at the structure to be guarded, a device for giving audible sounds located at the structure to be guarded, and a telephonic receiver in the station or office where watch is kept, substantially as specified.

254,700. PRINTER'S GALLEY. ELIJAH E. RUDOLPH and JOSEPH A. L. WOLFE, McKinney, Tex. Filed Aug. 19, 1881. (No model.)

Claim.—In a printer's galley, the bed-plate A, rails B, C, and D, spring-clip G, and guides *e e'*, in combination with the adjustable rail E, having studs *a a'* and pin A, and the springs F, substantially as and for the purpose set forth.

254,701. LIGHTING APPARATUS FOR LAMPS, &c. STEBBINS RUSSELL, Waterbury, Conn., assignor to the Scovill Manufacturing Company, same place. Filed Aug. 24, 1881. (No model.)



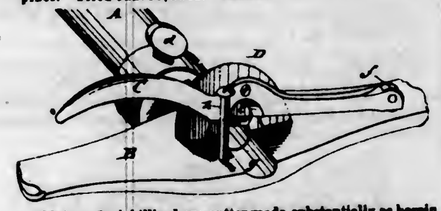
Claim.—1. The combination, with a lamp, lantern, or like device having an opening in its air-distributor or draft-plate, of a lighting apparatus having a case comprising a body and a conduit made in one integral structure with the body, and projecting therefrom, so as to be adapted to be inserted through the said opening, and means for detachably connecting the body of said case to said air-distributor or draft-plate, substantially as specified.

2. The combination, with the air-distributor or draft-plate of a lamp, lantern, or like device, of the case F, base J, and pin H, substantially as and for the purpose specified.

3. In a lighting apparatus for a lamp, lantern, or like device, a pivoted scratching igniting device, substantially as and for the purpose specified.

4. The combination, with the conduit of the case F, of the igniting device K, bearings therefor in which it may be turned, and a catch, *c*, substantially as and for the purpose specified.

254,702. CAR-COUPLING. THOMAS C. RYAN, Fort Collins, Colo., assignor to himself and William Lindenmeier, same place. Filed Jan. 4, 1882. (Model.)



Claim.—1. A car-coupling constructed substantially as herein shown and described, and consisting of the bumper-heads A, having side apertures, I, the pivoted plates J and their springs K, the spring-pressed levers F, carrying the coupling-pins E, and the link D, as set forth.

2. In a car-coupling, the combination, with the bumper-head A, provided with the side aperture, I, of the triangular plate J, having its rear edge curved on the arc of a circle and pivoted at its angle at the forward end of the said aperture, and the spiral spring K, attached to the outer angle of the said plate and to the draw-head, substantially as and for the purpose set forth.

3. In a car-coupling, the combination, with the bumper-head A, provided with the stud G, and the coupling-pin E, of the lever F, the spiral spring H, and the button B, substantially as and for the purpose set forth.

254,703. BILLIARD-CUE CUTTER. PATRICK RYAN, New York, N. Y., assignor to the J. M. Brunswick & Blake Company, same place. Filed Jan. 16, 1882. (Model.)

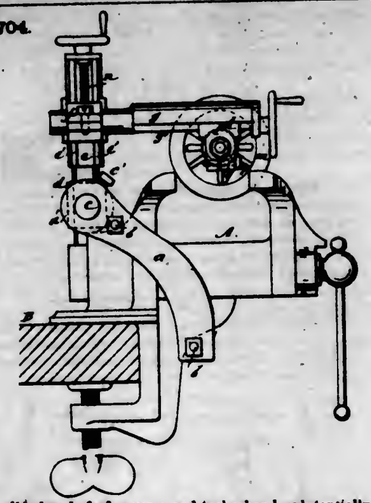
Claim.—1. A billiard-cue cutter made substantially as herein shown and described, and consisting of a cue-receiving sleeve or shell on the end of which is swiveled a stock that carries a hinged knife for dressing the cue, as set forth.

2. The billiard-cue cutter made, substantially as herein shown and described, with a clamping attachment, whereby the cue may clamped and held from longitudinal movement with respect to the blade during the cutting, substantially as set forth.

3. In a billiard-cue cutter, the sleeve A, provided with the screw *d*, substantially as and for the purposes set forth.

4. The combination, with the stock B, of the sleeve A, handle C, and the hub D, the handle carrying the blade *e* and the sleeve the screw *d*, substantially as and for the purposes set forth.

5. The sleeve A, provided with the screw *d* and formed with the flange *h*, in combination with the stock formed with the depressions *a' g* and channel *c'*, the hub D, formed with the cut-away place *a* and channel *c*, the handle C, and the stop *h*, the handle carrying the blade *e*, substantially as and for the purposes set forth.



254,704. MILLING ATTACHMENT FOR VISES. EDWARD E. SCHRAMMBERGER, New York, N. Y. Filed Nov. 16, 1881. (No model.)

Claim.—1. The milling attachment consisting of clamping-bars *a*, shaft *c*, having clamping-box *d*, post *e*, slide *f*, arm *g*, box *h*, and tool-arbor *k*, substantially as shown and described, combined for operation as set forth.

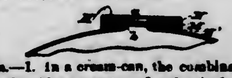
2. In milling attachments, the combination of post *e*, adjustable box *f*, arm *g*, and adjustable box *h*, carrying the tool-arbor, substantially as shown and described.

3. In milling attachments, the combination of adjustable

254,704.

arm *g*, slide-box *h*, feed-screw *o*, and tool-arbor *k*, substantially as shown and described.

4. In milling attachments, the combination of adjustable box *h*, screw-sleeve *i*, and tool-arbor *k*, substantially as shown and described.

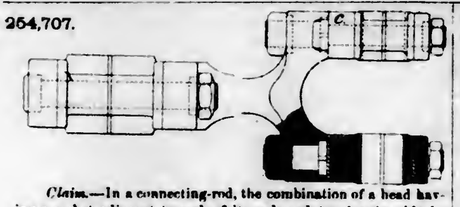


5. In milling attachments, the clamping-box *h* and screw *r*, combined with the screw-sleeve *i* and tool-arbor *k*, substantially as and for the purposes set forth.

254,705. SHIRT-BOSOM. ISAAC SCHNURR, New York, N. Y. Filed Dec. 26, 1881. (No model.)

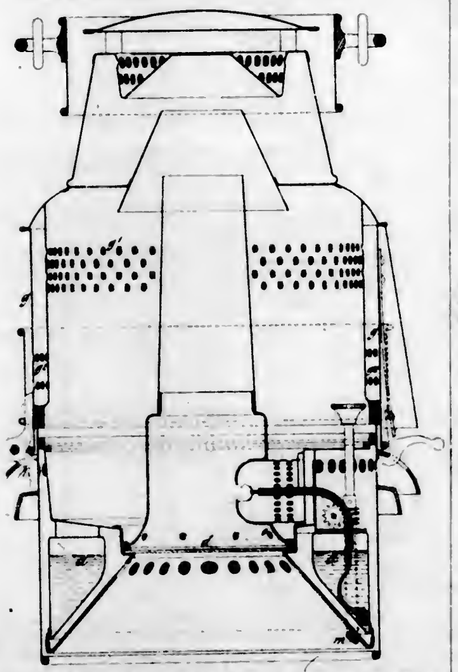
Claim.—The combination, with a shirt having a forward fold, *d*, of a three-part bosom having a back, *c*, projected beyond the parts *a b*, passed around the fold *d*, and secured to it by stitches 2, the parts *b c* being embraced within said fold and all the parts bound together by the stitches 3, as shown and described.

254,706. CREAM-CAN. HORACE B. SCOVILLE, Cortland, Ohio. Filed Nov. 26, 1881. (No model.)



Claim.—1. In a cream-can, the combination, with the body A, having the oblong aperture *d* and raised edges *b*, of the gage H, having the aperture I, with depressed edges *e*, forming a chamber, L, and the glass plate M, cemented within the gage H, substantially in the manner as and for the object stated.

2. In a cream-can, a gage consisting of a plate of sheet metal having the four wings *b*, *b'*, *i*, and *i'*, oblong aperture I, with depressed edges *e*, and the scale-marks K, the whole being adapted for attachment to the body A, to operate in conjunction with a transparent plate, M, substantially as and for the object mentioned.

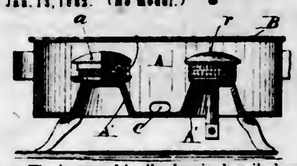


254,707. CONNECTING-ROD. HORACE ROE, Philadelphia, Pa., assignor of one-half to the William Cramp & Sons Ship and Engine Building Company, same place. Filed Jan. 26, 1882. (No model.)

254,707.

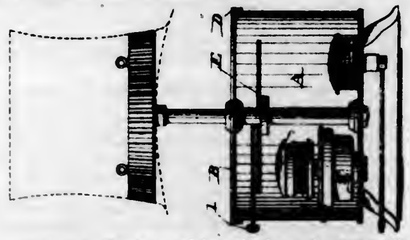
Claim.—In a connecting-rod, the combination of a head having a socket adjacent to each of its ends and two bearing blocks or sections, each abutting against the head, and having a central threaded stem fitting one of the sockets thereof and secured thereto by a nut, and being bored out on each side of the stem for the reception of a cap-bolt, substantially as set forth.

254,708. LAMP FOR LIGHTING RAILWAY-CARRIAGES. JOHN F. SHALLIS and THOMAS C. J. THOMAS, Minories, London, England. Filed Nov. 28, 1881. (No model.) Patented in England Aug. 16, 1881.



Claim.—1. In a lamp or lighting apparatus wherein oil or spirit is consumed, the combination of a combustion-chamber, a burner or burners projecting through and into the same horizontally or angularly, a metal chimney, a flat transparent diaphragm closing the bottom of the said combustion-chamber, a reflecting-chamber arranged below the combustion-chamber, and a reservoir or receptacle for combustible liquid, substantially as described.

2. In a lamp or lighting apparatus wherein oil or spirit is consumed, the combination of a combustion-chamber having holes to admit air, one or more burners projecting into such chamber horizontally or angularly, a metal chimney, a transparent diaphragm closing the bottom of the said combustion-chamber, a reflecting-chamber arranged below the combustion-chamber and perforated to admit air thereto, and a reservoir or receptacle for combustible liquid surrounding, or partly surrounding, the said reflecting-chamber and in communication with the burner or burners, substantially as described.

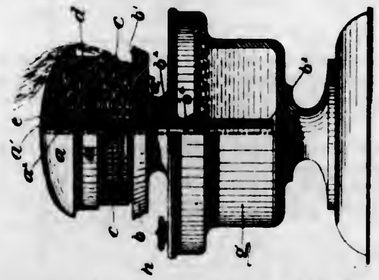


3. In a lamp or lighting apparatus, the combination of a combustion-chamber having holes to admit air, a burner or burners projecting into such chamber, a metal chimney, a flat transparent diaphragm closing the bottom of the said combustion-chamber, a reflecting-chamber below the same, a reservoir or receptacle for combustible liquid to supply the burner or burners, and a case or cover arranged to afford efficient ventilation and to keep the above-named reservoir or receptacle cool, and to carry off the vapor of any spirit [illegible] may escape or be spilled, all substantially as hereinbefore described and shown.

254,709. BROILER. MERRAY M. SHELDON, Pawtucket, R. I. Filed Jan. 13, 1882. (No model.)

Claim.—The improved broiler herein described, consisting of the dish A, its bottom provided with the truncated cones A' and spout C, the gridiron B, and vapor-retort or gas-burners *s* and *r*, the whole arranged as and for the purpose specified.

254,710. HAT-BRIM HEATER. HENRY H. SHELDON, Pawtucket, R. I. Filed Jan. 13, 1882. (No model.)



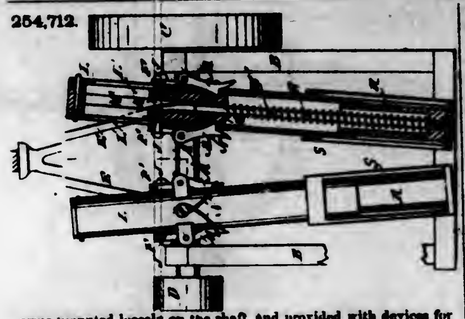
Claim.—1. The improved hat-brim heater herein described, consisting of the stove A, heated with vapor-retort or gas burners, deflector E, size-gage F, and support G, constructed and arranged as and for the purpose specified.

2. In combination with a hat-brim heater, the gage F, provided with one or more size-rings, F' F", substantially as shown and described.

254,711. VAPOR-RETORT BURNER. HENRY H. SHELDON, Pawtucket, R. I. Filed Jan. 13, 1882. (No model.)

Brief.—The heat from the flame is conducted to the oil-reservoir below through the metallic tubes in the center of the device, and the oil is thereby vaporized.

Claim.—1. In combination with the reservoir *g*, the vapor-retort burner herein described, consisting of the top *a*, provided with a downwardly-projecting hollow stem, *a'*, base *b*, having a tube, *b'*, perforated guard *c*, and perforated ring *c*, all substantially as and for the purpose set forth.



2. In combination with the top *a*, base *b*, guard *c*, and ring *c*, the asbestos packing *d*, all substantially as described, and for the purpose set forth.

254,712. MOTOR. SAMUEL N. SILVER, Auburn, Me. Filed Jan. 21, 1882. (Model.)

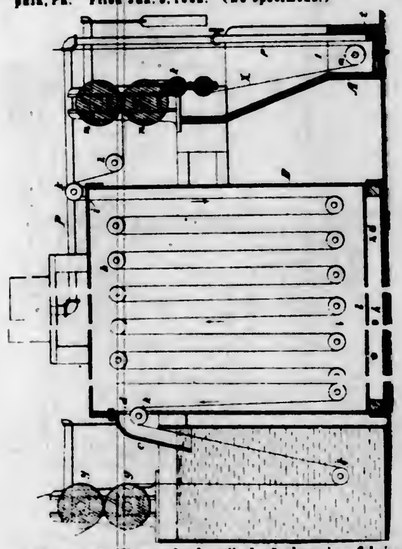
Claim.—1. A motor made substantially as herein shown and described, and consisting of reciprocating devices for bringing springs in tension, combined with devices for rotating a shaft by these stretched springs, as set forth.

2. In a motor, the combination, with a shaft, of the rocking

254,712.

arms mounted loosely on the shaft, and provided with devices for acting on the shaft, and of the reciprocating cylinders provided with springs for forcing the cylinders upward, substantially as herein shown and described, and for the purpose set forth.

3. In a motor, the combination, with the shaft A, of the rocking arms F, provided with devices for acting on the shaft, the reciprocating cylinders L, containing pistons K, connected with the ends of the arms J, and of the springs P, substantially as herein shown and described, and for the purpose set forth.



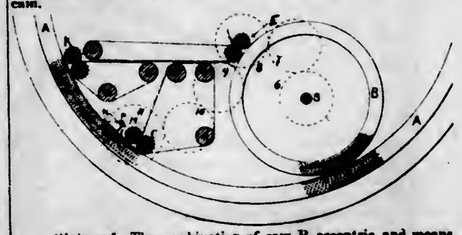
4. In a motor, the combination, with the shaft A, of the rocking arms F, provided with devices for acting on the shaft, the reciprocating cylinders L, containing the pistons K, each provided with a longitudinal slot, K', and sliding on the rods E', and of the springs Q, substantially as herein shown and described, and for the purpose set forth.

5. In a motor, the combination, with the shaft A, of the rocking arms F, provided with devices for acting on the shaft A, the cylinders L, the pistons K, the rods E', the springs Q, and the latches M, substantially as herein shown and described, and for the purpose set forth.

6. In a motor, the combination, with the shaft A, of the rocking arms F, provided with devices for acting on the shaft A, the cylinders L, the pistons K, the rods E', the springs Q, the clutches M, and the springs N, substantially as herein shown and described, and for the purpose set forth.

7. In a motor, the combination, with the shaft A, of the rocking arms F, provided with devices for acting on the shaft A, the cylinders L, the pistons K, the rods E', the springs Q, the cylindrical sockets R, and the guide-frames S, substantially as herein shown and described, and for the purpose set forth.

254,713. CHROMING FABRICS. THOMAS SIMPSON, Philadelphia, Pa. Filed Jan. 3, 1882. (No specimens.)

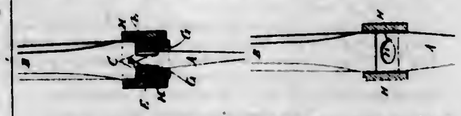


Claim.—1. The mode described of chroming fabrics, the same consisting in passing a traveling strip of padded or printed and dried fabric through a volume of chroming-solution sufficient to permit the thorough saturation of the moving strip, and feeding said volume from a main body as fast as it is taken up by the fabric, then heating said fabric without drying, and then passing the same while wet through a bath of water.

2. In the chroming of fabrics, feeding the chroming-solution into a supplemental tank, through which the fabric travels, so as to maintain a uniform quantity therein, and after passing the fabric from said tank heating the same and passing it before drying through a water bath, as specified.

3. In the process of chroming fabrics, first chroming the fabric, then heating the same, and then subjecting it before drying to a bath, as and for the purposes set forth.

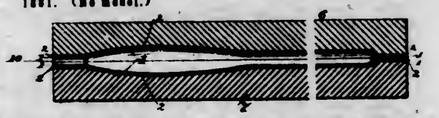
254,714. COMBING-MACHINE. ALBERT SMITH, Bradford, County of York, England. Filed Oct. 29, 1881. (No model.) Patented in France Aug. 29, 1881, and in Belgium Aug. 27, 1881?



Brief.—The short comb is placed behind the drawing-off rolls, and is provided with two spindles, which slide within two vertical projections formed on a clip which surrounds an eccentric secured to a perpendicular shaft. The said comb is rotated elliptically by the eccentric, and is raised and lowered by means of an inclined cam.

Claim.—1. The combination of cam P, eccentric, and means for rotating the same with clip H', having guide-rod and bearing therefor, and short comb N, carried by said clip.

2. The combination of the cam P, eccentric, and means for rotating the same with clip H', having guide-rod and bearing and carrying projections L L', and a comb, N, having spindles adapted to said projections, all substantially as set forth.



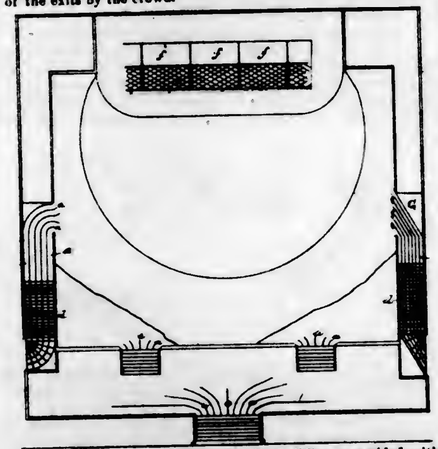
254,715. SAW-SWAGE. FURMAN S. SMITH, Woodville, Miss. Filed May 25, 1881. (No model.)

Claim.—1. A saw set and swage substantially as herein shown and described, formed of the handle B, the center piece, A, having grooves C and recesses D upon its opposite sides, the side pieces, E, having shoulders F and angular notches G, and the band H, as set forth.

2. A saw setting and swaging device consisting of the handle B and center piece, A, having the grooves and recesses C and D deeper on one side than on the other, the notched blocks E, having shoulders F, and the band H, whereby saw-teeth may be swaged and set, substantially as shown and described.

254,716. MANUFACTURE OF ARTICLES OF INDIA-RUBBER, &c. JOHN J. C. SMITH, College Point, N. Y. Filed Sept. 8, 1881. (No model.)

Claim.—1. The process of making hollow articles of rubber or other vulcanizable gum, by pressing the separate halves or parts in suitable molds or dies between sheet metal and foil, then removing the foil from surfaces which are to be joined together, uniting the parts under pressure, and vulcanizing the hollow articles in water under pressure, the water being admitted to the interior to prevent collapsing.



2. The process of forming hollow articles of rubber or other vulcanizable gum, which consists in pressing plastic-rubber composition into the parts of the mold while they are in a heated state, placing them together, so as to cause cohesion between the mar-

gins of the rubber in the respective parts of the mold, and then vulcanizing under water-pressure admitted to the interior of the article as well as to the outside of the mold.

3. The process of vulcanizing articles of rubber or other vulcanizable gum, which consists in placing them together with their molds in a tightly-closed vessel, completely filling said vessel with water under pressure, and subjecting the whole to the necessary degree of heat for a proper length of time.

254,717. EXIT FROM THEATERS. JOHN H. SMITH, Buffalo, N. Y. Filed Dec. 16, 1881. (No model.)

Brief.—Subdividing the exits of public buildings by arranging partitions lengthwise therein, allowing the audience to pass out in single files in case of fire, thereby preventing the blocking of the exits by the crowd.

Claim.—1. The exits from public buildings, provided with narrow passage-ways, allowing the audience to pass out single file, said passage-ways extending a greater or less distance into the corridors or rooms from the exits, and flaring at the inner ends thereof for a short distance in order to more readily receive the bodies of the outgoing crowd, as set forth.

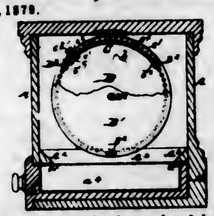
2. The herein-described divisions for the exits of public buildings, placed at suitable distances apart across the entire corridor and extending from the exits of the several departments or portions of the building separately down the corridors and stairways to the final opening to the street, substantially as set forth.

254,718. STOPPER FOR BOTTLES, JARS, &c. GEORGE A. SMITH, Newport, R. I. Filed Dec. 31, 1881. (No model.)

Claim.—In combination with the jar or bottle B, the blown stopper A, ground to fit said jar, and provided with an interior chamber containing filtering material, and having upper and lower openings, whereby vapor can pass from or air into the interior of the jar without allowing the admission of germs of decay, substantially as described, and for the purpose specified.

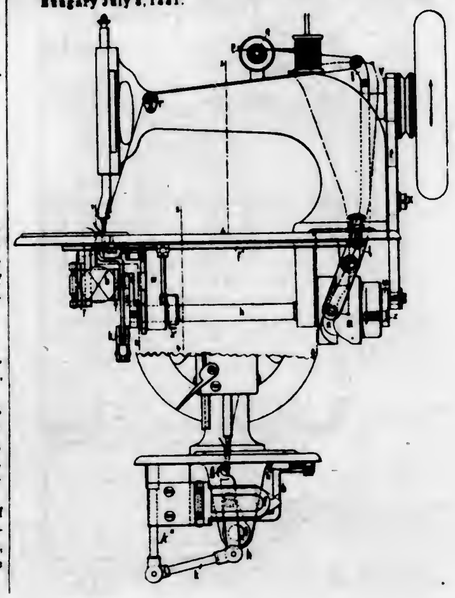
254,719. LATHE-HEAD. ELI T. STARR, Philadelphia, Pa., assignor to the S. S. White Dental Manufacturing Company, same place. Filed Jan. 24, 1882. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of the lathe-head frame, the bearings of said frame, the spindle fitted to turn in said bearings, the cone-journals of said spindle, one of which is formed by a longitudinally-adjustable cone-collar, and the screw-ring working upon said spindle to hold said adjustable cone-collar in its seat in its bearing.



2. The combination, substantially as hereinbefore set forth, of the lathe-head frame, the bearings of said frame, the socketed spindle fitted to rotate in said bearings, the pulley to drive said spindle, the pivoted latch to lock a shank in said socket as against endwise movement, and a sliding ring to control said latch.

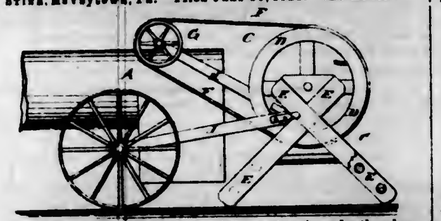
254,719.



3. The combination, substantially as hereinbefore set forth, of the lathe-head frame having the branching arms, the spindle fitted to turn in bearings in said arms, the pulley having a recess in its side keyed upon said spindle between said arms, the latch mounted in a recess in said spindle between said pulley and one of the bearings of said spindle, and the device to control the movement of said latch.

254,720. ASH-SIFTER. CHARLES STEEL, New York, N. Y. Filed Apr. 21, 1879.

Claim.—In an ash-sifter having a closed box and removable drawer, the rotary sifter described, consisting of the main body B' *b* and removable door C, having the curved side pieces, C', bars *b*, turn-button *c*, and handle *c*', constructed and arranged substantially as set forth, whereby the door may be entirely removed or merely opened as a hinge-door, substantially as set forth.

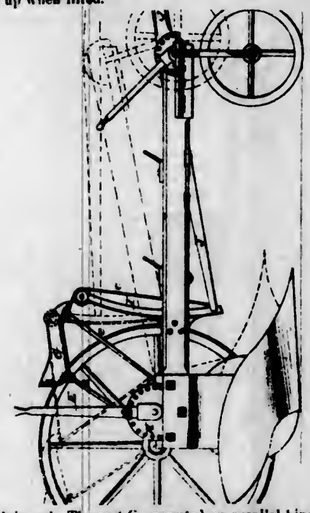


254,721. SEWING-MACHINE. JULIUS STEIN, St. Petersburg, Russia. Filed June 20, 1881. (No model.) Patented in England May 10, 1881, in France May 20, 1881, and in Austria-Hungary July 8, 1881.

Claim.—1. The shuttle herein described, consisting of cone *b*, formed with cone-point *b'* and recess *c'*, the pin *c*, set-screw *d*, and spring *e*, as set forth.

2. The combination of shuttle *b*, shuttle-carrier *f f' f'' f'''*, shaft A, crank *i*, hook *g*, bent at *g''*, radius-rod *h*, and depending bar *h''*, as set forth.

254,722. MOTOR AND THRASHER CONNECTION. CYRUS STINE, McVaytown, Pa. Filed June 30, 1881. (No model.)



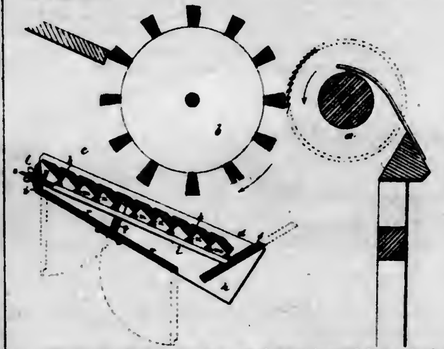
Claim.—1. The combination, with a motor, A, and a thrasher, B, of a jack, C, a tumbling-rod, L, a belt, F, and the braces H I, substantially as herein shown and described, whereby the engine can be placed at any desired distance from the thrasher and a short belt used, as set forth.

2. In a motor and thrasher connection, the combination, with the motor A and the jack C, formed of X-shaped frames E, of the braces H I, having their outer ends resting in the angles of the said frames and their inner ends against the bearing of the hand-wheel and axle, respectively, of the motor, substantially as and for the purpose set forth.

254,723. PLOW-TRUCK. OAKLAND B. ST. JOHN, Cedar Rapids, Iowa. Filed Sept. 27, 1881. (No model.)

Brief.—The sulky has at one end of the axle a land-wheel and at the other a plow with a disk or wheel for a land side. The latter also serves as a carrying-wheel, and its angle may be turned for that and other purposes. The rear end of the tongue moves vertically in a segment-guide. A cord from the tongue is attached to the hinged seat passing over a pulley. Backward movement of the seat raises the tongue and lifts the front end of the plow. The driver's weight tends to force down the plow at work and to hold it up when lifted.

Claim.—1. The seat G, mounted on parallel hinged supports *e e*, regulated by suitable stops, combined with the chain *c*, sheave *a*, segment I, and tongue J, substantially as shown and described.



2. The combination of the landside-wheel F, pivoted axle K, lever I, and quadrant *o*, or their equivalents, substantially as and for the purpose set forth.

254,724. COLLYRIUM. ABSALOM TEMPLETON, Round Rock, assignor of one-half to Daniel Spillars Page, Williamson County, Tex. Filed Jan. 17, 1881. (No specimens.)

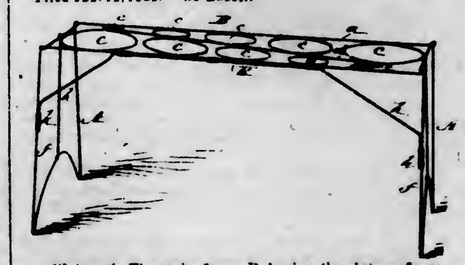
Brief.—Unites with one quart of rain-water one tea-cupful of honey, one tea-spoonful and a half of verdigris, (*Cupric acetate*,) one tea-spoonful of borax, and ten grains of morphia. After standing twenty-four hours the mixture is filtered.

Claim.—An eye-water composed of the following ingredients, viz: rain-water, honey, verdigris, borax, and morphia, mixed in about the proportions set forth.

254,725. COTTON-GIN ATTACHMENT. JESSE WOOD THAMES and ROBERT I. RILEY, Greenville, Ala. Filed Sept. 24, 1881. (No model.)

Claim.—1. In a cotton-gin attachment located beneath the brush-cylinder, the combination of the frame *h i* and slats *k*, journaled in the frame and forming the bottom of the gin-flue, with the rod *l*, attached to the slats, and means, substantially as described, for adjusting the openings between the slats, substantially as described, and for the purpose set forth.

2. In a cotton-gin attachment located beneath the brush-cylinder, the combination of the frame *h i*, having slats *k* journaled therein and forming the bottom of the gin-flue, with the rod *l*, secured to the slats, screw *s*, spiral spring *p*, and thumb-nut *t*, substantially as described, and for the purpose set forth.



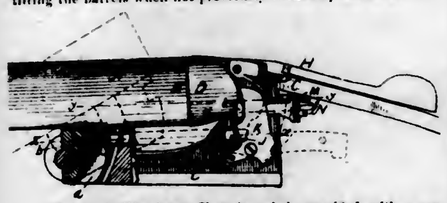
3. In a cotton-gin attachment located beneath the brush-cylinder, the combination of the frame *h i* and slats *k*, journaled in the frame, with the center board, *q*, substantially as described, and for the purpose set forth.

4. In a cotton-gin attachment located beneath the brush-cylinder, the combination of the frame *h i*, provided with inclined grooves and slats *k*, journaled in the frame, with the sliding mote-board *s*, whereby when the mote-board is raised and the slats closed the motes will be carried over the slats into the lint-room, substantially as described.

5. The combination, with the frame *h i* and slats *k*, journaled in the frame, of the center board, *q*, and a receptacle under the slats provided with doors *r r*, substantially as described, and for the purpose set forth.

6. The cotton-gin attachment herein described, composed of the tapering side boards, *h*, and end board, *i*, slats *k*, journaled in the side boards, rod *l*, attached to the under faces of the slats, screw *s*, spring *p*, thumb-nut *t*, center board, *q*, and doors *r r*, substantially as described, and for the purpose set forth.

254,726. FILTER-STAND. HENRY B. TIFFANY, Clyde, Ohio. Filed Jan. 12, 1882. (No model.)



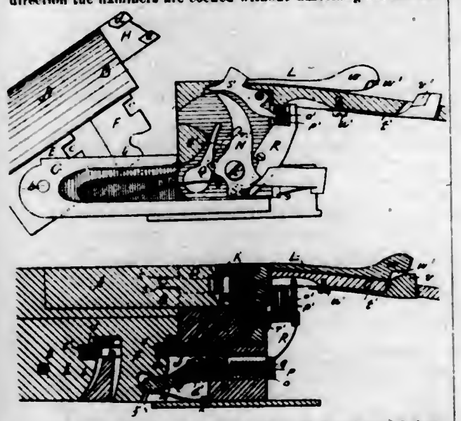
Claim.—1. The main frame B, having the rings or funnel-supports *c*, and the hinged legs A A, in combination with the rod H, bent to form the braces A A, and the sliding sleeves *k*, substantially as described.

2. The wire frame B and the wire *d*, bent to form the series of rings *e*, in combination with the hinged legs A A and means for bracing the legs, substantially as described.

3. In combination with the frame B and hinged legs A A, and the sleeves *k k*, the rod H, secured to the frame by the sleeve *i*, and bent to form the braces *h* and the straight portions *j*, substantially as described.

254,727. BREECH-LOADING FIRE-ARM. JOS. TOMES, Malden, Mass. Filed June 13, 1881. (No model.)

Brief.—The top lever, when swung in one direction, cocks the hammers. When swung in the other direction it unlocks the barrels without cocking the hammers. A cam on the front lug of the barrels operates a slide-rod to cock the hammers in the act of tilting the barrels when not previously cocked by the lever.

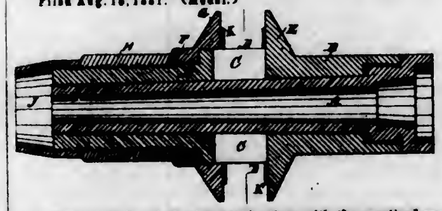


Claim.—1. The lump E to barrel A, provided with a cam groove or grooves, *a*, in combination with a slide bar or bars, J, and hammer K, all arranged together substantially as described, for the purpose specified.

2. In a breech-loading fire-arm, the combination, with the hammer, the swinging lever H, having the hub L, fulcrumed on the stock and provided with the side arm, *f*, and the pivoted lever M, of the stirrup-slide N, fitted to slide on the stock and provided with the forwardly-projecting arms extended by the hammers, and having at their front ends the lateral projections *h*, bearing against the front edges of the hammers, said stirrup-slide being provided with the cross-piece *g* and acted on by a spring, *l*, all arranged for operation substantially as and for the purpose described.

254,728. BREECH-LOADING FIRE-ARM. JOS. TOMES, Malden, Mass. Filed Apr. 4, 1881. (No model.)

Brief.—By turning the top lever in one direction the barrels are unlocked and the hammers cocked; by turning in the opposite direction the hammers are cocked without unlocking the barrels.



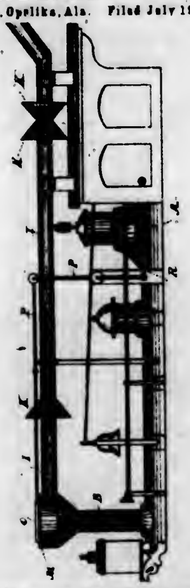
Claim.—1. The upper and lower bolts, K J, and lever L, having notches *x z*, in combination with the lug *y* of the upper bolt, K, and the lever M of the lower bolt, all substantially as and for the purpose specified.

2. The lever L, with the cam *a'*, lever *p'*, provided with a friction-roll, lever R, and hammer N, relatively arranged and constructed and to operate all substantially as described, for the purposes specified.

3. In fire-arms, the barrel hinged to the stock and provided with notched lumps E F, one in advance of the other, bolt J, adapted to fit the notches of said lumps, a lug, H, having side notches, *f*, and side lugs, *d e*, adapted to fit an opening, *g*, in the stock, in combination with a bolt, K, provided with two prongs, *z*, arranged to fit sockets *k* in breech end of the barrel, both of said bolts being operated through suitable connecting mechanism by one and the same lever, L, by which the barrel is locked and unlocked from the stock, substantially as described.

4. In a breech-loading fire-arm, the lever L, pivoted on the upper side of the stock, and provided in one side of its rear end with the notch *w'*, and devices, substantially as described, operated by the lever, to cock the hammer and lock and unlock the barrel, in combination with the depressible spring-catch *t*, having at one side of its rear end the vertical lip *v'*, arranged to engage the notch in the lever to prevent the latter from swinging in one direction unless the parts are disengaged, but permitting the lever to swing in the other direction without manipulating said catch, as and for the purpose set forth.

254,729. HUB. JOHN D. TORRENCE, Vermillionville, La. Filed Aug. 16, 1881. (Model.)

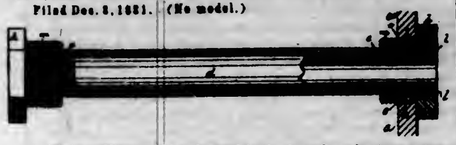


Claim.—1. In a hub, the combination, with the mortised core B and fixed collar E, provided with sharp-edged annular ring K, of the adjustable flanged ring F, provided with sharp-edged annular ring K, sleeve H, and dust-cap J, substantially as herein shown and described.

2. In a hub, the combination, with the mortised core B, fixed collar E, adjustable flange-ring F, sleeve H, and dust-cap J, of the detachable axle-box A, provided with screw-threads and adapted to be removed and replaced, substantially as shown and described.

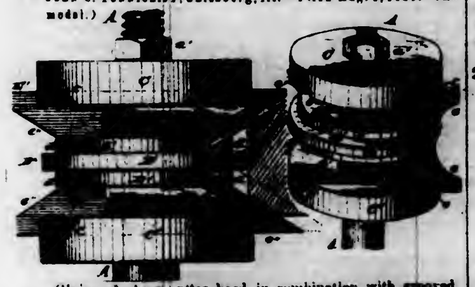
3. In a hub, the combination, with the core B, provided with the ring E, and flanged ring F, provided with the sharp annular rings on their inner surfaces, sleeve H, and dust-cap J, of the partitions D, forming spoke-mortises C between them integral with and projecting above the surface of the core B, substantially as shown and described.

254,730. SPARK-ARRESTER. JOHN W. TRIMBLE and ALFRED H. STANDIFER, Opelika, Ala. Filed July 15, 1881. (Model.)



Claim.—1. In combination with the smoke-stack provided with a suitable top and valve, the inner, forward, and rear deflectors, adapted to operate substantially in the manner specified.

2. In combination with the smoke-stack and deflectors, constructed as shown and described, the tube extending to the rear



and provided with reversely-set air-funnels and apertures for the admission of air, substantially as and for the purpose set forth.

254,731. BOILER-FLUE. HORACE L. TROUT, Prentonville, Va. Filed Dec. 8, 1881. (No model.)

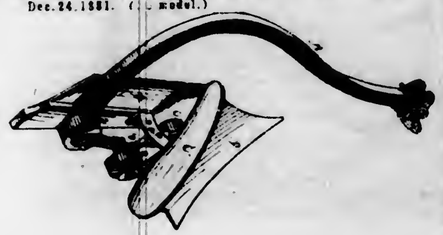
Claim.—The combination, with the iron flue-sheets *a a*, provided with the opposite orifices, *b*, threaded at *c*, and iron flues *d*, each threaded exteriorly on its ends at *e*, of the copper nuts A A, each threaded exteriorly and interiorly at *l* and *m*, whereby the iron threads on the flues and flue-sheets are prevented from corroding by the galvanic action of the metals, substantially as described.

254,732. CUTTER-HEAD FOR WOOD-WORKING MACHINES. JOHN C. TUPPICLIFF, Galesburg, Ill. Filed Aug. 6, 1881. (No model.)

Claim.—1. In a cutter-head, in combination with grooved head-stocks, the gage-collar D, having a thicker portion, D', or projection, with grooves in said thicker portion, in which grooves the cutters are seated, and may be adjusted lengthwise, and held after adjustment by said head-stocks, with all parts of their cutting-edges projecting beyond said portion D' to give clearance to the cutters, substantially as specified.

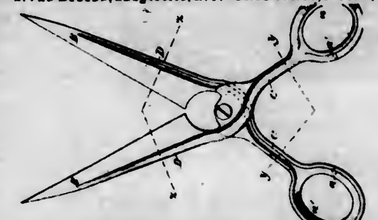
2. In a cutter-head, in combination with a shaft, A, grooved head-stocks C C', and nut *a'*, a gage-collar, D, having a thickened portion of smaller diameter and grooved for the reception of the cutters, substantially as and for the purpose specified.

3. The gage-collar D, having a thicker portion, D', or projection, for holding the cutters, which project beyond said portion, D', to give clearance to the cutters, in combination with the cutters and suitable head-stocks, substantially as and for the purpose specified.



254,733. MORTISING-CHISEL. GEORGE R. VALENTINE, New Bedford, Mass. Filed Dec. 10, 1880. (No model.)

Brief.—Passed after interference with the patent of Richard Hackett for same device, No. 234,669, dated November 23, 1880.



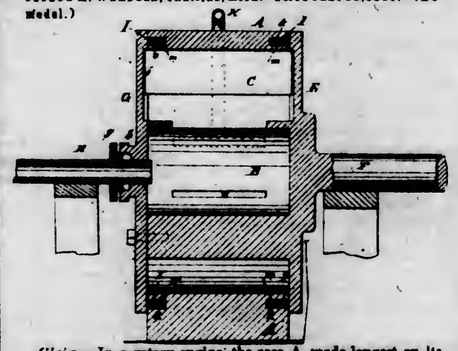
Claim.—A mortising-chisel provided within its back with a longitudinal groove which has its sides or flanks serrated to form horizontal cutters or teeth, substantially as and for the purpose specified.

254,734. PLOW. JAMES VANDERGRIFT, Princeton, Ill. Filed Dec. 24, 1881. (No model.)

Claim.—In a plow, the combination of the bearing-frame *a b f*, substantially as described, with the wheels *c*, *d*, and *e*, mounted and arranged substantially as described, and for the purpose set forth.

254,735. CORRUGATED SCISSORS AND SHEARS. WILLIAM S. VAN HUSEN, Saugerties, N.Y. Filed Oct. 17, 1881. (Model.)

Claim.—Cutting-blades of scissors and shears struck up of sheet metal with corrugation or corrugations running along or near the back edge of the blades and through the handle, terminating in the bows, as and for the purpose specified.

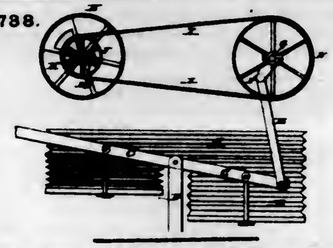


254,736. STEAM-PACKING. CHARLES H. VAN TINE, Hattenwan, N.Y. Filed July 6, 1881. (No model.)

Claim.—1. A packing-ring consisting of a band adapted to closely encircle the rod to be packed, and having a flange or flanges which project outward from the same at an angle greater than a right angle and terminate at a point in near relation to the wall of the stuffing-box, substantially as specified.

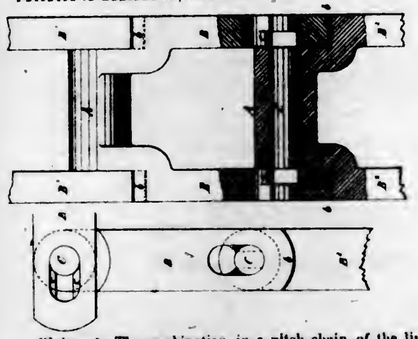
2. A packing consisting of a ring or series of rings, D, having the flanges *a*, which extend outward at an angle greater than a right angle and terminate in near relation to the wall of the stuffing-box, substantially as and for the purpose set forth.

254,737. ROTARY STEAM-ENGINE. GEORGE W. WADE and JOSHUA H. WARDELL, Cadillac, Mich. Filed June 30, 1881. (No model.)



Claim.—In a rotary engine, the case A, made longest on its vertical diameter, drawn in at the sides, having recesses *c*, and provided with heads E G, in combination with the radially-slotted cylinder B, having a steam-chest at its center B', the cut-away valves *b* C, and the packing-strips D, arranged in said recesses *c* of the case, whereby the engine operates as described.

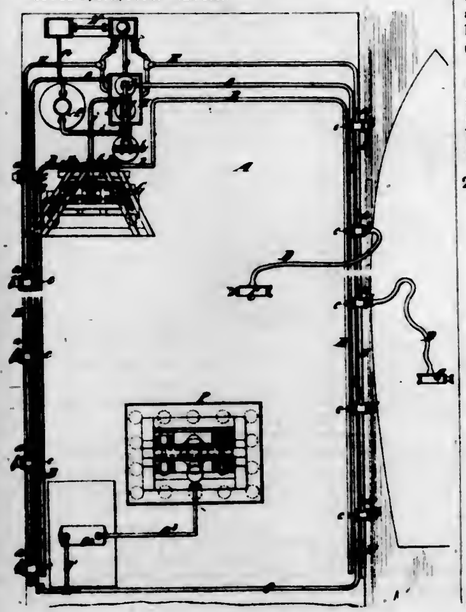
254,738. MECHANISM FOR WORKING ORGAN-BELLOWS. JULIUS WAGNER, Reading, Pa. Filed Dec. 30, 1881. (No model.)



Brief.—The bellows are worked by means of lever C, operated by the wheel H, fly-wheel L, and appropriate connecting crank-shafts.

Claim.—The combination, with the lever C, connected with the bellows B of an organ, of the connecting-rod E, the crank-shafts F G M K, the pulleys and belts H J I, and the fly-wheel L, substantially as herein shown and described, whereby the said bellows can be readily worked, as set forth.

254,738.



254,739. PITCH-CHAIN. ARTHUR H. WILLIS, Basingstoke, County of Hants, England. Filed Oct. 17, 1881. (Model.) Patented in England Sept. 15, 1881.

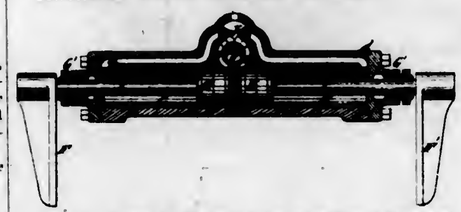
Claim.—1. The combination, in a pitch-chain, of the links, each consisting of a tubular boss, A, provided with slotted fork-arms B, and having ribs e within the slots of said arms, with the notched pins C, passing through the tubular boss of one link and through the ribbed hole or slot in the fork-arms of the next adjoining link, substantially as described.

2. In a pitch-chain, the bush D, fitted in the elongated hole of the boss A, substantially as and for the purpose set forth.

254,740. APPARATUS FOR STOWING CARGOES IN VESSELS. MAURICE J. WALSH, New York, N. Y. Filed Apr. 21, 1880. Renewed Feb. 2, 1882. (Model.)

Claim.—1. The combination, with a jack and its supply-pipe, of a waste-pipe extending from said jack and surrounding the supply-pipe, substantially as specified.

2. The combination, with a dock, of a line supply-pipe extending along the same for supplying a motive agent to a series of jacks, a line waste-pipe also extending along the dock for receiving the exhaust from said jacks, and a series of jacks connected with the said pipes by flexible hose-connections, substantially as specified.

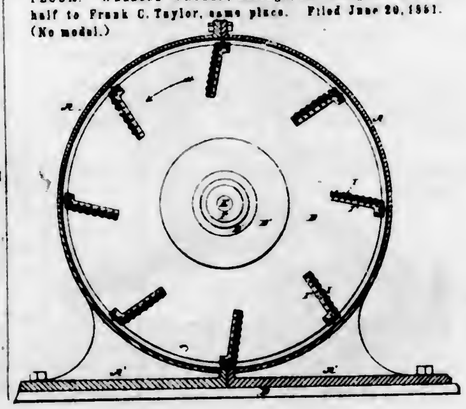


3. The combination, with a dock, of a line supply and a line waste pipe extending along the same, a series of couplings or T-pieces connected to said waste-pipe by branch connections, flexible supply-pipes extending through said couplings and connected to a series of jacks, and flexible exhaust-pipes connecting said jacks with said couplings, and surrounding the flexible supply-pipes, substantially as specified.

4. The combination, with a dock, of line supply and waste pipes extending along the same, a pump for supplying a motive agent to said supply-pipe, an accumulator for maintaining a uniform pressure in said supply-pipe, and a series of jacks connected with said supply and waste pipes by flexible hose-connections, substantially as specified.

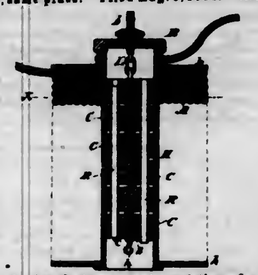
5. The combination, with a dock, of line supply and waste pipes extending along the same for operating a series of jacks, a pump connected with said supply-pipe for supplying a motive agent thereto, and a second pipe connected with said waste-pipe for exhausting the motive agent therefrom, substantially as specified.

6. The combination, with a jack and its supply and exhaust pipes, the exhaust-pipe surrounding the supply-pipe, of the valve C^2, for controlling the operation of the jack, substantially as specified.



254,741. JACK. MAURICE J. WALSH, New York, N. Y. Filed Dec. 21, 1880. Renewed Feb. 2, 1882. (No model.)

Claim.—1. The combination of a jack-cylinder, a piston and rod fitted thereto and adapted to be reciprocated therein for extending or contracting the jack, and two claws, arms, or pressers adapted to embrace the material to be compressed or moved and be drawn together by the operation of the jack, substantially as specified.

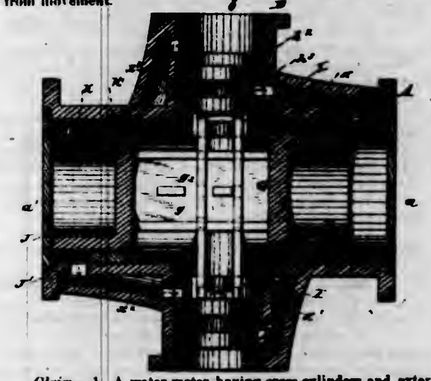


2. The combination, in a jack, of a cylinder, two pistons fitted thereto, two piston-rods working through opposite ends of said cylinder, passages or ports for supplying a motive agent to the two ends of said cylinder upon the outside of said pistons, and other passages or ports for supplying a motive agent to said cylinder upon the inner sides of said pistons, substantially as specified.

254,742. PROCESS OF MANUFACTURING WHOLE-WHEAT FLOUR. WALLACE WARREN, Chicago, Ill., assignor of one-half to Frank C. Taylor, same place. Filed June 20, 1881. (No model.)

Claim.—The method of making whole-wheat flour, which consists in first separating the inner grain substance from the bran; second, reducing the inner grain substance and the bran separately to flour, and thereafter mixing the two flour-products, substantially as described.

254,743. ELECTRO-MAGNET. ADDISON G. WATERHOUSE, New York, N. Y., assignor to the United States Electric Lighting Company, same place. Filed Aug. 1, 1881. (No model.)



Claim.—1. An electro-magnet consisting of a hollow core of non-magnetic metal, having a coil or coils wound thereon, in combination with a core composed of independent sections of iron, suspended at short distances apart by means of connections passing through the sections, which allow the sections to be drawn together when magnetized, substantially as described.

2. The combination of helix A, cylindrical case H, of non-magnetic metal, the cap B, adjusting-screw *d*, and a core composed of a number of independent sections connected together as described and suspended by a link, *l*, from the screw *d*, as set forth.

254,744. WATER-METER. PARKER WELLS, Lynn, Mass. Filed Oct. 12, 1881. (Model.)

Brief.—The pistons act alternately, each forming valves to the other, and each during its own movement locking the other from movement.

Claim.—1. A water-meter having cross-cylinders and external chutes to lead the water under force to reciprocating cross-pistons, and from said pistons to the service-pipes after measurement, the pistons acting alternately and automatically without the aid of internal valves or other moving mechanism, as herein specified.

2. A water-meter case having internally-projecting rings covering the area of the stroke of the piston-heads, said case being formed of cross-cylinders adapted to receive alternately-acting pistons and to be formed into a true cylinder by turning, boring, or otherwise, as set forth.

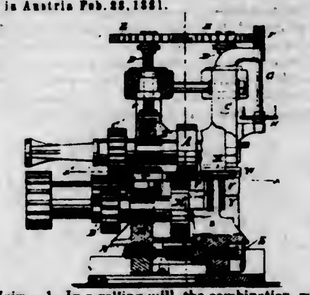
3. In a water-meter, the main piston and auxiliary piston, both being lapped up against friction by confined air and operating at approximately right angles with each other, as set forth.

4. In a water-meter, a lift-valve adapted to allow the water in the house-pipes to gravitate into the sewer as the water-pressure is cut off, as and for the purposes set forth.

5. The main piston G, having lugs g^2 upon the plate g, combined with the auxiliary piston H, having the recesses h', adapted to serve with the cross-cylinders A B, as set forth.

6. The receiving-chamber C, having ports w w' w^2 w^3, combined with the pistons G H, having connecting and shifting recesses, and with the cross-cylinders A B, as set forth.

7. The removable cap D, having exit D', aperture d, and inlet E, combined with the case A B, having central aperture, and with pistons and ports, as and for the purposes specified.



8. The cap D, having pipes D' and K, combined with the valve f and case A B C d, as and for the purposes set forth.

9. The cross-cylinders A B, having chamber C, ports w w', &c., and chutes x x', &c., combined with the pistons and chamber-cap D, as set forth.

10. The piston G, having groove h, recess h', and connected barrels, and the auxiliary piston H, with heads h^2, having annular recesses h^3, combined with the ports in the cross-cylinders A B, as and for the purposes set forth.

11. The recesses J' in the cylinder-heads, and the cross-bars J, adapted to limit and control the stroke of the pistons G H, as specified.

254,745. ROLLING-MILL. WILHELM WESTMAN, Orebro, Sweden. Filed Oct. 13, 1880. (No model.) Patented in England July 22, 1880, in France July 23, 1880, in Germany July 27, 1880, in Belgium July 29, 1880, in Sweden July 31, 1880, and in Austria Feb. 25, 1881.

Claim.—1. In a rolling-mill, the combination, with the rolls A K T V, of four short flat guides, one edge guide, G', fixed at the standard, a second a flanged guide, H', that follows the sliding frame M in all its movements, a third, H^2, leading from the lower roll underneath the bar or plate, and a flat guide, G^2, moving with the top roll, as shown and described.

2. In a rolling-mill, the combination of the horizontal rolls A and K, secured upon their journals midway between the bearings thereof, and the vertical rolls T and V, arranged between the bearings of rolls A and K on opposite sides of said rolls, whereby strain upon the upper and lower rolls shall be equally distributed between their respective bearings, substantially as shown and described.

3. In a rolling-mill, the combination, with the gear-wheels C' D', movable to and from each other, of the broad gear-wheel F, made broad to accommodate the lateral adjustment of wheel D', and the gear-wheel E', adapted for accommodating the vertical adjustment of wheel C', substantially as shown and described.

254,746. FIBER DISINTEGRATED FROM COTTON-STALKS. FRANK WEBATON, Brooklyn, N. Y. Filed Jan. 26, 1882. (No specimens.)

Claim.—1. Staple formed of disintegrated cotton-stalks having the fiber separated therefrom, preserved, and prepared substantially as set forth.

2. The method of disintegrating cotton-stalks, consisting in separating the fiber from the stalk by passing through rollers, or by retting, then drying, then scutching or breaking, and then carding or hackling the same, thus producing a staple of the fiber alone, substantially as and for the purpose set forth.

254,747. PAPER MADE FROM THE FIBER OF THE COTTON-PLANT. FRANK WEBATON, Brooklyn, N. Y. Filed Jan. 26, 1882. (No specimens.)

Claim.—Paper made from the fiber of the cotton-plant separated from the bark and stalk and prepared and steeped or boiled, cut, beat, or ground, and finished substantially as set forth.

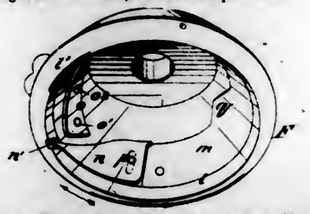
254,748. WEAVING THE FIBER OF THE STALK OF THE COTTON-PLANT INTO FABRICS. FRANK WEBATON, Brooklyn, N. Y. Filed Jan. 26, 1882. (No specimens.)

Claim.—1. Fabrics, including bagging and cloth covers, made of the fiber of the cotton-plant stalk separated, prepared, and woven substantially as set forth.

2. A woven fabric made from the fibers of the cotton-plant, substantially as herein set forth.

264,749. SEPARATION OF FIBER FROM THE COTTON PLANT AND MANUFACTURE OF ARTICLES THEREFROM. FRANK WRAXTON, Brooklyn, N. Y. Filed Nov. 3, 1881. (No specimens.)

Claim.—1. The separation of the fiber from the stalk of the cotton-plant and the spinning of the same, when prepared substantially as described, into fabrics, in the manner set forth.



2. Fabrics made by the spinning of the fiber of the stalk of the cotton-plant, when separated and prepared substantially as set forth, including twine, rope, cordage, and yarns, as well as threads.

3. Fiber separated from the stalk of the cotton-plant and prepared for wadding, stuffing, packing, and calking, substantially as set forth.

4. The fiber separated from the cotton-stalk and dried and prepared substantially as set forth, for wadding, stuffing, and calking.

264,750. KNITTING-MACHINE. GEORGE A. WHITE, Halifax, Nova Scotia, Canada, assignor of one-half to Williston I. Alvord, Bridgeport, Conn. Filed Oct. 4, 1880. (No model.)

Brief.—The lower portion of the cone or upper stationary cylinder is fitted with a ring suspended by rods or arms, and the upper part of the lower cylinder is fitted with a like ring sustained in the same way. The rings are grooved to receive the outer ends of the needles, to sustain them against side strain. By this construction the operative is enabled to observe the work at all times, and is afforded free access thereto. Novel stitch-forming cams and thread-guide and latch-opener are also provided.

Claim.—1. The needle-cylinder B, provided with grooved ring *f*, sustained by rods *f'* at the upper end of said cylinder, substantially as shown and described, and for the purposes set forth.

2. The cone E, for sustaining the upper needles, provided with grooved ring *e* at its base, sustained by arms or rods *e'*, combined with needle-cylinder B, substantially as shown and described, and for the purposes specified.

3. The combination, with the revolving cylinder C and the thread-guide *g*, of the latch-opener or fender *k*, provided with the eyes *a' b'*, and having its forward end pointed and curved outward from the thread-guide, substantially as and for the purpose set forth.

4. The combination, with the revolving cylinder C, provided with rib *r*, pin *m'*, the fixed cams *s u*, and the adjustable stitch-cam *t*, of the gate *v*, provided with the projections *v²*, pivoted to the said cylinder between the said ribs and adjustable cam, substantially as and for the purpose set forth.

5. The combination, with the slotted conical sleeve F, provided with the diagonal slot *n'* and the fixed plate *m*, of the triangular stitch-cam *n*, secured to the said sleeve by the set-screw *p*, substantially as and for the purpose set forth.

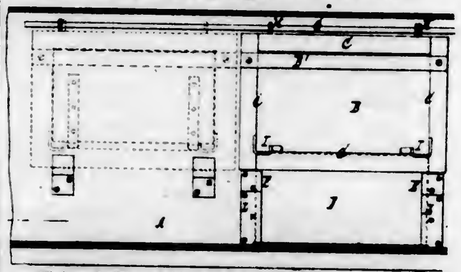
6. The combination, with the cone E, of the conical sleeve F, provided with the adjustable stitch-cam *n*, the swing-gate *v*, and the plate *m*, provided with the triangular projection *q*, substantially as and for the purpose set forth.

7. The combination, with the cone E, carrying the upper set of needles, and the conical sleeve F, provided with rib *l*, and the adjustable triangular stitch-cam *n*, of the plate *m*, arranged above the said rib and provided with a triangular projection, *q*, arranged at a distance of three or four needles from the said stitch-cam, as shown and described, whereby the old loop is shaken off after a new stitch is formed, the new loop being held by three or more new stitches when its needle reaches the point *q*, and the operation of casting the old loop cannot alter the new stitch, as set forth.

264,751. APPARATUS FOR DETERMINING THE NITRITION OF CELLULAR FIBER. LEWIS WHITE and KIRK WHITCOMB, Hoosick Falls, N. Y. Filed Dec. 19, 1881. (No model.)

Claim.—1. In the manufacture of pyroxyline or the combining of acids for similar purposes, the employment of a mixing-vessel in combination with a galvanometer or its equivalent for determining the condition of the compound, as hereinbefore set forth.

264,751.



2. The combination, with the mixing-vessel, of the pockets at opposite sides for holding the anode and the cathode attached to a galvanometer or its equivalent, as hereinbefore set forth.

3. The method of determining the nitrition of cellulose fiber or the condition of the acids for the same, which consists in mixing the elements always in the same vessel or one of the same size and connecting the opposite sides by an anode and a cathode attached to a magnetic needle or its equivalent, as hereinbefore set forth.

264,752. GRAIN-CAR DOOR. JAMES H. WICKES, New York, N. Y. Filed Aug. 15, 1881. (No model.)

Brief.—The door is hinged to a swinging frame, which slides on a rod on the side of the car. Shoulders are located at the sides of the opening for the door to rest on in sliding and swinging inward, and stops to prevent its falling outward when folded.

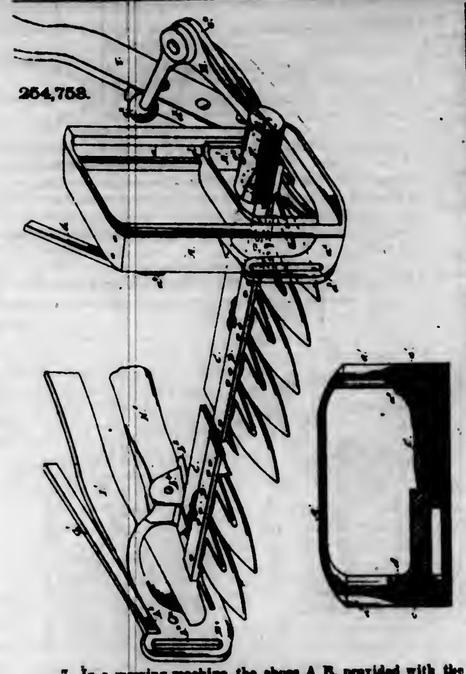
Claim.—1. The combination, substantially as hereinbefore set forth, of the door-frame on the interior and upper portion of the door-opening, adapted to slide horizontally and swing inwardly away from such opening, the door hinged to the lower side of the frame to swing outward and upward therein from a lower or closed position, and the stops at the opposite ends of the door-opening, for the purpose specified.

2. The combination, substantially as hereinbefore set forth, of the door-frame on the interior and upper portion of the door-opening, adapted to slide horizontally and swing inwardly away from such opening, the door hinged to the lower side of the frame to swing outward and upward therein from a lower or closed position, and the shoulders and stops at the opposite ends of the door-opening, for the purpose specified.

264,753. MOWING-MACHINE. JOHN D. WILDER, Towanda, Pa. Filed Dec. 16, 1881. (No model.)

Claim.—1. In a mowing-machine, the shoe A, constructed and arranged substantially as described, and provided with a vertically-sliding block, substantially as and for the purposes set forth.

2. In a mowing-machine, the shoe A, provided with a vertically-sliding block, A', in combination with finger-bar C, pivotally secured within said block and arranged at an angle thereto, substantially as and for the purposes set forth.



3. In a mowing-machine, the combination of the shoe A, provided with vertically-sliding block A', and finger-bar C, provided with arm c^3, and pivotally secured within block A', substantially as and for the purposes set forth.

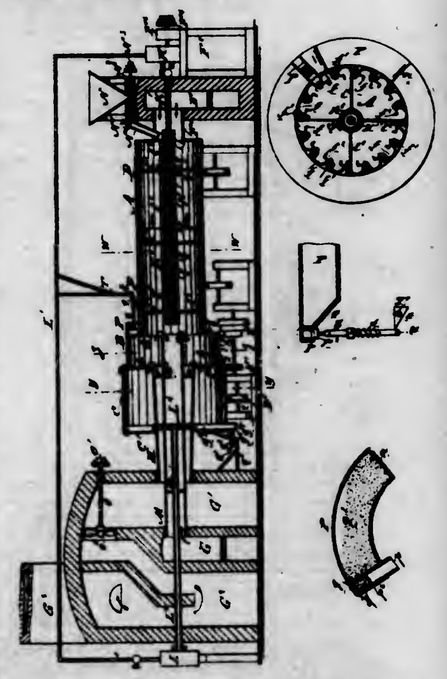
4. The bell-crank lever E, provided with balls e^2 at the ends of its arms, as described, in combination with finger-bar C, provided with arm c^3, cutter-bar D, provided with ball *d*, and coupling F, adapted to receive the ball upon the end of the bell-crank lever at a right angle to that upon the cutter-bar, substantially as and for the purposes set forth.

5. The combination, in a mowing-machine, of the shoe A, vertically-sliding block A', finger-bar C, provided with arm c^3, bell-crank lever E, secured pivotally upon said arm, and having its arms terminating in the balls e^2, cutter-bar D, provided with the ball *d*, and the coupling F, connecting said cutter-bar and bell-crank lever, the several parts constructed, arranged, and adapted to operate substantially as set forth and shown.

6. In a mowing-machine, the shoe B, provided with bracket b^3, said bracket being arranged at a point in advance of the finger-bar C, in combination with side arm, I', pivotally secured within said bracket, as and for the purposes set forth.

264,753.

7. In a mowing-machine, the shoes A B, provided with the horizontal ledges a^2 and b^2, arranged respectively in rear of the cutter-bar and at the base of the sockets a^3 and b^3, with which said shoes are provided, substantially as and for the purposes set forth.



264,754. CAR-COUPLING. CHARLES B. WILLSON, Summit Point, W. Va. Filed Jan. 27, 1882. (No model.)

Claim.—1. The draw-hook *d* herein described, consisting of the plate *c*, provided with the rear slotted arm, *h*, arms *h h*, secured to the upper and lower faces of said plate, and having their inner rear faces semi-circularly curved and their front outer surfaces hollowed out in arch of vertical and horizontal circles, and having the rounded front end of the plate *c* provided on its upper face with a curved plate, *l*, made convex on the rear of its lower face, and provided on its under face with the plate *l'*, having a concave edge, *F*, and the rear part of its upper face hollowed out inwardly, substantially as described, and for the purpose set forth.

2. The combination, with the draw-bars *a a*, provided with draw-heads *b b* at their opposite ends, having semicircular curves *b' b²* on the upper and lower faces of their ends, of the draw-hooks *d d*, pivoted in the draw-heads and constructed as set forth, substantially as described, and for the purpose set forth.

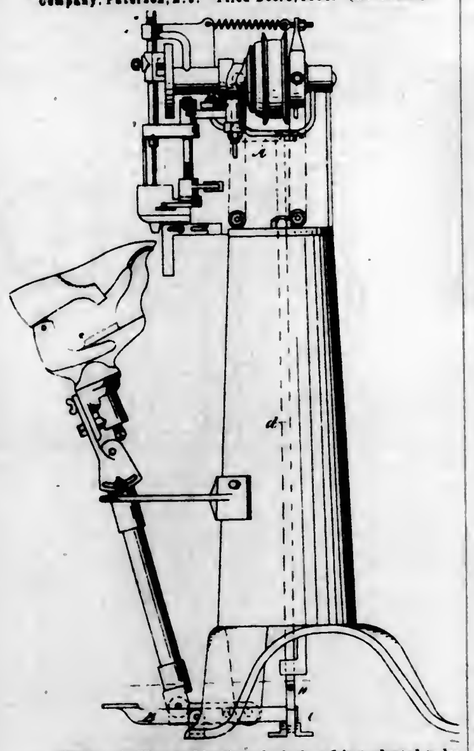
264,755. FURNACE FOR ROASTING, DESULPHURIZING, AND CHLORIDIZING ORES. WILLIAM P. WITHERELL, Chicago, Ill., and BENNETT H. VARY, Ogdensburg, N. Y. Filed Sept. 3, 1881. (No model.)

Brief.—The ore in the first division of the furnace A is desulphurized by the action of the products of combustion and heated air. At the rear end of this first division of the furnace the salt is added by the automatic feeding device for chloronating the ores. Here the ore is subjected to an increased temperature, by which the sulphates formed are decomposed. The mass then passes to the second division, B, of the furnace, where any lumps are crushed and the ores and chemicals mixed, the remaining excess of sulphur escaping. The ore then passes to the third division, C, of the furnace, where it is completely oxidized.

Claim.—1. An ore roasting, desulphurizing, and chloridizing furnace constructed substantially as herein shown and described, consisting of the revolving cylinders, divided into sections A B C, longitudinally connected and communicating with each other, having a fire-box and flue at each end, provided with suitable dust-collecting chambers, and with interior air-distributing pipes, K' L' L', interior buckets, *f f²* and *g g²*, corrugated lining B', and pulverizing-balls A^2, arranged as set forth.

2. In an ore-working furnace, the combination, with the longitudinally-corrugated cylinder A, of the longitudinal angle-irons *f²*, substantially as herein shown and described, whereby ore-lifting buckets are formed in said cylinder, as set forth.

3. In an ore-working furnace, the combination, with the cylinder B, provided with perforated annular flanges *h h* and corrugated lining B', of the iron pulverizing-balls A^2, substantially as and for the purpose described.



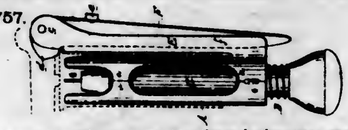
4. In an ore-working furnace, the combination, with the revolving cylinder A, of the perforated air-distributing pipe K', and its perforated jacket K², held in place by spiders F, substantially as herein shown, and for the purpose described.

5. In an ore-working furnace, the combination, with the revolving cylinder A B C, fire-box G, and dust-collecting chambers G' G^2, of the revolving flues H M, air-distributing pipes L^2 L', and spiders n n', substantially as herein shown, and for the purpose described.

6. In an ore-working furnace, the salt-box P, provided with slide u, slotted tube p, slide-valve p^2, and slides p^3, substantially as herein shown and described.

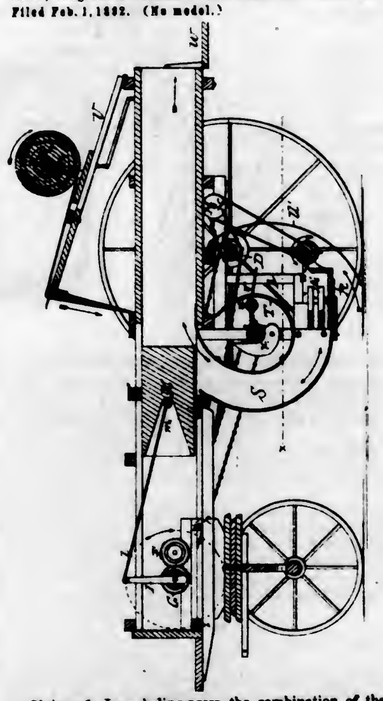
7. In an ore-working furnace, the combination, with the salt-box P, provided with slide-valve p^2, of the rod S, spiral spring s, and rod T, provided with wedge-shaped block t, substantially as herein shown and described, whereby said box is automatically operated, as set forth.

254,756. TACKING-MACHINE. ERASTUS WOODWARD, Somerville, Mass., assignor to the Copeland Tacking and Lasting Company, Paterson, N.J. Filed Dec. 5, 1881. (No model.)



Claim.—1. The combination of a jack and last adapted to be operated by a foot-treadle to present the work to the nozzle of the fastening-driving device, said fastening-driving device, and its start or start-and-stop motion mechanism, the said treadle having the movements, substantially as indicated, and mechanism, substantially as specified, for connecting the treadle with the start or start-and-stop motion mechanism, whereby the work is presented to the nozzle of the fastening-driving device and held by the foot-treadle, and by an additional sidewise movement thereof the fastening-driving mechanism is put in operation, all substantially as and for the purposes described.

2. The combination of a fastening-driving device, its start or start-and-stop motion mechanism, the treadle B, and intermediate mechanism for connecting the treadle with the start or start-and-stop motion mechanism, adapted to be actuated by the sidewise movement of the treadle, all substantially as and for the purposes described.



254,757. CARTRIDGE CAPPING AND UNCAPPING IMPLEMENT. ALVA WORDEN, Ypsilanti, Mich. Filed Oct. 12, 1881. (No model.)

Claim.—The cartridge implement herein described, consisting of the cylindrical open-ended frame A, having internally-projecting pins b, combined with the post C, sliding within the cylinder

A and provided with pin e, moving through the upper open end of said cylinder, and recess which receives and limits the stroke of the pins b, the spring D, surrounding the post and abutting against a shoulder on the post and against the pins b, the standard E, secured to the lower end of the cylinder A, and the lever F, all constructed, arranged, and combined to operate as and for the purpose set forth.

254,758. TRAVELING HAY-PRESS. PARVIS WRIGHT, Granite, Colo., assignor to William F. Dieterichs and Conrad Schaefer. Filed Feb. 1, 1882. (No model.)

Claim.—1. In a baling-press, the combination of the bale-chamber with the rake-teeth and intermediate mechanism for converging and delivering the hay from the teeth to the bale-chamber, as and for the purpose set forth.

2. In a baling-press, the combination, with a baling-box, one of the sides of which is free at the end, of a compressing means for reducing the diameter or passage of the exit end of the baling-box, substantially as described.

3. In a baling-press, the combination, with a baling-box having one of its sides free at the exit end, of the compressing means attached to the side and end of the discharge end of the box and actuated by a lever from the driver's seat, substantially as described.

4. In a traveling press, the combination, with raking-teeth, of a suspended box for receiving the hay or similar material before it is carried to the baling-chamber, substantially as described.

5. In a traveling press, the combination, with raking-teeth, of a revolving rake-stripper and a receiving-box, substantially as described, and for the purpose set forth.

6. In a traveling press, the combination, with raking-teeth, of a suspended box for receiving the hay from the raking-teeth, a curved chute leading into the baling-chamber, and means for elevating the hay from the box into the baling-chamber, substantially as described.

7. In a traveling press, the combination of raking-teeth, a suspended box for receiving the hay from the teeth, a curved chute leading into the baling-chamber, and side means for gathering and concentrating the hay in the receiving-box to the chute, substantially as described.

8. In a traveling press, the combination, with raking-teeth, of a revolving roller provided with studs or pins to strip the hay from the raking-teeth, and formed with annular grooves and fingers, attached to a suspended box, fitting in the grooves of the roller for shedding the hay from the roller and depositing it in a receiving-box, substantially as described.

9. In a traveling press, the combination, with a receiving-box and a curved chute leading to the baling-box, of side revolving forks mounted on vertical revolving shafts working in slots in the end and front walls of the receiving-box, substantially as described.

10. In a traveling press, the combination of raking-teeth, a receiving-box, a curved chute, side compressing or concentrating means, a carrier, a feeder, and press, all operating automatically to take the hay from the ground and press it into a bale, substantially as described.

11. In a traveling press, the combination of raking-teeth, a receiving-box, a curved chute, side compressing or concentrating means, a carrier or elevator, a feeder, a press, and a binder, all operating automatically, substantially as described.

12. A revolving shaft, s, provided with arms t, oscillating shaft u, with fingers or arms v, and a retractile device, substantially as described.

13. A revolving shaft, s, provided with arms t, oscillating shaft u, with fingers or arms v and trip-arm w, and a retractile spring, y, substantially as described.

14. The hay-lifting device composed of the revolving shaft s, arms t, oscillating shaft u, fingers v, trip-arm w, and a retractile spring, y, in combination with an eccentric or cam trip device, substantially as described.

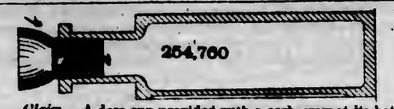
15. A revolving vertical shaft provided with arms d^2, carrying at the outer ends an oscillating shaft, d^3, with fingers d^4, substantially as described.

16. A revolving shaft provided with arms d^2, carrying at their outer ends an oscillating shaft, d^3, with fingers d^4 and trip-arm f, and a retracting-spring, f^2, substantially as described.

17. A means for concentrating the hay in a receptacle that is on its way to a baling-chamber, composed of oppositely-arranged revolving shafts provided with fingers, trip-arms, and retractile springs, in combination with eccentric or cam trip means for guiding the movement of the concentrating means and returning them to normal position, substantially as described.

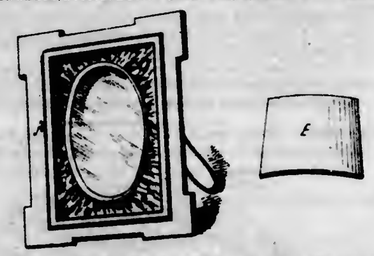
18. The combination, with a box or receptacle for receiving the hay from the rake, of means for concentrating the hay to a chute leading into a baling-chamber, means for elevating the hay through the chute into the baling-chamber, and trip devices for returning the concentrating and elevating means to their respective positions for further operation.

254,759. BED-MATTRESS. JOHN NELLES YOUNG, Sacramento, Cal. Filed Nov. 3, 1881. (No model.)



Claim.—1. The wedge-shaped mattress or bed A, having the head end D thick and gradually tapering to the foot end E, which is thin, thus making an upper incline surface from D to E, thereby securing a proper elevation of the head and upper portions of a person lying thereon, and maintaining that elevation by uniform support, as specified.

2. The openings or depressions B in a mattress or bed, as shown from b to c and b to d d, as herein set forth, for the purpose specified.



3. The separate and detachable piece C, to fit in the depressions of B, as herein set forth, and all for the purposes specified, in combination with the mattress or bed, as described.

254,760. DOSE-CUP BOTTLE-STOPPER. J. HENRY SHILLE, Philadelphia, Pa. Filed Aug. 5, 1881. (Model.)

Claim.—A dose-cup provided with a cork-screw at its bottom, whereby it may be attached to the outer end of the cork stopper of a bottle, substantially as and for the purpose stated.

254,761. PICTURE-FRAME. WILLIAM H. SIBB and HENRY EDWARDS, Boston, Mass. Filed July 3, 1881. (No model.)

Claim.—The herein-described spring for holding pictures, glasses, or similar objects in frames or cases, the same consisting of a sheet of boot card or other analogous stiff spring board, substantially as and for the purpose set forth.

254,762. ELECTRIC-LAMP REGULATOR. BENJAMIN B. BREWER and ADDISON O. WATERHOUSE, Sacramento, Cal., assignors of one-fourth to W. S. Johnston, same place, and Richard W. Tully, Stockton, Cal. Filed Oct. 11, 1880. (Model.)

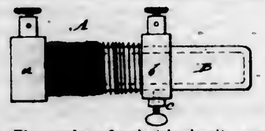
Claim.—1. In an electric lamp, the combination, with the carbon-carrier, of an electro-magnet, an armature, and a train of wheels sustained thereby and gearing with the said carbon-carrier, a time-escapement consisting of a click-wheel, y, and an oscillating pallet or verge and detent mechanism, substantially as described.

2. In a regulator for electric lights, the tube T, with box B, containing gearing controlled by a time-escapement, and the controlling rod or detent e, in combination with the electro-magnetic helix H, core C, lever a, and link l, substantially as and for the purpose set forth.

3. The combination, in an electric lamp, with the gravitating carbon-carrier, of an electro-magnet, an armature, and train of wheels sustained thereby and gearing with the said carbon-carrier, a cylinder-escapement consisting of the cylinder-wheel w, oscillating spindle w' and balance-wheel, and a stationary detent, e, substantially as and for the purpose set forth.

4. The combination, with the carbon-holder R, having spiral or threaded teeth, of a pinion, P, for controlling the position of the electrode R and allowing the same to be turned for adjustment, substantially as described.

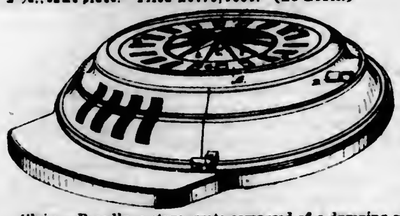
5. The combination of the rod R, tube T, guides g g, frame F, flexible connecting-link l, and lever a with an electro-magnet and its armature, as described.



254,763. THILL-LUG. NEHEMIAH T. FOLSOM, Boston, Mass., assignor to John S. Folsom, same place. Filed Sept. 5, 1881. (No model.)

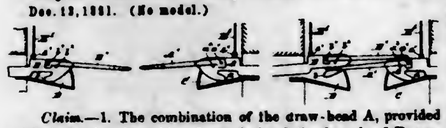
Claim.—The combination of the thill-leg having the recess a' in its upper end, the leather loop holding the buckle in its bight,

the clamping-plate *c*, operating to clamp the ends of the loop in the recess of the lug, and the screws *d d*, substantially as described.



254,764. RHEOSTAT FOR ELECTRIC LAMPS. PATRICK H. FOX, New York, N.Y. Filed July 7, 1881. (Model.)

Claim.—1. The regulator for electric circuits, consisting of a loose coil, A, adjustable slide *b*, and sustaining-rod B, combined for operation substantially as shown and described.

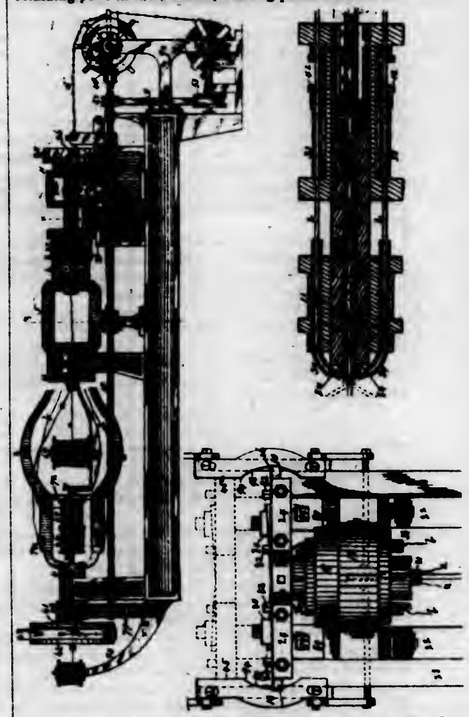


2. The combination with the circuit-wires of an electric lamp, of the coil A, fixed at one end, the slide *b*, and the slide-rod B, substantially as shown and described, for the purposes set forth.

254,765. STOVE-GRATE. ROBERT GALBRAITH, Troy, N. Y., assignor to the M. S. Vedder Pattern Works, Bascom, Galbraith & Co., same place. Filed Nov. 9, 1881. (No model.)

Claim.—Broadly, a stove-grate composed of a dumping central portion surrounded by a register-section capable of such manipulation as to cause its air-openings to be closed when desired, substantially as and for the purpose specified.

254,766. CAR-COUPLING. LYSANDER T. GOSS, Rome, Ind., assignor of one-half to Henry Vickrey, same place. Filed Dec. 13, 1881. (No model.)



Claim.—1. The combination of the draw-head A, provided with the hook *a*, loop A', and guard-pin *a'*, the draw-head B, provided with the hook *b*, loop B', and guard-pin *b'*, and the guides C D, all substantially as shown and specified.

2. The combination, in a car-coupling, of two draw-heads, each partially surrounded by a flaring guide and provided with both an eye and a loop, arranged as shown, whereby either one may pass under and engage with the other, being guided to its place by said guide, all substantially as shown and specified.

3. The combination, in a car-coupling, with a draw-head which is moved vertically during the operation of being uncoupled, of the lever E, pivoted to the car at *e*, and having a branch, E', which is attached to the draw-head at *e'*, substantially as shown and described, and for the purpose specified.

254,767. WIRE-BARBING MACHINE. JAMES J. BATHAWAY, Beaver Falls, Pa., assignor of one-half to John H. McMahon, same place. Filed Oct. 31, 1881. (No model.)

Brief.—The rotary barbing-head is in two parts. The front part reciprocates and the rear part is non-reciprocating. In front of the barbing-head and reciprocating therewith in a frame carrying bending-slides, which are forced inward as the head advances and rotates by stationary cams at the side of the frame. The main wires are drawn intermittingly through the machine, along grooves in the central core of the barbing-head, by the spooling device. The barb-wires pass through guides at the sides of the barbing-head, and the front ends of the guides are curved inwardly, to direct the barbs between the main wires. When the machine starts the barb-wires are bent around the main wires by the combined action of the rotating head and the bending-slides as the former moves forward and rotates and the latter move inward past each other. The bending of the barb causes it to bite against the main wires, and thus the barb-wires are drawn from their spools and through retaining-pawls on the non-reciprocating rotary part of the head by the advance of the reciprocating part of the rotary head. So soon as the coiling is finished the barbs are reversed by knives on the bending-slides, the ends of the barb-wire guides acting as stationary cutters. The barbing-head then begins to recede, and exposes the barb-wires at their front ends for a sufficient distance to form the next barbs, the barb-wires being prevented from slipping back the retaining-pawl in the non-reciprocating part of the head.

Claim.—1. The combination of a reciprocating rotating head a pair of laterally-reciprocating bending-slides, and a knife or knives moving with the slides, substantially as and for the purposes described.

2. A pair of laterally-reciprocating bending-slides, forked or grooved in the ends for receiving the ends of the barb-wire, and each provided with a recess for allowing the withdrawal of the finished barb, and a knife for cutting off the barbs at the end of the stroke, substantially as and for the purposes described.

3. A pair of laterally-reciprocating bending-slides, in combination with stationary cams, which force them inward to bend the barbs, the said cams having straight surfaces at their outer ends, which permit the slides to have a short stop while the applied barb is being withdrawn, substantially as and for the purposes described.

4. The combination of a rotating reciprocating head having a hollow spindle and curved barb-wire guides with a pair of laterally-reciprocating bending and covering slides, substantially as and for the purposes described.

5. A bending-slide forked or grooved in the end, and provided with a lateral recess back of the groove, and a knife or shear in the rear side of the recess and projecting into it, substantially as and for the purposes described.

6. The rotating barbing-head having a hollow spindle and inwardly-curved barb-wire guides, in combination with a core-rod having lateral grooves in its end, substantially as and for the purposes described.

7. The reciprocating barbing-head having a curved guide or guides through which the barb-wire is fed, in combination with devices which hold the barb wire or wires stationary, so that the head shall slip over them during its backward movement, substantially as and for the purposes described.

8. The reciprocating barbing-head having a barb-wire guide or guides, in combination with the non-reciprocating spring-dog, which permits the barb-wire to be drawn forward at the forward movement of the head and prevents its moving back at the backward movement of the head, substantially as and for the purposes described.

254,768. TOY BALL. EDGAR K. HAYNES, Boston, Mass., assignor to John B. Penby and John P. Lowell, both of same place. Filed Dec. 19, 1881. (No model.)

Claim.—The herein-described toy, consisting of the ball A, having sound-openings E E, the metal ball B, entirely inclosed within said ball, and the ball-clapper C, mounted on the spiral spring D, the said clapper being arranged to ring only when the ball is forcibly jarred and the ball being entirely protected from direct external blows, as shown.

254,769. CHILD'S TOY. SIEGFRIED L. HOCKNEY, Cincinnati, Ohio. Filed Dec. 14, 1881. (No model.)

Claim.—The combination, with the handle and the open ring, of the cord having one end loosely looped around and in a groove in the ring at a point in line with the handle, and provided at its other end with a ball or other object, whereby the loop of the cord will turn freely on the ring, in the manner and for the purposes described.

254,770. PIE-BAKING PLATE. CHARLES T. HERD, Peoria, Ill. Filed Aug. 11, 1881. (No model.)

Claim.—As a new article of manufacture, a pie-plate or analogous culinary utensil made of a single piece of foraminous material and provided with a concave bottom, substantially as shown and described.

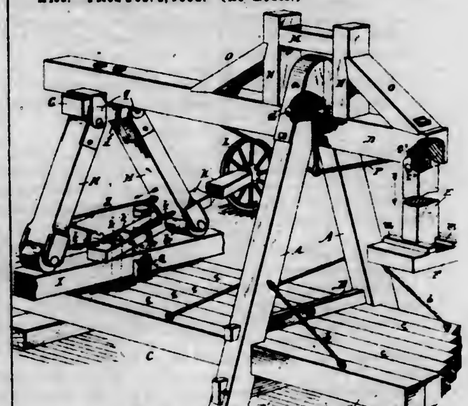
254,771. JOURNAL-LUBRICATOR. GEORGE JACKSON, New York, N.Y., assignor to the United States Electric Lighting Company, same place. Filed Oct. 27, 1881. (No model.)

Claim.—1. In a self-lubricating journal-bearing, the combination of a bearing having longitudinal recesses or channels connected at their ends by annular grooves with a journal having grooves adapted to register with the annular grooves in the journal, substantially as set forth.

2. In a self-lubricating journal and bearing, a journal having an enlarged shoulder adapted to fit in a corresponding enlargement of the bearing, and annular grooves at either end, in combination with a bearing having longitudinal recesses or channels and annular grooves in position to register with those in the journal, as described.

254,772. MAIL-BAG FASTENING. ADMIR JOHNSTON, Hoisbridge, N.Y. Filed Dec. 19, 1881. (No model.)

Claim.—In a mail-bag fastening, the jointed strap C, having tongues D and the shouldered tongue E, in combination with the staples *a* and lock F, consisting of the pivoted claws *c*, pivoted arm *g*, and spring *f*, substantially as and for the purpose specified.



254,773. NUT-LOCK. PRESTON JONES, Shelbyville, Ind., assignor to Hugh McKenzie, Cincinnati, Ohio. Filed June 13, 1881. (No model.)

Claim.—1. The plate E', having the housings *d'* and *d'*, jointly with the keys F' and F', substantially as and for the purpose set forth.

2. The combination, in fastenings for nuts, of washer-plates having housings folded over and provided with recesses *e* and keys F', as set forth.

254,774. COTTON-PRESS. GEORGE E. JUDSON, Williamsburg, Miss. Filed Feb. 4, 1882. (No model.)

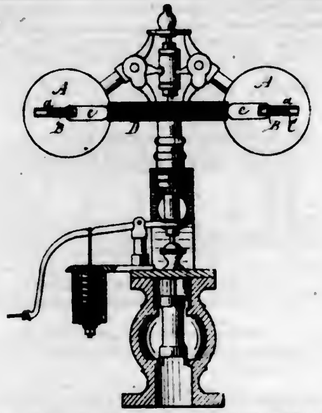
Claim.—1. The combination, with the lever D and a supporting-frame, of the roller toggle-arms H, means for operating said toggle-arms, pivotal connections between the toggle-arm and lever, and the track I, substantially as and for the purpose specified.

2. The combination, with the lever D and a supporting-frame, of the roller toggle-arms H, pivotal connection between said toggle-arms and lever, mechanism for operating said arms, and the track I, both the toggle-arms and the track being arranged at right angles to the lever D, substantially as and for the purpose specified.

3. The combination, with the lever D, a supporting-frame, the roller toggle-arms H, means for operating the same, and the track I, of the lever K, supported at its outer end by a wheel, L, and pivotal connections between the lever K and the toggle-arms, substantially as and for the purpose specified.

4. The combination, with the posts A, lever D, roller toggle-arms H, and the track I, of the base C, extending the full length of the lever D, substantially as and for the purpose specified.

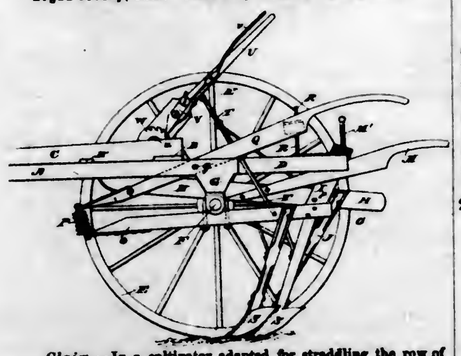
5. The combination, with the lever D, a supporting-frame for the same, roller toggle-arms H, and track I, of the lever K, staples *h k*, and adjustable chains *l*, constructed and operating substantially as and for the purpose specified.



6. The lever D, provided with a compression-truss frame, M N O, one side of its pivotal point, and on the opposite side with a tension-truss, P, substantially as and for the purpose specified.

7. The lever D, provided with an upper concave recess, *c*, in combination with the posts A, having rounded portions to fit in said recesses, substantially as and for the purpose specified.

8. The lever D, provided with an upper concave recess, *c*, and with lower concave recesses, *c' c'*, in combination with the posts A, the toggle-block G, and the follower-bar E, having rounded portions to fit in said recesses, substantially as and for the purpose specified.



254,775. GOVERNOR. JOHN L. JUDSON and WILLIAM A. COGSWELL, Rochester, N.Y., assignors to Junius Judson & Son, same place. Filed May 21, 1881. (No model.)

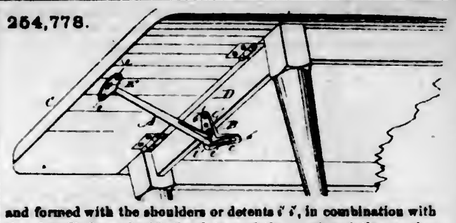
254,775.

Claim.—In a governor, the combination, with the balls A A, of cross-bars B B, attached to the balls and made adjustable forward and back, and coiled springs D D, connecting the cross-bars, as shown and described, and for the purpose specified.

254,776. CULTIVATOR. GABRIEL MARTIN, Monroe Township, Logan County, Ohio. Filed July 18, 1881. (No model.)

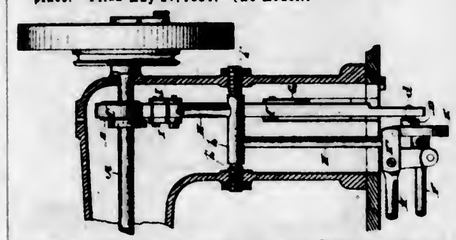
Claim.—In a cultivator adapted for straddling the row of corn, the combination of supplemental cultivators O S, hinged near their centers to the axle, springs P at the forward end of the beams of said cultivators, handles or levers Q, extending from said springs to the rear of the cultivator, and racks R, all arranged substantially as and for the purposes set forth.

254,777. BEDSTEAD. JNO. HOENEL, Chicago, Ill., assignor to Hoenel & Price, same place. Filed Jan. 25, 1882. (No model.)



Claim.—In combination with the main portion A of a bedstead head-board, the paneled top B, consisting of the grooved uprights F, having the shorter facings F, the top rail, E, and the panel C, the parts being secured and the panel being retained by the grooves *f* in the uprights F', and free to move vertically behind the rails D and E, or one of them, substantially as described.

254,778. TABLE-LEAF SUPPORT. JOSIAH H. HOSMER and GUERNON H. CRANE, Portland, Mich., assignors to Emory W. Blanchard and Jeptha B. Morehouse, same place. Filed Sept. 24, 1881. (No model.)



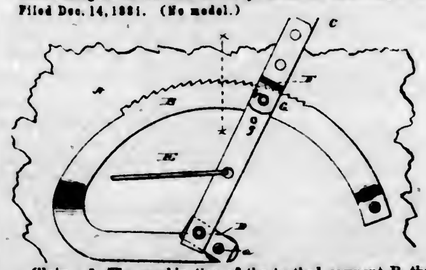
Claim.—The hinged arm A, having its outer end enlarged

254,778.

and formed with the shoulders or detents *c' c'*, in combination with the plate B, formed with the slot *c* and the opening *c'*, the opening *c'* being wider than the slot *c*, as and for the purposes set forth.

254,779. SEWING-MACHINE. GEORGE M. PRATT, Middletown, Conn., assignor to the Victor Sewing Machine Company, same place. Filed May 27, 1881. (No model.)

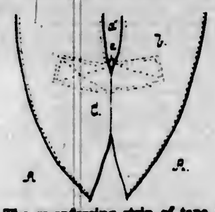
Claim.—The combination, in a sewing-machine, of the hollow standard, the driving-shaft, the feed-shaft, the connecting-rod C between the driving and feed shafts, the rod G, pivoted to the hollow standard and to the connecting-rod, the crank-lever H, one arm of which is in line with the connecting-rod and is linked thereto by the link I, and the other arm of which is to one side of the connecting-rod and is connected with the shuttle-lever K, the elongated hub of the lever H, and its bearings in the hollow standard, substantially as and for the purpose set forth.



254,780. ELECTRIC INCANDESCENT LAMP. EDWIN A. SCHIERER, Newark, N. J., assignor to the United States Electric Lighting Company, New York, N. Y. Filed Jan. 26, 1882. (No model.)

Claim.—1. An electric incandescent lamp containing a rarefied atmosphere of chlorine.

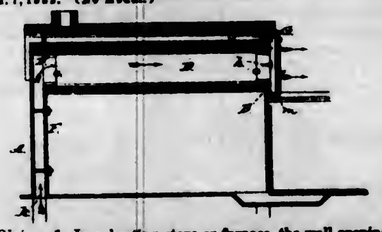
2. In an electric lamp, a carbon conductor adapted to be rendered incandescent, in combination with an inclosing-globe containing a rarefied atmosphere of chlorine, substantially as described.



254,781. WAGON-BRAKE LEVER. GEO. L. SLAPER, Buchanan, Mich., assignor of one-half to Joseph L. Richards, same place. Filed Dec. 14, 1881. (No model.)

Claim.—1. The combination of the toothed segment B, the lever C, and its short pivoted link D, substantially as described, with the rod E, for the purpose set forth.

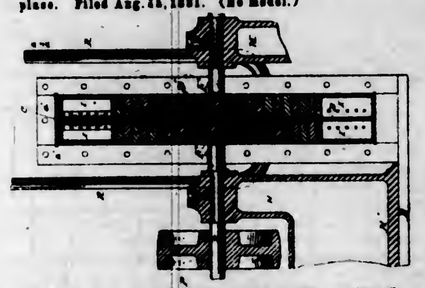
2. The combination of the toothed segment B, the lever C, its short link D, pivoted to an extension of said segment, the rod E, the arm F, and the spring-actuated pin *b*, substantially as described.



254,782. DRAWERS AND OTHER GARMENTS. JULIUS STIEFEL and MAX JUHR, Baltimore, Md. Filed Nov. 16, 1881. (No model.)

Claim.—1. The re-enforcing strip of tape C, or equivalent unyielding material, quilted to the garment across the end of the opening *a'* and between the parts A and *b*, as set forth.

2. In a garment, a re-enforcing strip of tape, C, or equivalent unyielding material, secured across the end of the opening and having the slack edges, as set forth.



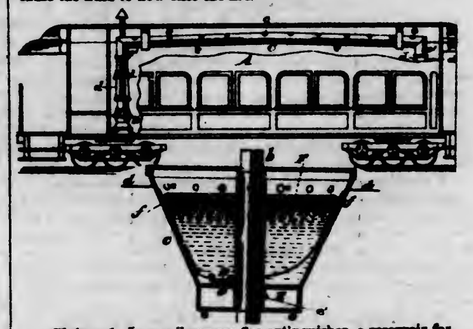
254,783. HEATING-STOVE. JOHN STRASSER, Manchester, No., assignor of one-half to George Strasser, same place. Filed Jan. 7, 1882. (No model.)

Claim.—1. In a heating stove or furnace, the wall-openings B B' in the upper portion, the up-draft-flue plate extending from the rear opening, B', to the bottom of the stove, the rim-bearing *c*, the removable front collar, E, and the removable horizontal hot-air flue D, having its ends seated on said rim-bearing, substantially as specified.

2. In a heating-stove, the combination, with the horizontal flue D and its front opening, E, of the register-door G, having a hinge at its lower edge, and a stop-shoulder, *n*, whereby it forms a shelf below said opening, substantially as specified.

254,784. BRAN-FLOURING MACHINE. WALLACE WARREN, Chicago, Ill., assignor of one-half to Frank C. Taylor, same place. Filed Aug. 25, 1881. (No model.)

Claim.—1. In a bran-souring machine, the combination, as shown, of the cylindric shell and winged disk, said shell having its inner periphery minutely and sharply rough, as described, and having a suitable inlet and a lateral adjustable outlet located near but slightly inward from the periphery, whereby the bran may be swept about against the rough face of the shell until suitably reduced and then discharged, substantially as described.



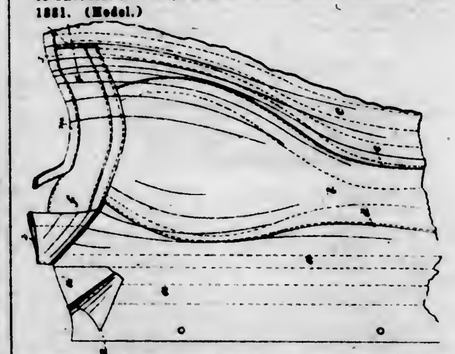
2. In combination with the shell having the lateral marginal opening J, the slide I, having the slot *l* arranged with the opening J, so as to vary the distance of the discharging-orifice from the periphery of the shell, substantially as described, and for the purpose set forth.

3. In the bran-reducing machine described, the disk D, provided with the wings I, having the flanges I' turned backward and supported from the disk at the outer margin of the wings, substantially as described.

4. In the bran-reducing machine described, the disk D, provided with opposite wings, I, each pair consisting of a single plate having a slot, *i*, and bent at the extremity of the slot, as shown and described, and for the purposes set forth.

254,785. AUTOMATIC FIRE-EXTINGUISHER FOR RAILROAD-CARS. FRANK A. WHITE, Cortland Village, N. Y., assignor of one-half to Wm. B. Stoppard, same place. Filed Feb. 13, 1882. (No model.)

Brief.—The reservoir C, for fire-extinguishing agent, has a distributer, E, attached thereto to spread the water or other fluid. In case of accident, whereby the stove is displaced or upset, the cords *d*, which are attached to the stove, will open the valves and cause the fluid to flow onto the fire.

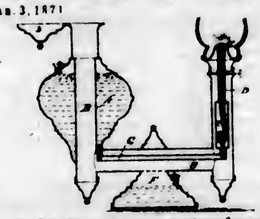


Claim.—1. In a railway-car fire-extinguisher, a reservoir for the fire-extinguishing medium, provided with valved apertures at top and bottom, in combination with the fluid-distributing chamber and operating cords or wires for releasing the valves, the ends of said cords or wires being secured to the stove, as and for the purposes specified.

2. In a railway-car fire-extinguisher, a reservoir for the extinguishing medium, provided with valved apertures at the top and bottom thereof, in combination with a fluid-distributing chamber having suitable perforations and means for operating the valves which control the apertures in said reservoir, substantially as shown and described.

3. A reservoir for the fire-extinguishing medium and a fluid-distributing chamber, communicating with each other by valved apertures, in combination with a stove-flue, with which said distributing-chamber also communicates, the opening between said chamber and stove-flue being suitably valved, substantially as set forth.

4. The reservoir C, having apertures *a*, and distributing-chamber E, having perforations *a*, in combination with the stove-flue having channel *d'*, valves D, and operating cord or wire *d*, as set forth.



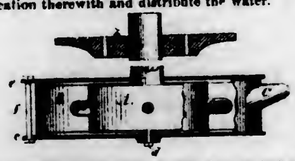
254,786. CORSET. CHAS. E. WILLIAMS, Worcester, assignor to Theodore C. Bates, North Brookfield, Mass. Filed Apr. 18, 1881. (Model.)

Claim.—In a corset having a gorelum breast portion, as set forth, the distending-strip *f*, combined with the pieces *a* and *c*, and pockets or slits made in the material thereof to receive and retain the ends of the said distending-strip, substantially as shown and described.

REISSUES.

10,050. LAMP. FRANKLIN T. GRIMES, Liberty, Mo., assignor, by mesne assignments, to Michael Hicks and Thomas Smith, New York, N. Y. Filed June 3, 1879. Original No. 110,648, dated Jan. 3, 1871.

Claim.—1. In a lamp, the combination of an oil-reservoir, A, air-supply tube B, passing through said reservoir and thence to the burner, an oil-conducting passage, G, and a closed burner, E, the wick-tube being set apart from the oil-reservoir, and to one side thereof, and connected therewith by the air-tube B and oil-tube G, whereby the heat from the flame will not come into contact with the reservoir, substantially as described.



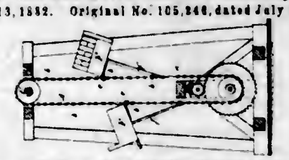
2. In a lamp, the combination of an oil-reservoir, A, an air-supply tube, B, passing through said reservoir in the direction of the greatest length of the latter, to thoroughly cool the oil, and thence to the closed burner E, oil-conducting tube G, wick-chamber C, and the said closed burner E, the wick-tube being set apart from and to one side of the oil-reservoir A, whereby the heat from the flame will not come into contact with the latter, substantially as described.

3. In a lamp, the combination of an oil-reservoir, A, an air-supply conduit, B, the walls of which are in contact with the oil in the reservoir, the wick-tube C, and closed burner E, to which latter the air is conducted by the conduit B, the said wick-tube being arranged or set away from and to one side of said oil-reservoir A, and connected therewith by the air and oil tubes or conduits B G, whereby the oil is thoroughly cooled by the passage of air to the burner, and the heat from the flame will not come into contact with the oil-reservoir, substantially as described.

4. In a lamp, the combination of oil-reservoir A, air-conduit B, the walls of which are in contact with the oil in the reservoir, a separate wick-chamber, C, the latter being arranged away from and to one side of the reservoir, and the connecting air and oil tubes B G, all arranged substantially as shown, to cool and preserve the oil at a low temperature, and the closed burner E, the chimney of which is set directly upon the burner, closely inclosing it, whereby all the air supplied by tube B comes into direct contact therewith, and the products of combustion are completely and immediately carried away by the chimney.

10,051. FIRE-EXTINGUISHER. ELIAS JONES, Pierrepont, N. Y., assignor to Joseph A. Miller, Jr., Providence, R. I. Filed Dec. 9, 1880. Original No. 110,931, dated Oct. 17, 1871.

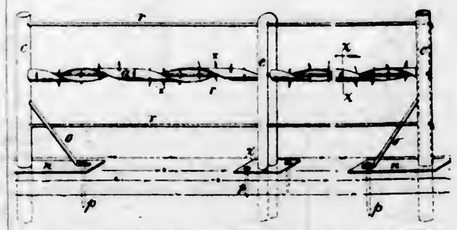
Brief.—The pipe *a* has an enlarged head, A, which has discharge-outlets *c*. The head is surrounded by case B, which, being attached to said head by pivots and having tangentially-arranged water-outlets, is caused to revolve when the water-supply is in communication therewith and distribute the water.



Claim.—1. The combination, with the supply-head consisting of a pipe with a head having one or more outlets, of a revolving vessel provided with outlets, the direction of which is inclined or oblique to the surface of the vessel, so as to revolve the vessel by the reaction of the discharging water and distribute the same, as described.

2. The combination, with the case B, provided with tangential discharge-outlets, of the pipe *a*, terminating in a case or supply-head, A, having outlets *c*, and forming a bearing for the surrounding case B, and the screw *d*, by which the case B is secured, the whole constructed to distribute water under pressure over a circular area and diffuse the same by centrifugal force, as described.

3. In a fire-extinguisher, the combination of a supply-head, consisting of a pipe with a head having one or more outlets, and a revolving distributer consisting of a loosely-fitting case surrounding said pipe and its head and covering the outlets thereof, said case having outlets from which water is discharged tangentially, as described.

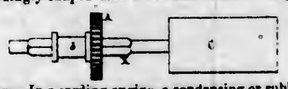


10,052. HOD-ELEVATOR. JESSE POWERS, Chicago, Ill. Filed Jan. 13, 1882. Original No. 105,246, dated July 12, 1870.

Claim.—1. The endless traveling ladder A, combined with a detachable hod, F, having hook *e* and shank *f* attached thereto, the said hook being attached to one end of the hod, as and for the purpose described.

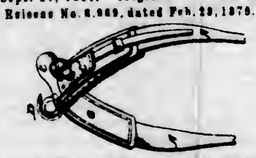
2. The hod F, provided with the shank *f* and hook *e*, secured to one end of the hod, adapted to be suspended upon a round of the traveling ladder A, as and for the purpose described.

10,053. BARBED-WIRE FENCE. WILLIAM WATKINS and HIRAM B. SCUTT, Joliet, Ill., assignors to Washburn & Moen Manufacturing Company, Worcester, Mass., and Isaac L. Ellwood, De Kalb, Ill. Filed Jan. 23, 1882. Original No. 163,055, dated June 1, 1875.



Claim.—1. The attachment of wire fences herein described, consisting of wire-encircling strip *a*, formed of spiral metal and having barbs *x* projecting through the sides thereof, constructed as and for the purposes described.

2. The combination, with a fence-wire, of a barbed metal strip, the metal strip being wrapped around or encircling the wire to form a strand of barbed fencing for the purpose of turning stock, as set forth.



10,054. CONDENSING-CYLINDER FOR CARDING-ENGINES. JAMES GREAVES, Philadelphia, Pa., assignor of one-half to John Dobson and James Dobson, same place. Filed Mar. 24, 1877. Original No. 187,820, dated Feb. 20, 1877.

Brief.—A portion of the shaft of the condensing-cylinder, near its end, is made polygonal in cross-section, and works through a correspondingly-shaped hole in the hub of the driving-gear.

Claim.—In a carding-engine, a condensing or rubber cylinder mounted on a polygonally-shaped horizontal shaft, in combination with a driving-gear, A, having a sleeve-shaped bearing, *b*, said shaft and cylinder being adapted to be revolved by the drive-wheel A, and at the same time to be rapidly and continuously reciprocated by suitable mechanism, substantially as and for the purposes described.

10,055. GIG-SADDLE. ANDREW ORTMAYER, Chicago, Ill. Filed Sept. 27, 1881. Original No. 169,095, dated Apr. 13, 1875; Reissue No. 8,949, dated Feb. 29, 1876.

Claim.—1. The combination, substantially as hereinbefore specified, of a removable pad with an unstuffed gig-saddle containing removable nuts located above the said pad, for the purpose set forth.

2. The combination, substantially as hereinbefore specified, of a removable pad consisting of a complete article of itself, and capable of attachment and removal without structural change or alteration, and an unstuffed gig-saddle containing removable terret-nuts supported by pockets arranged for exposure and for access to the said nuts when the said pad is removed, for the purposes set forth.

3. In a gig-saddle, the combination, with the metal jockey, of the skirts A A, provided with the pockets F F, to secure the terret plates or nuts *a a*, substantially as specified.

4. In combination, the metal jockey provided with the check-hook D, fastened thereto by means of a nut on the under side of the jockey, and the removable pad G, having an opening in its upper face to allow the said nut and the bolt of the hook to enter the padding of the pad, substantially as and for the purposes specified.

5. The combination, in a gig-saddle, of the check-hook D with the removable pad G, having therein the loop *e'*, adapted and arranged to receive the check-hook, and extending across the forward end of an opening adapted and arranged to receive the nut and screw of the check-hook when the pad is fastened to the latter by means of the said loop, substantially as and for the purposes specified.

10,056. PROCESS OF AND APPARATUS FOR MANUFACTURING GAS FOR HEATING AND ILLUMINATING PURPOSES. HENRY Y. ATTRILL and WILLIAM FARMER, New York, N. Y.; said Farmer assignor to said Attrill. Filed Mar. 30, 1880. Original No. 224,266, dated Feb. 10, 1880.

Claim.—1. The within-described process for the manufacture of gas, consisting in causing the gas-producing material to traverse slowly through a generator, and be subjected to a continuous or increasing high temperature and distilled to different degrees, and drawing off and conducting away independently different grades of gas at different points in the generator, as herein specified.

2. The within-described mode of operation to produce gases of different grades, consisting in, first, causing the gas-producing material to slowly traverse the generating-chamber; second, admitting air and maintaining the residuum of said material in a state of partial combustion; third, heating thereby a current of air for subsequent application to the gas; fourth, withdrawing the poor gas mixed with the carbonic oxide resulting from the partial combustion of the residuum; fifth, separating and conducting away a portion of the mixed gases; sixth, admitting the heated air to the remainder of the mixed gases and burning them; seventh, heating thereby the part of the chamber in which fresh material is introduced; eighth, distilling by such heat the gases and vapors from the freshly-introduced charges; ninth, passing said vapors and gases through partially distilled and coked portions which have a higher temperature; and, tenth, withdrawing the illuminating-gas without admixture with the poor gas, the two gases being kept separate, as herein specified.

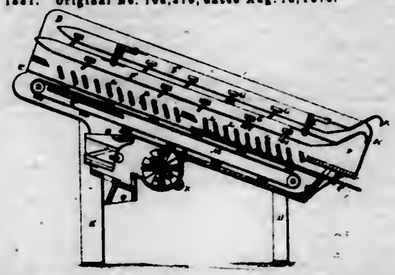
3. The combination of the chamber or stack *m*, having a combustion-chamber at the bottom, with the independent pipes *e* and *e* for withdrawing the gases of different grades without admixture, substantially as described.

4. The combination of the chamber *m*, having combustion-chamber at the bottom and the flue c^2 surrounding its upper part, with the independent pipes *e* and *e*, the latter communicating with the flues c^2, substantially as described.

5. The apparatus described, having, in combination, the upright retort *m*, surrounding flue c^2, fire-grate *a*, provisions *e* for taking away the illuminating-gas, provisions e' e^3 c^3 for taking away and utilizing the poor or heating gas, and passages *g g'* for supplying heated air to mingle with the products of combustion and supply heat to the material at the early stages of its distillation, substantially as herein specified.

6. In the construction of an apparatus for the continuous and simultaneous production and separation of heating and illuminating gases, or for the continuous manufacture of heating-gases alone, the combination of a furnace or combustion-chamber, a retort or distilling-chamber, with its surrounding flues at top and bottom, and the pipes arranged at different levels for withdrawal at will of gases of different composition, and the flue connecting the lower eduction-pipe with the upper flue surrounding the retort, whereby the said apparatus may at will be devoted to the simultaneous production and separation of illuminating and heating gases or the production of heating-gases alone, all in the manner substantially as described.

10,057. HOMINY-MILL. THEODORE HUSSEY, Terre Haute, Ind. Filed Jan. 27, 1862. Original No. 132,172, dated Dec. 26, 1871; Reissue No. 5,530, dated Aug. 5, 1873.



Claim.—1. The combination of the shaft B, plates E, lugs F, arms I, cutters G, and the collars D, all substantially as specified.

2. The combination of the cutters G, lugs F, arms I, shaft B, and plates E, substantially as specified.

3. The combination, with the shaft B, of longitudinal side plates formed with rigid lugs, and cutters bolted to said lugs, as and for the purpose described.

4. The combination, with the shaft B and the cutters, of longitudinal side plates formed with rigid lugs, which lugs on one plate alternate with those on the next plate to form broken spirals, as described.

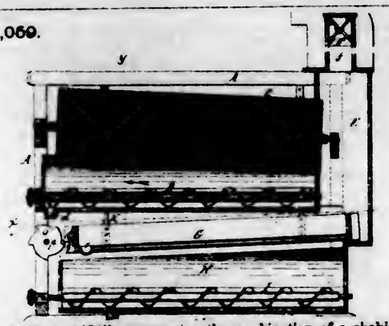
10,058. SEPARATOR ATTACHMENT FOR THRASHING-MACHINES. MOSES A. KELLER, Littlestown, Pa. Filed July 18, 1881. Original No. 108,370, dated Aug. 16, 1870.

Claim.—1. The combination, with a series of reciprocating straw-carriers and series of slats located beneath the straw-carriers and adapted to separate the straw from the grain and chaff, of an endless carrier provided with cross-bars, and a grain-board or inclined bottom placed below the carrier, whereby the grain and chaff fall between the cross-bars of the carrier onto the grain-board, and are then conveyed to the winnower, substantially as set forth.

2. The combination, with a reciprocating straw-carrier and a slatted separator, of an endless carrier located beneath the separator and grain-boards, one being located within the endless carrier near its upper end and the other being located below the lower end of the carrier, substantially as set forth.

3. The combination, with the reciprocating straw-carrying bars F G, of the adjustable slats I, located beneath the straw-carrying bars and in close proximity thereto, substantially as set forth.

4. The combination, with the fan and fan-shaft, of the pivoted bar *a*, weights *b*, rod *d*, register *g*, and devices for connecting the rod *d* and register, substantially as set forth.



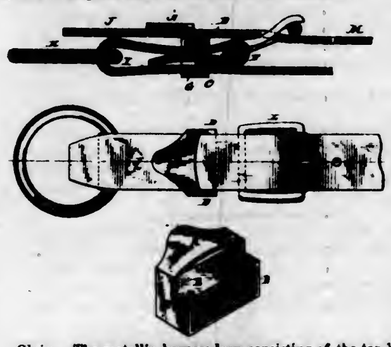
5. The combination, with the pulley for actuating the straw-carrier R and pulley T, of the belt S and guide-pulleys U, the latter supported on an elongated vertical stud, V, and adapted to be vertically adjustable thereon, substantially as set forth.

10,059. MACHINE FOR SEPARATING MIDDLINGS. WILLIAM R. MIDDLETON, Commonwealth, Wis., assignor, by mesne assignments, to W. W. Huntley, A. P. Holcombe, and Aug. Heinz. Filed Aug. 2, 1881. Original No. 102,926, dated Nov. 1, 1870. Reissue No. 4,237, dated Mar. 28, 1876. Division B.

Brief.—The original patent is reissued in two divisions, Division A having been granted September 6, 1881, No. 9,862.

Claim.—1. In a middlings-separator, the combination herein described of a shaking-sieve, whereby the middlings are sifted, a fan for causing an air-current, and a reel for separating the finer flour from the middlings before the latter reach the air-current and sieve.

10,059.



2. In a middlings-separator, the combination of a shaking-screen, a hopper arranged lengthwise underneath the screen, in which the sifted middlings are received, a conveyer arranged lengthwise in the hopper, whereby the sifted middlings are collected and removed, a suction-fan, whereby the floating impurities are drawn off, and a preliminary dusting-bolt, whereby the flour is separated from the middlings previous to subjecting the middlings to the action of the air-current and the shaking-sieve, substantially as set forth.

3. The combination, with a dusting-reel, whereby the flour is separated from the middlings, of a hopper arranged lengthwise underneath the reel, in which the flour is received, a conveyer arranged lengthwise in the hopper, whereby the flour is removed, a shaking-sieve which receives the middlings from the dusting-reel, a hopper arranged lengthwise underneath the shaker, in which the middlings are received, and a conveyer arranged lengthwise in this hopper, whereby the sifted middlings are collected and removed, substantially as set forth.

4. The combination, with a dusting-reel, whereby the flour is separated from the middlings, and a shaking-sieve by which the middlings are separated from the offal, of a suction-fan, and an air-trunk connected with the eye of the fan, through which an ascending air-current is drawn to the fan, and through which the middlings pass from the dusting-reel to the shaking-screen, substantially as set forth.

10,060. HARNESS-LOOP. DUNCAN MCMILLAN, Webster City Iowa, assignor, by mesne assignments, to Carrie M. McMillan, same place, and Edwin D. Myers, Cleveland, Ohio. Filed Nov. 4, 1881. Original No. 183,135, dated Sept. 12, 1876.

Claim.—The metallic harness-loop consisting of the top bar, A, the intermediate bar, B, extending in front of said top bar, the bottom bar, C, the side bars, D, and the rivet G, passed through the intermediate bar in front of the top bar, all constructed and relatively arranged as herein shown, and adapted to receive and secure a strap or straps, for the object stated.

THE ELIOTYPE PRINTING CO BOSTON

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the United States.

GOTTFRIED *v.* MILLER.

Decided January 23, 1882.

1. CONTRACTS OF CORPORATIONS—CORPORATE SEAL.
   A corporation may bind itself by a contract not under its corporate seal when the law does not require the contract to be evidenced by a sealed instrument.
2. SAME—AGENTS.
   Such contracts may be executed by an agent, and the rule is that the agent should in the body of the contract name the corporation as the contracting body, and sign as its agent or officer.
3. ASSIGNMENTS OF PATENTS—NOT UNDER SEAL.
   Assignments of patents are not required to be under seal. The statute simply provides that "every patent or any interest therein shall be assignable in law by an instrument in writing."
4. SAME—SAME—PARTICULAR CONTRACT.
   An assignment therefor, purporting on its face to be the contract of the corporation therein named, declaring that the consideration has been received by the company, that it is executed in pursuance of a resolution passed by the company and purporting to be signed by Smith, president of the company, who declares that he signs it as the act of the company, is transfer of said company and not the personal deed of Smith.
5. STOCK COMPANY—ATTACHMENT OF STOCKS—ENCUMBRANCE.
   The fact that a person holds stock in a company gives him no title to its property, and the attachment of such stock in the hands of a stockholder for a personal debt of the stockholder does not in any way encumber the property of the company.
6. SALE OF MACHINE—IMPLIED LICENSE.
   Where Stromberg sold to Miller a machine and the right to use the same and Stromberg subsequently acquired an interest in the patent covering the machine, *Held* that such sale was a license to Miller to use the machine so far as Stromberg could grant a license.

Messrs. E. & T. A. Banning for the appellant.

Mr. E. H. Abbott for the appellee.

APPEAL from the Circuit Court of the United States for the Eastern District of Wisconsin.

STATEMENT OF THE CASE.

The bill of complaint alleged that on May 3, 1864, letters patent of that date were granted to the complainants, Matthew Gottfried and John F. T. Holbeck, for an improvement in a machine for pitching beer-barrels. It charged that the defendant was infringing said letters patent, and prayed for the writ of injunction against him to restrain further infringement and for damages and an account of profits. The only defense relied on was that on November 25, 1872, one John H. Stromberg was the owner of an undivided one-third of the entire interest in the letters patent sued on, and being such owner had sold and delivered to the defendant for his use forever a machine for pitching barrels containing some of the improvements purporting to be secured by said letters patent; that the defendant had paid for said machine, and had since said November 25, 1872, hitherto continued to use, and was still using the same, and that the defendant, except as aforesaid, had never in any manner used or employed the method or improvements or the process or machine set forth in said letters patent. The cause was heard in the circuit court upon bill, answer, replication, and evidence, and that court, being of opinion that the defense had been made out, dismissed the bill. The appeal of the complainant brings the case to this court for review.

The controversy relates to the right of the defendant to use the machine purchased by him from Stromberg. The evidence establishes the following state of facts, about which there seems to be no dispute:

Letters patent dated May 3, 1864, were granted to Gottfried and Holbeck, the complainants, for an improvement in the mode of pitching barrels.

On November 25, 1872, one Stromberg sold to the defendant, Miller, a pitching-machine containing, as complainants asserted, the improvements covered by their patent. Miller claimed the right to use this machine, and has used it from the time of his purchase up to the filing of the bill. This is the infringement of which complaint is made. The controversy depends on several transfers and other transactions between the parties who at different times had or claimed to have an interest in the patent. They were as follows:

On December 19, 1870, Gottfried, one of the patentees, by written assignment, in consideration of five dollars paid and a royalty to be paid of ten dollars on every machine to be manufactured by Holbeck, sold and transferred to Holbeck all his interest in the patent and the invention, reserving to himself, however, in the same instrument the right to revoke the assignment if the royalty reserved should not be paid, and on January 3, 1871, Holbeck, being then the sole owner of the patent, sold and assigned to Charles F. Smith and Henry C. Comegys an undivided two-thirds of all his title and interest therein.

On January 25, 1871, the title to the patent being at that time in Holbeck, Smith, and Comegys, they, by written assignment, transferred all their right, title, and interest in and to various patents, including the Gottfried and Holbeck patent, to the Barrel Pitching Machine Company, of Baltimore. The assignment contained this provision:

> The same to be held and enjoyed by the said company as fully and entirely as they would have been held by us if this assignment and sale had not been made, with the exception that the said company shall not assign to any one but ourselves any or all the interest in and to the above-named patents in the proportion as they are now held by us, this assignment to hold good until the dissolution or liquidation of the said company, when the said company shall reassign to us in the same proportions as now assigned by us.

Afterward, on June 1, 1871, Holbeck, Smith, and Comegys made a further assignment to the company of their interest in the patents mentioned in the first assignment, which contained the following clause:

> And provided also that this assignment shall continue in full force until the dissolution of said company, in which event, or in the event of the liquidation of the affairs of said company, the several interests of each grantor in said patents shall, subject to the lawful rights of the creditors of said corporation, be reassigned to each grantor.

On December 9, 1875, the directors of the Barrel Pitching Machine Company resolved that all the right, title, and interest of the company in and to this patent acquired by the assignment from Smith, Comegys, and Holbeck should be assigned and conveyed back to those parties for the sum of five hundred dollars; and it was further resolved that Charles F. Smith, who was the president of the Barrel Pitching Machine Company, be

directed to execute and deliver to Smith, Comegys, and Holbeck an assignment on behalf of the Pitching Machine Company.

On the 11th day of December, 1875, in pursuance of the resolution just mentioned, an instrument was executed which purported to be an assignment, for the consideration of five hundred dollars, by the Barrel Pitching Machine Company to Smith, Comegys, and Holbeck of all the right, title, and interest of the company in and to the patent.

The attestation clause and signature were as follows:

In testimony whereof and in pursuance of a resolution passed by said company on the 9th day of December, 1875, a copy of which is appended hereto, the said Charles F. Smith hath hereto set his hand, as the act of the said company, this 11th day of December, 1875.

(Signed) CHARLES F. SMITH,
President Barrel Pitching Machine Company.

On the same day, December 11, 1875, Smith, for the alleged consideration of five hundred dollars, granted and assigned to Holbeck and Gottfried all his right and title to the patent; and afterward, on June 7, 1876, Comegys transferred to Stromberg all his interest in the patent.

It next appears that on October 9, 1876, Gottfried, Holbeck, and Stromberg, who are named as jointly interested in the patent by a certain instrument in writing, appointed J. H. B. Latrobe, of Baltimore, their attorney, with authority to prosecute suits against infringers of the patent and to compromise or adjust the same. This instrument contained the following clause:

And it is understood that all expenses, costs, and charges, including counsel fees, attending the litigation, if any, shall be deducted from the collections aforesaid and the balance paid over to the parties hereto in the proportion of their interest in the said patents, and particularly it is understood that the said John H. Stromberg shall be paid out of said collections, as fast as made, all moneys that he may have advanced in the prosecution of claims under said letters patent.

This instrument bears the signatures and seals of Holbeck, Gottfried, and Stromberg. During the years 1877 and 1878 bills in equity were filed by them against various defendants, in which they averred themselves to be joint owners of the letters patent.

On December 15, 1879, Stromberg, in consideration of the sum of five thousand dollars, assigned to Gottfried all his interest in the patent, and in all claims of every kind or nature for past infringements and all rights of action arising out of or connected with infringements This instrument of assignment recited the fact that Stromberg had theretofore disposed of rights and licenses under the patent as a part owner under mesne assignments of the same, and had caused suits to be instituted against infringers, and that it was a part of the consideration of the assignment from him that he should be released from all claim which Gottfried or Holbeck or their assignees might or could have against him for or by reason of any collections theretofore made by him or his attorneys, or against any person or persons to whom he had granted licenses to use the patented improvements, and it was then declared as follows:

Now therefore the said Matthew Gottfried and the said John F. T. Holbeck, (the said Holbeck uniting herein for the purpose of carrying out the agreement aforesaid,) for and in consideration of the premises, have released, and by these presents do hereby release, the said John H. Stromberg from all claim that they or either of them might or could have against the said Stromberg for or by reason of any collection he may have made from parties to whom he or his attorneys * * * may have granted licenses to use the said patented improvement, hereby ratifying and confirming all such licenses and all the acts of the said Stromberg and his attorneys in the premises; and the said Matthew Gottfried doth hereby covenant and agree that he will save harmless the said Stromberg and his attorneys from all claims that may be made against them, or either of them, for or by reason of any interest which the said Gottfried and Holbeck, or either of them, may have given to any other party in the said letters patent.

It appears also that in September, 1873, Charles F. Smith brought a suit against Henry C. Comegys in the superior court of Baltimore city upon an indebtedness from Comegys to him, in which an attachment was issued and a seizure made of the shares of capital stock held by Comegys in the Barrel Pitching Machine Company, which proceedings, on October 27, resulted in a judgment condemning the stock, according to the laws of the State of Maryland, for the satisfaction of Smith's claim.

On the day upon which Stromberg sold the machine to the defendant, Miller, he had no interest in the patent and no license under it, and it is admitted that in making and selling the machine to Miller Stromberg was an infringer.

At the January term, 1881, on motion of both complainants, the court below dismissed the bill as to Holbeck, and, upon final hearing in June following, a decree was made dismissing the bill as to Gottfried, the other complainant. From this decree Gottfried appealed.

Mr. Justice WOODS delivered the opinion of the Court.

The appellant rests his right to a decree in this case upon these grounds: First, that Stromberg never owned any part of the patent sued on; and, second, that if he did his ownership could not inure to the protection of the defendant, Miller. We shall consider these contentions in the order stated.

Upon the first point we remark that it is entirely clear that the assignment of his interest in the patent by Comegys to Stromberg, dated June 7, 1876, transferred to the latter an interest therein, provided the retransfer of the patent by the Barrel Pitching Machine Company to Holbeck, Smith, and Comegys vested the title to the patent in them. Briefly stated, the following is the chain of title: Gottfried and Holbeck are the joint patentees; Gottfried conveys all his interest in the patent to Holbeck, who, becoming thus the owner of the entire patent, conveys one undivided third to Smith and another to Comegys; Holbeck, Smith, and Comegys convey the entire interest in the patent to the Barrel Pitching Machine Company; the company reconveys its interest in the patent to its assignors, Holbeck, Smith, and Comegys; Smith conveys his interest to Gottfried and Holbeck, and Comegys conveys his to Stromberg. The contention of the appellant is that the assignment of December 11, 1875, by the Barrel Pitching Machine Company to Holbeck, Smith, and Comegys was not properly executed, and was therefore ineffectual to pass any title.

The assignment declares that in pursuance of a resolution passed by the Barrel Pitching Machine Company, and in consideration of five hundred dollars received by it from Smith, Holbeck, and Comegys, the said company has granted to them all its title and interest in said letters patent. It is officially signed by Smith as president of the company, who declares the setting of his hand thereto to be the act of the company. The resolution referred to in this assignment is in the record, from which it appears that the company decided to make the assignment, and directed Smith to execute and deliver the same to Smith, Comegys, and Holbeck on behalf the company on receiving from them the sum of five hundred dollars. On account of the want of the corporate seal and of the manner of its execution, it is insisted by appellant that this assignment was not the transfer of the Barrel Pitching Machine Company, but the personal deed of Smith.

There is no ground whatever for this contention to stand on. Assignments of patents are not required to be under seal. The statute regulating their transfer simply provides that "every patent or any interest therein shall be assignable in law by an instrument in writing." (16 Stats., 203, sec. 36; Rev. Stats., sec. 4898.) A corporation may bind itself by a contract not under its corporate seal when the law does not require the contract to be evidenced by a sealed instrument. (*Bank of Columbia* v. *Patterson*, 7 Cranch, 299; *Fleckner* v. *U. S. Bank*, 8 Wheat., 338; *Andover T. Corporation* v. *Hay*, 7 Mass., 102; *Dunn* v. *St. Andrew's Church*, 14 John., 118; *Kennedy* v. *Baltimore Ins. Co.*, 3 Harris & J., 367; *Stanley* v. *Hotel Corporation*, 13 Maine, 31.) Even the parole contracts of a corporation made by its duly authorized agent are binding. (*Fanning* v. *Gregoire*, 16, How., 524; *Fleckner* v. *Bank of the U. S.*, 8 Wheat., 338.) The absence therefore of the corporate seal from the contract of assignment does not render it invalid or void. The assignment is executed in the manner required by law of an agent when making a simple contract in writing for the corporation and by its authority. The rule as laid down by the authorities is that the agent should in the body of the contract

name the corporation as the contracting party and sign as its agent or officer. This is the mode in which bank bills, policies of insurance, and many other contracts of corporations are ordinarily executed. (*Mott* v. *Hicks*, 1 Cowen, 513; *Bowen* v. *Norris*, 2 Taunt., 374; *Shelton* v. *Darling*, 2 Conn., 435; *Brockway* v. *Allen*, 17 Wend., 40.)

The assignment under consideration purports on its face to be the contract of the Barrel Pitching Machine Company. It declares that the consideration has been received by the company; that it is executed in pursuance of a resolution passed by the company, and it purports to be signed by Smith, president of the company, who declares that he signs it as the act of the company. It would be an absurdity to hold that this instrument is the individual contract of Smith and not of the Barrel Pitching Machine Company. It is not the company which asserts that this instrument was ineffectual to divest it of title to the patent, and the record shows that the assignees therein named acted upon the assumption that the assignment vested them jointly with the title. We are of opinion therefore that the assignment was well executed by the Barrel Pitching Machine Company, and transferred the letters patent to Holbeck, Smith, and Comegys, and that Stromberg, on June 7, 1876, by virtue of the assignment made to him on that day by Comegys, became vested with an undivided interest in the patent.

It is contended by counsel for appellant that the attachment of the stock of Comegys in the Barrel Pitching Machine Company at the suit of Smith in the superior court of Baltimore city prevented Comegys from acquiring any interest in the patent by the assignment thereof to Smith, Holbeck, and Comegys by the Barrel Pitching Machine Company, and therefore Comegys could convey no interest in the patent to Stromberg. This position seems to be founded on the clause of the instrument by which the patent was transferred to the Barrel Pitching Machine Company, to wit, that any reassignment of the patent to the assignors should be subject to the lawful rights of the creditors of the company.

The answer to this contention is that Smith was the creditor of Comegys and not of the company, and the clause in the instrument of transfer to the Barrel Pitching Machine Company gave Smith no claim on the patent to secure a debt due him, not from the company, but from a stockholder in the company. The fact that Comegys held stock in the company gave him no title to its property, (Mr. Justice Bradley in *Morgan* v. *The Railroad Company et al.*, 1 Woods, 15; *Bradley* v. *Holdsworth*, 3 Mees. & W., 334; *Arnold* v. *Ruggles*, 1 R. I., 165.,) and the attachment of his stock did not in the least encumber the property of the company or prevent the assignment of the letters patent by it to Smith, Holbeck, and Comegys, or the transfer by Comegys to Stromberg.

It remains to consider whether the sale by Stromberg to the defendant, Miller, of one of the pitching-machines containing the improvement described in the patent, protects him from liability for its use in this suit. By the contract of sale Stromberg warranted not only the title to the machine itself, but of the right to use it. If at the time of the sale he had been the owner of the patent, the sale would have constituted a license to Miller to use the machine as long as it lasted; but Stromberg did not acquire any interest in the patent until long after the date of his sale to Miller. If he had subsequently become the sole owner of the patent his previous sale to Miller of a machine embodying his patented invention would have estopped him from prosecuting Miller for an infringement of the patent by the use of the machine. In analogy to estates in land by estoppel, Miller would have acquired a right to use the machine which could not have been controverted by Stromberg; but having acquired only a part interest in the patent, we do not undertake to decide that his previous sale of the machine to Miller bound the other joint owners of the patent. It is clear, however, that such sale was a license to Miller to use the machine so far as Stromberg could grant a license, and in our opinion the covenants of Gottfried and Holbeck in the contract by which Stromberg assigned his interest in his patent to them are sufficient to protect Miller from this suit. In that contract it is declared to be part of the consideration of the transfer by Stromberg of his interest in the patent to Gottfried and Holbeck "that he should be released from all claims which Gottfried or Holbeck, or either of them, or any person to whom they or either of them may have assigned an interest in said letters patent, might or could have against him * * * or against any person or persons to whom Stromberg may have granted licenses to use the said patented improvement." And by said instrument Gottfried and Holbeck, for and in consideration of the premises, declare that they do release said Stromberg from all claim they or either of them may have against him or the parties to whom he may have granted licenses to use said patented improvement.

We think there can be no doubt that it was the purpose of all the parties to this instrument, and it is clearly expressed therein that, as a part of the consideration of the transfer, Stromberg was released from claims against him arising out of his transactions in reference to said patent, and that all licenses granted by him were in effect confirmed. This contract, therefore, affords complete protection to Miller, the appellee, and is an effectual bar to the prosecution of this suit.

The decree of the circuit court dismissing the bill must therefore be affirmed.

U. S. Circuit Court—Eastern District of Pennsylvania.

COMBINED PATENTS CAN COMPANY v. LLOYD.

Decided January 30, 1882.

1. LAW OF 1870—REISSUE—NEW CLAIMS—ESTOPPEL.
The statute of 1870, relating to reissues, authorizes the insertion of new claims, founded upon the original invention as exhibited by the specifications or drawings, in reissues when the omission results from "inadvertence, accident, or mistake," and where the claimant has not by some act or omission estopped himself from exercising the right to amend.

2. SAME—SAME—MISTAKE—DECISION OF COMMISSIONER CONCLUSIVE.
The question whether a patent is "inoperative or invalid by reason of defective or insufficient description or specification," and whether such defect has arisen by "inadvertence, accident, or mistake, and without any fraudulent or deceptive intention," appears from the decisions of the Court to be submitted finally to the judgment of the Commissioner wherever the circumstances bring it within the jurisdiction conferred upon him by the statute.

3. SAME—SAME—ADDITIONAL CLAIMS—QUESTION OF ERROR.
Where additional matter is claimed, however, which does not appear by reference to the patent or contemporary records to be embraced in the invention, or where it appears by such reference that the alleged omission "could not have occurred through inadvertence or mistake," as said by the Court in *James* v. *Campbell et al.*, the case is not within the jurisdiction of the Commissioner, and a reissue for additional claims may be declared void.

4. SAME—DELAY THIRTEEN YEARS—ESTOPPEL.
Where the only mistake suggested is an omission of a claim, and the patentee neglects for thirteen years to file his application for reissue, *Held* that he must be regarded, in view of his conduct, as intending to dedicate such invention to the public, and he is estopped from asserting his claim to such invention in a reissue.

Mr. E. N. Dickerson for the complainant.
Mr. Henry Baldwin, Jr., for the defendant.

BUTLER, *J.*, MCKENNAN, *J.*, concurring.

On the 30th day of August, 1864, a patent, No. 43,979, was issued to August Destouy for a new and useful improvement in the manufacture of metal moldings, in which the claims, two in number, read as follows:

1. The T-shaped metal molding, made substantially as and for the purpose specified.
2. The jaws B and D D', either straight or curved, and tool C, constructed and operating substantially as herein set forth, for the purpose of imparting to the moldings the final touch before they are applied to the article to be ornamented.

On the 17th day of April, 1877, the patent was surrendered and a reissue, No. 7,609, granted to Herman Miller, with the claims enlarged and multiplied to four in number, the third and fourth, which were new, reading as follows:

3. The combination, with a table having a stationary jaw or angle, of movable jaws operating, as shown and described, to compress the bent metal against said stationary jaw.

4. The combination, with a table having a stationary jaw or anvil and movable jaws, as described, of treadles connected with said movable jaws by levers, substantially as and for the purposes herein set forth.

The complainant, charging infringement, prays for an injunction and account.

The respondent denies the validity of the reissued patent and the charge of infringement.

As the infringement alleged respects the third claim alone, our attention will be confined to it. This claim, as we have seen, was not embraced in the original patent. That the matter herein described was a part of the invention as shown by the specifications and drawings the plaintiff's expert testifies and the defendant seems to admit. That additional and enlarged claims may thus be inserted in reissues of patents under proper circumstances is too well settled by the decisions to admit of question. The statute of 1870, which did not materially change the law as previously understood and administered, provides that—

Whenever any patent is inoperative or invalid by reason of a defective or insufficient specification, * * * if the error has arisen from inadvertence, accident, or mistake, and without any fraudulent or deceptive intention, the Commissioner shall, on the surrender of such patent and payment of the duty required by law, cause a new patent for the same invention * * * to be issued to the patentee in accordance with the patentee's corrected description and specification.

That this statute authorizes the insertion of new claims, founded on the original invention as exhibited by the specifications or drawings, in reissues when the omission results from "inadvertence, accident, or mistake," and where the claimant has not by some act or omission estopped himself from exercising the right to amend, has been uniformly held, not only by the several circuit courts, but by the Supreme Court also. In *Seymour* v. *Osborne*, (11 Wall., 516,) the latter Court said:

Power is unquestionably conferred upon the Commissioner to allow the specifications to be amended if the patent is inoperative or invalid, and in that event to issue the patent in proper form; and he may under that authority allow the patentee to redescribe his invention and to include in the description and claims of the patent not only what was well described before but whatever else was suggested or substantially indicated in the specifications or drawings which properly belonged to the invention as actually made and perfected.

The reissue there involved, it is true, antedated the statute now in force, but as respects the question here involved this is unimportant, as before indicated.

In the last cases in which this subject is discussed (*Miller & Co.* v. *The Brass Company* and *James* v. *Campbell et al.*, very recently decided and not yet reported) the right to insert new and enlarged claims is clearly stated. In the first of these cases the Court says:

If a patentee who has no corrections to suggest in his specifications, except to make his claims broader and more comprehensive, uses due diligence in returning to the Patent Office, and says, "I omitted this" or "my solicitor omitted that," his application may be entertained, and on proper showing correction may be made.

And again—

While, as before stated, we do not deny that a claim may be enlarged in a reissued patent, we are of opinion that this can only be done where an actual mistake has occurred, * * * a real *bona fide* mistake, inadvertently committed, such as a court of chancery in cases within its ordinary jurisdiction would correct. Reissues for the enlargement of claims should be the exception.

In the last of these cases it is said:

Of course, if by actual inadvertence, accident, or mistake, innocently committed, the claim does not fully assert or define the patentee's right in the invention specified in the patent, a speedy application for its correction before adverse rights have accrued may be granted, as we have explained in the recent case of *Miller et al.* v. *The Brass Company*.

The question whether a patent is "inoperative or invalid by reason of defective or insufficient description or specification," and whether such defect has arisen by "inadvertence, accident, or mistake, and without any fraudulent or deceptive intention," appears from the decisions of the Court to be submitted finally to the judgment of the Commissioner wherever the circumstances bring it within the jurisdiction conferred upon him by the statute. It is so stated by Mr. Curtis, (Curtis's Law of Patents, sec. 282, 282ª, 282ᵇ,) who cites *Stimpson* v. *Railroad Company*, (4 Howard, 380;) *Woodworth* v. *Stone*, (3 Story R., 749, 753;) *Allen* v. *Blunt*, (3 Story R., 742;) *Jordan* v. *Dobson*, (2 Abbott's U. S. Reports, 308;) *Rubber Company* v. *Goodyear*, (7 Wall., 788,) and other cases in support of the proposition, and it has been so understood by the several circuit courts, in which it has been repeatedly announced and followed. While the language of the Supreme Court on several occasions may have exhibited a feeling of restiveness in view of the abuses which have grown out of the exercise of the extensive powers accorded to the Commissioner, no decision, we believe, has yet been announced inconsistent with the understanding and practice just stated. Where the additional matter claimed, however, does not appear by reference to the patent or contemporary records to be embraced in the invention, or where it plainly appears by such reference that the alleged omission "could not have occurred through inadvertence or mistake," as said by the Court in *James* v. *Campbell et al.*, the case is not within the jurisdiction of the Commissioner, and a reissue for additional claims may be declared void. Such, however, is not the case before us.

We are thus brought to the inquiry before suggested. Was the patentee estopped by delay and acquiescence from claiming correction of his patent by means of the reissue obtained? Nearly thirteen years elapsed before his application was made. If the matters described in the additional claims were a part of the original invention (as has been conceded) and were omitted through "inadvertence, accident, or mistake," it is impossible to believe that he did not discover the omission much earlier. In the language of the Court in *Miller & Co.* v. *The Brass Company*, it plainly appeared on the face of his patent and must have been seen on opening the paper. The patentee knew what he had invented, must necessarily have understood its scope and extent. He may not have comprehended all the *uses* to which it might eventually be applied. But to secure a different use simply does not require a different or additional claim. What he did not claim he must be regarded, in view of his subsequent conduct, as intending to dedicate to the public. He cannot, therefore, after others have acted upon what he thus did, be allowed to change position, and thereby suppress their enterprises and destroy their business.

This application of the equitable doctrine of estoppel has more than once been suggested by the Supreme Court, and it is announced and applied in *Miller & Co.* v. *The Brass Company* above cited. Every word there uttered relating to this question is as applicable here as it was there. The Court says:

The only mistake suggested is that the claim was not as broad as it might have been. This, if it was a mistake, * * * and if any correction was desired, should have been applied for without delay. The pretence that it was inadvertence or oversight which had escaped the patentee's notice for fifteen years is too bald for human credence. * * * It must be remembered that the claim of a specific device or combination and an omission to claim other devices or combinations, apparent on the face of the patent, are in law a dedication to the public of that which is not claimed. It is a declaration that that which is not claimed is either not the patentee's invention, or, if his, he dedicates it to the public. This legal effect of the patent cannot be revoked unless the patentee surrenders it and proves that the specification was framed in inadvertence, accident, or mistake, without any fraudulent or deceptive intention on his part; and this should be done with all due diligence and speed. Any unnecessary laches or delay in a matter thus apparent on the record affects the right to alter or reissue the patent for such cause. If two years public enjoyment of an invention with the consent and allowance of the inventor is evidence of abandonment and a bar to an application for a patent, a public disclaimer in the patent itself should be construed equally favorable to the public. Nothing but a clear mistake or inadvertence and a speedy application for its correction is admissible when it is sought to enlarge the claim.

The bill must, for the foregoing reasons, be dismissed with costs, and a decree may be prepared accordingly.

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington, D. C., February 25, 1882.

SIR: I am directed by the Secretary to inform you that he has ordered that William U. Saunders, of New Orleans, Louisiana, be not recognized from and after this date as an attorney in the prosecution of any claim or other matter before the Department of the Interior or any bureau thereof.

I am, sir, very respectfully, your obedient servant,

GEO. M. LOCKWOOD,
Chief Clerk.

The Commissioner of Patents.

9,189.—CAKES OF CHOCOLATE.—*Swain, Earle & Co.*, Boston, Mass. Application filed February 14, 1882.
"The picture of the port of Boston, with the view of the city."

9,190.—SOAP.—*Jas. B. Williams & Co.*, Glastenbury, Conn. Application filed January 3, 1882.
"The symbolical representation of a fanciful package."

9,191.—TANKS, CANS, AND PACKAGES.—*John A. Wright*, Keene, N. H. Application filed February 3, 1882.
"The syllable 'VUL' and the syllable 'IZED' arranged on either side of the symbol of a can, the whole combined indicating a fanciful representation of the word 'VULCANIZED.'"

9,192.—CIGARS AND CIGARETTES.—*Louis Ash & Co.*, New York, N. Y. Application filed February 16, 1882.
"The arbitrary word 'NOBILITY.'"

9,193.—CIGARS AND CIGARETTES.—*Louis Ash & Co.*, New York, N. Y. Application filed February 16, 1882.
"The arbitrary words 'BOSTON HERALD.'"

9,194.—CIGARS, CIGARETTES, SMOKING-TOBACCO, AND CHEWING-TOBACCO.—*Goodwin & Co.*, New York, N. Y. Application filed February 16, 1882.
"The word 'CHANCELLOR,' in connection with the bust of a man wearing a wig and robe, after the manner of a judge in his official capacity on the bench."

9,195.—CIGARS.—*George P. Lies & Co.*, New York, N. Y. Application filed February 1, 1882.
"The words 'MARIE ANTOINETTE,' accompanied by the portrait of the Queen of France of that name."

9,196.—CIGARS AND CIGARETTES.—*Louis Ash & Co.*, New York, N. Y. Application filed February 18, 1882.
"The arbitrary word 'HERALD.'"

9,197.—FLOUR.—*William S. Hills*, Boston, Mass. Application filed January 4, 1882.
"The arbitrarily-selected words 'LADIES DELIGHT.'"

9,198.—MEDICINE.—*The Hoyle Rock Oil Company*, Chicago, Ill. Application filed February 6, 1882.
"The arbitrarily-selected words 'MOUNTAIN ROCK.'"

9,199.—LINIMENT.—*John C. Weis*, Peoria, Ill. Application filed February 6, 1882.
"The compound word 'OLD-GOLD.'"

9,200.—FLOUR.—*D. L. Wing & Co.*, Springfield, Mass. Application filed March 25, 1881.
"The word 'NEPTUNE.'"

9,201.—FLOUR.—*D. L. Wing & Co.*, Springfield, Mass. Application filed March 25, 1881.
"The words 'QUEEN-BEE.'"

9,202.—FLOUR.—*D. L. Wing & Co.*, Springfield, Mass. Application filed March 25, 1881.
"The word 'PLANET.'"

9,203.—FLOUR.—*D. L. Wing & Co.*, Springfield, Mass. Application filed March 25, 1881.
"The word 'CLIMAX.'"

LABELS.

2,639.—Title: "BOWERS' WORLD RENOWNED EYE REMEDY, SIGHT PRESERVER AND RESTORER."—*Sylvester J. Bowers*, Canandaigua, N. Y. Application filed February 13, 1882.

2,640.—Title: "CRANE'S LADIES NOTE PAPER AND ENVELOPES. SATIN FINISH."—*Z. Crane, Jr., & Bro.*, Dalton, Mass. Application filed January 27, 1882.

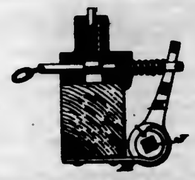
2,641.—Title: "DR. WARREN'S SYRUP OF WILD CHERRY."—*Silas B. Stiles* and *Frank M. Givens*, Fond du Lac, Wis. Application filed January 23, 1882.

2,642.—Title: "ROSE BLANCHARD'S COLD CREAM."—*Ferdinand Smith*, New York, N. Y. Application filed December 9, 1881.

2,643.—Title: "WHEAT BITTERS."—*Wheat Bitters Company*, New York, N. Y. Application filed February 16, 1882.

DISCLAIMERS.

No. 240,997.—*William Goodman*, Boston, Mass., dated May 3, 1881. IMPROVEMENT IN LEATHER-DRESSING MACHINES. Disclaimer filed March 8, 1882, by the inventor.

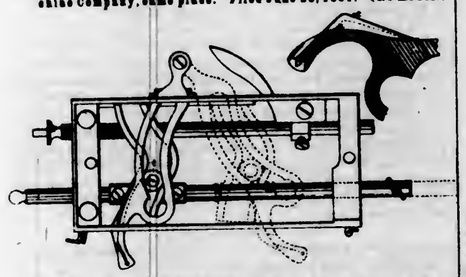


Enters his disclaimer "to that portion of the claim in said specification which is contained in the eighth clause thereof, and is in the following words, to wit: '8. The screw-shaft operating with the vertically-adjustable carriage and the tool-carrier to effect the traverses of the latter upon the carriage, substantially as herein set forth and described.'"

PATENTS

GRANTED MARCH 14, 1882.

254,787. HORSE HAY-RAKE. DAVID G. AUCHEY, Dayton, Ohio, assignor to E. C. Taylor, same place. Filed Sept. 21, 1881. (No model.)



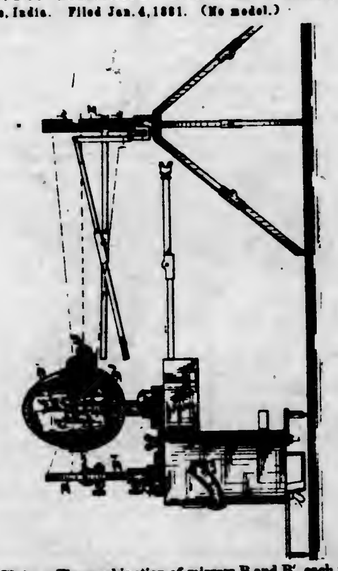
Claim.—1. In a horse hay-rake, the combination of the ratchets revolving with the carriage-wheels, the oscillating rod on the rake-head, the arms on the ends of said rods, and the sliding dogs with the central lever mounted on the oscillating rod, the sliding bolt projecting through the central lever, and the spring on said bolt operating to throw back the lever when the bolt is pushed back.

2. In a horse hay-rake, the combination of the oscillating rod on the rake-head, the central lever mounted on said oscillating rod, the sliding bolt projecting through the central lever, the spring on said bolt operating to throw back the lever when the bolt is pushed back, and the spring-bolt bearing on the sliding operating-bolt with frictional contact and serving to assist in holding it in adjusted position, substantially as described.

3. The combination, with the ratchets on the wheel-hubs, of the bearing-plates J, secured to the ends of the rake-head and having the bearings R R, the spring-bolts *r*, sliding longitudinally in said bearings, the oscillating rod, and the crank-arms on the ends of said rod, substantially as described.

254,788. TAKE-UP FOR SEWING-MACHINES. GEORGE W. BAKER, Cleveland, Ohio, assignor to the White Sewing Machine Company, same place. Filed June 28, 1881. (No model.)

Claim.—1. The combination, with a take-up lever the free end of which is provided with intersecting longitudinal and transverse slots, of a spring having its free end located within the longitudinal slot in the arm, the lower end of the spring having a thread-retaining hook formed thereon, substantially as set forth.

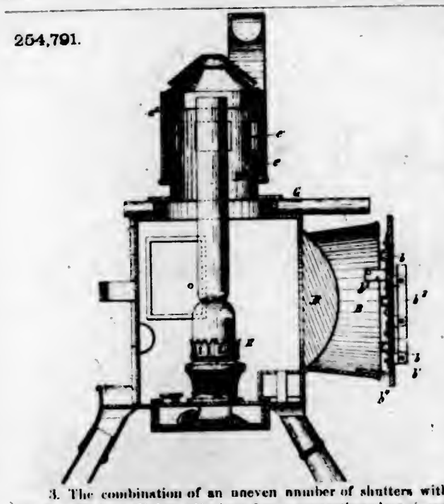


2. The combination, with the needle-bar, a cam attached thereto, a rotary shaft, and crank-pin for imparting a reciprocating movement to said needle-bar, of a take-up lever pivoted at one side of the needle-bar, and located between the crank-pin disk and needle-bar cam, and constructed with an arc-shaped slot, within which engages the crank-pin, which latter imparts motion in both directions to the take-up lever, substantially as set forth.

254,789. GALVANIC BELT. ARTHUR A. BALDWIN, Ionia, Mich. Filed July 27, 1881. (No model.)

Claim.—In an electric belt, and in combination with the batteries and the fixed electrode F thereof, the adjustable electrode F', loop K, extension-wire J, wire coil I, and a suitable connection between said coil and the batteries, substantially as described.

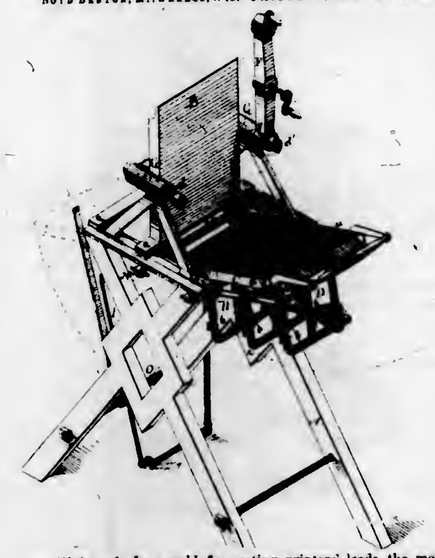
254,790. HELIOTROPE. ELPHINSTONE W. HEBBIR, Bangalore, India. Filed Jan. 4, 1881. (No model.)



Claim.—The combination of mirrors B and B', each provided with a central opening and a screen, consisting of three shutters, E', connected by brace E², and mechanism attached to the central shutter, whereby the rays of sunlight may be directed to a distant station and interrupted at the will of the operator, as and for the purpose specified.

254,791. SIGNALING-LANTERN. ELPHINSTONE W. HEBBIR, Bangalore, India. Filed Jan. 4, 1881. (No model.)

Claim.—1. The combination, in a signaling-lantern, of an uneven number of shutters connected by a cross-piece, b², and operated by means of lever C, substantially as and for the purpose specified.



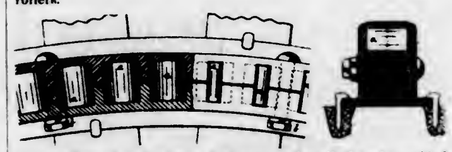
2. The combination, in a signaling-lantern, of shutters, as described, with cross-piece b², attached thereto, and the lever C, whereby the shutters are operated, substantially as and for the purpose specified.

254,791.

3. The combination of an uneven number of shutters with the lens D, lamp E, lever C, pivoted at c, connecting-piece c', and crank c^2, said crank being attached to the central shutter, as and for the purpose set forth.

254,792. MOLD FOR CASTING PRINTERS' LEADS. LISA ROYD BENTON, Milwaukee, Wis. Filed Jan. 9, 1882. (No model.)

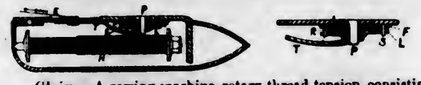
Claim.—1. In a mold for casting printers' leads, the mold-segment C, having a concave shape when cold, whereby it becomes plane when heated in use, substantially as and for the purposes set forth.



2. The combination of mold-segments B and C, constructed and operating as described, with the heaters D D, substantially as and for the purposes set forth.

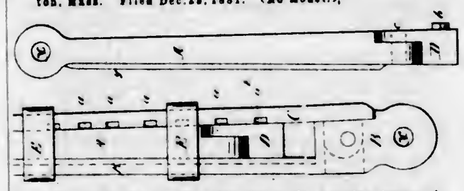
3. The combination of the mold-segments B and C, constructed and operating as described, with the heaters D D and the jointed smoking jet or torch I, substantially as and for the purposes set forth.

4. In combination with a mold for casting printers' leads, a heater composed of separate burners D D D, constructed so as to be capable of being extinguished separately and arranged in such position relatively to each other and to the mold as to permit the heating of a portion only of the mold-segment whenever desired, substantially as and for the purposes set forth.



254,798. RAIL FOR RAILROAD-CURVES. LEVI BRIGHAM, Osseo, Minn. Filed Apr. 22, 1881. Renewed Jan. 20, 1882. (No model.)

Brief.—A rail separated vertically in two parts and provided with a series of separated sockets having fitted in them a series of rollers.

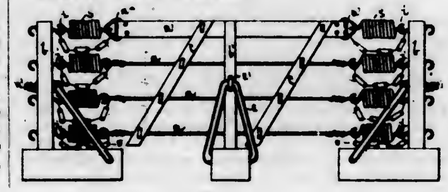


Claim.—A rail made in two parts, as described, and provided with a series of separate sockets running partially through the rail at right angles to its length, in combination with a series of rollers fitting in said sockets and protruding above the tread of the rail, substantially as set forth.

254,794. SEWING-MACHINE TENSION DEVICE. GEORGE W. BUNGESS Boston, Mass. Filed July 5, 1881. (No model.)

Claim.—A sewing-machine rotary thread-tension consisting of the wheels or disks F and L, adapted to be rotated upon the journal or pin P at a slight angle of inclination with each other by means of the wedge R and spring T, whereby the tension of the thread passing between the same near their peripheries may be automatically regulated, substantially in the manner described, as and for the purposes set forth.

254,795. ADJUSTABLE ROPE-CLAMP. WILSON C. BURNS, Somerville, assignor of four-fifths to Frank Hasey, Joseph W. Smith, William E. Woodbury, and James L. Smith, all of Boston, Mass. Filed Dec. 29, 1881. (No model.)

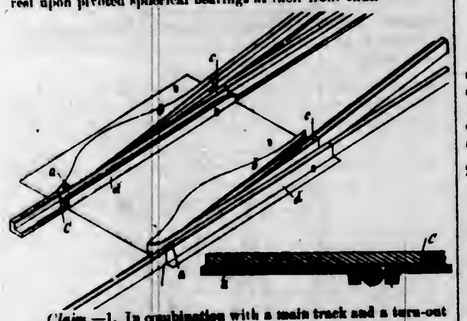


Claim.—1. In an adjustable clamp, the tapering tongue A, having a rib, *y*, in combination with the side plate B, having a slot, *z*, the side plate C, and bands E E, substantially as and for the purposes set forth.

2. In an adjustable clamp, the tapering tongue A, with the attachment D, having a projection, *b*, in combination with the side plate C, with the circular slots *a a a*, the plate B, and the bands E E, substantially as and for the purposes set forth.

3. In an adjustable clamp, the tapering tongue A, having a rib, *y*, with the attachment D, having a projection, *b*, in combination with the side plate B, having a slot, *z*, and the side plate C, with circular slots *a a a*, and the bands E E, all substantially as and for the purposes described.

4. An adjustable clamp consisting of a movable central piece or tongue having a guiding-rib, two sides plates, one provided with a slot to receive the guide-rib of the tongue, the other having suitable devices for temporarily holding the movable tongue during adjustment, and bands encircling and inclosing the said tongue and side plates, all combined and operating substantially as and for the purposes described.

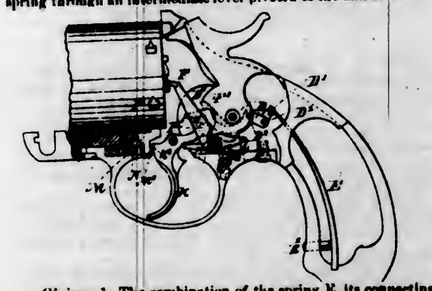


254,796. WIRE FENCE. SAMUEL CALHOUN, Edinburg, Ohio. Filed Nov. 7, 1881. (No model.)

Claim.—The wires *a*, springs *s*, hooks *i*, and chains *c*, connecting the hook and wire, in combination with posts *b*, substantially as described.

254,797. RAILWAY-SWITCH. JOHN B. CAREY, Boston, Mass., assignor of one-half to William V. Hutchings, same place. Filed Oct. 29, 1881. (No model.)

Brief.—Spring-held switch-plates are actuated to direct cars to the siding by a lateral pull by the draft-animal. The plates rest upon pivoted spherical bearings at their front ends.



Claim.—1. In combination with a main track and a turn-out track, a pair of pivoted switch-plates, each provided with the three rails *b*, *c*, and *d*, and springs for returning them automatically to their normal position, said plates being adapted to be shifted laterally on their pivots by the action of the car-wheels, substantially as set forth.

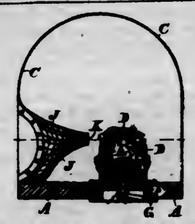
2. The pivoted switch-plates, each provided with rails *b*, *c*, and *d*, in combination with springs *f*, inclosed within said plates and operating to return the said switch-plates to their normal position after the car passes from them onto the turn-out.

254,798. REVOLVING FIRE-ARM. GEORGE W. CILLEY, Norwich, Conn. Filed Dec. 30, 1881. (No model.)

Brief.—The mainspring is made to serve as trigger and pawl-spring through an intermediate lever pivoted to the hammer.

Claim.—1. The combination of the spring E, its connecting-link D^3, the sickle-lever D D^4, having a cross-axis, D^5, with the revolver-lever F, having a friction-stud, F^3, all operating together substantially as described, and for the purpose set forth.

2. The combination of the trigger K, having a notch, K^3, with the stop-piece M M^1, having a notch at N, whereby it is allowed to move back and forth, all arranged substantially as described, and for the purpose set forth.



254,799. SUSPENSORY-BANDAGE. JOHN CODMAN, Boston, Mass. Filed Jan. 23, 1882. (No model.)

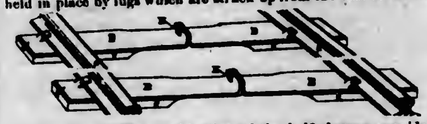
Claim.—In combination with a suspensory-bandage, a contracting and supporting strap, C, passing around the scrotum-sac at or near its inner edge, and secured to the body-belt independently of the sac by one or more buckles applied to such belt, all being substantially and to operate as set forth.

254,800. ROACH-TRAP. MEYER COHEN, Newark, N. J., assignor of one-half to Samuel Cohen, same place. Filed Dec. 21, 1881. (No model.)

254,800.

Claim.—The roach-trap constructed, as herein shown and described, with wire-netting C, having the depression J formed in one side and provided with a nozzle, K, the opening F in the floor A, and the skeleton bait-box D, provided with sponge E and secured in the opening F, substantially as and for the purpose described.

254,801. CAR-MOVER. GEORGE P. COFANY, Geneva Lake, Wis., assignor of two-thirds to Albert E. Lytle, same place, and Carles A. Cook, Chicago, Ill. Filed Dec. 14, 1881. (No model.)

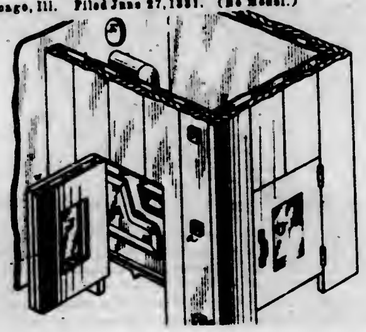


Claim.—1. In a car-mover, the combination of the lever A, having a shoe, S, provided with V-shaped notch c, the arm B, pivoted near the end of the lever and provided with hook C and loop *a*, and the brace E, one end of which is secured to the lever and the opposite end to the arm, substantially as shown and described.

2. In a car-mover, the combination of the hook C, loop *a*, and the arm B, substantially as shown and described.

254,802. RAILWAY-TIE. JOHN CONLEY, New Buffalo, assignor of one-half to Luther V. Moulton, Grand Rapids, Mich. Filed Mar. 13, 1880. Renewed Nov. 10, 1880. Renewed Aug. 13, 1881. (No model.)

Brief.—A metal tie composed of two sections which are united by a bolt, the joint being at a point midway between the rails. The edges of the sections are turned down and the rail is held in place by lugs which are struck up from the seat of the tie.



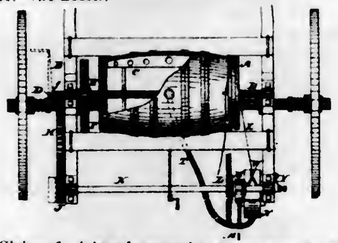
Claim.—1. The combination of the half-sleepers provided with the hooks D D D D and fastening E, substantially as and for the purpose specified.

2. The combination of the fastenings E with the plates B B, substantially as and for the purpose specified.

3. The combination of the plates B B with the hooks D D D D and the fastening E, substantially as and for the purpose specified.

4. In combination with the rails A A, the plates B B, hooks D D D D, and fastenings E, substantially as and for the purpose specified.

254,803. HEAT-FENDER FOR STOVES. JAMES A. COWLES, Chicago, Ill. Filed June 27, 1881. (No model.)



Claim.—1. A heat-fender composed of the separable sections

Claim.—1. The process above described for making rolls with

Claim.—1. A heat-fender composed of the separable sections, provided with air-flues, as described, and having the posts M, N, and O, held together by bolts, all constructed and arranged as set forth.

2. A heat-fender composed of sections, provided with the posts M, N, and O, for securing them together, and with the air-flues *r*, and with illuminated doors, as and for the purpose shown and described.

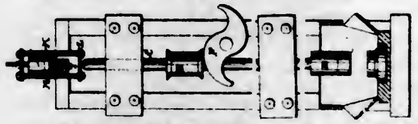
254,804. DISTRIBUTER FOR INSECT-POISON AND FERTILIZERS. DAVID E. DARNELL, Masonville, N. J. Filed June 15, 1881. (No model.)

Claim.—1. A barrel mounted on a carriage or truck, gearing operated by said truck, and an outlet-pipe connected to said barrel, in combination with a rotary fan, N, operated by said gearing, the case of said fan communicating with said barrel, substantially as and for the purpose set forth.

2. A barrel mounted on a carriage or truck, in combination with a rotary fan and gearing operated by said truck, the case of the fan being adjustable in vertical, lateral, and angular directions, substantially as and for the purpose set forth.

3. The barrel A, inclosed agitator C, and shaft D, in combination with the shifting wheel E, the shaft K, the pipe or tube T, and the fan, substantially as and for the purpose set forth.

4. The barrel and fan in combination with the belt S, laterally-shiftable belt-pulley L, and shaft K, substantially as and for the purpose set forth.



5. The fan in combination with the pulley L, bushing *a*, and swivel M, substantially as and for the purpose set forth.

6. The fan in combination with the rods P Q and lever R, substantially as and for the purpose set forth.

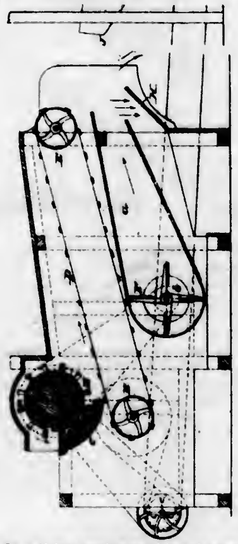
7. The suspended fan in combination with the yoke V, piece W, and cord X, substantially as and for the purpose set forth.

8. The shaft K, with pinion J, and pulley L, and carrying the suspended fan, in combination with the latch Y, substantially as and for the purpose set forth.

254,805. QUARTZ-MILL. JAMES DAY, San Francisco, Cal. Filed July 18, 1881. (No model.)

Claim.—In a crushing-mill, a stamp or beater and mechanism for raising and dropping the same, in combination with the cylinder G, air-tight piston H, and sliding frame consisting of the cross-head J, cross-base L, and side bars or rods, K K, arranged for operation substantially as set forth.

254,806. METHOD AND MEANS OF EXHIBITING PHOTOGRAPHS. JOHN DAWS, Ottawa, Ontario, Canada. Filed July 27, 1881. (No model.)



Claim.—1. The improved art of exhibiting photographs by first making the picture translucent and exposing it on a suitable frame to the rays of light reflected from a colored and reflecting surface or surfaces at the back of the picture, whereby the reflected hue or hues are seen by an observer viewing the picture, and a natural effect of light, shade, and color produced.

2. The art of imparting a scenic effect to photographs exhibited by the aid of rays of light reflected against the back of the picture, consisting in applying coloring material to that portion of the back of the picture to which the desired hue of color is to be given, and then reflecting colored rays of light from a suitably-colored surface or surfaces at the back of the picture, substantially as described.

3. In combination with the frames A B and props C, the intermediate frame, D, provided with an axially-rotating slat or slats, E, as set forth.

254,807. MACHINE FOR DISINTEGRATING CORN-HUSKS, &c. JOSEPH B. DU YOUNG, Philadelphia, Pa. Filed Feb. 8, 1881. (No model.)

Claim.—1. In a disintegrating-machine, the toothed cylinder, toothed concave, endless conveyor, fan, and wind-chest, combined and operating substantially as and for the purpose set forth.

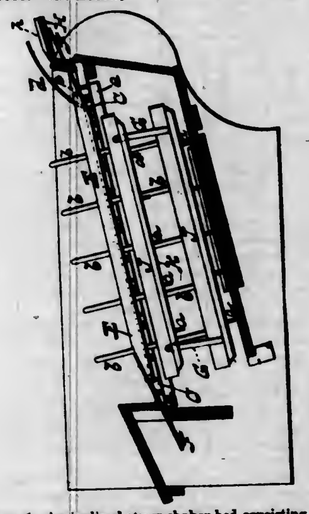
2. The disintegrating-machine formed of a toothed cylinder, toothed concave, endless conveyer, a fan, and a wind-chest, which latter extends under the conveyer and has its outlet adjacent to the back of said conveyer and below the same, substantially as and for the purpose set forth.

3. The disintegrating-machine having a conveyer, D, and wind-chest G, and a chute, H, which is secured to the casing at the back of the machine below the outlet of said chest, substantially as and for the purpose set forth.

4. The disintegrating-machine consisting of the toothed cylinder, toothed concave, endless conveyor, fan, wind-chest, and shaker, the latter being separated from the casing of the other parts, whereby the fiber or disintegrated husk is directed to the shaker and discharged clean at one end thereof, and the stubs and refuse are collected at places in advance of the other end of said shaker, substantially as set forth.

254,808. DREDGE-BOX FOR SPICES, &c. PATRICK DIAMOND, Philadelphia, Pa. Filed July 30, 1881. (No model.)

Claim.—The combination of the box A, having a shoulder, *a*, and a projection above the same, the strip D, of foil or other thin metal, larger in diameter than said projection, and the lid B, having an opening, *d*, and a flange, *b*, between which and the projection of the box the edge of the strip D is bent down and confined, thereby securely retaining the same and forming a tight joint, all as set forth.

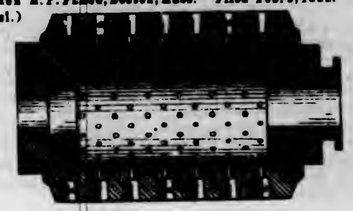


254,809. SHADE FOR LAMPS AND LANTERNS. JOHN H. EWING and EDWARD L. BILL, Wheeling, W. Va. Filed July 14, 1881. (No model.)

254,809.

Claim.—A lamp-shade consisting of a single piece of molded glass having the form of a truncated pyramid, the several faces of which are each provided with a bull's-eye lens, substantially as shown and described.

254,810. STRAW CARRIER AND SHAKER FOR THRASHING-MACHINES. JOSIAH FAHRNEY, Waynesborough, Pa. Filed Jan. 4, 1882. (No model.)



Claim.—1. An inclined straw-shaker bed consisting of fixed scalloped bars, intermediate vertically and longitudinally reciprocating bars, carrying teeth vertically movable through the latter, and ribbed inclined guides at the upper or tail ends of the fixed or scalloped bars, substantially as described.

2. In a straw-shaker, the combination of the fixed scalloped bars, the intermediate endwise-reciprocating bodily-moving bars, cranks for operating said bars, and the raking-teeth *b*, vertically movable through the reciprocating bars by means substantially as described.

3. The combination of the wire bridges *d*, the scalloped fixed bars C, to which these bridges are secured, the endwise and vertically movable bars J, rake-teeth *b*, mounted thereon, and the bars E, substantially as described.

4. The combination of the board H, provided with ribs A, the scalloped bars C, the bridge-wires *d*, extending from these bars over the said board H, the guide-bars E, and raking-teeth *b*, operating substantially as described.

254,811. ROLL FOR BUFFING OR POLISHING MACHINES. GEORGE H. P. PLACE, Boston, Mass. Filed Feb. 3, 1882. (No model.)

Claim.—1. The process above described for making rolls with a cellular rubber covering, consisting in first applying the covering A to the core B; secondly, truing the covering, and then forming the cells *a*.

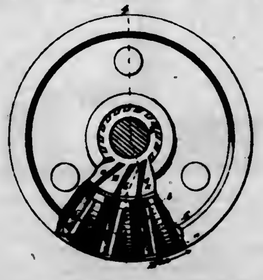
2. The improved roll above described, consisting of the core B, rubber covering A, having the cells *a* formed in it, and the cells provided with vents, substantially as and for the purpose specified.

254,812. MACHINE FOR SPLITTING GRAIN. LOUIS GATHMANN, Chicago, Ill. Filed June 27, 1881. (No model.)

Claim.—1. In combination with a smooth-surfaced disk provided with furrows *b*, having inclined-bottom faces, an opposing disk, A, having grooves *a*, of fluted or rounded form, substantially as described, and for the purposes set forth.

2. The combination of the disk A, having the grooves *a*, of fluted or rounded form, and the disk B, having the alternating furrows *b*, lands *b'*, and recesses C, substantially as described.

254,813. GRINDING-MILL. LOUIS GATHMANN, Chicago, Ill. Filed June 27, 1881. (No model.)



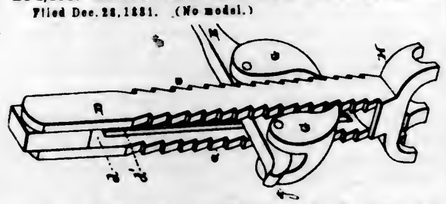
Claim.—1. In combination with the disk A, having the alternating closed furrows *a*, lands *a'*, and open recesses A^2, and also having the land-faces smooth, the opposing disk B, having its working-face *b* continuous and of a sharply rough or granular structure, substantially as described.

2. In combination with the disk A, having the alternating closed furrows *a*, lands *a'*, and open recesses A^2, and also having its land-faces smooth, the opposing disk B, of porcelain, the working-face *b'* thereof presenting the natural granular structure of the porcelain in opposition to the smooth faces *a'* of the disk A, substantially as described, and for the purposes stated.

3. In the disk A, having the alternating closed furrows *a*, lands *a'*, and outwardly-open recesses A^2, the said recesses cast in form to cut the working-face of the disk in a curve parallel with the curved feather-edge of the furrows *a*, substantially as described, and for the purposes stated.

254,814. MILL-DISK. LOUIS GATHMANN, Chicago, Ill. Filed Oct. 11, 1880. Renewed Apr. 29, 1881. (No model.)

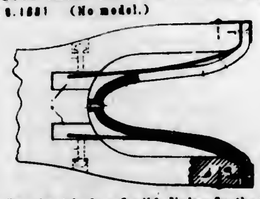
Claim.—1. In a grinding-mill, the combination, with an opposing disk having a relatively-plane working-face, of a disk, B, provided in its working-face with alternating blind feeding-furrows G, lands I, and recesses H, having abrupt rear walls and discharge-openings, arranged and operating substantially as and for the purposes set forth.



2. In a grinding-mill, the combination, with an opposing disk having a relatively-plane working-face, of a disk, B, having in its

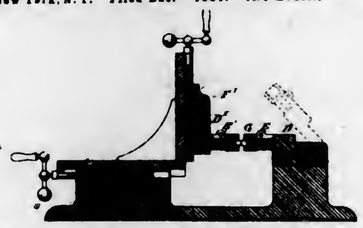
working-face furrows G, leading from the bosom outward and terminating near the periphery, recesses H, having abrupt rear walls and extending inward from the periphery nearly to the bosom, and intervening lands I, of practically uniform width, substantially as and for the purposes set forth.

3. In a grinding-mill, the combination, with an opposing disk, of the disk B, having the blind feeding-furrows G, the discharging-recesses H, and the intervening lands I, of practically uniform width, arranged in alternation as shown, substantially as and for the purposes set forth.



4. In a grinding-mill, the combination, with the disk B, having blind furrows G, discharging-recesses H, and intervening lands I, arranged in alternation as shown, of the opposing disk A, unlike the disk B, in having a relatively plane and uniform surface, whereby all parts thereof present the same acting surface in opposition to the lands I, substantially as described.

254,815. LIFTING-JACK. CHARLES GRACEY, Contention, Ariz. Filed Dec. 26, 1881. (No model.)

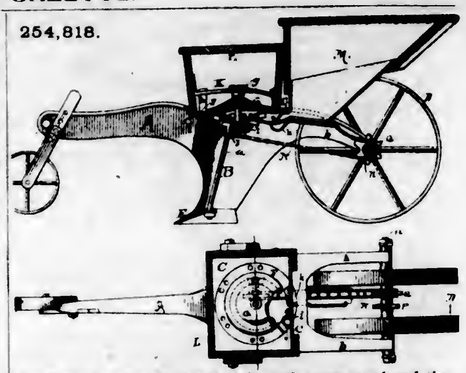


Claim.—The slotted standard D, provided with a bifurcated foot, H, grooves *d'*, and notches *e*, flat on their upper faces, in combination with the lever E, having projecting end *g* and studs *h* fitting into the grooves *d'*, and the pair of swinging pawls G, all constructed, arranged, and operated as set forth, whereby the lever is made to travel toward the top of the standard, as specified.

254,816. BOOT-JACK. JOSEPH J. GERSTENWALD, Newark, N. J. Filed Dec. 6, 1881. (No model.)

Claim.—In a boot-jack, a flexible lining for the jaws, consisting of a rubber-covered metallic spring having its end secured to the front ends of the jaws, combined with means for securing the lining within the jaws at a fixed level, substantially as set forth.

254,817. DIAMOND-CUTTING MACHINE. FRED. A. HARKINS, New York, N. Y. Filed Dec. 8, 1881. (No model.)



Claim.—In a diamond-cutting machine, the swinging blocks D D', provided with clamps E E', and attached at one end to the carriages C and J, respectively, by means of hinge-joints, substantially in the manner and for the purpose described.

254,818. SEED-PLANTER. REUBEN HOFFMEIER, York, Pa. Filed Jan. 23, 1881. (Model.)

Brief.—The various sets of devices are cast integral. The journals for the several operating-wheels are cast upon a chill.

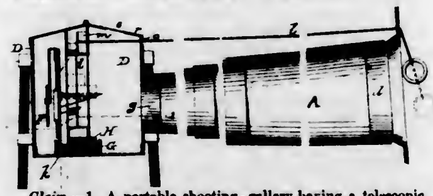
Claim.—1. In a seeding-machine, the beam A, frame or bed-plate C, with its central opening and seat for the feed-ring, standard B, and wheel-arms *b*, all cast integral in one piece.

2. In a seeding-machine, the standard B and bed-plate C, with its circular opening for the feed-ring and crown-wheel, and the lug I, projecting laterally from the side of the standard across and below said opening, and provided with a step-socket, all cast integral in a single piece.

3. The bed-plate and hopper, with the feed-ring and the driving-pinion and sprocket, the latter located close to the axis of said ring, combined with the crown-wheel G, concave on its under side to admit and cover the sprocket, and in engagement with said pinion and feed-ring to communicate motion from one to the other, substantially as set forth.

4. The bed-plate or frame C, provided with the chilled seat *e* and socket *f*, all cast integral in one piece, as set forth.

5. The double-rim open-web or spoked wheel D, with its tubular hub, all cast integral in one piece, as set forth.



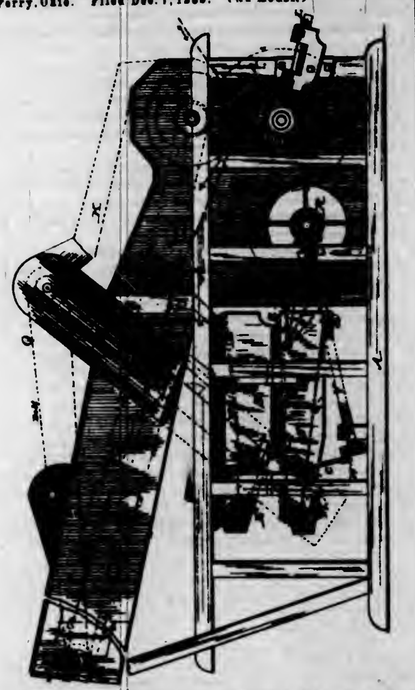
6. The seed-hopper L and the phosphate or fertilizer hopper M, placed between said hopper L and the supporting-wheel D, combined with the sprocket-chain N, which drives the seed-feeding devices, and is also arranged to pass through said hopper M at its bottom, to feed the fertilizer, as set forth.

7. The fertilizer-hopper M and the feeding-chain N, combined with the side-delivery feeder-chute at the discharge-opening of the fertilizer-hopper, to cause the fertilizer to fall toward the side clear from the returning part of the feed-chain, as set forth.

8. In a seeding-machine, the seed-hopper and its feeding devices and the supporting-wheel D, combined with the hoppers mounted upon the axle of said supporting-wheel, and their distributers operated thereby, whereby seeds may be simultaneously dropped in three rows.

9. For a seeding-machine, a beam-standard or boot, frame or bed-plate, and wheel-arms provided with jags, bearings, seats, and bolt-holes for attachment of parts, all substantially as shown and described herein, cast integral and completed in a single piece.

254,819. PORTABLE SHOOTING-GALLERY. JAMES HOLAHAN, Ansonia, Conn. Filed Oct. 31, 1881. (No model.)

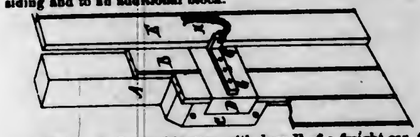


Claim.—1. A portable shooting-gallery having a telescopic shooting-tube, removable legs for supporting the same, and a case for containing the target, said case being removable from the telescopic tube, substantially as and for the purpose set forth.

2. In a shooting-gallery, the combination, with the target, of a brush and a suitable device, substantially as described, for guiding said brush across the face of the target to obliterate the shot-marks, and cords or equivalent mechanism for operating said brush from the shooting-stand, for the purpose described.

3. The case D, having guides *i*, tray G, and target E, in combination with brush H, rollers *m*, and cord or chain *l*, substantially as and for the purpose set forth.

4. The portable shooting-gallery herein described, consisting of telescopic tube A, perforated front plate, C, folding legs B, case D, centrally-perforated target E, disk F, tray G, brush-guides *i*, brush H, cord or chain *l*, and rollers *m*, substantially as and for the purpose set forth.



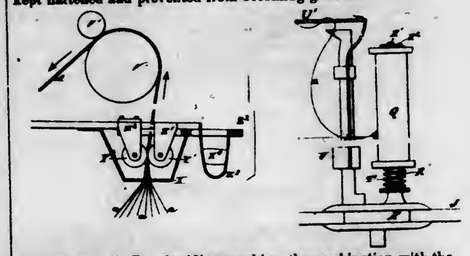
254,820. GRAIN-SEPARATOR. ELLIS J. HOYLE, Martin's Ferry, Ohio. Filed Dec. 7, 1880. (No model.)

Claim.—The combination, with the shoes S S' and mechanism for vibrating them in opposite directions, the shoe S, having screen E and inclined board or bottom E', and the shoe S', having inclined board *b*, short riddle F, and long riddle G, the adjustable deflector Y, and the blast-fan, of the canvas Z, for connecting said shoes together at their sides to close the openings between them, substantially in the manner, as and for the purpose herein shown and described.

254,821. FASTENING FOR FREIGHT-CAR DOORS. JAMES JACKSON and JAMES W. BROCKWAY, New York, N. Y., assignors of one-third to Edward H. Carpenter, same place. Filed Dec. 22, 1881. (No model.)

Brief.—An L-shaped iron cleat is connected to a freight-car door by a chain, and has nail-holes to secure it behind the car-door when closed to a removable wooden block bolted to the car-siding and to an additional block.

Claim.—1. In combination with door E of a freight-car, the brace or cleat G, provided with nail-holes to secure it to the removable block D, and secured by chain and staple H to door E, substantially as and for the purpose set forth.



2. The combination of block D and brace or cleat G, secured to the door, substantially as and for the purpose set forth.

3. In combination with post A of the doorway of a freight-car, the removable block D, substantially as and for the purpose set forth.

4. In combination with post A and removable block D, the block C.

254,822. BRAIDING-MACHINE. NICHOLAS JERRIDS, New Haven, Conn. Filed Feb. 26, 1880.

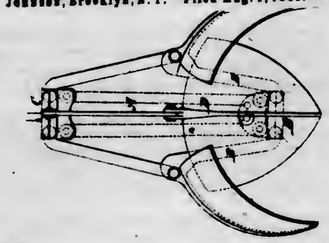
Brief.—Adapted for braiding wire. The drop-weights of the carriers are provided with extensions, which rest on the wires at some distance from the holes in the guide-posts through which the wires pass, so that the weights can depress the ends of broken wires and descend to stop the machine. The wires pass upward from the carriers through an aperture in a guide-plate and between a pair of pressure-rolls situated at the point at which they become braided together, and by said rolls the braided fabric is kept flattened and prevented from becoming guttered.

Claim.—1. In a braiding-machine, the combination, with the stop-levers W W' and stop-weight U, having an attachment, U', of the rod B^2, an ordinary or suitable carrier, R, and spindle R', adapted to carry a bobbin, Q, the stop-weight being adapted to rest on the wire *a* after it has passed the guide-hole and at a distance from the guide, as and for the purposes set forth.

2. In a braiding-machine, the combination, with a series of bobbin-carriers, R, of framing J, having serpentine grooves in which the carriers are moved, carrying means $J' J^3$, weights U, having the loops U', and flattening-rollers $Y' Y^3$, arranged to guide the wires *a* at the point where they are braided together, so as to cause the braid to be produced in a plain condition, as herein specified.

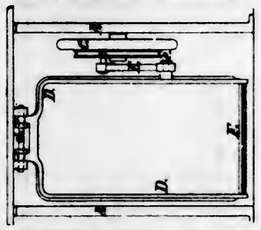
3. In a braiding-machine, the spring Z^2 and adjusting means Z^1, in combination with the rollers $Y' Y^3$, the carriers R, gearing $J' J^3$, framing J, provided with serpentine paths, and suitable take-up mechanism, as set forth.

254,823. LIFTING-JACK. THOMAS J. JEBB and CHARLES S. HARMON, Chicago, Ill. Filed July 29, 1881. (No model.)



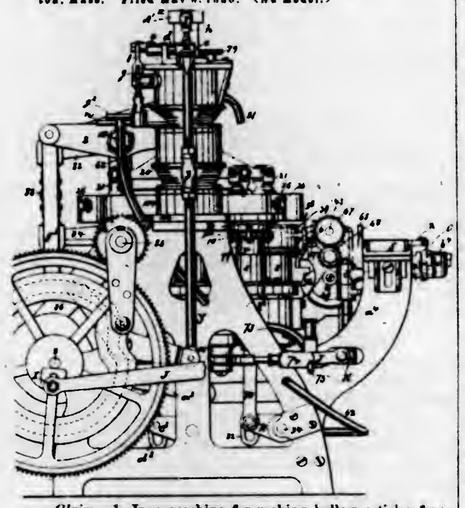
Claim.—1. In a lifting-jack substantially as described, a removable stop for the sliding pawl, as and for the purpose set forth.

2. In a lifting-jack comprising a standard, A, lifting-bar B, pivoted lever D, friction-pawls E and E', and clevis F, constructed and operating substantially as described, a removable stop at the rear of the said standard, below the upper pawl, as and for the purpose set forth.



3. In a lifting-jack, the combination of the standard A, having its upper part forked and provided with a plate, *c*, recessed as shown at *a*, and having notches *b*, lifting-bar B, sliding vertically in guides on the said standard, collar C, journaled to the top of the standard and surrounding the bar B, lever D, having the trunnions of the collar C for a fulcrum, friction-pawls E and E' upon the bar B, clevis F, connecting the short arm of the lever with the upper pawl, and bar G, adapted to fit the notches *b*, substantially as described.

254,824. AUTOMATIC GRAPPLING-BUCKET. FRANK G. JOHNSON, Brooklyn, N. Y. Filed Aug. 1, 1881. (No model.)



Claim.—In connection with the semi-globular bucket, Fig. 1, the combination of the head-plate C and foot-plate E with the ball-and-socket joints, substantially in the manner and for the purposes described.

264,825. TREADLE. HEINRICH KAMPRATH, Culln, Prussia, Germany. Filed Dec. 31, 1881. (No model.)

Claim.—The combination of the swinging frame D, hinged at a point above the axis of the crank or fly wheel, and provided with the foot-rest D', the crank or fly wheel, and the pitman or connecting rod E, connecting the crank or fly wheel directly to the swinging frame at a point between its hinge and the foot-rest, substantially as described.

264,826. PAPER-BOX MACHINE. WILLIAM J. KNAPP, Boston, Mass. Filed May 6, 1880. (No model.)

Claim.—1. In a machine for making hollow articles from pulp, a vat-valve to control the flow of pulp from the pulp-vat to the receiving-cylinder and means to operate it intermittingly, combined with the pulp-receiving cylinder and the pulp-controlling valve between them to retain the pulp in the receiver and to permit its discharge therefrom intermittingly into the forming-cylinder.

2. In a machine for making boxes from pulp, the pulp-receiving cylinder and forming-cylinder, combined with an intermediate pulp-controlling valve to permit the intermittent discharge of pulp from the receiving into the forming cylinder, substantially as described.

3. The pulp-receiving and the forming cylinders, combined with the automatically-operated pulp-controlling valve *a*, to permit the discharge of the pulp from the pulp-receiving into the forming cylinder, and then to close the opening between said parts, substantially as described.

4. The vat-valve, in communication with a supply of pulp, means to move it intermittingly, and the pulp-receiving cylinder, combined with the forming-cylinder and pulp-controlling valve therein to permit the pulp in the receiving-cylinder to be discharged intermittingly into the forming-cylinder, substantially as described.

5. The pulp-receiving cylinder, the forming-cylinder, the pervious former adapted to be placed therein, and the pulp-controlling valve between them, combined with the valve and pipes to introduce compressed air into the forming-cylinder to quickly force the water of the pulp through the pervious former.

6. The forming-cylinder and pulp-controlling valve to close it and the pervious former, combined with the port *e* and inlet and outlet valves for the compressed air, substantially as described.

7. In a machine for forming hollow articles from pulp, the vat-valve and its connected adjustable slotted link and the pulp-controlling valve, combined with the rocker-shaft *d* and its arms *h i*, to operate the said valves at the proper times, substantially as described.

8. The rocker-shaft *d*, and the adjustable pitman to operate the arms *h*, *i*, and *e* on the said shaft, and the link and lever *g*, combined with the vat-valve, the pulp-controlling valve, and the outlet and inlet valves for the compressed air, to operate all substantially as described.

9. In a machine to produce hollow articles from pulp, the forming-cylinder, largest in diameter at its upper end and tapered to join with a cylindrical portion of smaller diameter, combined with a pervious former of less diameter and length than the cylindrical portion of the forming-cylinder, herein described as of least diameter, substantially as and for the purpose set forth.

10. In a machine to produce hollow articles from pulp, a stationary or fixed forming-cylinder with a valve for the admission into the said cylinder of compressed air, a table and means to rotate it intermittingly, a series of pervious formers, and means to successively place the formers and lower portion of the said cylinder in proper contact and relation to enable the formers to successively receive a deposit of pulp, substantially as described.

11. The former provided with the hollow stem *r*, combined with the air-pipe and valve to act as a stop for the same, substantially as and for the purpose described.

12. The pervious former combined with the deflecting-plate 76, as and for the purpose described.

13. The pervious former having a hollow stem and outlet, combined with a hollow reciprocating plunger to elevate the said former and make connection between its stem and the plunger to enable water within the former to be delivered out through the plunger, as described.

14. The pervious former and means to elevate it within the space between the compressing-dies, combined with the compressing-dies and means to close them to express the water from and compact the pulp at the sides of the former, substantially as described.

15. In combination, the pervious former, reciprocating side-compressing dies, and the box-plunger and sleeve in which it moves, substantially as described.

16. The box to contain the pressing-dies, and the pressing-dies, combined with the adjustable gibs, as and for the purpose described.

17. The sleeve q^3, extended upward above the box in which the pressing-dies move, and the pressing-dies and toggle-levers, combined with the collar and its arms to simultaneously move the said dies, substantially as set forth.

18. The radially-movable series of pressing-dies recessed, as described, at one side, combined with the toggle-levers and headed connecting-rods A^3, as and for the purpose described.

19. In a machine to produce hollow articles from pulp, the combination, with the pervious former and its hollow stem, of a pipe connecting the interior of the former with an exhausting-pump or vacuum-chamber to remove fluid from the inside of the former and box thereon, substantially as described.

20. In a machine to produce hollow articles from pulp, a pervious former, a series of radially-movable pressing-dies, a die-box to contain them, a plunger and sleeve in which it moves, and means to exhaust the water from the interior of the former as it is expressed from the fiber on the former, substantially as described.

21. The pervious former and bood to cover it, combined with a pipe to lead water under pressure to and discharge it within and cleanse the former, substantially as described.

22. The former, the receiving-bed, and the two concaved jaws of the taking-off cap, combined with means to move the jaws into position above the former and then above the bed, and means to lower and raise the said jaws in each of their two positions and open and close them at the stated times to transfer the box from the former to the receiving-bed, substantially as described.

23. The two concaved pivoted jaws of the taking-off cap and their oscillating carrying-shaft, the slide, and means to lower the jaws in position to surround but not to touch the box on the former, combined with the slide and its forked part to close the said jaws together while they surround the former and box, substantially as described.

24. The two pivoted concaved jaws of the taking-off cap, the oscillating shaft 43, to move the said jaws from a position above the former to a position above the receiving-bed, and vice versa, and the bevel-gear carried by the said shaft, combined with the shaft 46, its bevel-gear 45, and cover 44, to operate all substantially as described.

25. The oscillating shaft, the yoke 43, provided with the finger 6, and the two pivoted concaved jaws actuated by the said shaft, combined with mechanism, substantially as described, to oscillate the said shaft, and the slide and its projections 56 67, to check the oscillation of the said shaft and place the jaws in proper horizontal position preparatory to the descent of the slide.

26. In a machine for the manufacture of hollow articles from pulp, the former upon which the box is pressed into shape, its hollow stem, the taking-off cap composed of the two concaved jaws, which, when closed together, do not come into contact with the box, and the cover 41, combined with a valve and pipe to introduce compressed air into the former to expand the box, detach its inner face from the perforations of the former, and place the outside of the box in contact with the concaved jaws, substantially as described.

27. In a machine for making hollow articles from pulp, a taking-off cap to remove the box from the former, a receiving-bed for the hollow articles, and means to move said bed forward intermittingly, as and for the purpose set forth.

28. In a machine for the manufacture of hollow articles from pulp, an intermittingly-rotating table and a series of sleeves thereon, and a series of formers having stems fitted to the said sleeves, combined with the plunger-bed and a series of hollow plungers, and means to reciprocate the plungers at the proper times, as stated, to lift the formers into operative position, substantially as set forth.

29. The combination, in a machine for the manufacture of hollow articles from pulp, of the following instrumentalities—viz., a pulp-receiver, the forming-cylinder, a valve located between them, a rotary table and a series of formers carried by it, means to place the formers successively within the said cylinder, a series of hollow reciprocating plungers and means to automatically place the plungers in connection with the stems of the formers to exhaust the water from the formers, a set of dies to compress the fiber upon the formers, and a taking-off cap and means to operate it at the proper times—the combination being and operating, substantially as described, to automatically form and deliver the said hollow articles, as set forth.

30. That improvement in the art or process of manufacturing articles from paper-pulp wherein the water of the pulp is pressed through the pervious former by compressed air, which consists in heating the pulp before it is delivered into the forming-cylinder about the pervious former, whereby the water of the said pulp as the compressed air is permitted to expand is kept at the proper temperature to flow freely through the fiber of the pulp and the perforations of the former, substantially as and for the purpose set forth.

31. In a machine for making hollow articles from pulp, the pervious former upon which the box is formed and pressed, combined with the separate taking-off cap to remove the hollow article to be dried.

32. The perforated metallic seamless former-shell, substantially as described.

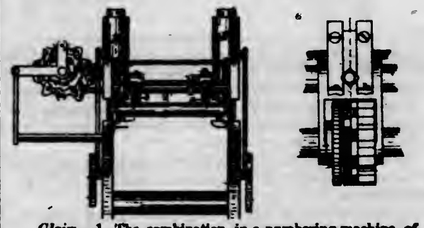
33. In a machine to produce hollow articles from paper-pulp, a stationary forming-cylinder, a pervious former adapted to be placed below the same to receive a charge of pulp, as described, a rotating table and means to remove the former from the forming-cylinder into position between pressing-dies, and pressing-dies and means to move them to compress the hollow article on the said former.

34. The series of formers and their rotating carrying-table, notched at its edges, its supporting-shaft, ratchet, and pawl, combined with the reciprocating rack to move the table intermittingly and a stop to hold the table at rest at the proper time, substantially as described.

35. The pulp-vat, receiving-cylinder, and forming-cylinder, combined with a vat-valve located between the pulp-vat and receiving-cylinder, and with a pulp-controlling valve between the receiving and forming cylinders, substantially as described.

36. The pervious former provided with a hollow stem for the passage of air and water, substantially as and for the purpose described.

37. In a machine to make paper boxes from pulp, a taking-off cap composed of two jaws and a cover, 41, to operate substantially as described.



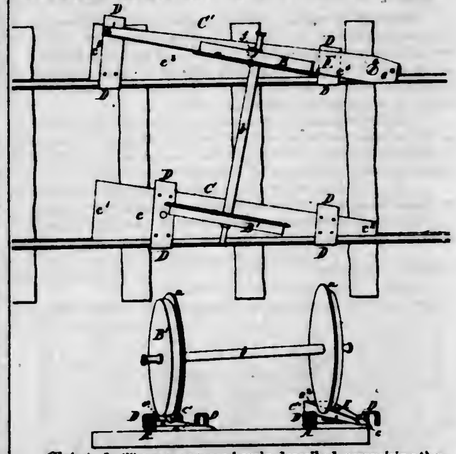
38. In combination, the hood 72 and means to hold it, the former *p*, the force-pump 74, and a suitable pipe or passage for water from the said pump into the former in the said hood, substantially as described.

39. A paper-box-making machine provided with a suction-pump for withdrawing water from the pulp on the former *p*, and with a force-pump, 74, for clearing the interior of the former, substantially as described.

40. The combination of the sliding bolt 95, provided with a finger, 98, and the teeth 94 upon the circular table *t*, that carries the pervious formers *p*, and with the projection 99 on the rock-bar, that rotates the said circular table, substantially as described.

41. That improvement in the art or method of manufacturing hollow articles from pulp which consists in forcing the water from the pulp through a pervious former surrounded by it by means of compressed air, and subsequently pressing the fibrous portion of the pulp so left on the pervious former between the said former and pressing-dies, substantially as described.

264,827. NUMBERING-MACHINE. WELLINGTON P. KIDDER, Boston, Mass. Filed Mar. 18, 1881. (No model.)

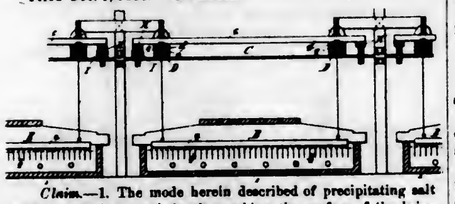


Claim.—1. The combination, in a numbering-machine, of a units-wheel and a tens-wheel and mechanism, substantially such as is described, for not only giving the proper motions to the wheels to print from 1 upward in regular order, but in addition for moving the tens-wheel two steps with the unit, as above described, in order to begin again at 1, as above explained.

2. In a numbering-machine, the tens-wheel above described, carrying, in addition to types for printing the digits, the type for printing 10 and the blank space, and arranged and operating with the units-wheel, as set forth, the tens-wheel having a double motion with the units-wheel after 99 has been printed, the first step of this double motion bringing the 10 in line with the 0 of the units-wheel and printing 100, and the next step the blank space in line with the 1 of the units-wheel and printing 1.

264,828. CAR-REPLACER. JEAN LAFITEAU, New Orleans, La. Filed Aug. 8, 1881. (No model.)

Brief.—Consists of sloping plates having right and left hand hooks, one of which is provided with a pivoted stop and guide-rail.



Claim.—1. The car-replacer herein described, comprising the horizontally-flaring and vertically-tapering portions C and C', the portion C consisting of a double wedge-shaped track-plate, *c*, having right and left handed hooks D D, a broad and thin front end, and a narrow and high rear end, *c'*, which supports the flange of the car-wheels, and thereby brings the tread of the wheel higher than the surface of the railroad-rail, and also having a sloping or

downward inclination from its highest point, c^2, while the portion C' consists of a plate, a^2, similar to the plate c of portion C, and provided with right and left handed hooks and a pivoted swinging rail, E, of tapering form, the portion e^2 of which projects over the railroad-rail and slopes down gradually to the top surface thereof, all substantially as and for the purpose described.

2. The combination of the removable pin f, pivoted rail E, and plate c of portion C, whereby the rail E is allowed to vibrate on its pivot when in use and may be fastened in position while it is out of use and is being transported, substantially as described.

254,829. MAKING SALT. JAMES M. LAISE, Bay City, Mich. Filed Dec. 1, 1881. (No model.)

Claim.—1. The mode herein described of precipitating salt particles in brine, consisting in combing the surface of the brine substantially in the manner set forth.

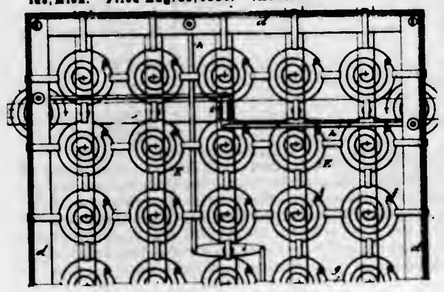
2. The rakes B, provided with teeth b, dipping into the brine and actuated on by suitable mechanism for raking off the brine, substantially as and for the purpose specified.

3. The combination of the carriage C and suspended rakes B, as and for the purpose described.

4. In combination with the carriage C, the tracks D, suspended above the grainers so as to form no obstruction around or near these, substantially as described and shown.

5. The mechanical movement for operating the rakes, consisting of the gear-wheels K O O', lever L, revolving tappets M M', and arms N N', when constructed, operating, and combined substantially as described.

254,830. CORE-BOX. CURTIS H. LEWIS, Indianapolis, Ind. Filed Nov. 5, 1881. (No model.)



Claim.—1. A core-box made in two parts, provided with openings for the insertion of a rubber or other elastic cushion, the upper half having end extensions, D, for closing the box and fitting guides in the lower part, the abutting edges of the two parts being beveled off, so as to cut the sand when the parts are closed, substantially as and for the purpose set forth.

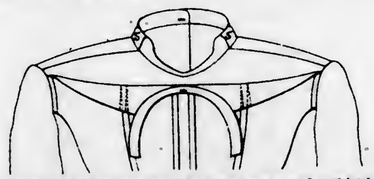
2. A core-box made in two parts, each part having a rubber or other elastic cushion, G, and provided with flanges h h', having beveled cutting-edges, whereby irregular or flanged cores may be formed, substantially as and for the purpose set forth.

3. A core-box provided with rubber or other elastic cushions, as described, and one or more extension-boxes, B', having openings d, to receive the shank of a partition, C, whereby T-shaped cores can be formed, substantially as and for the purpose set forth.

254,831. SPRING BED-BOTTOM. WILL J. LOWN, Grand Rapids, Mich. Filed Aug. 25, 1881. (Model.)

Claim.—1. In a spring bed-bottom, the combination, with the upper and lower frames and the intermediate springs, c, of the longitudinal rods h h, and pivoted connecting-bar i, and the transverse rods h h, and pivoted connecting-bars i, arranged near the forward and rear ends of the bed-bottom, substantially as and for the purpose herein shown and described.

2. In a spring bed-bottom, the combination, with the upper and lower frames, the intermediate springs, c, and the springs E, having the hook and eye f, of the longitudinal rods h h, and pivoted connecting-bar i, and the transverse rods h h, and pivoted connecting-bars i, arranged near the forward and rear ends of the bed-bottom, substantially as and for the purpose herein shown and described.



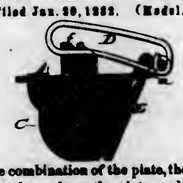
254,832. NEUTRAL POTASH SOAP. WILLIAM J. HUSSINS, Saint Helen's, County of Lancaster, England. Filed Feb. 8, 1882. (No specimens.)

Claim.—1. A neutral potash soap, substantially as herein described.

2. The process herein described for producing potash soaps, consisting in treating saponifiable oils and fats with a caustic potash free from carbonate, substantially as set forth.

3. In the manufacture of potash soap, the treatment of a caustic potash of the purity and strength described with saponifiable oils and fats, in substantially the proportions set forth.

254,833. SHIRT. HORACE W. HUSSEY, Troy, N. Y., assignor of two-thirds to Manville & Clark, same place. Filed Sept. 21, 1881. (No model.)



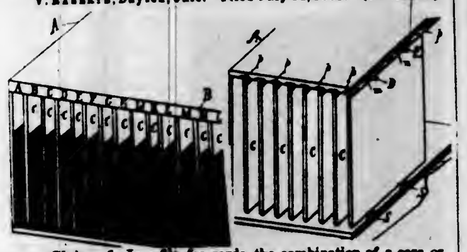
Claim.—In a bosom shirt, the combination of a shirt-bosom unattached to the shirt-body at the top of the bosom, subtending tabs formed upon the neckband of the bosom, and pockets or guides made in the neckband of the shirt-body, as and for the purposes described and set forth.

254,834. COMPRESSED VENEER. MURRAY E. HOGAN, Chicago, Ill., assignor of two-thirds to George Farnsworth, same place, and John Thomas, Defiance, Ohio. Filed Oct. 27, 1881. (No specimens.)

Claim.—As an article of manufacture, cold-compressed wood veneer for barrels, cheese-hoops, &c., having the qualities herein described—viz., toughness, density, and pliability—in degree essentially distinguishing it from natural veneer of like thickness, substantially as set forth.

254,835. BOTTLE-STOPPER. JOSEPH HORSCHHAUSER, Poughkeepsie, N. Y. Filed Jan. 30, 1882. (Model.)

Claim.—1. The combination of the plate, the plunger, the elastic stopper, the spring-loop above the plate, and the swinging bail or stirrup.



2. In combination with the plate A, piston B, and elastic stopper C, the inclined spring-loop D and the bail or equivalent pressure device arranged to swing within the loop and seat itself in the upper end of the piston.

3. In a bottle-stopper, the combination of a top plate, a vertical plunger passing through the same, an elastic stopper upon the lower end of a plunger, and pressure devices, substantially as shown, acting upon the upper end of the piston to force the same downward through the plate.

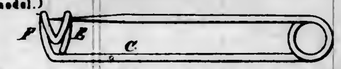
4. In a stopper, the combination of a perforated plate, a piston passing through the same, an elastic stopper applied to the lower end of the piston, a spring operating to raise the piston, and means, substantially as described, to force both the piston and the plate downward.

5. The combination of the plate, the elastic stopper, and the bail with the plunger having its upper end provided with the seat e.

254,836. FILE FOR POSTAL AND OTHER CARDS. GEORGE V. MARRETT, Dayton, Ohio. Filed July 26, 1881. (No model.)

Claim.—1. In a file for cards, the combination of a case or frame-work, and laterally-movable partitions suspended within said box, and a provision, substantially as described, whereby said partitions are prevented from coming into contact, substantially as and for the purposes specified.

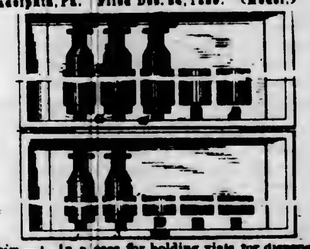
2. In a file for cards, the case or frame-work A and the suspended laterally-movable vertical partitions, said case being provided with recesses in the top and bottom of the box, receiving the ends or extensions of the vertical partitions and controlling the extent of the lateral adjustment of said partitions, substantially as and for the purposes specified.



3. The combination of the case A, provided with the rods D E, and the separate laterally-movable partitions, suspended on said rods by means of hooks or eyes, substantially as and for the purposes specified.

4. The combination of the case A, provided with the rods D E, and the recesses p, and the separate laterally-movable partitions, suspended on said rods by means of hooks or eyes entering the said recesses, substantially as and for the purposes specified.

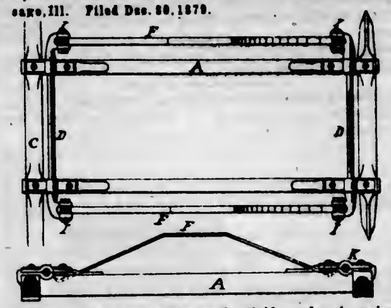
5. The combination of the case A, provided with rods D E, and the recesses p s, and the vertical partitions provided with beveled edges and suspended from and sliding laterally on said rods, substantially as and for the purposes specified.



6. In a postal-card file, the vertical laterally-movable partitions C, suspended from the under side of the top of the case, and not resting on the bottom of said case, the upper and lower edges of said partitions being provided with means, substantially as described, for controlling the amount of the lateral movement of said partitions and for permitting an equal degree of movement at top and bottom, substantially as and for the purposes specified.

254,837. SAFETY-PIN. EDWIN L. PAINE, Newark, N. J., assignor to Charles R. Lane, same place. Filed Mar. 5, 1881. (No model.)

Claim.—The safety-pin having the loop A, bent at right angle with the shank C, and folded upon itself at a, said fold forming a lock, E, and guard F, substantially as specified.



254,838. MEDICINE CHEST AND CASE. MYLA H. PEACOCK, Philadelphia, Pa. Filed Dec. 24, 1880. (Model.)

Claim.—1. In a case for holding vials for dispensing medicines, clasping-springs attached to the back of such case, adapted to hold the sides of the vials and display the fronts thereof, in combination with springs placed beneath the vials and adapted to press them upward upon the stoppers, in the manner and for the purpose as shown and described.

2. The combination, with a packing-case, of a clasping-spring open in front, so as to display the label and contents of the bottle, with a lifting-spring adapted to press the stopper against the case and into the bottle, as set forth and shown.

254,839. SIDE-SPRING BUGGIES. GEORGE PENOYER, Chicago, Ill. Filed Dec. 20, 1879.

Claim.—The combination of the rigid reaches A, springs F, and equalizing-bars D, the equalizing-bars D being located in bearings on top of reaches A, said bearings consisting of a strap or tip iron having a recess in its upper face, and a cap-piece similarly recessed and secured upon the strap by bolts or screws, whereby the removal of the equalizer-bar at any time is permitted.

254,840. SAMPLE-FASTENER FOR PACKAGES. WALTER R. PERRY, New London, Conn. Filed June 20, 1881. (No model.)

Claim.—1. In combination with a box or package, a sample-fastener comprising a coiled spring secured to said box or package, as explained, so as to leave beneath the spring a space for the reception of the sample, substantially as described.

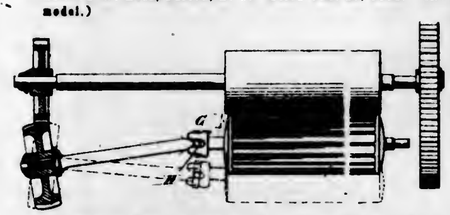
2. The combination, in a device for attaching samples to packages, of the spring c, the loops d, and the loop-fasteners A A, all as set forth.

3. The combination of the box or package A, the coiled spring c, the loops or rings d, and the fasteners A A, as set forth.

254,841. LUMINOUS ATTACHMENT FOR HARNESS. RUDOLF F. PFLUGER, Akron, Ohio. Filed May 19, 1881. (No model.)

Claim.—1. A plate of metal or other suitable material provided with devices for attaching it to the bridle or harness of a horse, and coated with a paint composed of sulphide of calcium and a siccative oil or paint varnish, substantially as and for the purpose hereinbefore set forth.

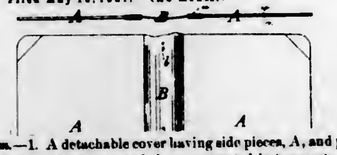
2. A new article of manufacture consisting of a plate of metal or other suitable material adapted to be attached to the bridle or harness of a horse, and covered with a substance which is luminous in the darkness, substantially as and for the purpose hereinbefore set forth.



254,842. BUTTON AND BUTTON-FASTENING. EMIL PFLUG, Berlin, Germany, assignor to Nicolay Fritzner, same place. Filed Oct. 26, 1880. (No model.) Patented in Germany Apr. 26, 1881.

Claim.—1. The hollow button-head described, formed of two pieces, a and b, the latter extended into the nipple c, as shown, in combination with the fastening-strip d, bent upon itself and inclosed in the head a b, which it fills, substantially as set forth.

2. The button described, consisting of the two head-pieces *a* and *b*, fastened together as described, the fastening-piece *d*, having a bent portion lying within and filling the head *a b*, and the washer *e*, having a central hole, radial depressions *e'*, and recessed edges for engaging the points of the fastening-piece *d*, all constructed and arranged as herein set forth.



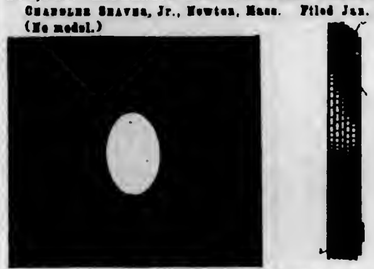
254,843. EXTENSIBLE UNIVERSAL JOINT FOR SHAFTS. ELMORE W. ROSS, Fulton, N. Y. Filed Jan. 27, 1882. (No model.)

Claim.—1. The two parts of a jointed tumbling-shaft, provided one with a slotted cylindrical head and the other with a hub or collar having rigid radial pins passing through the slots of said head, and forming in connection therewith an extensible universal joint, substantially as described.

2. An extensible universal joint for shafting, consisting of the slotted cylindrical head G and the hub or collar H, having rigid radial pins adapted to pass through and to slide in the slots in the cylindrical head, as described.

254,844. TEMPORARY BINDER. EDWARD ROSS, Hoboken, N. J., assignor to A. Liebenroth, Von Auw & Co., New York, N. Y. Filed May 10, 1881. (No model.)

Claim.—1. A detachable cover having side pieces, A, and pliable back B, the said side pieces being constructed in two parts, *a a*, or of one piece split on the inner edge, forming the lips *a'*, to overlap the said pliable back on either side, which is securely fastened between them by glue or other adhesive material, substantially and for the purposes shown and described.

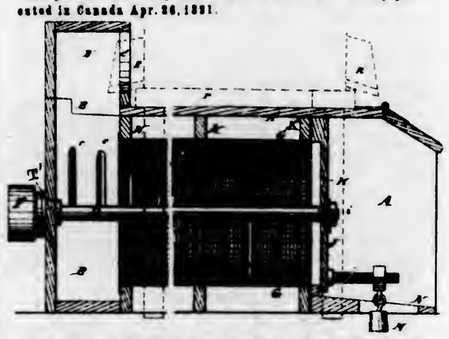


2. A detachable cover having side pieces, A, and pliable back B, the said side pieces being constructed in two parts, *a a*, or of one piece split on the inner edge, forming the lips *a'*, to overlap the said pliable back on either side, which is securely fastened between them by glue or other adhesive material, said cover and back being reversible by having the same finish on both sides thereof, substantially and for the purposes shown and described.

3. A detachable cover having side pieces, A, and pliable back B, the said side pieces being constructed in two parts, *a a*, or of one piece split on the inner edge, forming the lips *a'*, to overlap the said pliable back on either side, which is securely fastened between them by glue or other adhesive material, said cover and back being reversible by having the same finish on both sides thereof, said back having two or more eyelet-holes, through which a binding may be run to attach the leaves of a book, substantially and for the purposes shown and described.

4. The combination of a detachable cover having side pieces, A, and pliable back B, the said side pieces being constructed in two parts, *a a*, or of one piece split on the inner edge, forming the lips *a'*, to overlap the said pliable back on either side, which is securely fastened between them by glue or other adhesive material, said cover and back having two or more eyelet-holes, through which a binding may be run to attach the leaves of a book, combined with the leaves C and binding D, substantially and for the purpose shown and described.

5. The combination of a detachable cover having side pieces, A, and pliable back B, the side pieces being constructed in two parts, *a a*, or of one piece split on the inner edge, forming the lips *a'*, to overlap the said pliable back on either side, which is securely fastened between them by glue or other adhesive material, said cover and back being reversible and having the same finish on both sides thereof, said back having two or more eyelet-holes, through which a binding may be run to attach the leaves of a book, combined with the leaves of a book secured to the pliable back by the binding D, substantially and for the purposes shown and described.



254,845. APPARATUS FOR VIGNETTING PHOTOGRAPHS. CHANDLER SEAVER, Jr., Newton, Mass. Filed Jan. 9, 1882. (No model.)

Claim.—1. The device for vignetting photographic pictures substantially as herein described, consisting of a plate with an opening to admit rays of light to the negative, and the combination, with said plate having such opening, of a series of semi-transparent sheets, each having an opening to permit of the unobstructed passage of light, the series of openings gradually increasing in size outward to proportionately increase the opacity of the combined sheets about the lesser opening and stop off the rays of light with regular gradations as the margin of the negative is approached.

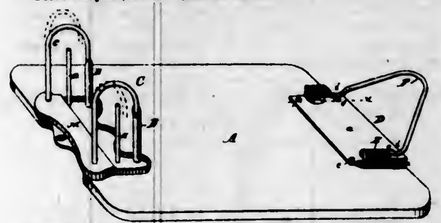
2. In a printing and vignetting device, the removable or changeable shield or screen *c*, in combination with the plate A and sheets *a a*, substantially as and for purposes stated.

254,846. BARLEY-BEARDING MACHINE. JAMES SENDALL, Brockport, N. Y., assignor of one-half to Dewain Richards, same place. Filed Sept. 6, 1880. (No model.) Partly patented in Canada Apr. 26, 1881.

Claim.—1. A barley-bearder consisting of a chamber at the feeding end, provided with a bottom depressed or lowered below the screening-cylinder to form a box, in combination with a screening-cylinder and a rotating shaft provided with spirally-arranged beaters or blades, substantially as and for the purpose specified.

2. A barley-bearder consisting of a chamber at the feeding end, provided with a bottom depressed or lowered below the screening-cylinder to form a box, in combination with a screening-cylinder opening therefrom, an automatic discharge-door, and a rotating shaft provided with a series of spirally-arranged blades or beaters, substantially as and for the purpose specified.

3. In a barley-bearder, a screening-cylinder in which the grain is treated, in combination with a feed-chamber at one end, into which said cylinder opens, said chamber extending below the bottom of the cylinder to separate stones, dirt, &c., from the grain fed into the chamber, to prevent its passing into the cylinder with the grain, and means to feed the grain to be treated from the feed-chamber into the cylinder, substantially as and for the purpose specified.



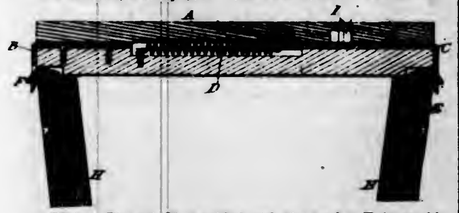
4. In a barley-bearder, a chamber to separate stones, dirt, &c., from the grain, located in the feeding end of the machine, the bottom of said chamber being depressed or lowered some distance below the screening-cylinder to form a box, in combination with said cylinder, and an extension of said chamber above the body of the machine, and provided with a feeding-aperture located on the side facing the rear end of the machine, as and for the purpose specified.

5. A discharging-door for a barley-bearder in which the door is hung and arranged with reference to the center of gravity, so that it exerts automatically an increased pressure to close itself in proportion as the discharge increases, and vice versa, in combination with a screening-cylinder and means to feed the grain through said cylinder and door, as and for the purpose specified.

6. In a barley-bearder, a screening-cylinder, in combination with a vertical door hinged at the top and provided with an arm and a regulating-weight adjustable thereon, said door operating to increase its tendency to close in proportion as the discharge of grain increases, and vice versa, as and for the purpose specified.

7. In a barley-bearder, the combination of the screening-cylinder G, supported in a frame, A, open on the bottom, with chamber B, having bottom O below the cylinder G, shaft D, with spirally-arranged beaters *e*, and discharge-door J, as shown and described.

254,847. PAPER-FILE. JAMES S. SHANNON, Chicago, Ill. Filed July 26, 1880. (No model.)



Claim.—1. The paper-file described, consisting of a base, A, and two parallel receiving-wires, B B, provided with a double punch mounted upon the same base, and adapted to simultaneously punch two holes in the paper in position and of size to admit the receiving-wires, substantially as set forth.

2. The paper-file consisting of a base, A, having receiving-wires B arranged at one end of the base, provided with the punch described, consisting essentially of the fixed studs *d*, the apertured movable plate *a*, and the hinged cam-lever F, secured to the base at the opposite end, and adapted to perforate the papers to fit the wires B, substantially as set forth.

3. The paper-file consisting of the base A, receiving-wires B, and a gage, G, provided with a punch adapted to perforate the papers to fit the wires, and having a gage corresponding with the gage of the receiving-wires, substantially as described.

254,848. FASTENING FOR BUTTER-PAIL COVERS. CHESTER L. STEPHENS, Brooklyn, Pa. Filed Oct. 1, 1881. (No model.)

Claim.—The tub H, provided with the catches F, in combination with the cover A, provided with the fixed plate B and the sliding plate C, having thumb-piece I, and retracting-spring D, all constructed to operate substantially as described.

254,849. METALLIC TRAY. JOB TAYLOR, East Hamburg, N. Y. Filed Nov. 9, 1881. (No model.)

Claim.—1. A dipping-tray having a removable handle-frame locked to the tray, substantially in the manner as and for the object specified.

2. A dipping-tray having a removable handle-frame and cross-bars over the cans to hold them down in said tray, as stated.

3. A dipping-tray having a removable handle-frame, the handles of which are fixed to and form an integral part of said handle-frame, said handle-frame forming a separate frame for said tray, as stated.

4. A dipping-tray having handles attached to and forming a part of a frame, said tray being constructed with capability of being removed from said frame, as specified.

5. A dipping-tray, in combination with a removable frame having handles, as stated.

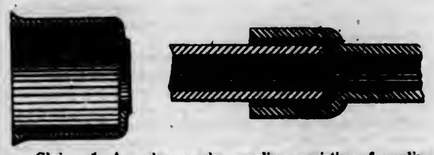
6. In dipping-trays, the combination, with the trays, of a frame having a pair of handles and a locking device, substantially as described.

7. In dipping-trays, the combination, with the tray, of a frame having two handles and a U-shaped locking-bar for the cans and frame, substantially as described.

8. In dipping-trays, the combination, with said tray, of a handle-frame having two handles and a U-shaped locking-bar pivoted to one of said handles, as specified.

9. The combination, with a dipping-tray, of a pair of cross-bars over the cans, said cross-bars being constructed with capability of being locked to the handles for said tray, as stated.

10. The combination, with the tray, of a frame consisting of the bars F F', formed into the U-shaped handles E E', cross-bars L, and locking-bars H, as stated.



11. The combination, with the tray, of a frame consisting of the bars F F', formed into the U-shaped handles E E', cross-bars L, and locking-bar H, said bar H consisting of a U-shaped rod pivoted to one of said handles, as specified.

12. The combination, with the tray, of a frame consisting of the bars F F', handles E E', cross-bars L, and U-shaped locking-bar H, said locking-bar being pivoted to the handle E' and adapted to engage pins I on the handle E, substantially as and for the object specified.

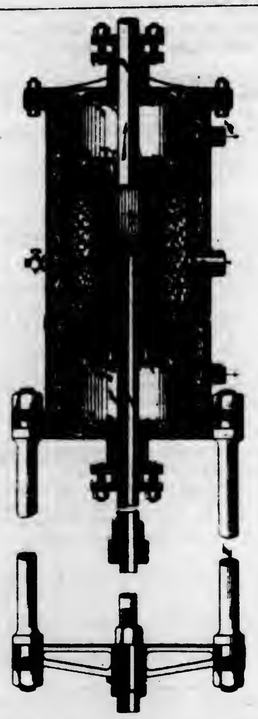
13. A dipping-tray having a frame provided with handles formed integral with the longitudinal slats of said frame, as specified.

14. A dipping-tray having a frame provided with handles formed integral with the longitudinal slats of said frame, and with cross-bars L, having upwardly-pointing ends, as shown and described.

254,850. PIPE-COUPLING. JOHN C. TELFER, Cleveland, Ohio. Filed July 11, 1881. (No model.)

Claim.—1. A washer or pipe-coupling consisting of a cylindrical portion having an inwardly-projecting flange adapted to fit upon the end of a pipe-section, said cylindrical portion adapted to receive the end of the same pipe-section, substantially as set forth.

2. As an article of manufacture, a washer or pipe-coupling made of tarred paper, consisting of a cylindrical portion and an inwardly-projecting flange formed on one end thereof, substantially as set forth.



3. The combination, with two pipe-sections, one having an enlarged end adapted to receive the adjacent end of the next pipe-section, of a washer or coupling having a cylindrical body adapted to snugly fit between the adjacent cylindrical surfaces of the pipe-sections, and provided with an inwardly-projecting flange adapted to fit between the end of one section and a shoulder on the other section, substantially as set forth.

254,851. AIR-COMPRESSOR. JOHN B. WARING, New York, N. Y., assignor of one-half to Milan C. Bullock, Chicago, Ill. Filed May 21, 1881. (No model.)

Claim.—1. The combination, in an air-compressor, of a stationary outer cylinder, a movable inner cylinder, piston-heads fitting said outer cylinder and movable with said inner cylinder, a stationary piston fitting said inner cylinder, and the several valves, substantially as described, for admitting air to each end of the outer cylinder for controlling the passage of air from the outer to the inner cylinder and for the discharge of air from the inner cylinder, substantially as and for the purpose specified.

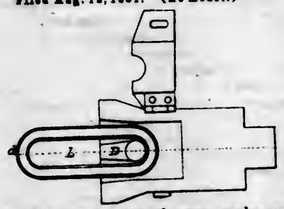
2. The combination, in an air-compressor, of a stationary outer cylinder, a movable inner cylinder, piston-heads fitting said outer cylinder and movable with said inner cylinder, a stationary piston fitting said inner cylinder, inlet-valves for the outer cylinder, valves controlling the passage of air from the outer to the inner cylinder, discharge-valves for the inner cylinder arranged in the stationary

254,851.

piston, and a hollow piston-rod, to which said piston is attached, and which serves as a discharge-pipe, substantially as and for the purpose specified.

3. The combination, in an air-compressor, of a stationary outer cylinder, a movable inner cylinder and piston-heads, valves for the proper operation of said cylinders, a stationary piston fitting said inner cylinder, a piston-rod therefor, and a tube surrounding said piston-rod secured in one of the movable piston-heads and provided outside the cylinders with a stuffing-box which works upon said piston-rod, substantially as and for the purpose specified.

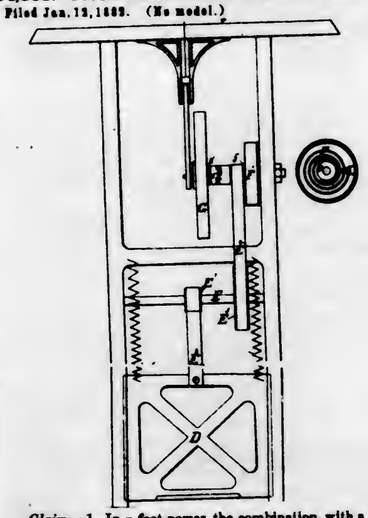
4. The combination, in an air-compressor, of a stationary outer cylinder, an inner movable cylinder, piston-heads movable with said inner cylinder and fitting said outer cylinder, valves for the proper operation of the cylinders and pistons, a water-inlet passage leading to the annular space between the outer and inner cylinders and between the movable piston-heads, and a water-outlet from said space, substantially as and for the purpose specified.



5. The combination, in an air compressor, of a stationary outer cylinder constructed with a surrounding jacket, a movable inner cylinder and piston-heads, a stationary piston fitting said inner cylinder, valves for the proper operation of said cylinders and pistons, a water-inlet passage leading to the annular space between the inner and outer cylinders and between the movable piston-heads, a port or aperture leading from said annular space to the jacket surrounding the outer cylinder, and a water outlet or outlets from said jacket, substantially as and for the purpose specified.

6. The combination, with a valve opening or openings in a valve-seat, of a valve composed of a circular disk of corrugated spring metal having a central opening and means for securing it in place at one edge, substantially as specified.

7. The combination, with a valve-seat having in it an annular groove or channel and openings communicating therewith, of a valve composed of a circular disk of corrugated spring metal secured to the seat near its center and overlapping said annular groove or channel, substantially as specified.



8. The combination, with a valve-seat in which is an opening or openings, and which is constructed with a projecting annular lip or flange having an inclined inner surface forming a conical or taper seat, of a valve composed of a circular disk of corrugated spring metal overlapping said opening or openings and bearing against the taper or conical seat, substantially as specified.

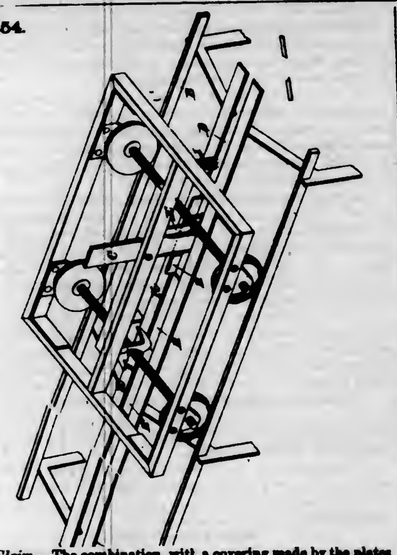
254,852. CAR-COUPLING. WILLIAM W. WATKINS, Bellevue, Iowa. Filed Aug. 12, 1881. (No model.)

Claim.—The combination of a car-coupler, substantially as described, with a draw-head that is open on the top, with a cover that can be locked, a pin that is fastened and can with reasonable ease be removed when wished, and all in connection with a link of the same size, or nearly so, as those in most common use, and that may be coupled to cars using such or similar links.

254,853. FOOT-POWER. JOHN A. WEBSTER, Detroit, Mich. Filed Jan. 12, 1882. (No model.)

Claim.—1. In a foot-power, the combination, with a shaft, of a reciprocating hub arranged to work upon said shaft and provided with clutch-teeth at one end, a drive-wheel fixed upon said shaft and having a hub provided with clutch-teeth projecting toward the clutch-teeth of the reciprocating hub, but inclined in an opposite direction therefrom, and an intermediate shifting clutch-ring, arranged to be driven toward the drive-wheel and engaged therewith by the reciprocating hub when the latter moves in one direction and to be thrown out of engagement with said drive-wheel when said hub moves in the opposite direction, said ring at the same time reciprocating with said reciprocating hub, substantially as described.

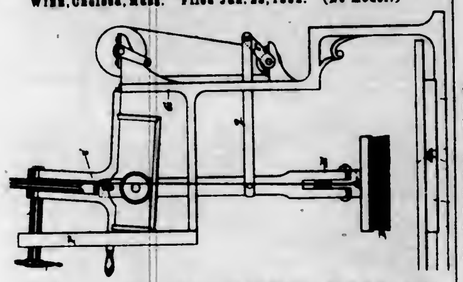
2. In a foot-power, the combination, with a drive-wheel having a ratcheted hub, f', an engaging clutch, I, and driving-hub f, of a spring, F, the construction being such that the spring acts to reverse the motion of the hub after it has been rotated forward by the belt, substantially as described.



3. The combination, with the drive-wheel, the clutch I, and hub f, of the spring F, the belts E^2 and E', and a treadle, substantially as described.

4. The combination of a drive-wheel provided with ratchets f', a clutch-ring provided with ratchets i, inclined faces i', and shoulders i^2 and i^3, and in connection therewith a reciprocating driving-hub, f, provided with inclined faces f' and shoulders f^3, substantially as described.

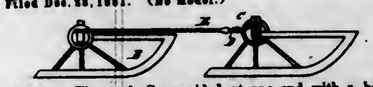
254,854. COVERING THE SLOT OF CABLE-ROADS. MARY JEFFRIES WHALEY, Lincoln, Nebr. Filed Nov. 21, 1881. (No model.)



Brief.—Beveled hinged plates that are operated by means of an opening and a closing plow secured to a car or truck are arranged to cover the slot of a cable-railway.

254,854.

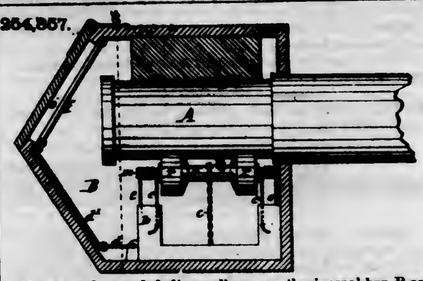
Claim.—The combination, with a covering made by the plates H, fastened on hinging-rod K, for the beveled slot D of cable-roads, of the opening-plow E and closing-plow F, for operating the same.



254,855. MACHINE FOR CLEANING CASTINGS. STEPHEN WISE, Chelsea, Mass. Filed Jan. 23, 1882. (No model.)

Claim.—1. The machine substantially as described, consisting of the movable table or platform and the brush and its mechanism for vibrating it, its mechanism for depressing and raising it, and its mechanism for turning it laterally, all being adapted and to operate substantially as and for the purpose specified.

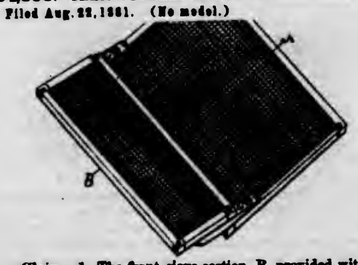
2. The combination of the spring i, with the brush and its carrier or vibrator, and the frame F, adapted to such vibrator, in manner essentially as set forth.



254,856. BOB-SLEIGH. FRANK YAGER, Clarkston, Mich. Filed Dec. 28, 1881. (No model.)

Claim.—The neck C, provided at one end with a hole, a, adapted to lie loosely between the bolster and beam of the forward bob, and having a bifurcated rear end, in combination with the part D, provided at one end with a tongue adapted to be pivoted in the bifurcated end of the neck C and at its other end with a ball or knob, and the reach E, connected to the rear bob and provided with a spherical recess to receive the ball end of the part D, substantially as shown and described, and for the purpose specified.

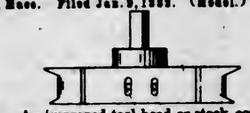
254,857. CAR-AXLE BOX. GEORGE H. YOST, Theresa, N. Y. Filed Dec. 20, 1881. (No model.)



Claim.—1. In combination with the journal A and box B, the frame a, provided with ears b b, the spring-arms c c, fixed to

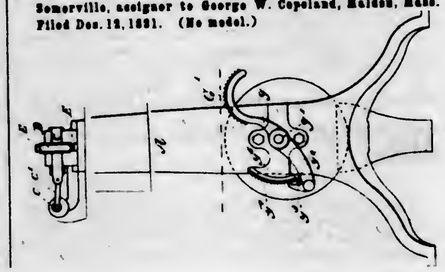
said ears and extended diagonally across the journal-box B and carrying respectively at opposite sides of the journal the mandrel m and the rollers r, journaled on said mandrel, and provided with the endless chain e, substantially as set forth.

2. The combination, with the frame a, supporting the rollers r r, with their lubricating-chain e, as set forth, of the hail formed of sections d, d', and f, the latter of which is provided with the diagonal bars f f across the front opening of the journal-box B, substantially as described and shown.



254,858. GRAIN-SEPARATOR. DAVID YOUNG, Stockton, Cal. Filed Aug. 22, 1881. (No model.)

Claim.—1. The front sieve-section, B, provided with fingers forming a comb upon its rear beveled-frame edge, and connecting-bars C C, combined with the rear sieve-section, A, having a front beveled-frame edge, all constructed substantially as set forth.

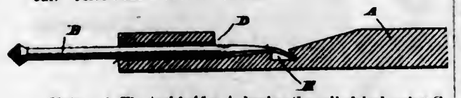


2. The combination of two sieves of unequal size, which are secured together at an angle to each other, the smaller one of the two being provided with fingers upon its edge where it overlaps the larger one, and the two sieves having their edges beveled away so as to permit the grain to escape between them, substantially as described.

254,859. EDGE SETTING AND BURNISHING MACHINE. ROBERT ADEE, Somerville, assignor to George W. Copeland, Malden, Mass. Filed Jan. 9, 1882. (Model.)

Claim.—An improved tool head or stock, consisting of a hollow holder provided with a bushing or sleeve adapted to oscillate therein, and a tool having a spindle fitting within such sleeve or bushing and held therein by frictional contact, all substantially as set forth.

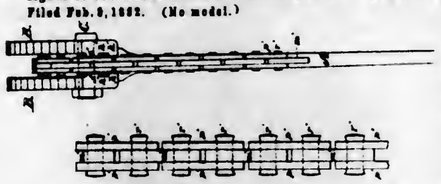
254,860. EDGE-BURNISHING MACHINE. ROBERT ADEE, Somerville, assignor to George W. Copeland, Malden, Mass. Filed Dec. 12, 1881. (No model.)



Claim.—1. A rod for trimmers consisting of a coiled wire bar, [illegible] space, where it rests upon the rail, to allow the lower end of the

Claim.—1. In a burnishing-machine, the foot-rest G, as and for the purposes described.

2. In a burnishing-machine, the foot-rest G and means for varying the height, all substantially as specified.

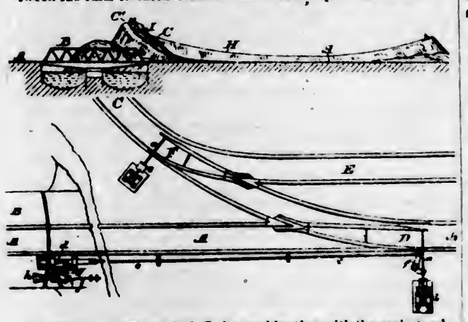


264,861. TOOL-HANDLE. THOMAS BOLTON, San Francisco, Cal. Filed June 27, 1881. (No model.)

Claim.—1. The tool-holder A, having the cylindrical socket C extending longitudinally into one end, and the inclined surface D, with the slot or notch E, formed across it at such a point that the angle or shoulder F stands in a line with the center of the socket C, substantially as and for the purpose herein described.

2. The tool B, having the curved elastic and flattened tang G, as shown, in combination with the holder A, with the socket C, the inclined flattened surface D, transverse groove or notch E, and shoulder F, whereby the tang of the tool is engaged and held, substantially as herein described.

264,862. CHAIN-WRENCH. WILLIAM H. BROCK, Corona, assignor of one-fourth to John W. Alexander, New York, N. Y. Filed Feb. 8, 1882. (No model.)



Claim.—1. The combination, in a chain-wrench, with the two detachable serrated double jaws B, with claws *f'* and lugs *k'*, the bolt C, pin D, and shank A, of a flat-link chain, E, with its links *m'* and *p'* fashioned, located, and riveted, as shown, for short adjustment of chain, and projecting rivets *r'*, for locking the chain, all substantially as and for the purposes as herein set forth.

2. The combination, in a chain-wrench, with the jaws B, made with claws *f'* and lugs *k'*, the bolt C, pin D, and shank A, of a flat-link chain, E, with its rivets *r'*, projecting laterally for locking the chain, substantially as herein described.

264,863. RAILWAY DRAW-BRIDGE APPLIANCE. JOHN CHANDLER, Brooklyn, N. Y. Filed Dec. 6, 1876. Renewed Feb. 10, 1882. (No model.)

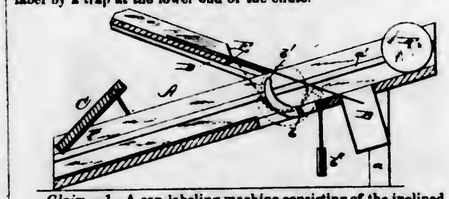
Brief.—The draw is locked in position by the act of shifting the switch to the main line, its normal position being to the siding, and it cannot be so shifted unless the bridge is in proper position in view of a lug upon the bridge which operates a locking-bolt to permit the switch-lock bolt to secure the bridge. The siding has an incline, whereby trains will be brought to a stand, and an automatic switch at the summit of the siding acts to direct a runaway locomotive into a double inclined siding, whereby it will be brought to rest. Weighted tilting forked catch-levers are arranged between the rails to catch about the axles and stop the locomotive.

Claim.—1. The switch D, in combination with the main track A, safety-siding C, and draw-bridge B, and provided with a weight, *c*, or its equivalent, tending constantly to open it from the track A to the siding C, substantially as and for the purposes set forth.

2. The combination of the main track A, draw-bridge B, and safety-siding C, having a heavy upward grade, and connected with the track A by a switch, D, which constantly tends to open to it from the track A, substantially as set forth.

3. The combination of the main track A, draw-bridge B, safety-siding C, and switch D with the connecting-rod *a* of that switch, the weight *c*, or its equivalent, tending to operate it, the draw-bridge bolt *d*, and its rod or rope *e*, whereby the opening of the switch D to the main track locks the draw-bridge in position, substantially as set forth.

4. The combination of the main track A, the draw-bridge B, the safety-siding C, and the switch D with the connecting-rod *a* and weight *c*, or its equivalent, for operating the switch, and with the locking device at the draw, consisting of the bolts *d* and *g* and tappet *h*, and with the rod or rope *e*, for connecting the locking device with the switch mechanism, whereby when the draw is open the switch is locked in position, substantially as set forth.



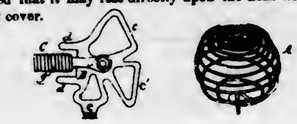
5. The combination, with the track A, draw B, siding C, and switch D, of the siding E, connecting with the siding C by an automatic switch, F, operated by a weight, *c*, or its equivalent, whereby a train backing off from the siding C will be directed onto the siding E instead of onto the track A, substantially as set forth.

6. The combination of the track A, switch D, safety-siding C, having a heavy upward grade, switch I, and siding H, having a double grade rising in both directions toward its ends, substantially as and for the purposes set forth.

7. The sidings C and H, having upward grades toward the switch I, and provided with automatic pawls J J, consisting each of a pawl-arm, *q*, a weighted arm, *p*, and a depressing-lever, substantially as and for the purposes set forth.

264,864. CAN-LABELING MACHINE. JOHN F. CHASE, Augusta, Me., assignor of one-fourth to Henry Sewall, same place. Filed Jan. 24, 1882. (No model.)

Brief.—The label is fed down into the reservoir, so as to get paste on both sides of its lower end, and then drawn back until its pasted end rests on bottom of trough just above the pivoted U-shaped attaching device. The can being rolled down the chute, upon reaching the label the latter adheres to the can and begins to wind around it, and when the can rolls on the arms of the attaching device they rise and press the label against the can. As the can continues to move down the chute a final pressure is given the label by a trap at the lower end of the chute.



Claim.—1. A can-labeling machine consisting of the inclined trough A, having attached to its sides the upwardly-inclined guides D, supporting the adjustable holder E, the paste-reservoir B, placed in the bottom of the trough, attaching device *b*, pivoted centrally in a U-shaped slot, and having upwardly-inclined hooks extending into the trough, and the trap C, pivoted across and above the sides of the chute, all operating in combination, substantially as shown and described.

2. In a can-labeling machine, in combination with the trough A, the attaching device *b*, consisting of a straight bar placed in a slot extending across the trough immediately below the paste-reservoir, and having its ends bent at right angles and curved upwardly in the arc of a circle, and placed in slots extending along the direction of the chute, substantially as and for the purposes set forth.

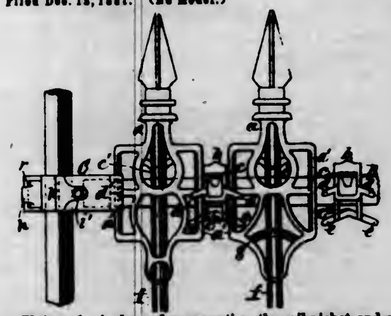
3. In combination with the trough A and holder E, the attaching device *b*, adapted to press against the side of the can and draw the label around it, substantially as shown and described.

264,865. TRUSS. CHARLES CLOVER, Toronto, Ontario, Canada. Filed Nov. 4, 1881. (Model.)

Brief.—The entire pad is formed of a coil of wire so flattened and arranged that it may rest directly upon the flesh without an intervening cover.

Claim.—1. A pad for trusses, consisting of a coiled wire having close coils extending across its face and approximately flattened at the point of contact with the body, whereby it is adapted to press on the hernia with or without an intervening covering and to exert its greatest pressure at its exterior circumference, substantially as described.

2. In a double truss and in combination with the cross-bar connecting the pads, the plates B, turning on the same centers which hold the cross-bar, and provided with stops *d d*, to limit their motion, substantially as and for the purpose specified.



3. The top plate, B, for trusses, provided with the loops *c c'*, stops *d*, and screw *e*, constructed and arranged substantially as and for the purpose set forth.

4. The combination, with a double truss, of the stiff spiral-spring cross-bar C, provided with open at each end for pivotally attaching it to the pads, substantially as described.

5. The combination, with a double truss, of the stiff spiral-spring cross-bar C, provided with adjustable screw-eyes *f*, substantially as and for the purpose specified.

6. The combination, with a truss, of a thigh-strap consisting of a stiff spiral spring rigidly secured to the pad-plate at one end and flexibly connected with the belt at the beak, whereby said spring assumes a curve when applied to the body to prevent contact with and chafing of the skin, substantially as described.

264,866. IRON FENCE. BENJAMIN G. DEVOR, Kenton, assignor of one-half to Albert C. Ramsay, Bellefontaine, Ohio. Filed Dec. 13, 1881. (No model.)

Claim.—1. A clamp for connecting the rail-picket and post together, in two vertically-divisible sections, with self-connecting devices at one end, and a hook on the front section, at the other end, for catching over the side bar of the ornament of the picket, whereby the latter is held, in connection with the rail, to the post, when bolted together as specified.

2. In a fence-picket constructed with a wrought-iron rod and malleable ornaments thereon, as shown, an ornament having a separable spear-head with a hole in the base end for the picket-rod, and having a key-seat or groove cast in one side of said hole for the insertion of a tang formed upon the top of the ornament and extending above the latter, whereby the head is firmly fastened upon the picket and prevented from turning, as set forth.

3. In iron fences having wrought rods and malleable ornaments, a clamp for connecting the rail and end picket with the post, in two sections, having self-connecting devices at the post end and a hook at the opposite or rail end cast upon the front plate for connecting with the ornament of the picket, whereby said ornament is clamped to the rail, prevented from lateral displacement, and at the same time allowed sufficient movement to incline the picket when adjusting it to the grade.

4. The buckle-clamp C, having its sections *b* and *b'* self-connecting at the post end by means of the loop *c'* and hook *h*, and having an inwardly-bent hook, *d'*, on the rail end of plate *b*, for catching over the bar *a* of ornament *a*, securing it to the rail and preventing the picket from lateral displacement, or the rail from being withdrawn from its fastening, as shown and described.

5. A clamp for connecting the ornaments of an iron fence, having a bearing-hook provided with an angle on the under side of the same, where it rests upon the rail, having parallel sides and lateral lugs extending from either side of its frame-bars, the upper arms or lugs extending from the front and the lower and longer lugs extending from the rear side of said frame-bars, and diverging from their point of union with the body of the clamp to their ends, so as to straddle the side bar of the ornament-frames and hold it tightly when connected together, as shown and specified.

6. In iron fences constructed with wrought rods and malleable ornaments, a bracket or supporting ornament for a picket, having its bearing-hook formed with an angle on the under side of the same, where it rests upon the rail, to allow the lower end of the picket to be swung to the right or left to suit the inclination of the rail, substantially as hereinbefore specified.

7. In iron fences constructed with wrought rods and malleable ornaments, a clamp or clip for connecting said ornaments, having a single bearing-hook, vertically central therewith, extending rearward from the top end, and having an angle on its under side for a bearing upon the top of the rail to allow it to be placed in its position from the front of the rail, and to adapt it, in connection with the pickets, to be inclined either to the right or left to suit the rail when the latter is inclined, substantially as hereinbefore set forth.

8. A clamp or clip for connecting the pickets of iron fences, having a hook extending from the rear side, at the top end, vertically central with the body thereof, said hook being formed with an angle on its under side, as described, and having lateral extending limbs or lugs from either side for clamping the picket-ornament on both its front and rear sides, whereby it may be more securely fastened and greater strength given to the connections, and allowed to be inclined in either direction to suit any inclination of the rail, substantially as shown and specified.

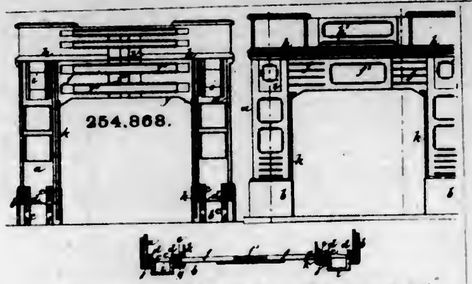
9. The clamp or clip *b*, having parallel sides, the hook *b*, with an angle, *c*, on its under side, the lateral limbs *d*, extending from its front sides, near the middle line thereof, and the lateral limbs *e*, extending from its rear sides at the lower end, and connected centrally, forming the angle *c'''*, said limbs *e* being extended beyond the limbs *d*, for catching under the side bar of the ornament-frame in guiding the latter into its place between the lugs *d* and *e*, and to prevent the clamp from tilting during the operation of connecting the pickets therewith, as hereinbefore set forth.

10. A clamp or clip for connecting the ornaments of pickets in iron fences with the rail, having a single bearing-hook, and having front and rear lugs extending from its side bars and diverging laterally from each other, each pair of lugs connected across the body of the clamp for the purpose of strengthening the same, and, with reference to the front upper limbs, of connecting the lines of ornamentation at the middle of the ornament and clamp.

11. A foot-plate, H, for line-posts, divided vertically and longitudinally in the center, and having the sockets *t t*, for inserting the pickets therein, and the oblong transverse holes *s''*, for adjusting the post upon its base P when attaching it thereto, substantially as shown and specified.

12. A buckle-clamp, G, in two sections, 1 and 2, for connecting the top end of the brace to the post in an iron fence, having self-connecting devices *r'* and *h* at one end, and an inclined hole, *j*, formed by a groove cast in the inside surface of each section at the opposite end for securing the upper end of the brace-rod *g*, and connecting the same with the post-bar when clamped in place and secured by the bolt *i*, as shown and specified.

264,867. COMBINED REGISTER AND OTTOMAN. JOHN A. GRAHAM, AMELIA L. GRAHAM, and EMILIE C. RAUDOH, Red Wing, Minn. Filed Jan. 30, 1882. (No model.)



Claim.—1. An ottoman or like article of furniture, having an open base or bottom, and provided with doors in its sides, whereby it is adapted to receive and distribute heat from a register-opening, as set forth.

2. The herein-described article of furniture A, provided with doors or valves C, latches D, and keepers E F, substantially as and for the purposes set forth.

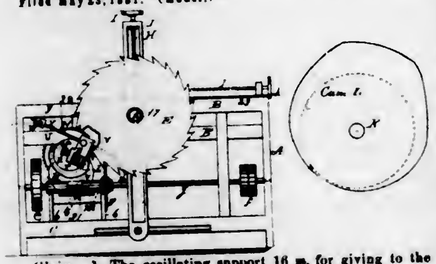
3. The ottoman A, provided with doors C and stops H, substantially as shown and described.

264,868. ADJUSTABLE MANTEL. ROBERT H. GIBBONS, Winchester, County of Hants, England. Filed Nov. 28, 1881. (No model.) Patented in England Feb. 8, 1881.

Brief.—The jambs are vertically adjustable, and the frieze, shelf, &c., laterally adjustable. Panels are adjusted in grooves in the jambs.

Claim.—1. The combination, in a chimney or mantel piece, of the slides *c c*, plinths *b*, pins *d*, and vertically-adjustable jambs *a a*, constructed substantially as shown and described.

2. The combination of the slides *c c*, jambs *a a*, and adjustable frieze *f f'*, substantially as shown and described.



3. The combination of the slides *c c*, jambs *a a*, adjustable frieze *f f'*, and mantel-board *h h'*, substantially as shown and described.

4. The combination of the slides *c c*, jambs *a a*, adjustable frieze *f f'*, mantel-board *h h'*, and shifting panels *i*, substantially as shown and described.

5. The combination of the adjustable friese composed of the part *f'* and of the shifting dovetailed pieces *f f* with the jambs *a*, provided at the upper ends with dovetail grooves *e e*.

6. The shifting panels *i*, formed with the series of grooves *j*, in combination with corresponding projections on the jambs, as and for the purposes shown and described.

254,869. SAW-SHARPENING MACHINE. WILLIAM H. HALLADAY, Chicago, Ill., assignor of one-half to Edwin Benjamin, Jasper E. Mallery, and Engiebert Fischer, all of same place. Filed May 23, 1881. (Model.)

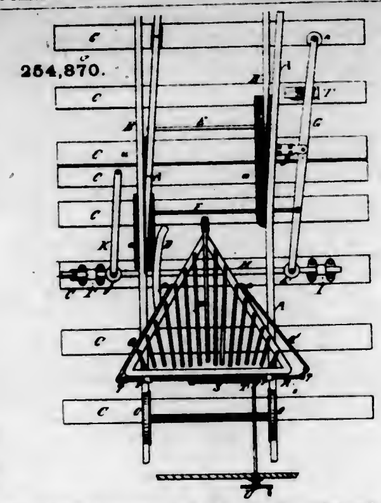
Claim.—1. The oscillating support 16 *m*, for giving to the wheel F a diagonal position, in combination with the tilting frame 2 3 4 *n*, as and for the purpose specified.

2. The combination of the feeding devices for bringing the saw-teeth to the wheel F, consisting of the blocks S T, weighted pawl X, and T-bolt *b*, substantially as specified.

3. In a saw-sharpener, the grinding-wheel F, combined with suitable operating and adjusting supports 2 3 4 *n* and 16 *m*, placed below the axis of the saw, as and for the purpose specified.

4. The tilting frame 2 3 4 *n*, in combination with a continuous cam, L, and supporting-frame 16 *m*, and wheel F, with the feed devices S R T X, as and for the purpose specified.

5. The combination of the reciprocating bar 11, tilting frame 2 3 4 *n*, support 16 *m*, and wheel F with the grooved cam M, as and for the purpose specified.



254,870. SAFETY RAILWAY-SWITCH. PAUL G. HARSON, Rochester, Minn. Filed Sept. 7, 1881. (No model.)

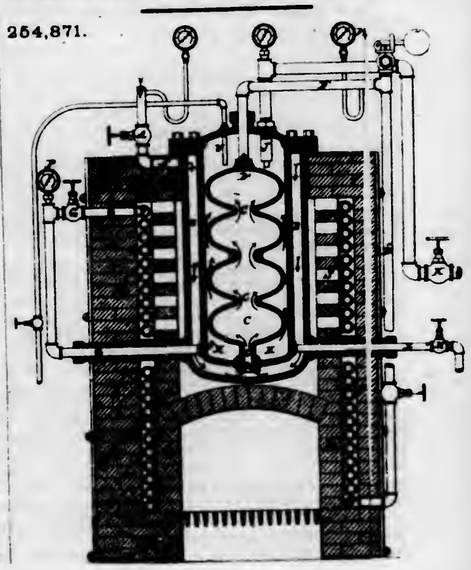
Brief.—The switch-rail is shifted automatically through pivoted levers alongside the track, which are actuated by laterally-adjustable bars on the pilot or cow-catcher. A transverse rod, to which one end of each of said levers is pivoted, slides in guide-shoes having anti-friction rollers, a hand-operating lever being secured to said rod in one of the guide-shoes.

Claim.—1. In combination with rails A A' and B B', sole-plates *a a'*, and guard-rail D, the bar H, guide-shoes I I, side lever, G, and connecting-bar F, all constructed and arranged for automatically adjusting the switch-rail A' from the pilot of an approaching locomotive, substantially in the manner set forth.

2. In combination with rails A, A', B, and B', sole-plates *a a'*, and guard-rail D, the cross-bar H, guide-shoes I I', levers G and K, with wheels *h*, *h'*, and *j*, and connecting-rod F, all constructed

254,870.

and arranged for automatically adjusting the switch-rail A' from the pilot of an approaching locomotive, substantially in the manner set forth.



3. In combination with the switch-rail A, connected by bar F with lever G, which is again connected by bar H with lever K, the pilot of a locomotive, having side bars, Q Q', connected by a bar, R, and arranged to be adjusted from the cab of a locomotive by any suitable devices and connections, all substantially in the manner and for the purpose specified.

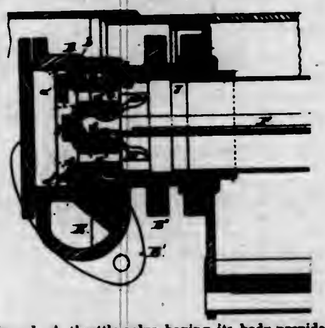
4. In combination with the switch-rail A', connected by bar F with lever G, which again is connected by bar H with lever K, such levers G and K having wheels *h*, *h'*, and *j*, the pilot of a locomotive, having side bars, Q Q', connected by bar R, and arranged to be adjusted by a crank, T, and pitman S, all substantially in the manner and for the purpose described and shown.

5. The combination, with the automatic switch, as described, of the shoes I and I', forming the guides for cross-bar H, and having rollers *i* and cap-plates *l*, all substantially as and for the purpose set forth.

6. In combination with the automatic switch described, the cross-bar H, having slot *n*, and the guide-shoe I', having tapering slot *m*, all substantially as and for the purpose described and shown.

254,871.

254,871. APPARATUS FOR GENERATING VAPOR FROM LIQUID HYDROCARBONS. HENRY P. HAYDEN, Washington, D. C., assignor to the International Vapor Fuel Carbon Iron and Manufacturing Company, same place. Filed June 11, 1881. (No model.)

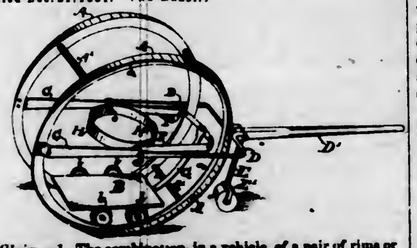


Claim.—1. In the apparatus for generating vapor from liquid hydrocarbons, herein described, the generating-chamber having an internal steam-space consisting of two or more communicating spheroidal receivers, as and for the purposes described.

2. In the apparatus for generating vapor from liquid hydrocarbon, herein described, the generating-chamber provided with internal spheroidal steam-spaces and external steam-jacket, as and for the purposes described.

3. The combination of the spheroidal receivers, the pipe through which the superheated steam enters the generating-chamber, and the oil-supply pipe.

4. The combination of the outer steam-jacket, B, spheroidal receivers C, connecting-pipe D, superheater F, and generating-chamber H, as and for the purposes described.



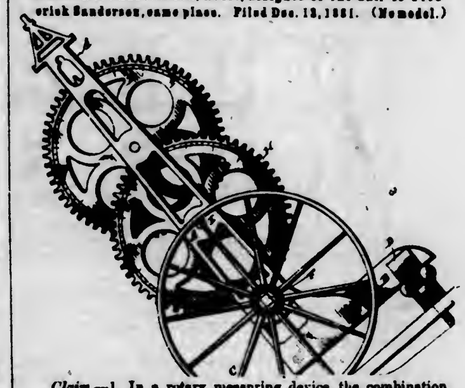
254,872. THROTTLE-VALVE FOR LOCOMOTIVES. SAMUEL J. HAYES, HENRY SCHLACHS, and O. FILLMORE STARKWEATHER, Chicago, Ill. Filed Sept. 5, 1881. (No model.)

Claim.—1. A throttle-valve having its body provided with openings or passages leading from its rear to its front face, and loosely connected to a valve stem or rod by a ball on the end of the rod fitted within the half-boxes *c* of the valve, and a box adapted to receive the valve and to be attached in the smoke-arch at the end of the dry-pipe, and provided with interior valve-seats, steam space or chamber in front of the valve, and a steam-passage leading to the steam-pipes, in combination with a valve stem or rod and a dry-pipe, substantially as and for the purposes specified.

2. The combination, with the valve-box B, having seats on its inner face, of the valve A, provided with exterior seats and steam-passages *a''* and with a central opening, the half-boxes *c*, fitted in the central opening of the valve and having a recess receiving a ball, *f*, upon the end of the valve-rod F, and the nut *g*, said members being constructed and arranged for operation substantially as described.

254,873. VEHICLE. JAMES E. HELLER, Indianapolis, Ind. Filed Dec. 21, 1881. (No model.)

Claim.—1. The combination, in a vehicle, of a pair of rims or follies of large size, having track-rails upon their internal surfaces, means, substantially as described and acting directly upon said rims, for propelling the same, and a truck or carriage having much smaller wheels, which is adapted to travel upon said rails, whereby when said large rims are revolved a continually-inclined track is formed for said truck, down which it will continually of its own weight descend, substantially as set forth.



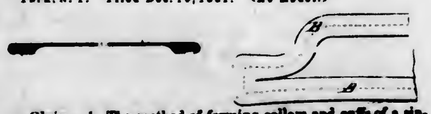
2. The combination, with a pair of large wheels or rims and a truck which runs upon a truck formed by the internal faces of said wheels, of a pair of arms running from said rims to a point central thereto, short shafts or gudgeons thereon, outside supporting draft or other rods, a frame-work running around in proximity to the rims and the cross-bars connecting them, and a rod connecting said frame-work and said truck, whereby the motion of said truck is steadied, substantially as set forth.

3. The combination, with a pair of large wheels or rims the internal faces of which form the track for a truck, of arms extending from said rims to a point central thereto, provided at said central point with short shafts or gudgeons, and draft-rods attached to said gudgeons and extending to a point to one side of said rims, where the motive power can be readily applied thereto, substantially as set forth.

4. The combination of the rims A, truck B, arms C, having shafts or gudgeons *c*, and draft-rods D, all substantially as shown and described, and for the purposes specified.

5. The combination of the rims A, truck B, arms C, short shafts *c*, rods D, frame F, and rod G, all substantially as set forth.

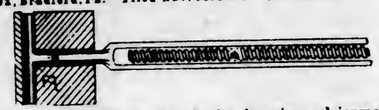
254,874. ROTARY CLOTH-MEASURING APPARATUS. ORLANDO HUFFMAN, Friend, Nebr., assignor of one-half to Frederick Sanderson, same place. Filed Dec. 13, 1881. (No model.)



Claim.—1. In a rotary measuring device, the combination, with the upright frame adapted to support bearing-wheels and a system of graduated wheels, the said frame being provided at its lower end with an outwardly-extending tongue, of a retaining-lever adapted to be removably secured at one end to a counter and afford pivotal bearing for the said tongue at the other end, substantially as set forth.

2. In a rotary measuring device, the combination, with the upright frame adapted to support bearing-wheels and a system of graduated wheels, the said frame being provided at its lower end with an outwardly-extending tongue and with pointers to note the number of yards and fractions of yards passing under the bearing-wheels, of a retaining-lever adapted to be removably secured at one end to a counter and afford pivotal bearing at its opposite end for the said tongue, substantially as set forth.

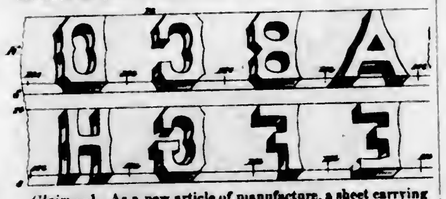
3. The combination, with the frame A, tongue B, bearing-wheels C, shaft F, cog-wheel G, wheel H, shaft I, cog-wheel J, wheel L, and pointers M and N, the said wheels H and L being provided with graduated circumferential scales, and adapted to operate as described, of the retaining-lever D, adapted to be secured at one end to the counter, and provided with the spindle *a*, adapted to pass through a hole in the tongue B and form a pivotal support for the frame, substantially as set forth.



254,875. COLLAR AND CUFF. CHARLES O. KANOUSE, New York, N. Y. Filed Dec. 16, 1881. (No model.)

Claim.—1. The method of forming collars and cuffs of a single sheet or thickness of xylonite, celluloid, or analogous material, which consists in first cutting the article to the desired shape from a single sheet, then strengthening by strips of woven fabric applied at the edges upon the sides and ends only of the plastic sheet, then folding the strips and edges of the body material to form a seam, and finally finishing the article by heated dies, as hereinbefore set forth.

2. As a new article of manufacture, a collar or cuff formed of a single sheet of xylonite, celluloid, or analogous substance, and strengthened by strips of woven fabric applied at the edges of the body material, the strips and edges being folded, cemented, and finished by heat and pressure, as set forth.



254,876. TEMPER-SCREW FOR DRILLING WELLS. ORRIN A. KNOX, Bradford, Pa. Filed Nov. 16, 1881. (No model.)

Claim.—1. A temper-screw having its reins and journals formed in one piece, substantially as and for the purpose set forth.

2. A temper-screw having a neck to fit within the slot of a walking-beam, and journals formed integral with the neck, substantially as described.

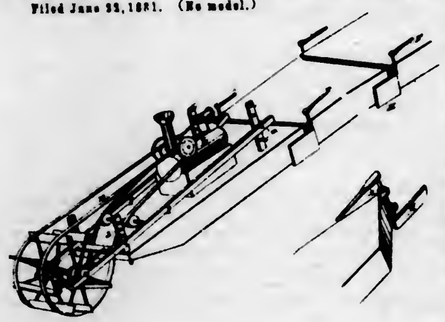
254,877. PRINT FOR TRANSFER-LETTERS. WILLIAM H. KNOX, Cincinnati, Ohio, assignor of one-half to James R. Anderson, same place. Filed July 25, 1881. (No model.)

Claim.—1. As a new article of manufacture, a sheet carrying on its face side transfer-letters and provided on its back side with the spacing-marks *m*, substantially as and for the purposes specified.

2. As a new article of manufacture, a sheet carrying on its face side transfer-letters and on its back side the spacing-marks *m* and lines *n* and *s*, straight or curved, substantially as and for the purposes specified.

3. As a new article of manufacture, a sheet carrying on its face side transfer-letters and the marks *m* and on its back side the marks *m*, substantially as and for the purposes specified.

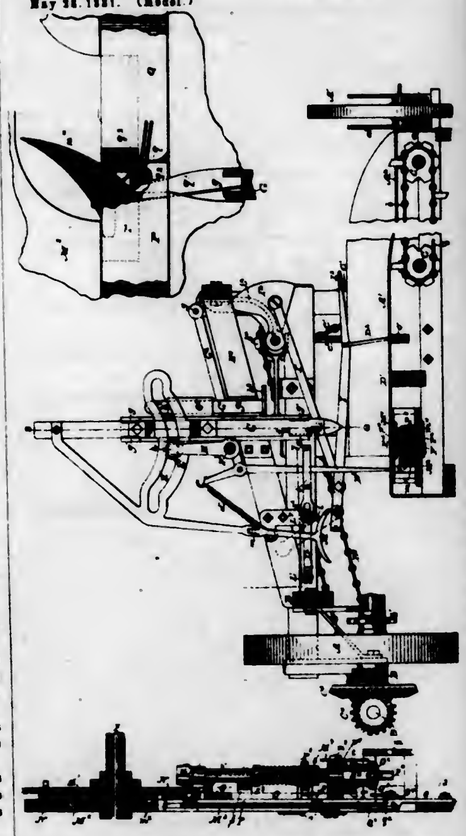
4. As a new article of manufacture, a sheet carrying on its face side transfer-letters and the marks *m* and on its back side the lines *n* and *s*, substantially as and for the purposes specified.



5. As a new article of manufacture, a sheet carrying on its face transfer-letters and the marks *m* and on its back side the lines *n* and *s* and marks *m*, substantially as and for the purposes specified.

6. As a new article of manufacture, a sheet carrying on its face transfer-letters and lines *n* and *s* and on its back side the marks *m*, substantially as and for the purposes specified.

7. As a new article of manufacture, a sheet carrying on its face transfer-letters and lines *n* and *s* and on its back side the marks *m* and lines *n* and *s*, substantially as and for the purposes specified.



8. As a new article of manufacture, a sheet carrying on its face transfer-letters and marks *m* and lines *n* and *s* and on its back side the marks *m* and the lines *n* and *s*, substantially as and for the purposes specified.

254,878. TRAIN-BOAT. WILLIAM J. LITTLE, Stockton, Cal. Filed June 23, 1881. (No model.)

Claim.—In a train of boats coupled appropriately, as by the cross-chains D D, the supplementary rudders or flanges E, extending from the boat-section preceding, along the sides of the boat-section following, and covering the ends of the joint or line of contact between the boat-sections, substantially as and for the purpose described.

254,879. GRAIN-BINDER. WILLIAM LEVERINGH, Osage, Iowa, assignor of eight-eighteenths to Martin V. Nichols and four-eighteenths to Cyrus H. Cotter, both of same place. Filed May 26, 1881. (Model.)

Claim.—1. The combination of the platform, the grain-delivering apparatus thereof, the gavel-evener, the pivot passing through its base near its outer end, and means by which the evener is vibrated to cause its vertical portion to repeatedly strike the butts of the grain, substantially as and for the purpose hereinbefore set forth.

2. The combination of the platform, the grain-delivering bands or chains, the binding-table, the vibrating gavel-evener, and the pair of driven pulleys, by connections with which the grain-delivering chains and gavel-evener are actuated, substantially as and for the purpose hereinbefore set forth.

3. The combination, substantially as hereinbefore set forth, of the binding-table, the vibrating gavel-evener, to which the butts of the grain are presented as passing to the binding-table, the pitman connected to said evener, the link-rod, the elbow-lever connecting said pitman and link-rod, the driven pulley, and its crank connected to the link-rod, for the purpose described.

4. The combination of the driving-chain F', the shaft C', the pair of connected loosely-mounted pulleys thereon, the chain C', the shaft C, driven thereby for actuating the platform grain-delivering apparatus, the pulley-crank, and the vibrating gavel-evener actuated thereby, substantially as and for the purpose hereinbefore set forth.

5. The combination, substantially as hereinbefore set forth, of

the platform, the grain-delivering apparatus, the binding-table, the gavel-gatherer, its pivoted and jointed or elongating and contracting shank, the rotating crank plate or cam by which the gatherer is lifted and dropped, and the controller-arm or link-rod connecting the crank-plate and gatherer-shank, and by which the gatherer is moved outward while elevated by the action of the cam-plate and drawn inward after it is dropped.

6. The combination of the reciprocating rising and falling gavel-gatherer, the intermittently-rotating actuating-shaft, the cam-shaped crank-plate, and the guide or lifter arm of the gatherer, substantially as and for the purpose hereinbefore set forth.

7. The combination, substantially as hereinbefore set forth, of the cam-shaped crank-plate, the shaft by the rotation of which the crank-plate is actuated, the reciprocating rising and falling gatherer operated by the crank-plate, the loosely-mounted constantly-rotating pulley on the actuating-shaft, and the clutch-coupling connection between said pulley and shaft to throw the gatherer out of operation upon the descent of the binder-arm.

8. The combination of the gavel-gatherer, the shaft by the rotation of which the gatherer is operated, the clutch-coupling for throwing the shaft into and out of operation, the lever acting on the clutch-coupling and by which its two members are normally held in gear, the controlling-rod engaged by said lever, and the binder-arm acting upon the controlling-rod to throw the clutch out of gear and intermit the operation of the gatherer, substantially as hereinbefore set forth.

9. The combination of the grain-delivering apparatus, the gavel-gatherer, the gavel-evener, and the driven pulley, by connections with which said delivering apparatus, gatherer, and evener are actuated, substantially as and for the purpose hereinbefore set forth.

10. The combination, substantially as hereinbefore set forth, of the reciprocating binder-arm, the reciprocating pivoted gavel-arrester or stop-arm against which the grain is compressed, its spring acting with a tendency to hold it in its lowermost position and against movement by the pressure of the grain, the arm or link actuated by the swing of the arrester to throw the bundle-securing mechanism into operation, the crank on the binder-arm actuating-shaft, and mechanism actuated by said crank to lift the arrester upon the ascent of the binder-arm, for the purpose described.

11. The combination, substantially as hereinbefore set forth, of the binding-table, the gavel-gatherer, the vibrating and reciprocating gavel-arrester, between which and said gatherer the grain is accumulated and compressed, bundle-securing mechanism thrown into operation by the swing of the arrester when a sufficient quantity of grain has been gathered to form a gavel, the rotating shaft, its crank, and mechanism connected with the arrester and actuated by said crank to elevate the arrester and free a bundle.

12. The combination, substantially as hereinbefore set forth, of the swinging gavel-arrester, the vibrating arm to which it is pivoted, and the vertically-reciprocating bar to which said vibrating arm is linked, for the purpose described.

13. The combination of the swinging gavel-arrester, the vibrating arm to which it is pivoted, the vertically-reciprocating bar, the link connecting it with the vibrating arm, the stud on the reciprocating bar, and the roller on the crank of the binder-arm actuating-shaft, substantially as and for the purpose hereinbefore set forth.

14. The combination, substantially as hereinbefore set forth, of the reciprocating binder-arm, its actuating-shaft, the cam-way or slot of the binder-arm, the crank of the actuating-shaft, its pin or roller passing through said cam-way, and the vertically-reciprocating gavel-arrester actuated by said roller upon the ascent of the binder-arm, for the purpose described.

15. The combination of the vertically-reciprocating binder-arm and the swinging pusher pivoted thereto, to insure the discharge of a bound bundle upon the descent of the binder-arm, substantially as hereinbefore set forth.

16. The combination of the vertically-reciprocating vibrating gavel-arrester, the reciprocating arm, in the slot or link of which the arrester works to move it in one direction to throw the binding mechanism into operation, and by the positive movement of which arm in the opposite direction the arrester is caused to forcibly compress the gavel, substantially as and for the purpose hereinbefore set forth.

17. The combination of the vibrating gavel-arrester, the reciprocating arm in the slot or link of which the arrester works, the vibrating arm to which this reciprocating arm is pivoted, the thrust-arm pivoted to said vibrating arm, the stud or roller on the thrust-arm, and the wiper on the binder-arm actuating-shaft, substantially as and for the purpose hereinbefore set forth.

18. The combination of the vertically-reciprocating binder-arm, the cranked actuating-shaft thereof, the tyer-actuating shaft, the intermittently-revolving driving-shaft E, by which said actuating-shafts are thrown into operation, the constantly-rotating loosely-mounted pulley or chain-wheel on said driving-shaft, the clutch-coupling connection between the pulley and shaft, the clutch-shifter by which the clutch-sections are normally held apart, the vibrating gavel-arrester, mechanism connecting it with the clutch-shifter and by the actuation of which the binder-arm and tyer are thrown into action, the roller on the crank of the binder-arm actuating-shaft, and mechanism connected with the arrester and acted upon by said roller upon the ascent of the binder-arm, substantially as and for the purpose hereinbefore set forth.

19. The combination of the driving-shaft E, the binder-arm actuating-shaft geared therewith, the clutch-coupling on said driving-shaft, the clutch-shifter, the reciprocating bar pivoted to the clutch-shifter, the vertically-vibrating elbow-lever pivoted to said bar, its spring, the link-connection between the downwardly-projecting arm of the elbow-lever and a vibrating arm actuated by the gavel-arrester, and the wiper-cam on the binder-arm actuating-shaft operating upon a roller carried by the horizontally-projecting arm of the elbow-lever, substantially as and for the purpose hereinbefore set forth.

20. The combination of the cord-clamps, the two vibrating cord-placers, their reciprocating actuating-arms, and the oscillating shaft, to the opposite ends of which the cord-placers are respectively fixed, substantially as and for the purpose hereinbefore set forth.

21. The combination of the cam-carrier, its cams N n, the arm N^3, its roller, the oscillating shaft to which said arm is pivoted, and the cord-placers carried by said shaft, substantially as hereinbefore set forth.

22. The combination, substantially as hereinbefore set forth, of the cam-carrier, the reciprocating actuating-arm M^3, the cutter, and the slide or reciprocating carrier-frame to which the cutter is pivoted.

23. The combination of the reciprocating arm M^3, the pivoted cord-placers vibrated thereby, the reciprocating carrier-frame, the bracket thereon, and the lug on said reciprocating arm, substantially as hereinbefore set forth.

24. The combination of the reciprocating carrier-frame, the cam-carrier, by the direct action of which it is moved in one direction, the arm M^3, acted upon by the cam-carrier and serving to move the carrier-frame in the opposite direction, and the cutter, substantially as and for the purpose hereinbefore set forth.

25. The combination of the binder-arm, the vibrating cord-placers, and the upper and lower cord-clamps arranged in different vertical planes, and above and below which the cord-placers work to direct the band ends first to the upper clamp and subsequently place the end of the cord in the lower clamp, substantially as and for the purpose hereinbefore set forth.

26. The combination, substantially as hereinbefore set forth, of the binder-arm, the cord-placers, the upper cord-clamp, by which the band ends are held while being looped by the tyer, the lower cord-clamp, by which the end of the cord passing direct to the binder-arm is held, and the cutter for severing the cord forming the band after the end of the binder-arm cord is nipped by the lower clamp and before the release of the band ends by the upper clamp.

27. The combination, substantially as hereinbefore set forth, of the binder-arm, the upper cord-clamp, knotting mechanism acting on the cord while the band ends are held by said clamp, and the lower cord-clamp, to which the end of the cord passing to the binder-arm is directed before the completion of the knot, and by which the end of the cord is nipped before the release of the band ends, for the purpose described.

28. The combination, substantially as hereinbefore set forth, of the reciprocating inner slide-bar or main section of the cord-clamp, the griper-bar or outer sliding section thereof, provided with upper and lower clamping-surfaces in different vertical planes, and the spring acting upon said griper-bar, for the purpose described.

29. The combination of the cord-clamp main slide, the griper-bar or outer clamp-slide, the shoulder thereon, between which and the main slide the cord is nipped, and the cord-arresting nose of said outer slide, substantially as and for the purpose hereinbefore set forth.

30. The combination of the inner clamp-section or slide-bar, the spring-actuated griper-bar or outer section of the clamp, and the stationary clamp-plate, these members being and operating substantially as hereinbefore set forth.

31. The combination of the outer clamp-slide or griper-bar, the stationary plate slotted at its end, and the lower clamping projection of said griper-bar provided with the horn and nose, substantially as and for the purpose hereinbefore set forth.

32. The combination, substantially as hereinbefore set forth,

of the clamp-slide or main section, its arm or shank, the cam-car-

ward toward and against the arrester, and falling into position be-

upon opposite sides of the frame, a shaft journaled upon said bear-

2. In a book-sewing machine, a sliding head to which one or

of the clamp-slide or main section, its arm or shank, the cam-carrier, the griper-bar provided with two clamping-surfaces, the spring bearing on the griper-bar, and the clamp-plate or stationary clamping-surface, for the purpose described.

33. The reciprocating griper-bar Q, provided with the shoulder q, the horn Q^2, and the incline q^2, substantially as and for the purpose hereinbefore set forth.

34. The combination, substantially as hereinbefore set forth, of the rotating non-reciprocating mandrel, the sliding vibrating cord-engaging outer hook rotating with said mandrel, mechanism for imparting the sliding and vibratory movements to said hook, and means whereby the mandrel and hook are turned first in one direction and then in the other to form the loops in the band ends, as described.

35. The combination, substantially as hereinbefore set forth, of the mandrel, turning first one way and then the other, against which the band ends are pressed and upon which the cord is wound to form the outer loop of the knot, the vibrating reciprocating outer hook rotating with said mandrel, and by which the inner loop of the knot is formed, the reciprocating inner hook rotating with the mandrel, and means whereby said hook is caused to engage the inner loop to draw tight the knot, as described.

36. The combination of the rotating mandrel, the vibrating outer hook, its carrier or sliding head, by which it is reciprocated upon the mandrel and caused to rotate therewith first one way and then the other, and the inner hook, rotating with the mandrel and reciprocating therein to draw one loop through the other as cast off, substantially as and for the purpose hereinbefore set forth.

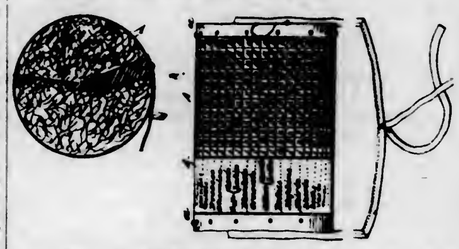
37. The combination of the mandrel, to which is first imparted a movement of rotation in one direction and then a partial reverse turn, the reciprocating hook-carrier or sliding head turning with the mandrel, the vibrating hook, and the incline acting thereon to rock the hook, to allow the loop formed in the cord about the mandrel to be cast off by the sliding head, substantially as hereinbefore set forth.

38. The combination of the rotating mandrel turning in both directions, the reciprocating inner hook rotating therewith, the reciprocating vibrating outer hook, also turning with the mandrel, the head sliding on the mandrel to cast off the cord, the cord-placer, by which the cord is directed to and pressed against the mandrel, cord-clamping mechanism, and the cutter to sever the band ends and enable the inner hook to draw the knot tight, substantially as hereinbefore set forth.

39. The combination of the cord-looping mandrel, the pinion thereon, the sector-rack, the recessed cam-carrier, and the stop-pin on the mandrel, substantially as and for the purpose hereinbefore set forth.

40. The combination of the cord-looping mandrel, the pinion thereon, the cam-carrier, and the stud thereon operating on the pinion to give the reverse turn to the mandrel, substantially as hereinbefore set forth.

41. The combination of the mandrel, the cam-carrier, the sector-rack, the mandrel-pinion, the stop-pin on the mandrel, the stud on the cam-carrier, the stop-lug on the mandrel, and the yielding stop-arm acting thereon, substantially as and for the purpose hereinbefore set forth.



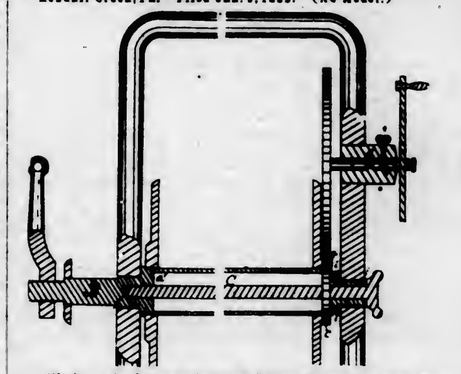
42. The combination of the cord-looping mandrel, the outer cord-engaging hook rotating therewith, the hook-carrying head sliding on the mandrel, the reciprocating carrier-frame, and the bracket thereon engaging the hook-carrying head, substantially as and for the purpose hereinbefore set forth.

43. The combination of the tubular-ended non-reciprocating mandrel, the cam-carrier, mechanism actuated thereby for turning the mandrel first one way and then the other, the reciprocating cord-engaging hook sheathed in the mandrel and rotating therewith, the spring acting on the hook to move it one direction, and the slide-bar actuated by the cam-carrier and serving to move the hook in the opposite direction, substantially as and for the purpose hereinbefore set forth.

44. The combination of the reciprocating carrier-frame, its guideway, the rotating non-reciprocating cord-looping mandrel supported in bearings above the carrier-frame, the cam-carrier acting on said frame to move it outward, the slide-bar actuated by the cam-carrier to retract said frame, mechanism actuated by the cam-carrier for turning the mandrel first one way and then the other, the sliding vibrating outer hook rotating with the mandrel, the reciprocating inner hook also rotating with the mandrel, the thrust-spring acting on the inner hook, the slide-bar of said hook actuated by the cam-carrier, and the bracket on the carrier-frame acting on the outer hook, for the purpose described.

45. The combination of the binding-table, mechanism by which the grain is accumulated thereon, the grain-arrester or stop-arm against which the grain is gathered, and the grain holder (or holders) lifted by the upward pressure of the grain as drawn inward toward and against the arrester, and falling into position behind the gathered grain, for the purpose described.

254,880. LAUNDRY-CUSHION. JAMES A. B. LOVETT, Huntsville, Ala. Filed Jan. 4, 1882. (Model.)



Claim.—1. A laundry-cushion with the ends or heads a, and the fabric-casing A, having a laundry-list and numbered columns or spaces thereon, said columns being adapted to be designated by removable means for indicating any particular number thereon, substantially as and for the purpose set forth.

2. In a laundry-cushion, the combination of the heads or ends a, the connecting-bar a', having its outer edges flush with the edges or peripheries of the ends or heads, the casing A, ruled and printed thereon, and having an internal packing, as shown and described, and for the purpose set forth.

3. In a laundry-cushion, the combination of the ends or heads a, their connecting-bar a', having its outer edges flush with the edges of the heads, the casing A, ruled and printed upon, as described, and having an internal packing, and the casing fastened to the said connecting-bar, substantially as and for the purpose set forth.

254,881. MEASURING-LINE REEL. ERNEST G. MCCLEAN, Kendall Creek, Pa. Filed Jan. 6, 1882. (No model.)

Claim.—1. A measuring-reel having its moving parts surrounded and supported by a frame provided with a device for attaching it to a stationary object, substantially as described.

2. A measuring-reel provided with a secondary shaft having a gear-wheel engaging with a spur-wheel on the main shaft, the whole supported and surrounded by a frame having a device for attaching it to a stationary object, substantially as described, and for the purpose set forth.

3. In a measuring-reel, a frame having a gudgeon provided with a nut anterior to the frame, for the purpose substantially as set forth.

4. In a measuring-reel, a frame having a gudgeon provided with a bearing for a shaft and a nut anterior to the frame, for the purpose substantially as set forth.

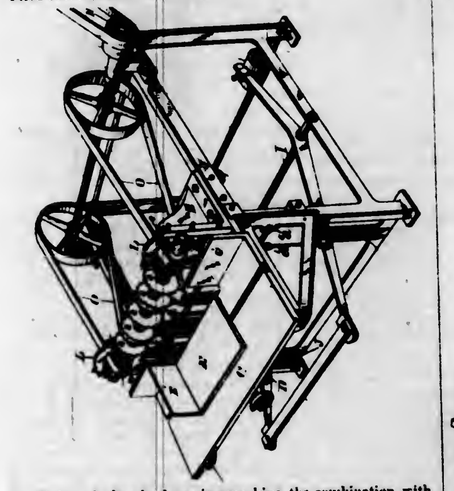
5. In a measuring-reel, a frame having an attaching-pin, provided with a bearing for a shaft, in combination with a gudgeon provided with a bearing for the shaft and a nut anterior to the frame, for the purpose set forth.

6. In a measuring-reel, a frame having an attaching-pin and a gudgeon arranged upon opposite sides of the frame, a shaft having its bearings upon said pin and gudgeon, and a clamping-bolt for holding the parts in place, all combined and arranged substantially as described, and for the purpose set forth.

7. In a measuring-reel, a frame having bearings arranged upon opposite sides of the frame, a shaft journaled upon said bearings and provided with a spur-wheel, a bolt for adjusting or clamping the parts, and a driving-wheel meshing in the spur-wheel, all combined and arranged substantially as described.

8. In a measuring-reel, a driving-wheel journaled in a frame and adapted to be moved laterally upon its bearing, and provided with a device, substantially as shown, whereby the shaft, when the wheel has been adjusted, can be fixed, all combined substantially as described, and for the purpose set forth.

9. In a measuring-reel, the combination of a revolving shaft or body having a spur at one end with a driving-wheel meshing in said gear-wheel and provided with an adjustable handle, substantially as shown, whereby the speed of the respective parts can be regulated.



254,882. METALLIC REED FOR MUSICAL INSTRUMENTS. WILLIAM MUNSON, Worcester, Mass., assignor to the Munson Organ Reed Company, same place. Filed Apr. 8, 1881. (No model.)

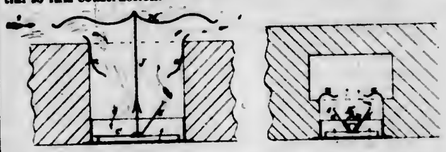
Claim.—1. A metallic reed for musical instruments, consisting of the slotted reed-plate A, provided with projections c c, the forward end of each projection being inclined at an angle of about ten degrees (10°) to the rear of a line passing vertically through its lower forward end, in combination with the tongue B, secured on its seat between said projections by upsetting or flattening them down thereon, substantially as described.

2. As an improvement in metallic reeds for musical instruments, a reed-plate provided with the two projections on its upper side, having a dovetail groove or channel between them of such size and form as to receive the rectangular heel of a tongue whose upper edges only fit or come into contact with the sides of the channel, in order thereby to guide the free or vibrating portion of the tongue in line with the slot in the plate, a space being left in the channel at its bottom, on each side of the heel, whereby when pressure is applied to said projections the heel of the tongue will be upset and expanded into said spaces, and the metal of the projections for welding or uniting the plate and tongue also closed down therein to insure a solid and permanent bond or union between them which will preclude the possibility of any movement or vibration of the heel in or upon its bed or seat, as set forth.

254,883. BOOK-SEWING MACHINE. ERNEST J. HOLIN, Chicago, Ill., assignor to Edward P. Donnell, same place. Filed Oct. 19, 1881. (No model.)

Claim.—1. In a book-sewing machine, the combination, with a flanged table and an adjustable flanged carriage supported thereon, of one or more circular saws secured to shafts and journaled in vertically-sliding heads, substantially as shown and described.

2. In a book-sewing machine, a sliding head to which one or more saws are attached, in combination with a lever, said sliding head connected to and operated by said lever, substantially as described and shown, and for the purpose set forth.

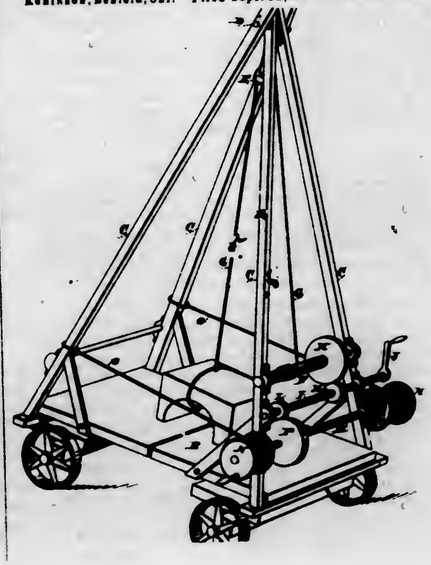


3. In a book-sewing machine, the sliding heads L L, in combination with the adjustable shafts S' S', carrying saws S, substantially as shown and described.

4. The sliding heads L L, to which are attached the shafts S' and S', carrying saws S, provided with racks d, in combination with pinions d^2 on shaft d^3, whereby said heads may be connected and made to move simultaneously when desired, substantially as shown and described, and for the purpose set forth.

5. The table C, having the flanges C' at right angles thereto, in combination with a movable carriage, E, having the right-angled flange E', whereby the sections of the book are evenly adjusted for sewing, substantially as described and shown.

254,884. VENTILATOR. JAMES G. PENNYCUICK, Boston, Mass. Filed Oct. 3, 1881. (No model.)

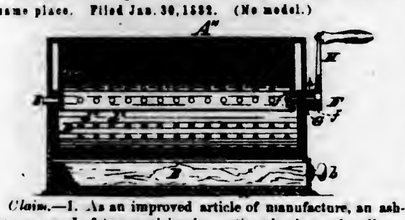


Brief.—The invention contemplates regulating automatically the escape of air from an apartment and to provide for excluding backdraft. To this end a frame built in the wall or loosely inserted in the flue or in direct contact with the atmosphere is provided with spindles arranged at an angle to the face of the frame, which carry suitable valves C C, which only serve to transmit air from the room and close when there is the slightest backdraft. When the frame is built in the chimney or atmospheric contact a division-plate, J, is provided, whereby the escape of air from the room is not effected by any downdraft. A wind-cap, H, is essential to this construction.

Claim.—1. In combination with a perforated ventilator-frame, A, the self-acting valves C C, attached to vertical spindles arranged at an inclination to the face of the frame A, substantially in the manner and for the purpose described.

2. In combination with a ventilator-frame, A, provided with valves C C, hung in an inclined position, the division-plate J and wind-cap H, arranged to operate in an opening passing direct through the wall of a building, in the manner and for the purpose substantially as specified.

254,885. COMBINED TRUCK AND DERRICK. ALEXANDER ROBINSON, Benicia, Cal. Filed Sept. 12, 1881. (No model.)

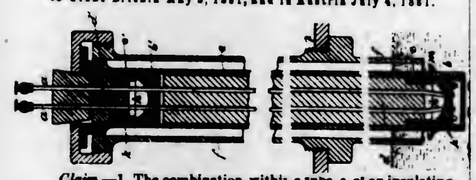


Claim.—1. The separate trucks A B, in combination with the derrick-timbers C, connected with the trucks and converging above and journaled or hinged at their tops, said trucks being adapted to separate or approach by means of appropriate ropes, as shown, when arranged substantially as and for the purpose herein described.

2. The trucks A B and derrick-timbers C, connected therewith and journaled together above, when combined with a lifting-rope, tl, and pulley E, and a means for separating or drawing together said trucks, substantially as herein described.

3. The trucks A B and derrick-timbers C, journaled together as shown, in combination with the shaft F, gear-wheel H, rope G, pulley E, and operating-shaft I, with its pinions K and L, whereby a weight is secured and raised, and the shaft M, with its gear-wheel P and drum N, and the connecting-ropes O, whereby the two trucks are drawn together and a weight is lifted upon them, substantially as herein described.

254,886. REVOLVING ASH-SIFTER. EDWARD G. SCHULTS, Buffalo, N. Y., assignor of one-half to Ferdinand J. Korsten, same place. Filed Jan. 30, 1882. (No model.)



Claim.—1. As an improved article of manufacture, an ash-sifter composed of two semicircular sections having end walls, as specified, said sections being pivoted upon journals or axles located in the center of said sections, whereby the sections are opened and closed by revolving one section around the other, substantially in the manner as and for the object specified.

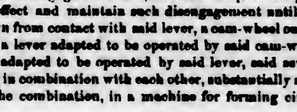
2. In ash-sifters, two semi-cylindrical perforated sections, D D', journaled as specified, in combination with angular sections F F' on the journal G and bolt *f*, and the handle H, with the socket A, as and for the object specified.

3. As an improved article of manufacture, an ash-sifter consisting of a hinged casing, A, having the drawer B, two semi-cylindrical perforated sections, D D', provided with pivot E and hollow journal G, respectively, the latter having the angular section F', and the bolt *f*, having the angular section F, the whole being constructed and combined substantially in the manner as and for the use and purpose indicated.

4. In ash-sifters having a drum consisting of two semi-cylindrical sections journaled as specified, the means, substantially as described, whereby said sections are locked together in either an open or a closed position, substantially as described, for the object mentioned.

254,887. SAFETY APPARATUS FOR STEAM-BOILERS. RICHARD SCHWARTZKOPFF, Berlin, Germany. Filed Oct. 18, 1881. (No model.) Patented in Germany Aug. 10, 1880, and Apr. 30, 1881, in France May 4, 1881, in Belgium May 4, 1881, in Great Britain May 5, 1881, and in Austria July 4, 1881.

Claim.—1. The combination, within a tube, *e*, of an insulating-cup, *b*, of two insulated conducting-wires, *a a*, connected with an electric alarm-bell or other electric receiver and passing into the said cup, and of a metallic body so arranged with regard to the wires *a a* that it will cause contact between them either by its own fusion or by the fusion of tallow, wax, paraffine, stearine, or any other easily-fusible substance by which the said metallic body is kept suspended, substantially as and for the purpose described.



2. The combination, with the tube *e*, containing in its upper part the insulating-cup *b'*, the two insulated conducting-wires *a a*, connected with an electric alarm-bell or other receiver and passing into the said cup, and the easily-fusible metallic ring or body *c'*, arranged as described, of the tube *f*, surrounding the tube *e* and hermetically attached to the same at the top, as hereinbefore described, and for the purpose specified.

3. The combination, with the tubes *e* and *f* and the two conducting-wires *a a*, of the two insulating-cups *b* and *b'* and the two easily-fusible metallic rings or bodies *c* and *c'*, the wires *a a*, passing into or through the cup *b'* and into the cup *b*, substantially as described, and for the purpose stated.

4. The combination, with the tube *e*, containing the cups *b* and *b'*, the conducting-wires *a a* and the fusible metallic rings or bodies *c* and *c'*, and with the tube *f*, made of two parts, of the pipe *l*, as hereinbefore described, and for the purpose specified.

5. The combination, with the tube *e*, surrounded by the tube *f* and containing the described parts *a a*, *b b'*, *c*, and *c'*, of the collar *m*, as and for the purpose stated.

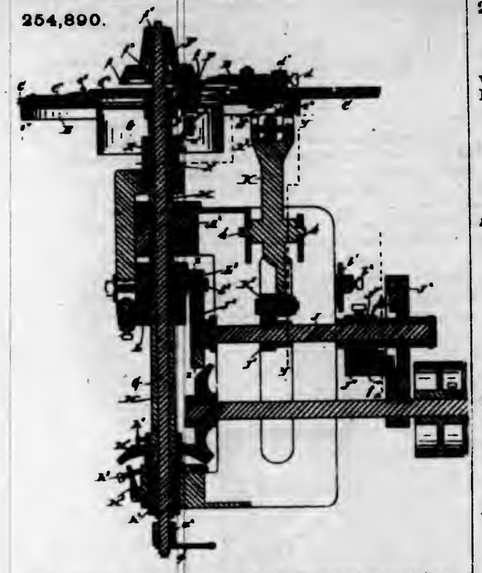
254,888. FENCE-WIRE BARB. SCOTT SHALLWOOD, Chicago, Ill., assignor of one-half to Frank F. Cole, same place. Filed Dec. 23, 1881. (No model.)

Claim.—A sheet-metal barb having two holes about central and at the outer edges thereof, in combination with a single wire passing through said holes, substantially as and for the purpose specified.

254,889. CAR-DOOR HANGER. DENNIS F. VAN LIEW, Aurora, Ill. Filed Jan. 17, 1882. (No model.)

Brief.—Improvement on Letters Patent No. 245,033 by making the horizontal portion of the carrier and hanger inclined.

Claim.—The ball-and-socket hanger composed of the carrier, the hanger, and the ball, both carrier and hanger having laterally-inclined horizontal surfaces or channels upon said surfaces, substantially as and for the purpose set forth.



254,890. MACHINE FOR FORMING CIRCUMFERENTIAL CRIMPS IN SHEET-METAL PIPES. WILLIAM A. WHEELER, Indianapolis, Ind. Filed Nov. 14, 1881. (No model.)

Brief.—Improvement on Letters Patent No. 224,974. At a little distance above a ring supporting the end of the pipe the pipe is automatically clamped between an interior cone and exterior sliding jaws. Crimping-wheels carried on a revolving head are automatically forced outward against the pipe.

Claim.—1. In a machine for forming circumferential crimps in sheet-metal pipes, a driving-shaft, a counter-shaft, a loosely-running clutch-wheel thereon which is driven by a wheel on the first shaft, a clutch part on said counter-shaft provided with a spring-bolt adapted to engage with the clutch-wheel, a lever adapted to disengage said bolt, a detent adapted to operate said lever to effect and maintain such disengagement until purposely withdrawn from contact with said lever, a cam-wheel on said counter-shaft, a lever adapted to be operated by said cam-wheel, and a plate, E, adapted to be operated by said lever, said several parts operating in combination with each other, substantially as set forth.

2. The combination, in a machine for forming circumferen

254,890.

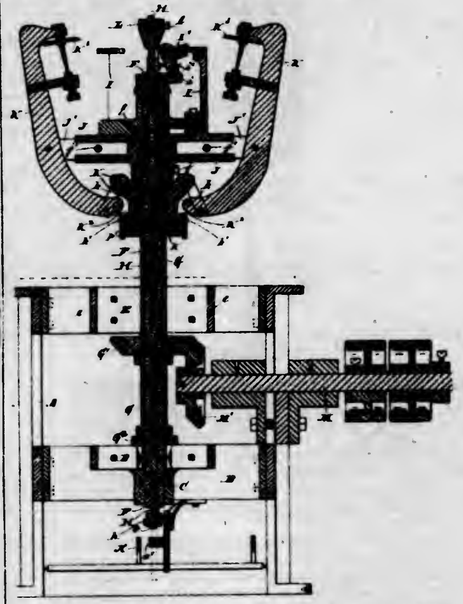
tial crimps in sheet-metal pipes, of a shaft adapted to rotate intermittently, having a cam-wheel thereon, a vibrating lever operated by said cam-wheel, and a disk adapted to be partially rotated by said lever and connected with the clamps D, which are thereby operated, substantially as set forth.

3. In a machine for forming circumferential crimps in sheet-metal pipes, a disk adapted to partially revolve, and which is provided with slots running at an angle to the radii thereof, through which project points from the clamps D, whereby said clamps, as said disk is turned, are caused to move toward and from a common center, in combination with the lever K and means, substantially as described, for operating the same, substantially as specified, and for the purposes set forth.

4. The combination, in a machine for forming circumferential crimps in sheet-metal pipes, of a horizontal shaft having a cam-wheel and adapted to revolve intermittently, a vertical shaft having a vertically-moving sleeve thereon, with which (or an anti-friction truck thereon) said cam-wheel will engage, a toggle-joint mechanism, means for connecting said sleeve and said mechanism when they are some distance apart, and a set of revolving formers or crimping-wheels adapted to be expanded from each other by said toggle-joint mechanism, substantially as set forth.

5. The combination, with the crimping-wheel-expanding mechanism of a machine for forming circumferential crimps in sheet-metal pipes and means for operating the same, of the two sleeves L N and a connecting-arm, M, which is capable of adjustment by means of a screw-bolt, *m*, and an adjusting-screw, *m'*, substantially as set forth.

6. The combination, with crimping mechanism of a machine for forming circumferential crimps in sheet-metal pipes, of the shaft H, the sleeve H^2, the bell-crank lever H^3, and the adjusting-screw h^4, whereby said mechanism may be adjusted vertically and the position of the crimps in the pipe thus determined, substantially as set forth.



7. The combination of the clamping mechanism of a machine for forming circumferential crimps in sheet-metal pipes, the shaft whereby said mechanism is driven, the clutch parts J^2 J^4, the spring-bolt j^4, which is the means of engagement between said two parts, a lever, J^3, for withdrawing said bolt, and a detent, b', for operating said lever, substantially as set forth.

8. The combination, with the adjustable segments *f*, of the inside sleeve, *f'*, and cone-shaped nut f^2, whereby said segments can be expanded and the size of the working portion of the inside clamp or rest, F, thus increased to compensate for the wear incident to its use or varied to accommodate variations in the size of the pipe to be operated upon, substantially as set forth.

9. The combination, with the ring C^2, upon which the pipe-section rests while in the machine, of the adjustable brackets C', which sustain said ring, and by which the position thereof can be varied, substantially as set forth.

254,891. MACHINE FOR CLOSING DOWN THE SEAMS OF SHEET-METAL PIPE. WILLIAM A. WHEELER, Indianapolis, Ind. Filed Nov. 5, 1881. (No model.)

Brief.—Pressure on the treadle first operates clamping devices, then throws in revolving jaws which carry seaming-wheels. Device O locks clamping devices until treadle rises.

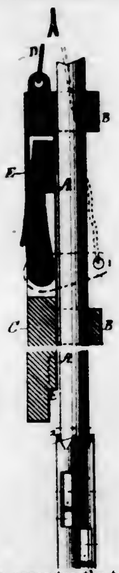
Claim.—1. In a machine for closing down the seams connecting sections of sheet-metal pipe together, the combination of a circular frame of about the same diameter inside as the outside diameter of the pipe for supporting said pipe, rollers carried by jaws which revolve around outside of said frame and said pipe, means for revolving said jaws, and means for bringing said rollers down close to said frame, whereby they are enabled to force the crimps forming the seam of said pipe down upon the top of said frame, and thus pinch said seams tightly together, substantially as set forth.

2. The combination of the outside revolving hollow shaft carrying the arms and jaws, means whereby said jaws may be operated, the inside stationary hollow shaft carrying the frame and inside clamps, and the inside vertically-movable rod, whereby said clamps may be operated, substantially as set forth.

3. The combination, with the clamps for holding the pipe while being operated upon, of the treadle N, device O, studs *a* and *a'*, and rod H, substantially as set forth.

4. The combination of the treadle N, rod P, head P', trunnioned ring K^2, toggle-center K', toggle-links *k*, and jaws K, the upper ends of which are armed with devices for closing the pipe-seams, substantially as described, and for the purposes specified.

5. The combination, with the jaws K, having suitable devices upon their upper ends for closing the pipe-seams, of the device J, having adjustable arms J', whereby the distance between said jaws may be increased or lessened, substantially as set forth.



6. The combination, with the adjustable arms J', of the tie-rods J^5, whereby said arms are secured in position and are at the same time rendered accurately adjustable, substantially as set forth.

7. The combination of the treadle N, rod H, head L, clamps I I', vibrating jaws K, pivoted at *j*, and carrying closing-down wheels, and mechanism for operating the same, substantially as set forth.

254,892. WELL-BORING APPARATUS. FRANK WESLAR, San Francisco, Cal. Filed May 6, 1881. (No model.)

Claim.—1. The tool-holder C, with its clasps B, sliding upon the rods A, and the rope or flexible connection D, by which it is raised or lowered independent of the rods, in combination with the square lower section of the rod A, to receive the clasps and unite the holder with the rod, substantially as and for the purpose herein described.

254,892.

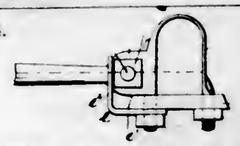
2. In a well-boring apparatus, the tool-holder C, having the clasps B to slide upon the rods A and fit the lower section, in combination with the acute-angled projections *a* on the rod and the similar projection or guide, *c*, upon the holder, substantially as and for the purpose herein described.

3. In a well-boring apparatus, the tool-holder C, having the clasps B to slide upon the rods A and fit the lower section, in combination with the latch or catch E, which engages and locks in slots in the rod or shank, substantially as and for the purpose herein described.

4. In a well-boring apparatus, the tool-holder C, with its clasps B, sliding upon and fitting the lower end of the rods A, and united thereto by the latch E, in combination with the arm *s* and rope *s*, connected with the main rope or an equivalent device, substantially as and for the purpose herein described.

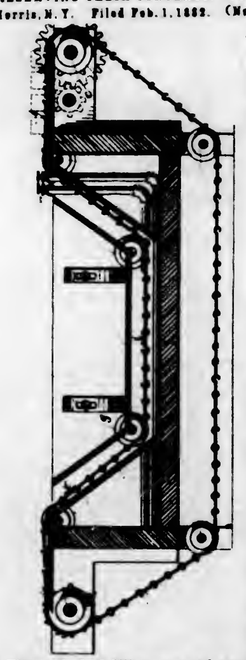
5. In a well-boring apparatus, a tool-holder, C, guided so as to move up and down the actuating-rods by means of a rope, D, without moving said rods, in combination with a latch or equivalent connection by which to unite said tool-holder with the lower end of the rods, substantially as and for the purpose herein described.

254,893. BAG-HOLDER. JAMES E. WHITMAN and ELBRIDGE M. BROWN, Spring Valley, Minn. Filed June 11, 1881. (No model.)



Claim.—As an improvement in bag-holders, the combination, with the forwardly inclined or slanting platform A, having a single coaster, F, swiveled at its rear end, of the two parallel uprights, B B, secured one on each side of the platform and connected near their center by rearwardly-curved rigid semicircular cross-brace C, and having rigidly secured to their top the horizontal cross-pieces or braces D D, having projecting edges, over which cross-pieces the top of the bag is adjusted.

254,894. THILL-COUPLING. GEORGE E. WILSON, Morristown, assignor of one-half to Austin D. Taylor, Belmont County, Ohio. Filed Dec. 30, 1881. (Model.)



Claim.—1. The combination, with the clip and bolt for holding the thill to the axle, of a lock-bar pivoted and turning laterally to and from the jaw of the clip and against the edge of the nut on the end of the bolt which holds the thill to the clip, substantially as set forth.

254,894.

2. The combination, with the clip and bolt for holding the thill to the axle, of an L-shaped lock-bar having its end *c'* fixed and turning on the under end of the bolt which holds the clip to the axle, and turning laterally to and from the jaw, and having its end *c²* arranged to turn in against the jaw and close to the edge of and lock the nut on the end of the bolt which holds the thill to the clip, substantially as set forth.

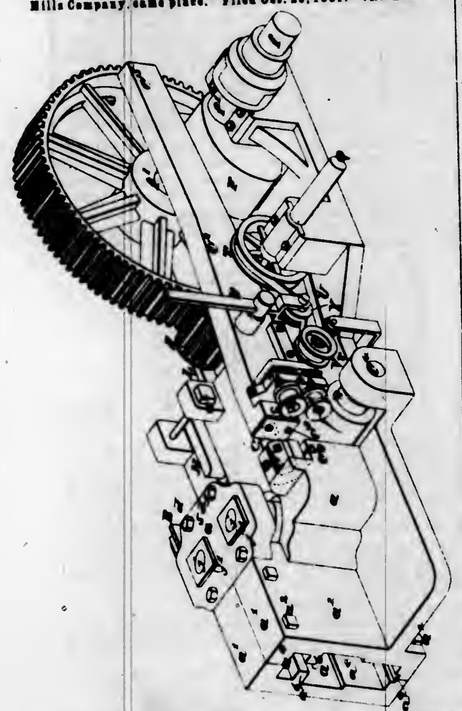
254,895. METHOD OF AND APPARATUS FOR FILLING CANS AND PRESERVING THEIR CONTENTS. JOHN C. WINTERS, Mount Morris, N. Y. Filed Feb. 1, 1882. (No model.)

Claim.—1. The method of filling cans and preserving their contents, the same consisting in mechanically passing such cans through the filling liquid at a rate of speed commensurate with the length of time required for the processing of their contents, substantially as described.

2. A water-tight tank, an endless carrier passing through such tank, and guides in said tank for the article carried by such carrier, combined substantially as shown and described.

3. A machine for filling cans and preserving their contents, the same consisting of a water-tight tank, an endless carrier traveling through said tank, means to move such carrier at a regulated speed, variable at pleasure, and guides through which the carrier moves in taking its burden through the apparatus, substantially as shown and described.

4. The water-tight tank, an endless carrier adapted to travel therethrough, and adjustable guides, combined substantially as and for the purpose set forth.



5. The water-tight tank, endless belts adapted to travel therethrough, lugs connecting said belts transversely to forward positively the article supported by said belts, and guides for retaining in the proper position the article carried by said belts, combined substantially as described.

6. The water-tight tank, the endless carrier, two sets of guides adjustable horizontally toward or from each other, one set of such guides being also adjustable vertically to vary the distance between the two sets, substantially as and for the purpose described.

7. A water-tight tank, heating apparatus within the same to keep its contents at a given temperature, an endless carrier, and

guides, and means to operate said carrier to cause it to forward its burden in the path of the guides through the contents of said tank at a given uniform rate of speed, whereby fruit, vegetables, and other material in cans, jars, or other like receptacles may be supplied with the requisite quantity of liquid and preserved, substantially as described.

254,896. LINK-BENDING MACHINE. LEONARD ACHESON, St. Louis, Mo., assignor to the Helmbacher Forge and Rolling Mills Company, same place. Filed Oct. 29, 1881. (No model.)

Claim.—1. The combination of the shear-arm C^2 and the feed-rolls B B', substantially as described.

2. The combination of the shear-arm C^2, the feed-rolls B B', and the shears C C', substantially as described.

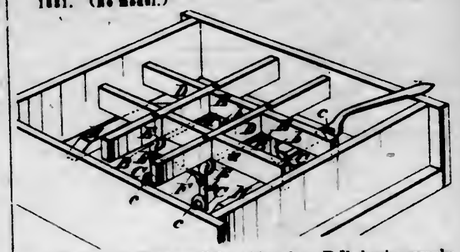
3. The combination of the frame *a*, the shear C, the arm C^2, having the extension C^3, the fulcrum C^4, and the shear C', said shears being arranged as shown and described.

4. The combination of the shear-arm C^2, the feed-rolls B B', the gears W W' W^2 W^3, the shaft *r*, and the pulley V, substantially as described.

5. The combination of the shear-arm C^2, the feed-rolls B B', the gears W W' W^2 W^3, the pulley V, the belt U, the pulley T, and the pulley Y, substantially as described.

6. The combination of the shear-arm C^2, the pulley V, the belt U, the shaft Q, the pulley T, and the pulley Y, substantially as described.

7. The combination of the mandrel H, having the shank *h*, the carriage I, and the friction-belt O and spring *o*, substantially as and for the purpose set forth.

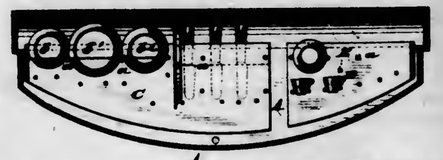


8. The combination of the frame *a'* *a'*, the projections a^3 a^3, the carriage I, having the mortise, the mandrel H, having the shank *h* and the arm *h'*, and the friction-belt O and spring *o*, substantially as described.

9. The combination of the frame *a'* *a'*, having the ledges a^4 a^4, the rotating heads J J', the carriage I, and the mandrel H, said mandrel being vertically adjustable in said carriage, as and for the purpose set forth.

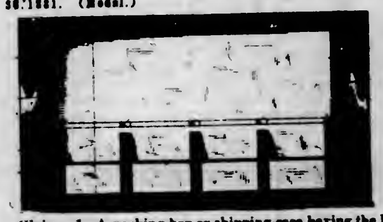
10. The combination of the frame *a'* *a'*, having the ledges a^4 a^4, the mandrel H, the rolls D D', and the rotating heads J J', substantially as described.

11. The combination of the frame *a'* *a'*, the rolls D D', the mandrel H, the heads J J', the shafts *j j*, the pinions *j'* *j'*, the carriage I, and the racks K K, substantially as described.



254,897. TIRE-COOLER. DORA AMMERMAN, THOMAS BAIRD, and EBENEZER H. FOREMAN, Fairmount, Ill. Filed Aug. 26, 1881. (No model.)

Claim.—1. The parallel rocking bars B B, having cranks with journals working in staples C, in combination with the rack D, connected by eyebolts E with the parts *a* of the rocking bars, as shown and described.



2. The combination, with the rocking bars B B, of the parallel leveling-bars H, arranged on opposite sides and in the bottom of box, as and for the purpose specified.

254,898. DISH-WASHING MACHINE. SALLIE J. ARMSTRONG, Bartlett, Tenn. Filed Dec. 8, 1881. (No model.)

Claim.—In a dish-washer, the combination of the pan or vessel A, provided with the rack C, and tilting rack D, having a crank-shaft, E, for rocking or tilting it from the outside within the pan A independent of the stationary rack C, as shown and set forth.

254,899. SHIPPING-CASE FOR JARS AND BOTTLES. BENJAMIN S. ATWOOD, South Abington Station, Mass. Filed July 26, 1881. (Model.)

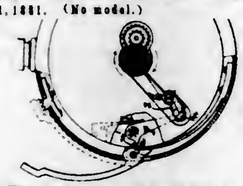
Claim.—1. A packing-box or shipping-case having the lower interior portion of its sides and ends projecting inwardly beyond said upper portion and provided with vertical grooves, in combination with the strips of the rack, detachably fitted in said grooves substantially as herein set forth.

2. The box-head having a hand-hole, and an interior covering-board provided with a cavity located opposite said hand-hole, as and for the purpose set forth.

3. In a packing-box, the combination of the end boards, consisting of an outside apertured board, two vertical strips or bars, and a smaller interior board having a cavity, with the side boards, the cover, and the rack let into the side boards and end boards, as and for the purpose set forth.

254,900. BOX-FASTENER. BENJAMIN S. ATWOOD, South Abington Station, Mass. Filed Aug. 4, 1881. (No model.)

Claim.—The combination of the recessed or notched cover, the pendent slotted plate projecting below the same, the double-

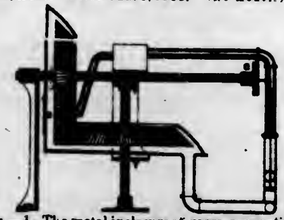


spring latch secured to the under side of the cover and extending

Claim.—1. The rear-wheel B, mounted upon shaft *b*, and

254,910

spring latch secured to the under side of the cover and extending through the pendent plate, the box having a notch in its upper edge, the double-hooked plate extending above the bottom of said notch on the inner side of the box, and the stay-plate, as and for the purpose herein set forth.

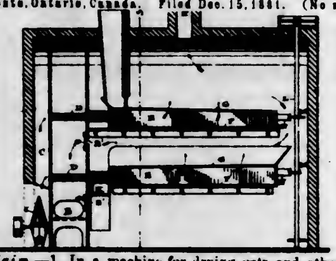


254,901. ALARM-WATCH. JOSEPH BACHNER, New York, N. Y. Filed Aug. 1, 1881. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of the anvil on the rim of the watch-case for the reception of a percussion-cap, the hammer hung by an interior pivot to the case-rim, and having its outer end adapted to strike the anvil, the hammer-spring on the interior of the case-rim, the index-wheel on the arbor of the hour-hand carrying a trip-pin, and the hammer-lock mechanism adapted to be actuated by the trip-pin for releasing the hammer.

2. The combination, substantially as hereinbefore set forth, of the anvil on the rim of the watch-case for the reception of a percussion-cap, the hammer hung by an interior pivot to the case-rim, and having its outer end adapted to strike the anvil, the hammer-spring on the interior of the case-rim, the dog engaging the hammer, the trigger engaging the dog, and the index-wheel on the arbor of the hour-hand carrying a trip-pin adapted to actuate the trigger.

254,902. AUTOMATIC LUBRICATOR. FRANK H. BARBER, Holyoke, Mass. Filed Jan. 6, 1882. (No model.)

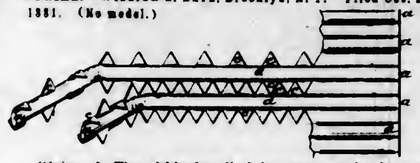


Claim.—1. The metal inclosure of gears, preventing the flying off of the lubricating material.

2. The connection of the same with the force-pump.

3. The reservoir, forming a settling-tank.

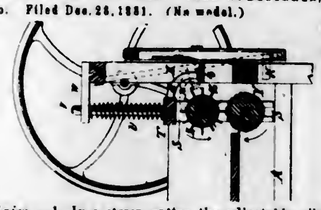
254,903. MACHINE FOR DRYING GRAIN. JOHN BARCLAY, Toronto, Ontario, Canada. Filed Dec. 15, 1881. (No model.)



Claim.—1. In a machine for drying oats and other grain through the application of artificial heat, one or more sieves arranged to carry the grain, and contained within a chamber through which the smoke and heated gases from a furnace are conducted, an air-space below each sieve and supplied with heated air under pressure, so that in passing through the sieves the force of its escape prevents the smoke mixing with the grain carried on the sieves.

2. The sieves O, provided with air-chambers E, in combination with the furnace B, the pipes D, passing through the furnace and into the air-chambers E, and suitable means for forcing a current of air through said pipes D, substantially as described.

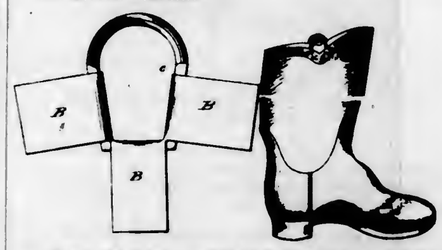
3. The combination, with the sliding sieves O, of springs at one end of said sieves, and the vertical shaft L, provided with wipers M, to operate against the opposite ends of said sieves, and the pipes D, serving as inlets to the sieves and as supports for the said springs, substantially as described.



254,904. PROCESS OF PRODUCING BARBED FENCING MATERIAL. WILLIAM S. BATH, Brooklyn, N. Y. Filed Oct. 27, 1881. (No model.)

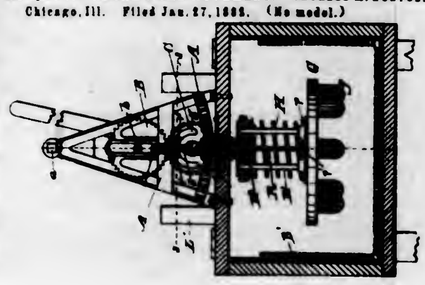
Claim.—1. The within-described improvement in the mode of making barbed fence-wire, the same consisting in first forming a sheet with a series of parallel ribs separated by thin webs, then cutting said webs on both sides of each rib and on zigzag lines, producing barbs on the opposite ribs and on both sides of each rib without waste, and then bending said barbs, as specified.

2. As a new article of manufacture, a barbed wire consisting of a strip, *a*, having △-shaped barbs, one-half the barbs on opposite edges being radial to the wire, the other and intermediate barbs being bent on opposite sides tangential to the wire, as set forth.



254,905. STRAW-CUTTER. JOHN W. BAUGHMAN, Wooster, Ohio. Filed Dec. 28, 1881. (No model.)

Claim.—1. In a straw-cutter, the adjustable gibs K, constructed substantially as herein shown and described, and consisting of the plate 1, having end and side flanges, the plate 2, having end flange and longitudinal slot, and the fastening-bolt 6, as set forth.



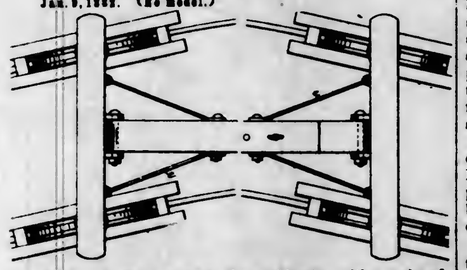
2. In a straw-cutter, the guide-arms W, the rods V, and the cross-bar T, in combination with the bars S and the device *a b*, whereby the top roll and plate *b* are pressed simultaneously upon the straw, as and for the purpose specified.

254,906. BOOT-STRAP. JOHN B. BELCHER, Charlotte, Mich., assignor of one-half to Frank S. Belcher, same place. Filed Jan. 18, 1882. (Model.)

Claim.—The combination of the metallic loop A, the cloth or rubber holder B, the cloth and rubber support D, and the rubber boot-leg, as and for the purpose herein described and specified.

254,907. MECHANICAL MOVEMENT. CHARLES A. BENYOUR, Chicago, Ill. Filed Jan. 27, 1882. (No model.)

Claim.—1. The gear-wheel B, mounted upon shaft *b*, and having wrist r^1, adapted to impart vibratory motion to segment-gear A, substantially as described.

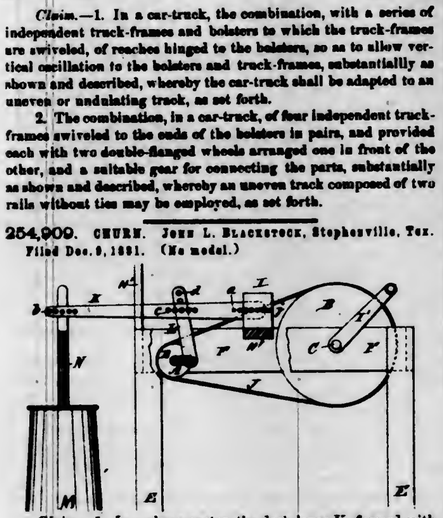


2. The combination of gear-wheel B, having wrist r^1, loop S, and connecting-rod R, adapted to transmit vertical motion to disk G, substantially as described.

3. The combination of slotted gear C with the pins *r*, adapted to secure true vertical motion to the lower part of loop S, substantially as described.

4. The gear-wheel C, mounted on shaft *c*, having teeth on its periphery and the circular slot S′ through it, adapted to impart motion from its shaft to gear-wheel B and move over pins *r* by reason of its semicircular slot S′, substantially as described.

5. The spring H, in combination with disk G, having the two guide-rods R′ and the hollow journal E, adapted to force down again the disk after it has been drawn up by the described mechanical movement, substantially as described.

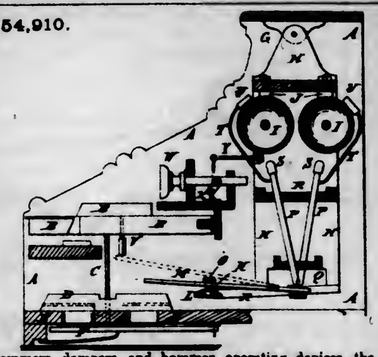


254,908. CAR-TRUCK. ALANSON A. BLACKMAN, ELNAHAN BLACKMAN, and HYRCANUS BLACKMAN, Snohomish, Wash. Filed Jan. 9, 1882. (No model.)

Claim.—1. In a car-truck, the combination, with a series of independent truck-frames and bolsters to which the truck-frames are swiveled, of reaches hinged to the bolsters, so as to allow vertical oscillation to the bolsters and truck-frames, substantially as shown and described, whereby the car-truck shall be adapted to an uneven or undulating track, as set forth.

2. The combination, in a car-truck, of four independent truck-frames swiveled to the ends of the bolsters in pairs, and provided each with two double-flanged wheels arranged one in front of the other, and a saltable gear for connecting the parts, substantially as shown and described, whereby an uneven track composed of two rails without ties may be employed, as set forth.

254,909. CHURN. JOHN L. BLACKSTOCK, Stephensville, Tex. Filed Dec. 9, 1881. (No model.)



Claim.—1. In a churn-motor, the dash-lever K, formed with the series of holes *a*, *b*, and *c*, in combination with the vertical board I, formed with the series of holes *j*, and the connecting-rod L, formed with the series of holes *d*, substantially as and for the purpose set forth.

2. In a churn-motor, the combination, with the rectangular frame E F G, the cross-bar H, the drive-wheel B, and the crank-shaft A, provided with the pulley D, of the vertical board I, provided with the series of holes *j*, the dash-lever K, provided with the series of holes *a b c*, the connecting-rod L, provided with the series of holes *d*, and the guide-arms H′, substantially as and for the purpose set forth.

254,910. BELL ATTACHMENT FOR ORGANS. RUFUS W. BLAKE, Derby, Conn. Filed Dec. 13, 1881. (No model.)

Claim.—1. A bell attachment for organs, made substantially as herein shown and described, and consisting of a swinging bell-frame suspended within the organ-case and carrying the bells, their

254,910.

hammers, dampers, and hammer-operating devices, the whole adapted to be swung forward by the movement of a pull-stop, so as to bring the hammer-levers under the pins of the organ-keys and cause the sounding of the bells when the organ-keys are depressed, and by the contrary movement of the pull-stop to swing the bell-frame back, and thereby carry the hammer-levers away from the organ-keys, so that the latter will not sound the bells, all as set forth.

2. In a bell attachment for organs, the combination, with the case and the keys of an organ, of the hinged frame H, the bells I, the hammers S, the dampers U, the levers M, and the screw-pins V, substantially as herein shown and described, whereby the bells can be operated by the organ-keys and thrown into and out of gear, as set forth.

3. The combination, with the case A, having brackets G at the upper part, of the frame H, hinged at the projecting upper ends of its side bars to said brackets, whereby said frame may be applied to different organ-cases, as described.

4. The combination, with the case A, of the hinged frame H and bells I, attached in two rows by brackets J to the top board of said frame, as and for the purpose set forth.

5. The combination, with the bells, dampers T U, and hammer-pitmen P, passing through the boards Q, of the hinged frame H, having the top-beveled fulcrum-board L, the levers M, pivoted to the highest part of said board, and the cap-board O, as and for the purpose specified.

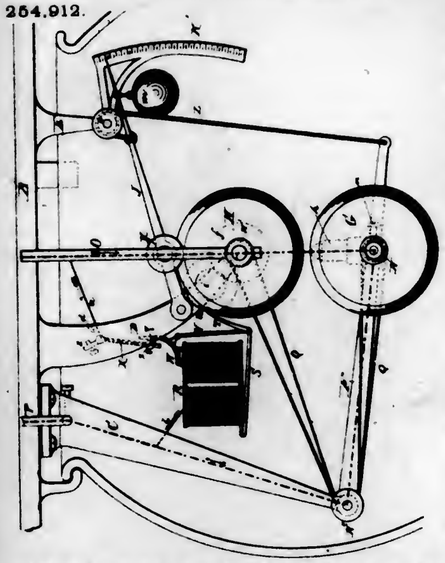
6. The combination of the keys B, having screw-pins V on the under side, the levers M, fulcrumed on board L, and the hinged frame H, whereby the ends of said levers are brought beneath the screw-pins, as described.

7. The combination, with the bell attachment and keys B, of the hinged frame H and draw-stop W, connected by rod Y, and crank-rod X, as and for the purpose specified.

254,911. VAPOR-BURNER. WILLIAM B. BLAKE, Bedford, Ohio. Filed Jan. 20, 1882. (No model.)

Brief.—The burner-slit is cut deeper upon one side than upon the other, and an irregular blaze is produced; but a portion of it is deflected by the deflector, thus leaving the remainder symmetrical in form.

Claim.—1. In a vapor-burner, a tip having its slit cut deeper upon one side than the other, in combination with a deflector which is placed upon the inlet-pipe, substantially as shown.



2. The combination of a vapor-burner with a deflecting device, the parts being so arranged that a portion of the gas which is escaping from the tip will be deflected without impairing the symmetry of the flame for the purpose of vaporizing the fluid, substantially as described.

3. The combination of the inlet-pipe provided with a deflector which has its inner edge to extend inward toward or against the side of the tip, the vaporizing-tube, and a tip which has its slit cut deeper upon the side which is next to the deflector for the purpose of producing a subsidiary jet, substantially as described.

254,912. ELECTRIC LAMP. VIRGIL W. BLANCHARD, New York, N. Y. Filed Feb. 10, 1881. (No model.)

Claim.—1. In an electric lamp, the combination of the light-

254,912.

producing devices and a meter for registering the total volume of electrical energy used, substantially as described.

2. The combination, in an electric lamp, of the suitably-supported revolving-disk electrode H with the arm J, carrying pulley K and the scale K', substantially as and for the purpose set forth.

3. The combination, in an electric lamp, with the revolving-disk electrodes H and G, the latter hung upon a pivoted arm, of the cord L, pulley *e*, weight *m*, arm J, and pulley K, whereby the one is automatically fed toward the other, substantially as described.

4. The combination, in an electric lamp, of the revolving disks H and G, arm F, pulleys N N' N'', band O, cord L, arm J, pulley *e*, weight *m*, and pulley K, substantially as described.

5. In an electric lamp, the combination, with the revolving disk H and the revolving disk G, mounted upon the swinging arm, of the feeding mechanism composed of the toothed pinions *i* and *f*, ratchet-wheel *u*, pawl T, armature S, and electro-magnet R, and the bands and pulleys for transmitting motion from one disk-shaft to the other, substantially as described.

6. The combination, in an electric lamp, of the conductor O, wire *a*, pendulum X, bell-crank lever W, electro-magnet R, armature S, arm V, and a suitable electrical connection between said magnet and the conductor P, substantially as described.

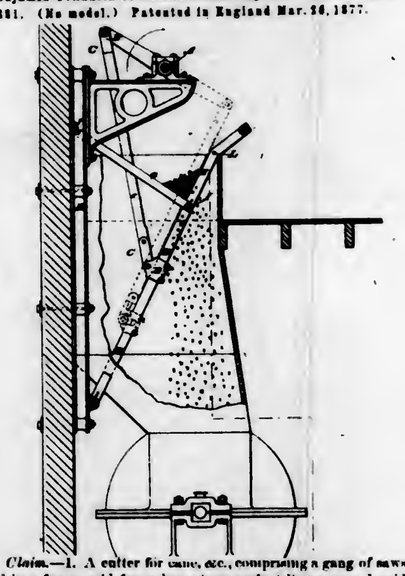
7. The combination, in an electric lamp, of the electrodes and their operating devices, and the pendent studs supporting the same, the cap B and the globe supported by said cap, substantially as described.

8. The combination, in an electric lamp, of the pendulum X with the bell-crank lever W, connecting-arm V, armature S, electro-magnet R, and suitable electrical connections between the opposite terminals of said magnet and the main light-circuit, substantially as described.

9. The combination, in an electric lamp, of the disk H, having beveled margins, with the grooved pulley, arranged to straddle the edge of said disk and bear upon said beveled margins without pressing heavily upon the edge formed by the junction thereof, substantially as and for the purpose set forth.

10. The combination, in an electric lamp, of the rotary-disk electrode H, having beveled margins, with the grooved pulley K, bearing upon said margins, but not upon the edge formed by the junction thereof, the arm J, weighted cord L, and the hinged arm F, carrying the electrode opposite to the disk H, substantially as and for the purpose set forth.

254,913. BUTTON. BERTHOLD BLOCK, New York, N.Y. Filed Dec. 29, 1881. (No model.)

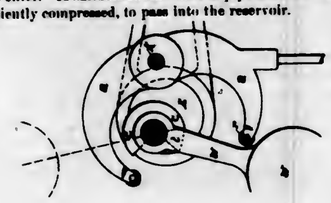


Claim.—1. The plates E and F, having angular hubs *d*, combined with the stem B of the button, in which they are hung, and with the yoke C and spring D, substantially as specified.

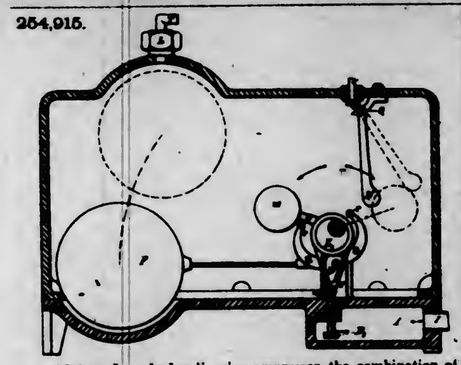
2. In a button, the combination of its body A and stem B with the yoke C, that straddles the stem, and with the spring D, placed beneath said stem into said yoke, and with the lower swinging plate or plates hung on the pivot-pin *b*, substantially as described.

3. The folding plates E F, combined in a button with spring D and yoke C, and made, one or both, with slotted hub *d*, to operate substantially as herein shown and described.

254,914. MACHINE FOR CUTTING SUGAR-CANE. FRANÇOIS ALCIDE BOUDUPIN, Mauritius Island, assignor of one-half to Benjamin Franklin Stevens, London, England. Filed Sept. 1, 1881. (No model.) Patented in England Mar. 26, 1877.



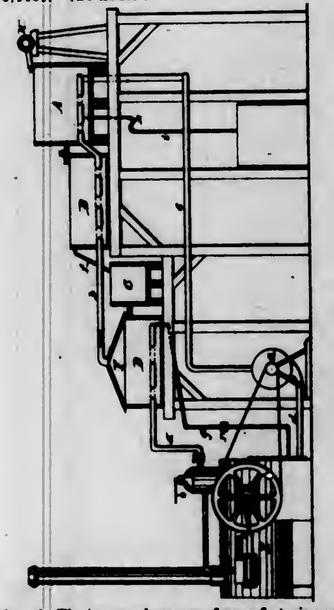
Claim.—1. A cutter for cane, &c., comprising a gang of saws fixed in a frame, said frame hung to a crank at its upper end, said crank mounted in rotative bearings, slides to which the frame is coupled at its lower end, said slides arranged to reciprocate on inclined guides when the crank is rotated, and a slotted cradle to hold the material to be cut, all combined and arranged substantially as set forth, whereby the gang of saws moves upward entirely outside of the bed occupied by the cane and is brought down upon the same with a chopper-like action, substantially as set forth.



2. A cutter for cane, &c., wherein the cane is placed in its cradle or bed and cut at one operation, which comprises a gang of saws mounted in a frame, C, a crank, B, rotatively mounted, to which the upper end of the frame is coupled, slides D, to which the lower end of the frame is coupled, inclined guides E, on which the slides D reciprocate, and a cradle to hold the material to be cut, the bottom of which is composed of bars G, between which the saws reciprocate, and the front wall, H, of bars arranged in the same inclined plane with the guides E, substantially as set forth.

254,915. HYDRAULIC AIR-COMPRESSOR. JEROME BRADLEY, New York, N.Y. Filed Oct. 26, 1881. (No model.)

Brief.—Air is compressed by water rising in box A, which, by carrying with it the float F, opens an eduction-port when the operation is completed and allows the water to flow out and fresh air to enter. A suitable check-valve in pipe L allows the air, when sufficiently compressed, to pass into the reservoir.



254,915.

Claim.—In a hydraulic air-compressor, the combination of the rubber-faced inlet and outlet poppet-valves D' and D, connected with suitably-set eccentrics E and E' on a shaft, S, with the cam *c* and weighted arm *w*, operated by the float F through the forked piece *a*, substantially as and for the purpose set forth.

254,916. PROCESS OF AND APPARATUS FOR MANUFACTURING SALT. OLIVER L. F. BROWNE, Syracuse, N.Y. Filed Dec. 13, 1881. (No model.)

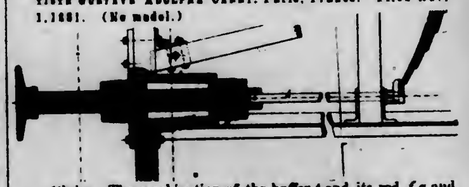
Claim.—1. The improved process of manufacturing salt from natural brine, consisting in conveying the brine successively through preliminary evaporating and purifying tanks or vessels to the final evaporating and granulating vessel, applying the primary and main heating agent to said granulating-vessel, and collecting from the latter the vapor emitted from the brine in process of granulation, and applying said vapor to the preliminary evaporating and purifying vessels for the purpose of heating the contents thereof, substantially as set forth.

2. The within-described process of manufacturing salt from natural brine, consisting in passing the crude brine through one or more preliminary heating and purifying tanks or vessels to the final evaporating and graining vessel, applying the primary heating agent to the latter and gathering the vapor generated in the said evaporating and graining vessel, and applying said vapor to the preliminary heating and purifying tanks in such a manner as to heat the brine contained therein and bring the same to that degree of saturation at which oxide of iron, carbonate of lime, and the usual attendant sulphates are precipitated, then introducing soda-ash to neutralize and precipitate the chlorides of calcium and magnesium, and drawing off the purified brine into the final evaporating and graining vessel, and there reducing it to salt, substantially as set forth.

3. The within-described process of manufacturing salt from natural brine, consisting in introducing the brine into a suitable receptacle and admixing therewith a sufficient quantity of salt to increase its density to the degree of saturation, then allowing the impurities to settle, and subsequently drawing off the purified and saturated brine and conveying the same to the final evaporator or grainer, and there converting it into salt, substantially as specified.

4. The within-described process of purifying natural brine preparatory to converting the same into salt, consisting in introducing the brine into a suitable vessel or tank, and there heating the brine and admixing with it common salt in sufficient quantity to bring the brine to the point of saturation, thereby precipitating the oxide of iron, carbonate of lime, and the usual sulphates with which natural brine is generally contaminated, then drawing off the purified brine to the final evaporator or grainer, and there reducing it to salt, as set forth.

5. The within-described process of manufacturing salt from natural brine, consisting in introducing the brine into a suitable receptacle, and there heating the brine and admixing with it common salt sufficiently to saturate said brine, and adding thereto soda-ash, and after the resultant elimination of the impurities conveying the purified brine to an evaporating apparatus, and there converting said brine into salt, substantially as set forth.



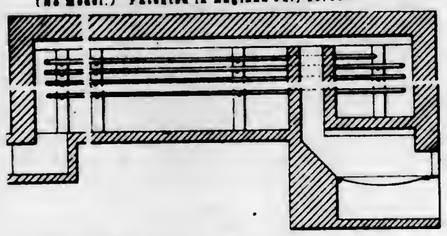
6. A salt-water-evaporating apparatus comprising a granulator or final evaporator heated by the primary heating agent, vats or suitable receptacles for preliminary heating and purifying of the brine heated by the vapor emitted from the granulator, and suitable ducts for conveying the brine successively through said tank to the granulator, substantially as set forth.

7. A salt-water-evaporating apparatus comprising a grainer or final evaporator heated by the primary heating agent, vats or suitable receptacles for preliminary heating, evaporation, and purification of the brine heated by the vapor emitted from the grainer or final evaporator, and a settling-tank interposed between the said grainer and preliminary heating and purifying tanks, the brine being conveyed successively through the said tanks to the grainer, substantially as set forth.

8. A salt-water evaporator consisting of the following appliances and arrangements, to wit: first, a receptacle for the crude brine; second, a brine-saturating tank or vessel having communicative connection with the first receptacle; third, a tank arranged to receive the saturated brine of the second tank and allow the impurities of said brine to settle; fourth, a grainer or final evaporator communicating with the third tank; fifth, a steam-generator; sixth, a steam-duct extended from the steam-generator through or along the grainer or final evaporator; seventh, a cover applied to the top of the grainer; eighth, a vapor-duct extended from the cover through the brine-saturating tank and the first crude-brine receptacle; and, ninth, a suction fan or pump having its induction-port communicating with the end of the aforesaid vapor-duct and its discharge directed to the fire-box or furnace of the steam-generator, all arranged and operating substantially as described and shown.

9. The receptacle A, saturating-tank B, settling-tank C, and grainer D, communicating successively, as described, in combination with the steam-generator E, having the steam-pipe *a* extended through the grainer D and returned from there to the steam-generator, the cover F, having the vapor-duct *b* extended through the saturating-tank B and through the crude-brine receptacle A, and the fan G, having its induction-pipe *c* connected with the vapor-duct *b* and the crude-brine receptacle A, and its discharge-pipe *d* communicating with the fire-box of the steam-generator E, all arranged and combined substantially as described and shown, for the purpose set forth.

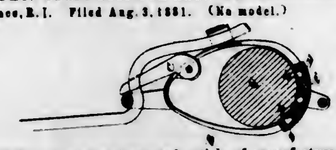
254,917. HYDRAULIC BUFFER FOR VEHICLES. JEAN BAPTISTE GUSTAVE ADOLPHE CABET, Paris, France. Filed Nov. 1, 1881. (No model.)



Claim.—The combination of the buffer *f* and its rod *f g* and piston *q*, having orifice or orifices *n*, with the cylinder *k*, having

tapering rod or rods m, and with the spring r, for operation substantially as specified.

254,918. PURIFICATION OF ALKALINE SOLUTIONS. EUSTACE CAREY, HOLBROOK GASKELL, Jr., and FERDINAND HUNTER, Widnes, County of Lancaster, England. Filed Dec. 15, 1881. (No specimens.) Patented in England Mar. 17, 1881.

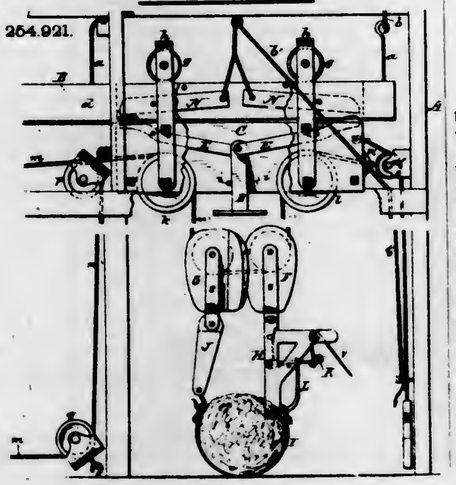


Claim.—In the purification of alkaline solutions, the addition of alumina to the solution, substantially in the manner and for the purpose hereinbefore described.

254,919. PURIFICATION OF ALKALINE SOLUTIONS. EUSTACE CAREY, HOLBROOK GASKELL, Jr., and FERDINAND HUNTER, Widnes, County of Lancaster, England. Filed Dec. 15, 1881. (No model.) Patented in England July 18, 1878.

Claim.—The system or mode of purifying alkaline solutions by submitting the same to the action of sulphur or sulphur compounds added to or produced in such alkaline solutions, and of carbonic acid, the solutions thus treated being then subjected to an elevated temperature in order that the iron which they contain may be separated therefrom, substantially as hereinbefore described.

254,920. SHAFT-LOOP FOR HARNESS. PETER CAREY, Providence, R. I. Filed Aug. 3, 1881. (No model.)



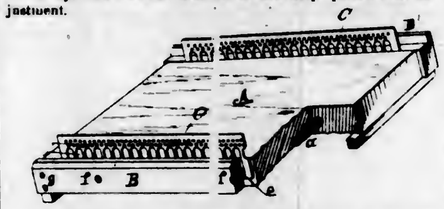
Claim.—1. As an improved article of manufacture, a shaft-loop provided with a rigid buckle-frame at its upper end, a tongue pivoted in its side, and a series of balls in its lower part, substantially as herein shown and described.

2. The combination, with the shaft-loop B, of the balls E, loosely held in bearings in the lower portion of the said loop, substantially as and for the purpose set forth.

3. The combination, with the shaft-loop B, provided with apertures D, of the balls E and the plate F, substantially as herein shown and described, and for the purpose set forth.

254,921.

254,921. HAY-ELEVATOR. PETER F. CRAMBARD, Fayette, Ohio. Filed Feb. 14, 1882. (No model.)



Claim.—1. The track B, composed of the outer timbers or sections, *c d*, center timber or section, *e*, and having the space *f*, in combination with the carriage C, having pivoted latch-arms E, curved at their outer ends, as shown, the tripping-lever D, hangers *h*, pulleys *g k l*, and hoisting-rope m, constructed to operate substantially as and for the purpose set forth.

2. The carriage C, tripping-lever D, pivoted latch-arms E, curved at their outer ends, as shown, in combination with the track B, constructed as described, with the space *f*, and having pivoted thereto the levers N, operated by the rope *b'*, substantially as and for the purpose specified.

3. The track B and carriage C, constructed substantially as shown and described, in combination with the hoisting-rope m, pulley-blocks G F, having straps *s* secured to their sides, and having detachably connected thereto the hooked arm J, bracket H, carrying pivoted tripping-hook L, latch K, with hole *t*, spring *u*, and rope r, and the sling I, constructed and arranged to operate substantially as and for the purpose described.

254,922. FLUTING AND PLAITING BOARD. LEWIS C. CHASE, Waupun, Wis. Filed Jan. 27, 1882. (No model.)

Brief.—The vertical slots in the side strips permit their adjustment.

Claim.—1. In a fluting-board, the combination of the body portion and strips provided with upper lines of perforations and lower upright slots or oblong perforations, substantially as shown and described.

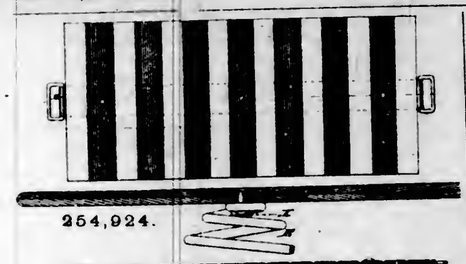
2. In a fluting-board, the combination of the body portion and strips provided with upper lines of perforations and lower upright slots or oblong perforations and means for holding said strips in an elevated or in a depressed position, substantially as shown and described.

3. The combination of the base-board A, side cleats, B, and rods *a* with the perforated strips C, substantially as shown and described.

4. In a fluting-board, the combination of the body A, cleat B, screws *f*, and strip C, slotted at *e*, substantially as shown and described.

254,923. BARBED FENCE-WIRE. NORMAN CLARK, Sterling, Ill. Filed Jan. 5, 1882. (No model.)

Claim.—1. The herein-described method of constructing a barbed fencing material, consisting of first weaving or forming a web and afterward separating the same, substantially as shown.

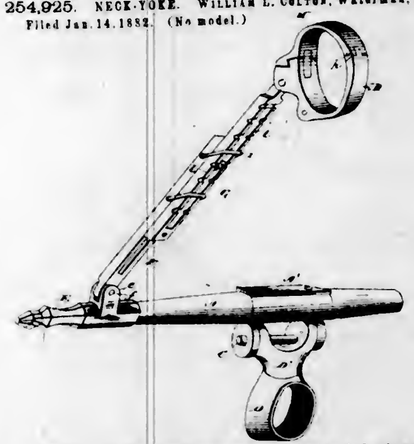


2. The combination of three or more strands, the same being neither braided nor twisted with each other, with barbs interwoven with said strands and held in position without being twisted or wrapped around any of said strands, substantially as shown.

3. An improved fencing material consisting of three or more strands, in combination with barbs held in position by being interwoven with said strands as contradistinguished from braiding or twisting, said strands not being in contact with each other, substantially as stated.

4. The method of manufacturing a coated fencing material having a sharp-pointed barb, consisting of subjecting the material to a galvanizing or coating process before pointing the barb, substantially as set out.

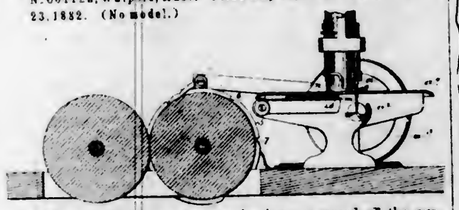
254,924. ELASTIC MATERIAL FOR SEATS, WINDOW-BLINDS, &c. HENRY B. COMB, Wilmington, Del. Filed Dec. 8, 1881. (No model.)



Claim.—An elastic material for car-seats, window-blinds, and other purposes, formed of a series of stiff slats each formed of two

254,924.

thin layers or leaves joined together crosswise and on both sides of a metallic spring-band, substantially as described.

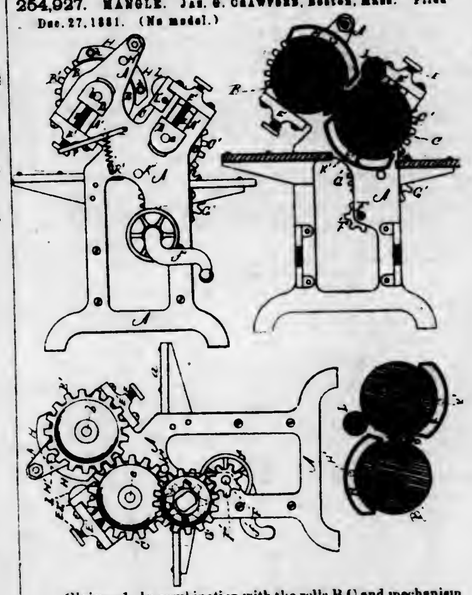


254,925. NECK-YOKE. WILLIAM L. COLTON, Waterman, Ill. Filed Jan. 14, 1882. (No model.)

Claim.—1. The combination of the yoke-bar A, having swiveled center-pieces D' D and end thimbles, E, hinged extensible stays F G, constructed as described, and hinged spring-clasps H, substantially as and for the purpose herein shown and set forth.

2. In a neck-yoke for harness, the extensible stay consisting of the recessed and slotted arm or bar F, having screw F' and adjustable spring-washer *n*, recessed slotted arm or bar G, having screw G', adjustable spring-washer *n'*, and notched side flanges, *l l*, and hinged loops or bails I I, the whole constructed and combined to operate substantially in the manner and for the purpose herein shown and described.

254,926. SEWING-MACHINE FOR QUILTING, &c. FREEMAN N. COTTLE, Walpole, Mass. Filed May 28, 1881. Renewed Jan. 23, 1882. (No model.)



Claim.—1. The sewing mechanism composed of the eye-pointed needle and hook and means to operate them and the roller-feed located at one side of the sewing mechanism, combined with the ratchet and pawl, and pawl-controlling disk, *s*, described, adapted to operate the roller-feed intermittingly for a short distance and then for a long distance, leaving the feed-wheels at rest at intervals during two descents of the needle, to operate substantially as and for the purpose set forth.

2. The sewing mechanism composed of the eye-pointed needle and hook and the feeding mechanism, combined with the thread-cutting device *w*, located below the cloth-plate, over which the loop of thread is drawn and severed between the material being sewed and the eye of the needle, substantially as described.

3. The combination, with the cloth-plate *a'*, the needle-bar and eye-pointed needle, of the thread-holder *n*, adapted to receive between its forked end the end of the thread projecting beyond the eye of the needle and hold the same until the needle again descends to form a succeeding stitch, substantially as described.

254,927. MANGLE. JAS. G. CRAWFORD, Boston, Mass. Filed Dec. 27, 1881. (No model.)

Claim.—1. In combination with the rolls B C and mechanism for actuating and supporting the same, substantially as shown, the adjustable guide N, arranged substantially as described, whereby its upper edge will lie against the roll B, or about midway between the two said rolls, for the purpose specified.

2. In combination with the frame A and rolls B C, the guide-plate N, shaft O, spring-arm P P', and spring R, all substantially as described, and for the purpose set forth.

3. In a mangle, the combination, with an ironing-roll, of an ironing-bed centrally pivoted, or nearly so, for the purpose of allowing play between the roll and bed, substantially as specified.

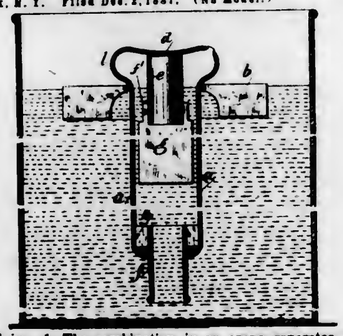
254,928. PAPER-BAG MACHINE. WILLIAM C. CROSS, Boston, Mass. Filed Dec. 7, 1881. (No model.)

Claim.—1. In combination with the guide-bar, the rotating nipper-cylinder, and the intermittently-moving vibratory nipper carried by the same, adapted and arranged, substantially as herein-before set forth, to sever or cross-cut the adjoining ply of the blank at the point where said nipper subsequently takes hold of that ply in the operation of opening the mouth of the blank for the formation of the diamond fold.

2. The combination of the gnide-bar, the vibratory nipper arranged and adapted, substantially as described, both to cross-cut at the mouth end of the blank that portion of the adjoining ply opposite to it and to take hold of the part of the ply thus cut, the rotating nipper-carrying cylinder or roll, its rotating fellow roll, and the cutting mechanism carried by the same, the combination being and acting substantially as hereinbefore set forth.

3. The rotating diamond-fold forming or laying and pressing rolls and cutting mechanism carried by the same, arranged and operated, substantially as hereinbefore set forth, to make the final cut which separates the blanks from one another before the blank in rear enters the bite of said rolls, in combination with mechanism, substantially as described, for opening the mouth of the blank and presenting it to said rolls, the combination being and acting substantially as set forth.

4. The rotating diamond-fold forming or laying and pressing rolls, the cutting mechanism carried by the same, arranged and operated to make the final cut which severs the blanks from one another at the times specified, and the presser, in combination with mechanism, substantially as described, for opening the mouth of the blank and presenting it to said rolls, the combination being and acting substantially as set forth.



5. The guide-bar, the rotating nipper-cylinder and its fellow roll, the blank-cutting mechanism, and the vibratory nipper arranged and operating both to cross-cut and to grasp the central part of the adjoining ply at the times and in the manner substantially as specified, in combination with the rotating diamond-fold-pressing rolls and the final-cutting mechanism carried by the same, substantially as and for the purposes hereinbefore set forth.

254,929. CIGARETTE-WRAPPER. EDMOND A. G. D'ARGY, Paris, France. Filed July 27, 1880. (No model.) Patented in France Jan. 24, 1873, in England May 2, 1873, and in Belgium June 5, 1880.

Claim.—As an article of manufacture, a cigarette-paper which is saturated at one end with a saliva-proof substance and adapted to be used as a wrapper for making cigarettes at the convenience of the smoker or manufacturer, substantially as shown and described.

254,930. OZONE-GENERATOR. JOHN M. DAVIDSON, New York, N. Y. Filed Dec. 2, 1881. (No model.)

Claim.—1. The combination, in an ozone-generator, of the guide-tube *a*, float *b*, stop-finger *d*, phosphorus-cup *f'*, and float *g* within the guide-tube, substantially as set forth.

2. The combination, in an ozone-generator, of the guide-tube *a*, float *b*, stop *d*, float *g*, phosphorus-cup *f'*, and removable weighted stopper *h*, substantially as set forth.

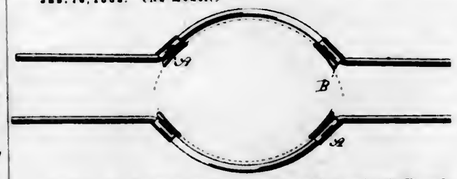
3. The combination, in an ozone-generator, of a guide-tube, a removable weighted stopper at the lower end of a float, a phosphorus-holder, and perforated cap at the upper end of the guide-tube, forming also a stop for the end of the phosphorus, substantially as set forth.

4. The combination, with the guide-tube, phosphorus-holder, and its float, of a reversible float for the guide-tube, having one surface recessed, so that the phosphorus may be entirely immersed to stop the generation of ozone, substantially as set forth.

254,931. CHAIN-CROSS-BAR. SALOMON DAVIDSON, New York, N. Y. Filed Jan. 23, 1882. (No model.)

Brief.—The collar serves to firmly retain the ring in the bar-groove, the collar acting as a tie, thereby dispensing with the use of solder.

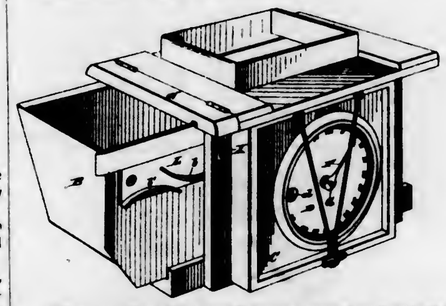
Claim.—1. The combination, substantially as hereinbefore set forth, of the bar having a groove or depression at about its mid-length, the collar fitted on the bar, and the cleft coupling-ring inserted into the bar-groove through the collar.



2. The combination, substantially as hereinbefore set forth, of the bar having a groove or depression at about its mid-length, the collar fitted on the bar and provided with notches or openings coinciding with the bar-groove, and the coupling-ring inserted into the bar-groove through the collar and engaging the collar notches or openings.

254,932. CULTIVATOR. WILLIAM J. DAVIDSON, Big Spring, Va. Filed Nov. 23, 1881. (No model.)

Claim.—The combination, with the single-bar beam A, of slotted brackets constructed as set forth and with their free ends projecting to the rear, and standards connected to the brackets and constructed for attachment to either side thereof and adjustable thereon, substantially as set forth.



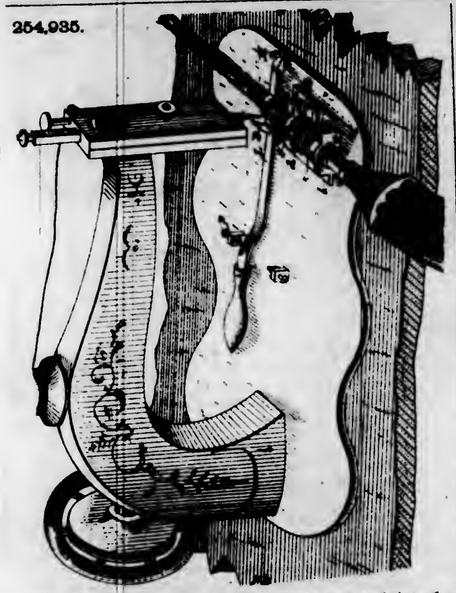
254,933. STOVE-LIFTER. GEORGE DAY, Dixon, Ill. Filed Jan. 14, 1882. (No model.)

Claim.—1. A stove-carrier consisting of the clutch B and sleeve A, the clutch being provided with teeth on its upper edge, substantially as shown and described.

2. The combination of the sleeve and clutch B with a lifting or carrying bar adapted to be run through the sleeve, substantially as and for the purposes set forth.

254,934. GRAIN MEASURE AND TALLY. THOMAS F. DODGE, Lawton, Mich. Filed July 2, 1881. (No model.)

Claim.—1. The sliding box B, having secured to its side the reversely-curved ribs or beads *l l'*, in combination with registering mechanism actuated by said ribs, substantially as set forth.



2. The sliding box B, having on its side a plate, L, provided with reversely-curved ribs or beads *l l'*, in combination with lever J, having end *j*, that enters the channel between said ribs, pawl I, toothed wheels H and E, shaft G, and lug *g*, substantially as set forth.

3. A box or drawer having a plate attached to its rear end and arranged to overlap the next succeeding box or drawer, in combination with the cage and registering mechanism, substantially as set forth.

4. In combination with the cage and drawer of a grain-measure, a striker, N, hinged to the edge of the cage so as to lie flatly on said drawer, and adapted to be turned back off from the same and retained in this inoperative position by its own gravity, substantially as set forth.

254,935. SEWING-MACHINE ATTACHMENT. GEORGE DOOLITTLE, Bridgeport, Conn. Filed Jan. 13, 1882. (No model.)

254,935.

Claim.—1. A sewing-machine attachment consisting of a tubular box or work-holder adapted to contain a rope or congregation of strands of yarn or other suitable material mounted in boxes or bearings arranged upon a securing-plate, said box or work-holder adapted to rotate in its bearings upon an axis at right angles to the needle, in combination with suitable intermediate mechanism between the work-holder and the driving mechanism of the machine, whereby a rotary feed is given to the rope or yarn contained in the tubular work-holder and short circumferential and intersecting diametric stitches are made, substantially as hereinbefore set forth.

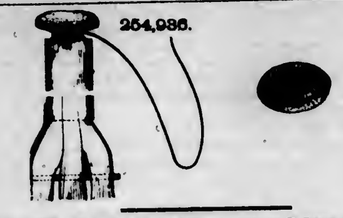
2. In a sewing-machine attachment for the manufacture of yarn tufts, the combination, with the plate B, of the tubular box *c*, mounted in said plate, and means, substantially as described, for rotating the box, as hereinbefore set forth.

3. In combination with the tubular box *c*, provided with ratchets *d*, the plate B, pawl-carrier *e*, pawls *g h*, and suitable mechanism for vibrating the carrier *e*, substantially as hereinbefore set forth.

4. In combination with the plate B, box *c*, and the ratchets and pawls for giving rotary motion to the box *c*, the condensing-tube I, adapted to be secured within the box *c* and to rotate therewith, substantially as described.

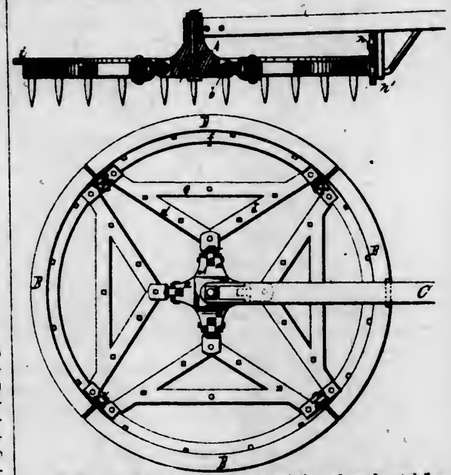
5. The box *c*, having a feather-groove at its outer end, and the tube I, with a short feather, *k*, in combination with the loose ring *l*, whereby the tube I and box *c* are rigidly connected, substantially as described.

6. In combination with the box *c* and tube I and mechanism for producing rotary feed, as described, the vibrating lever L, provided with the hinged arm N, having spear O, substantially as described.



7. The box *c*, provided with two ring-ratchets, *d*, having their working-faces in opposite directions, the pawls *g h*, arranged upon a common shaft in relation to each other, as described, in combination with the spring-arm *i*, provided with teat for holding either pawl in working contact, substantially as and for the purpose set forth.

254,936. FURNITURE-TUFT AND METHOD OF MAKING THE SAME. GEORGE DOOLITTLE, Bridgeport, Conn. Filed Feb. 13, 1881. (No model.)



Claim.—1. The method of making tufts of yarn or other suitable material by condensing the strands and confining and associating the same together by circumferential and radial intersecting stitches, substantially in the manner hereinbefore set forth.

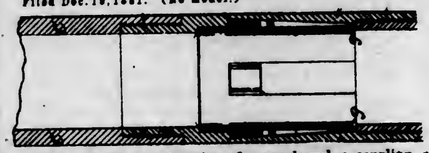
2. As an improved article of manufacture, a tuft for upholstery, composed of strands of yarn or other suitable material bound and stitched by circumferential and intersecting radial stitches, substantially as shown and described.

254,936.

254,937. ROTARY HARROW. ALPHONSO H. DOTY, Marshland, Wis. Filed July 16, 1881. (No model.)

Claim.—1. In a rotary harrow consisting of quadrantal flexibly-connected sections, the combination of a continuous sectional edge and endwise-projecting flanges, a flexibly-connected central head, and a centrally-pivoted draw-beam provided with anti-friction pulleys, substantially as shown and described.

2. The combination of the centrally-pivoted draw-beam C with the central head, A, and flexibly-connected sections B, each provided with the edge and endwise-projecting flange *i*, the said draw-beam being provided with anti-friction pulleys *n n'*, substantially as shown and described.



254,938. MANUFACTURE OF FUR-FACED FABRICS. WILLIAM E. DOUBLEDAY, Bay Ridge, N. Y., assignor to Ellen M. Doubleday, same place. Filed Nov. 1, 1881. (No specimens.)

Brief.—The fur fiber is first blown on the cone being fed by a continuous belt. The fibrous cotton is laid on the belt in the rear of the fur, so that it will be blown on the cone afterward, thus covering the fur.

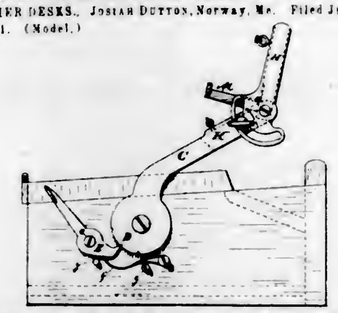
Claim.—1. The herein-described process of forming a fur bat—that is to say, by first depositing a coating of fur upon a reticulated surface and subsequently depositing a coating of loose cotton upon the fur—substantially as set forth.

2. The herein-described fur bat, consisting of a layer of fur and a superimposed layer of loose cotton, substantially as set forth.

254,939. CORE LIFTER AND GUIDE FOR ANNULAR ROCK-DRILLS. SAMUEL W. DOUGLASS, New York, N. Y., assignor to the American Diamond Rock Boring Company, same place. Filed Dec. 19, 1881. (No model.)

Claim.—1. The combination of a core-barrel, a coupling, a ring fitting into an internal recess in the coupling, provided with separated guide projections or fingers, a split ring working in a

254,944.



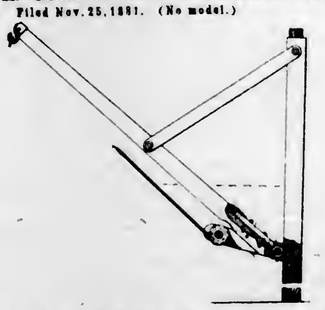
254,946.

tapered recess in the coupling, and provided with wedges which project inwardly between the guide-fingers, and a drill-head, all combined substantially as and for the purposes set forth.

2. A drill-rod coupling recessed on its inner periphery, and a guide-ring fitting into the recess, in which there are slots, through which the core-grasping wedges act, substantially as and for the purposes set forth.

3. The combination of a slotted ring supported in a recess in the coupling, through the slots in which ring wedges on a contractible ring act, said contractible ring working in a tapered recess in the coupling, all combined substantially as and for the purposes set forth.

254,940. BOOK-REST ATTACHMENT FOR SCHOOL AND OTHER DESKS. JOSIAH DUTTON, Norway, Me. Filed June 30, 1881. (Model.)



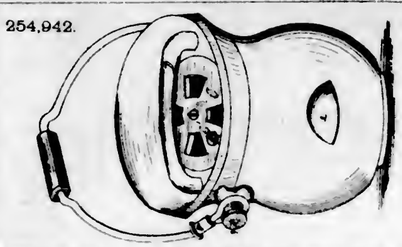
Claim.—1. A book rest or support consisting of arms C and H and H', the rest or cross-piece G, combined with the rest I, and mechanism for adjusting it, as described, to and from the plane of the rest or cross-bar G, as set forth.

2. The rest G, in combination with the rest I, provided with the hinged shelf M, and provided with adjusting devices substantially such as described, whereby the rest I may be set at any desired angle and converted into a large or small book-support at will, as set forth.

3. The combination, in a book-rest, of the arms C, provided with the notched disks, the pawl E, arm H, slotted as described, and the thumb-nut K, whereby the rest may be adjusted at any desired height or angle, as set forth.

4. A book-rest attached to the rear ends of arms which are pivoted at their front ends to the sides of a desk or table, and mechanism for adjusting the book-rest, substantially as described, to raise the rest above the surface of the desk or table and lower it onto or into a recess in the rear part of the table or desk, as set forth.

254,941. DERRICK. LOUIS DUVAL, Longueuil, Quebec, Canada. Filed Nov. 25, 1881. (No model.)



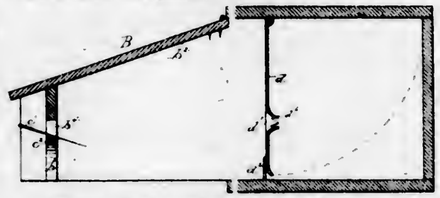
Claim.—A derrick or derrick-crane composed of the following elements, namely: a post suitably secured, a jib or boom of nearly the same length as the post, having a changeable point of connection therewith, and adapted to be folded vertically against such post, and braces or arms pivoted to the post and to the jib, all substantially as and for the purposes described.

254,942. COMBINED COMMODE AND SLOP-JAR. SAMUEL A. EMERY, East Liverpool, Ohio. Filed Jan. 12, 1882. (No model.)

Claim.—1. A concave or dished detachable cover of pottery or like ware, having a discharge port or ports, and a sliding valve for closing the same, in combination with a vessel of like material, said

254,942.

vessel having a beveled or flaring lip for the reception of the cover, whereby the article is adapted for use as a commode and a closed slop-jar, substantially as specified.



2. A detachable dished lid or cover having a discharge-valve and a handle which spans and protects the valve, substantially as and for the purpose specified.

3. A detachable dished lid or cover having a discharge opening or port, a slide-valve adapted to close the port of the cover, and an interposed packing arranged between the valve and its seat, substantially as and for the purpose specified.

4. The combination, with a pottery-ware vessel having lugs or pintles of like material formed thereon, of a wire bail having a coil or eye which receives the pintle, and a sliding sleeve which confines the free end of the wire next the bail-eye and prevents the escape of the pintle, substantially as and for the purpose specified.

5. The bail for pottery-ware, having a coil or eye adapted to receive a lug or pintle, and the notched free end, in combination with a slotted sliding ferrule, substantially as and for the purpose specified.

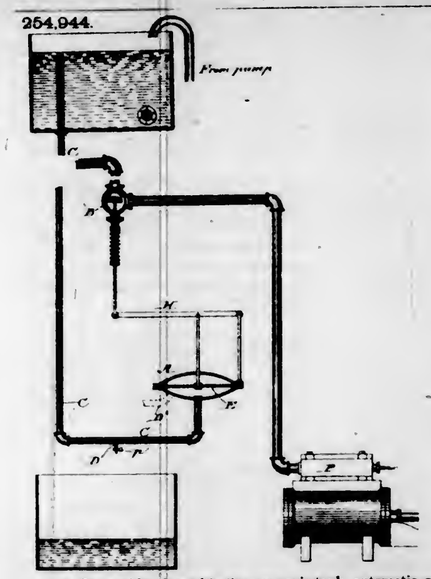
254,943. ANIMAL-TRAP. EZRA EMMERT, Dixon, Ill. Filed Dec. 29, 1881. (No model.)

Claim.—1. In an animal-trap, the automatically-acting needle c', pivoted on the wire c, passed through the slot b' of the partition b', supported therein by the supporter c^2, and adapted to turn upon its pivotal point when the animal passes under its point in entering the trap, substantially as shown and described.

2. In an animal-trap, the tunnel B, projecting from the side of the box or trap, formed of the extended side board, a, and partition b, provided with a hinged roof, b', a recessed partition formed with a slot, b', adapted to form a guide for the needle, and a supporter adapted to retain the needle within the slot, substantially as shown and described.

3. In an animal-trap, the pivoted partition d, placed within the box between the sides a and b, and having a perforation, d', and projections d^2, substantially as shown and described.

4. In an animal-trap, the combination, with the slotted and recessed partition b^2, of the needle c', pivoted to the wire c, and adapted to operate within the slot of the partition b', substantially as and for the purposes set forth.



254,944. AUTOMATIC REGULATOR FOR TANKS AND RESERVOIRS. QUIMBY N. EVANS, Brooklyn, N. Y., assignor of one-half to Herbert A. Joslin, same place. Filed July 12, 1881. (No model.)

Claim.—1. The combination, with a reservoir-tank and a pump for supplying the same with liquid, of a steam-engine or equivalent motor, and an automatic regulator to control the throttle or operating-clutch of the motor, said regulator being governed in movement by the flow to and through it of a limited and intermittent current of liquid from the tank, substantially as set forth.

2. The combination, with a reservoir-tank and automatic regulator, of the supply-pipe C and the discharge-pipe D, of less diameter therewith, substantially as described.

3. The combination, with a reservoir-tank, of the supply-pipe C, the discharge-pipe D, of less diameter therewith, the regulator A, throttle-valve B, steam-pipe K, and engine P, substantially as herein set forth.

254,944.

4. In combination with the reservoir-tank, automatic regulator, and supply and discharge pipes, substantially as described, the valve-stem I, provided with the retraction-spring, the steam-pipe, and engine-pump, substantially as described.

254,945. MODE OF MAKING INLAID JEWELRY, &c. CHAS. P. PERT, Philadelphia, Pa., assignor to George P. Farmer, Montclair, N. J., and Wilson Pratt, Philadelphia, Pa. Filed Jan. 3, 1882. (No model.)

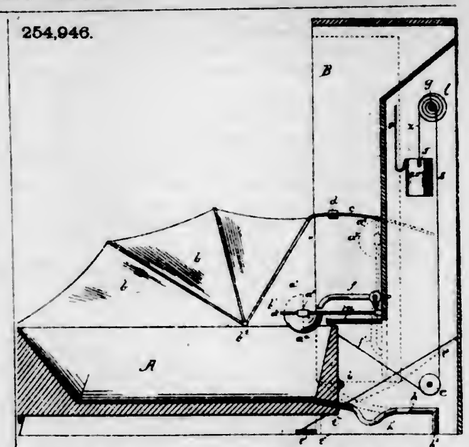
Brief.—The body-piece and the inlaid piece, being fastened together by cement, are cut at one operation. The inlay is inserted into the body and the surfaces made flush.

Claim.—The mode herein described of inlaying pearl, ivory, shell, and similar substances with substances of another shade or color, by first cutting out the two pieces in the desired outline at one and the same operation, leaving a tapering opening in the piece to form the body, and inserting the cut-out portion of the other piece into this opening, and finally making the surfaces of the two substances flush by grinding or otherwise, all substantially as set forth.

254,946. BATH-TUB. FRANKLIN H. PICKETT, Chicago, Ill. Filed Nov. 28, 1881. (No model.)

Brief.—The bath-tub A may be raised so as to be entirely within the casing B. For this purpose it is pivoted at i, and is raised by a weight, w, by means of pulleys l e and cords r x s f'. Splashers b b' are provided to prevent soiling the adjacent portions of the apartment. A wash-basin, a', resting upon hinged prongs a^2, can assume a position perpendicular to its normal. A flexible joint, h', is provided, whereby the oscillation of the tub will not affect the drain-pipe h^2.

Claim.—1. The bath-tub A, hinged at i, and attached by cords s to spiral pulley l' and spiral pulleys l l, in combination with the weight w and cords x and r, arranged to operate substantially as specified.

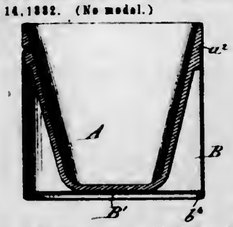


2. In combination with a bath-tub hinged to and so as to fold into a cabinet, and provided with a waste-pipe, the flexible joint h', and pipe h^2, constructed to operate substantially as specified.

3. In combination with a bath-tub hinged to and so as to fold into a cabinet, the hinged base t' and cord t, arranged to operate substantially as specified.

4. In combination with a bath-tub hinged to and so as to fold into a cabinet, the T-shaped and jointed cock f and lid m, arranged to operate substantially as specified.

5. In combination with a bath-tub hinged to and so as to fold into a cabinet, a folding splasher arranged upon the longitudinal



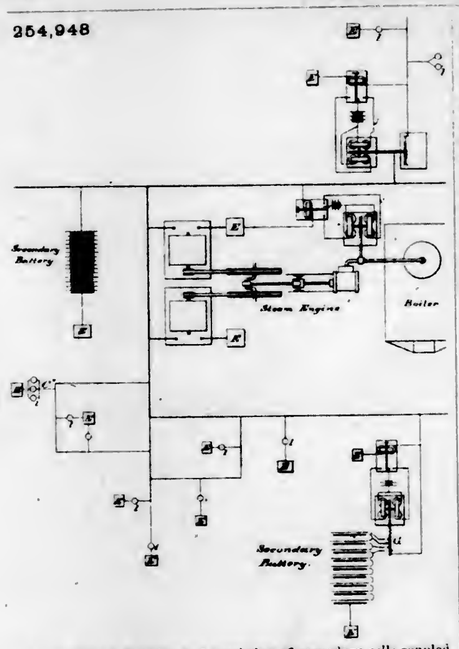
254,946.

sides of the tub and so as to fold with it into the cabinet, substantially as specified.

6. In combination with a bath-tub hinged to and so as to fold into a cabinet, the wash-bowl a', operated upon a hinged and vertically-swinging frame, a^2, substantially as specified.

254,947. CULINARY VESSEL. JOHN W. FISHER, New York, assignor of one-half to Michael W. Hamma, Brooklyn, N. Y. Filed Jan. 14, 1882. (No model.)

Claim.—1. The combination, with the bowl A, having annular shoulders a a^2 and groove a', the circumference of the upper shoulder being greater than that of the lower one, of the band B, having an inwardly-bent upper edge, b, adapted to engage within the groove a', whereby said parts are securely connected, substantially as described.



2. The herein-described vessel, consisting of the bowl A, having tapering sides, and provided near the top with annular shoulders and groove, and the casing B, having vertical walls and an inwardly-turned edge, b, adapted to engage with the annular groove formed in the bowl, said casing being provided with a bail, C, and having at its lower end an annular recess, b', for the attachment of the perforated flanged bottom B', a space being left between the bowl and its casing for the circulation of heat, substantially as specified.

254,948. DISTRIBUTION OF ENERGY BY ELECTRICITY. ST. GEORGE LANE FOX, London, England. Filed Jan. 13, 1881. (No model.) Patented in England Oct. 9, 1878, Oct. 13, 1878, and Nov. 14, 1878, in France Oct. 23, 1878, and in Belgium Oct. 30, 1878.

Claim.—1. The combination of an electric circuit divided into branches, a continuous-current generator arranged in the undivided portion thereof, a number of electric lamps arranged in said branches in multiple arc, and a secondary battery arranged in a branch by itself, whereby when the generator is supplying more electro-motive force than is required by the lamps the excess may develop a charging-current through the secondary battery, and when the potential in the circuit falls below the normal the secondary battery may discharge and supply a current to the lamps, re-enforcing that from the generator, substantially as set forth.

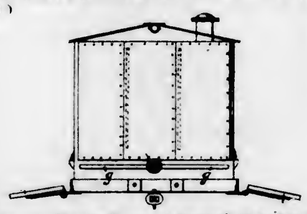
2. The combination of a continuous-current generator, an earth-connection with one electrode thereof, a conductor leading from the other electrode thereof, a number of branches from said conductor to earth, a number of electric lamps arranged in said branches in multiple arc, and a secondary battery arranged by itself

254,948

in one of said branches and consisting of secondary cells coupled in series, substantially as and for the purposes set forth.

3. The combination of an electric-current generator, a conductor leading from one electrode thereof to the point or points where the current is to be used, an earth-connection with said point or each of said points, a compound secondary battery, one of whose electrodes is in connection with one electrode of the generator, and the other of whose electrodes is in connection with the earth, and commutators in connection therewith, constructed to operate substantially as set forth, whereby any one or more of the cells of the secondary battery may be cut out or replaced while the battery is being charged.

4. The combination of a continuous-current generator, a conductor leading therefrom to the point or points where the current is to be used, an earth-connection with said point or each of said points, a compound secondary battery, one of whose electrodes is in connection with one electrode of the generator and the other of whose electrodes is in connection with earth, a commutator in connection with said battery, an electro-magnetically-operated regulator in connection with said commutator, and means, substantially as herein set forth, interposed between said regulator and said commutator, whereby one or more of the battery-cells are automatically cut out and replaced, according to the varying intensity of the current, all substantially as herein described.

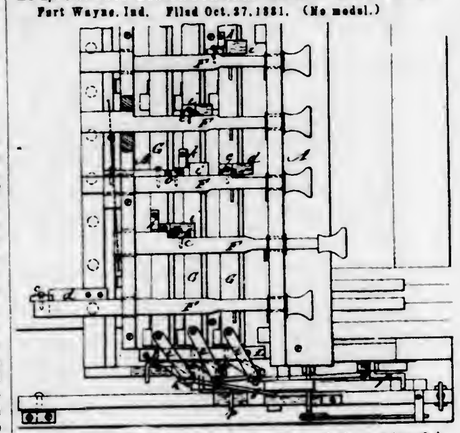


5. The combination of a current-generator, an earth-connection with one electrode thereof, a conducting-main leading from the other electrode thereof, a branch from said main, including a rheostat and a device to be acted on by the electric current and terminating in earth, a sub-branch leading from said branch between said rheostat and earth, including an electro-magnet, and also terminating in earth, and means, substantially as hereinbefore set forth, interposed between the armature of said electro-magnet and said rheostat, whereby more or less resistance is interposed in said branch, according as the charge of potential in said sub-branch becomes greater or less than normal.

6. The combination of a generator, an earth-connection with one electrode thereof, conducting mains or branches leading from the other electrode thereof to the several devices to be acted on by the electric current and thence to earth, an electro-magnetically-controlled variable rheostat interposed in one of the said branches, a sub-branch leading from said branch between said rheostat and earth, including the electro-magnet controlling said rheostat and terminating in earth, and a branch leading from either of said conducting mains or branches, except from between said rheostat and earth, including a secondary or reservoir battery, and also terminating in earth, substantially as and for the purposes set forth.

7. The combination of an electro-magnet, its armature, means for exerting a variable retractile force applied thereto, which force shall be greatest when the armature is attracted close to the magnet, and which shall decrease as it is drawn away therefrom, a contact-lever connected to and receiving motion from said armature, an arc along which said lever may move, and a pair of contact-stops arranged one on each side of said lever and capable of being adjusted or set to different positions along said arc, substantially as set forth.

8. The combination of electro-magnets *m m*, their armatures *n n'*, connected together substantially as shown, whereby when one armature approaches its magnet the other recedes from its magnet, rock-shaft *o*, receiving motion from said armatures, and retarding-fan *r*, actuated by said shaft, substantially as set forth.



254,949. STOCK-CAR. FREDERICK W. FRANKLIN and WILLIAM F. FLAGG, Baltimore, Md. Filed Jan. 10, 1882. (No model.)

Claim.—1. In a stock-car, a water-tank to occupy the entire width of the car end, and provided with vertical partitions the edges of which are attached to the two opposite broad sides of the tank, said partitions extending from near the bottom to near the top, leaving openings below and above by which the water may have access from one side of the partition to the other, as set forth.

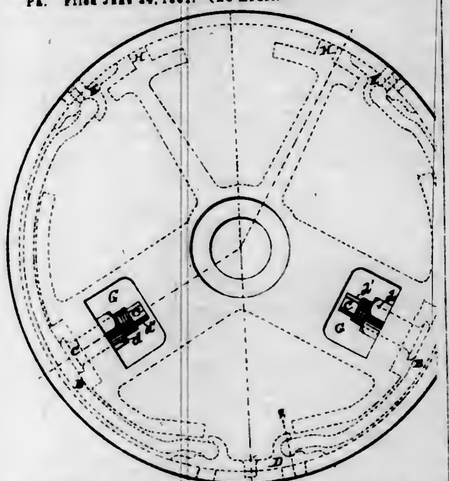
2. In a stock-car, the combination of a water-trough on the side of and located partly outside of the wall of the car, a slanting board which extends from the wall of the car to the outer top edge of the trough, and a horizontal rail to serve as a hip-fender, as set forth.

254,950. STOP-ACTION FOR REED-ORGANS. BROOKS FRENCH, Fort Wayne, Ind. Filed Oct. 27, 1881. (No model.)

Claim.—1. In organs, the combination, with the stop-board A and the stop drawers F, provided with the wheels *c*, of the flaps G, hinged to the said boards and provided with the fixed arms *d*, projecting beneath the wheels of the said stop-drawers, substantially as and for the purpose set forth.

2. In organs, the combination, with drawer F and the block I, of the hinged flaps G, provided with the fixed arms *e*, the mutes H, provided with the rigid arms *f*, the pivoted arms *h*, and the connecting-rods *g*, substantially as and for the purpose set forth.

3. In organs, the combination, with the grooved post *b* and the stop-drawer F, of the link *a*, suspended from the said post and pivoted to the stop-drawer, substantially as and for the purpose set forth.



4. In organs, the combination, with the stop-board A and the hinged flaps G, provided with the fixed arms *e*, of the block I, provided with the pivoted arms *h*, and the means for connecting said arms to the mutes, substantially as shown and described, whereby the stop-board is adapted to be removed without disconnecting the several mutes, as set forth.

5. The adjustable arms *i*, combined with the flaps G and stop-drawers F, substantially as and for the purposes set forth.

6. In organs, the combination, with the stop-drawers F, provided with the wheels *c*, of the flaps G, provided with the rigid arms *d* and the adjustable arms *i*, substantially as and for the purpose set forth.

7. In organs, the combination, with the block D, the mutes H, provided with the arms *e* and the crank-wires *p*, of the lever I and the means for operating said lever, substantially as and for the purpose set forth.

254,951. PISTON-HEAD. HUGH D. GARRETT, Philadelphia, Pa. Filed June 24, 1881. (No model.)

Claim.—1. A piston-head provided with levers and supports, substantially as described, whereby the weight of the piston through said levers bears directly against the upper circumference of the packing-rings to expand the same in the upper part of the cylinder.

2. A solid piston-head provided with levers and supports, substantially as described, whereby the weight of the piston through said levers bears directly against the upper circumference of the packing-rings to expand the same in the upper part of the cylinder.

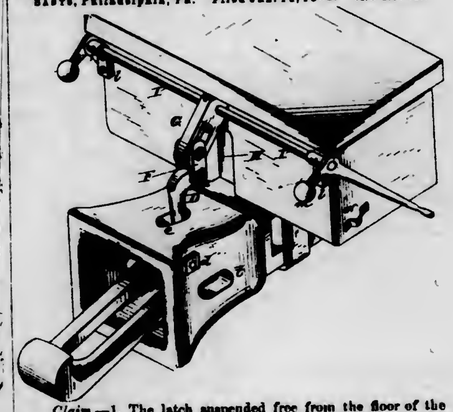
3. A piston-head provided with levers, supports, and centering device, substantially as described, whereby the piston is centered in the cylinder and the weight thereof utilized through said levers to bear directly against the upper circumference of the packing-rings to expand the same in the upper part of the cylinder.

4. A piston-head having a lever or levers fulcrumed in the lower portion of the piston and extending into the upper portion so as to rest against the packing at that point, with suitable bearings for the piston against the levers, whereby the weight of the piston is utilized to expand the packing, substantially as set forth.

5. In a solid piston-head, the combination of the levers B, bolts C, and openings G, substantially as and for the purpose specified.

254,952. PLOW. FERNANDO GAUTIER, Pascagoula, Miss. Filed Jan. 13, 1882. (No model.)

Brief.—The spoke-wheel, by its contact with the ground, revolves gearing, which rotates an eccentric which vibrates the cutting-plate, which makes a shear cut against both upper and lower jaws.

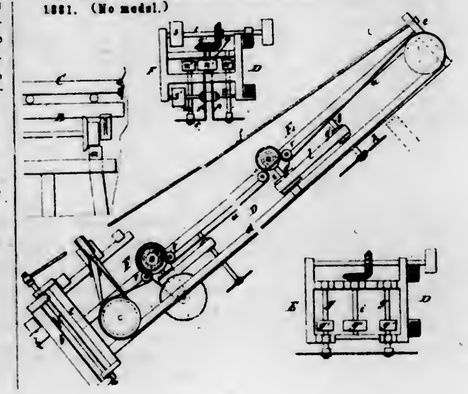


Claim.—1. In a plow, the combination, with the oscillating cutter G, of the stationary adjustable cutters E and F, substantially as shown and described, whereby the stationary cutters may be adjusted toward each other to take up wear and utilize the whole of their cutting-edge, as set forth.

2. In a plow, the beam A, having its forward end enlarged and provided with a vertically-flaring recess, in combination with the T-shaped clevis M, having a horizontal projection, P, substantially as shown and described, and for the purpose set forth.

3. In a plow, the combination of the beam A, having a deep longitudinal recess in its rear end, and the handles R, having standard Q, pivoted in said recess, and adapted for adjustment to a higher or lower position, substantially as shown and described, and for the purpose set forth.

254,953. CAR-COUPLING. DAVID H. GREEN and JOSEPH SAUPE, Philadelphia, Pa. Filed Jan. 14, 1882. (No model.)

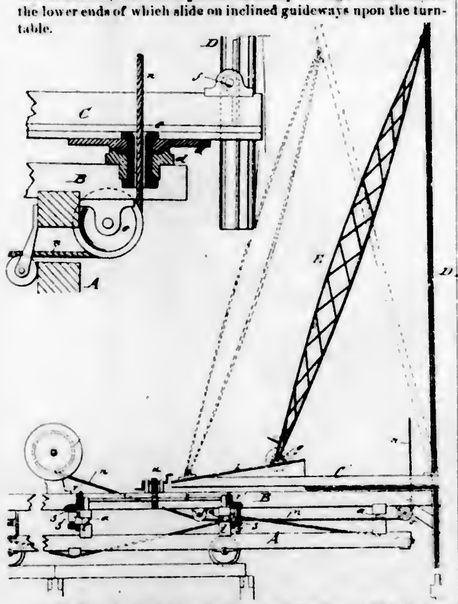


Claim.—1. The latch suspended free from the floor of the draw-head and balanced as described, so as to not rest with its entire weight upon the link, in combination with the vertically-supporting arm, the upper arm, and the swinging shackle connecting the said arms, having a loose bearing and sliding freely in a slot of said upper arm, substantially as described.

2. The combination of the side levers provided with counter-balance-weights at their upper inner ends, the sliding rod supporting said levers, the upper slotted arm, the lower vertical arm, their sliding connecting link or shackle, and the latch, substantially as described.

3. The combination of the vertical arm D, the swinging sliding link or shackle F, the arm G, provided with slot h, and the recess H, formed in the sill of the car to permit the swinging back of the first-named parts to their fullest extent.

4. In a car-coupling device, the link F, provided with bolt *x* and loose sleeve *w*, in combination with slotted arm G, and latch-arm D, substantially as described.



254,954. MACHINE FOR SAWING OFF AND TENONING PILES. ANDRUS L. GILBERT, Albany, N. Y. Filed Dec. 29, 1881. (No model.)

Claim.—The combination, with the adjustable platform C and swinging derrick D, of the saw-frames E F, carrying arbors, saws, and operative mechanism, whereby horizontally and vertically cutting saws may be successively brought to cut the piles, as described.

254,955. PILE-DRIVER. ANDRUS L. GILBERT, Albany, N. Y. Filed Dec. 29, 1881. (No model.)

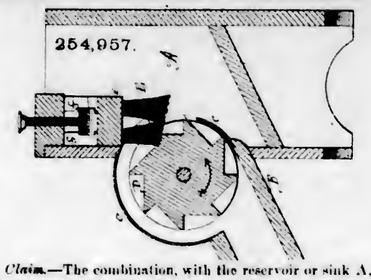
Brief.—The hammer is mounted upon a turn-table turning about a hollow pivot, through which the hammer-rope passes, said turn-table resting upon a laterally-adjustable platform upon a car-platform. The hammer-leaders are formed of T-irons, over which are riveted channel-bars, and they are pivoted to the front edge of the turn-table, and are adjusted vertically through brace-frames, the lower ends of which slide on inclined guideways upon the turn-table.

Claim.—1. In a pile-driver, the combination, with the turn-table C, the leaders D, and the brace-frame E, provided with the pivoted slide-blocks *g*, of the inclined ways A, substantially as shown and described, whereby a greater inclination of the leaders is obtained by a shorter movement of the blocks, as set forth.

2. In a pile-driver, the combination, with the turn-table C, the leaders D, and the brace-frame E, and the pivoted blocks *g*, of the inclined ways A, provided with racks *i*, the shaft *l*, the pinions *k*, and means for operating said shaft, substantially as and for the purpose set forth.

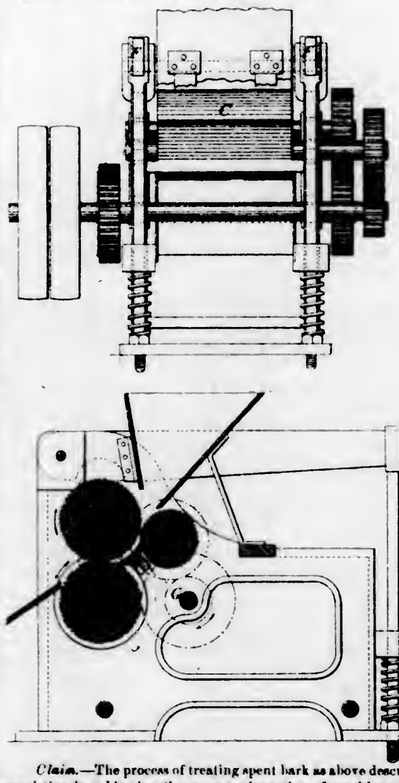
3. In a pile-driver, the turn-table C, carrying adjustable pivoted leaders, and sustained on a hollow pivot through which the hammer-rope passes, substantially as shown and described.

4. In a pile-driver, the combination of shaft *r*, bevel-gears *r'*, shafts *s*, pinions *s'*, and racks *t* with the platform B and car A, substantially as shown and described.



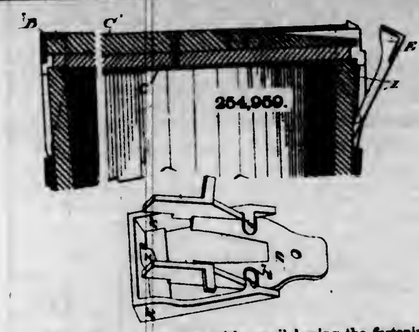
5. In a pile-driver, the leaders formed of T-plates *a'* and angle-plates *h'*, substantially as shown and described.

254,956. BUTTON-HOLE DEVICE FOR SUSPENDERS. BENJ. J. GUERLY, Boston, Mass. Filed Apr. 5, 1880. (No model.)



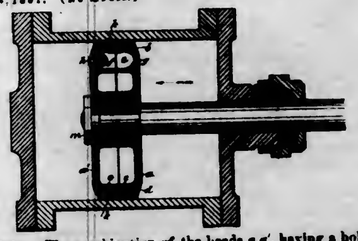
Claim.—The improved button-hole device above described, composed of the short cord *a*, having its ends brought together and each end encircled and compressed by the tubular portions 1 2 of clasp *b*, the clasp *b* being formed of one piece of metal with the two tubular portions 1 2, to receive and compress the ends of cord *a*, as described, and also with the attaching portion 3, by which the device is attached to the suspender, as set forth.

254,957. WHEAT-FEEDER. FRANK J. GROW, Alpha, Ind. Filed June 25, 1881. (Model.)



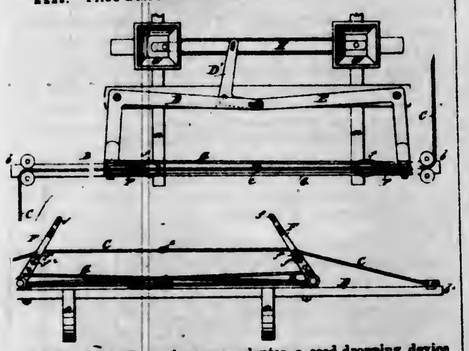
Claim.—The combination, with the reservoir or sink A, having side opening, *b*, of the discharge-spout having circular portion *c c* and flue *c'*, the grooved roller arranged in said circular portion, with its periphery projecting into said reservoir, and an adjustable brush arranged in said reservoir and engaging with the periphery of the roller, substantially in the manner as and for the purpose herein shown and described.

254,958. TREATING TAN-BARK, &c., TO RENDER THE SAME SUITABLE FOR USE IN MANUFACTURING PAPER. WILLIAM GOEST, Deptford, County of Kent, and CHARLES COURT, Rotherhithe, County of Surrey, England. Filed Jan. 14, 1882. (No model.) Patented in England June 18, 1881.



Claim.—The process of treating spent bark as above described, consisting in subjecting the same to the action of crushing-rollers to reduce the knots to a fibrous state, and then submitting the crushed material to agitation in a closed vessel under steam-pressure and in the presence of an alkaline solution, whereby the natural fibers of the bark are separated and converted into half-stuff in an economical manner and the tannic acid contained in the spent bark is extracted in a concentrated form.

254,959. BUTTER-PAIL EAR AND COVER-FASTENING. JOS. E. GUNN, Brooklyn, Pa. Filed Feb 23, 1881 (Model.)

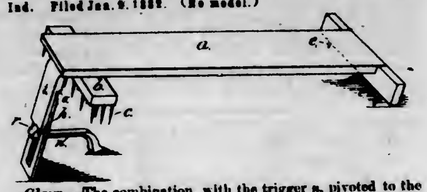


Claim.—The combination, with a pail having the fastening devices B, D, and E, of a cover provided with a cleat, C', one end of which fits in the ear B, while the other end is provided with a spring-latch, with which the bail E engages, substantially as set forth.

254,960. PISTON. JOHN C. HALL, Stephens City, Va. Filed Oct. 4, 1881. (No model.)

Claim.—The combination of the heads *a a'*, having a hollow space inclosed between them, a recess, *b*, formed in their adjacent peripheries, and provided with a groove, *i*, in its bottom, a ball-cage, *c*, communicating with the said recess and groove through the port *j*, and with opposite ends of the cylinder through ports *g* and *h*, the ball *f*, and the packing *k*, having its ends recessed and overlapped laterally, and provided with a lining, *l*, secured to one end and underlying the said joint, substantially as shown and described, and for the purposes set forth.

254,961. CHECK-ROW PLANTER. OLIVER L. HALL, Parsons, Kans. Filed Dec. 13, 1881. (No model.)



Claim.—1. In a check-row planter, a seed-dropping device composed of two horizontal crank-levers connected to a seed-dropping slide, and provided with vertical oscillating guide-arms and connecting-rods, and a knotted cord or wire, said parts being combined for operation substantially as specified.

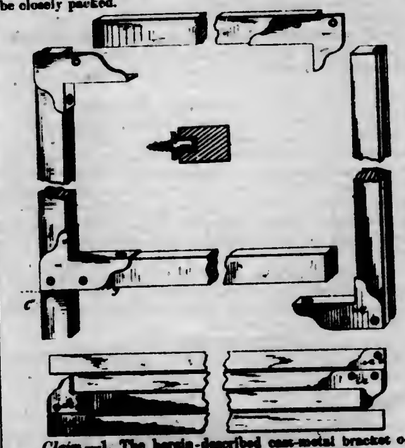
2. In a check-row planter, the combination of the bar B, having two sheaves at each end, the crank-levers D E D', pivoted together and connected to a seed-dropping slide, the guide-arms F, journaled to the said levers D E, and provided with loops *f*, and the connecting-rods G and the knotted cord C, substantially as shown and described.

254,962. TANNING. JOHN W. HAMMOND, Osceola, Pa. Filed Dec. 29, 1881. (No specimens.)

Claim.—The improvement in the art of tanning hides and skins, which consists in first subjecting them to submersion in a liquor consisting solely of saltpeter and water, substantially as and for the purpose set forth.

254,963. MOLE-TRAP. WILLIAM S. HARMON, Owensville, Ind. Filed Jan. 9, 1882. (No model.)

Claim.—The combination, with the trigger *a*, pivoted to the bar A, and the bar *i*, supported on the top of the bar A by a notch near its upper end and retained in position by the trigger *a*, of the fall *a*, the armed end of which rests upon the top of *i*, substantially as described.



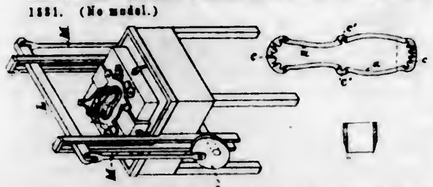
254,964. PLASTIC COMPOUND. BRUNO HARRASS, Schlan, near Gross Breitenbach, Schwarzburg-Rudelstadt, Germany. Filed Aug. 2, 1881. (Specimens.)

Claim.—1. The herein-described composition for making imitation wood objects, consisting of cellulose, starch, flour, and a small quantity of sawdust, in the proportions stated, substantially as described.

2. The herein-described composition for the first layer on the veneer in making imitation or artificial wood objects, consisting of from two to ten parts of cellulose, six to thirty parts of sawdust, one to five parts of binding material—such as dextrine, albumen, &c.—one to five parts of flour, and one-eighth to two parts of pipe-clay, chalk, &c., as set forth.

254,965. WINDOW-SCREEN. HENRY C. HART, Detroit, Mich. Filed Dec. 5, 1881. (No model.)

Brief.—Screws formed with a notched head and oblong in cross-section are placed on the sides of the screen and slide in grooves of a frame. The screen-frame consists of pairs of bars of different length, their joints covered by metallic corner-pieces consisting of a face-plate formed with an angular flange having a long side and a short side of such shape that the bars and plates may be closely packed.

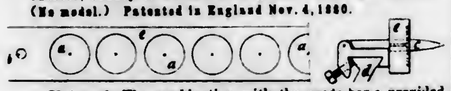


Claim.—1. The herein-described cast-metal bracket or corner-piece for a screen-frame, consisting of a solid face-plate, B, adapted to conceal the frame-joint, with the angular flange C, having a plane outer surface, and formed with a long side, *c'*, and a short side, *c²*, both arranged and adapted in length with relation to each other and to the face-plate, so that the distance between the corner of the flange and the outer end of its long side is equal, or nearly so, to the distance between the outer end of the short side of the flange and the outer edge, *c²*, of the face-plate, whereby the frame-bars, with these brackets attached, can be closely packed together, as specified.

2. The screw, in combination with the grooved side of a screen-frame, said screw being formed with a notched head made oblong in cross-section, and having a flange at its junction with the screw-threaded shank, substantially as described.

3. The combination, in a screen-frame, of the four bars in pairs of different length with the herein-described cast-metal brackets or corner-pieces, one attached to each bar, and each of said brackets consisting of a face-plate, B, with the angular flange C, having a plane outer surface formed with a long side, c', and a short side, c^2, both adapted in length so that the distance between the corner of the flange and the outer end of the long side is equal, or nearly so, to the distance between the outer end of the short side and the outer edge, c^3, of the face-plate, whereby these bars, with brackets attached, can be closely packed, in the manner and for the purpose specified.

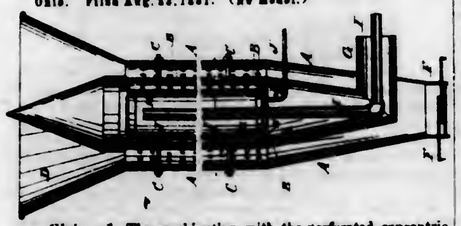
254,966. METHOD OF AND MEANS FOR LASTING BOOTS AND SHOES. GILBERT HAWES, Lynn, Mass. Filed Mar. 31, 1881. (No model.)



Claim.—1. The herein-described method of lasting a boot or a shoe, consisting in first drawing the upper over a last to which the inner sole has been previously applied, then cutting notches in the turned-over edges of the upper, next applying to the surface of the inner sole and turned-over portions of the upper a binding-strip coated with a fusible cement, and finally subjecting the whole to pressure under heat, sufficient to melt the cement, and thereby unite the parts, all in one continuous operation, substantially as specified.

2. In a lasting-machine, the combination of a last, a die having a continuous cutting-edge provided with scallops c c at the heel and toe and scallops c' c' at the sides, and suitable mechanism for operating said die, whereby notches are cut in the edges of the upper at the sides, heel, and toe, substantially as set forth.

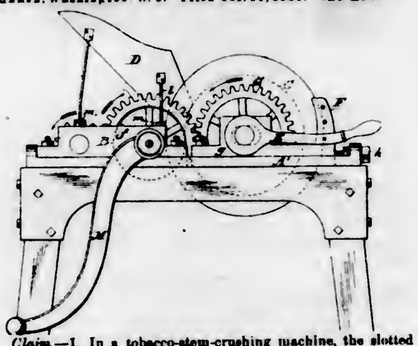
3. In a lasting-machine, the combination, with a last, F, having yielding surfaces f f and a holder, B, for the attachment of a cutting or pressing tool, of the beam L, rods M M, eccentrics O O, and suitable supporting and operating mechanism, substantially as shown and described.



254,967. EMBROIDERING-MACHINE. ALFRED HEAVER, Manchester, County of Lancaster, England. Filed Oct. 1, 1881. (No model.) Patented in England Nov. 4, 1880.

Claim.—1. The combination, with the guide-bar e, provided with the recesses a, and the end apertures, b, of the pins c, hinged to the carriage d, which carries the needle-holders, and adapted to enter the apertures b of the said guide-bar, whereby a series of figures is adapted to be held in alignment with and to be placed automatically upon the needles, substantially as herein shown and described.

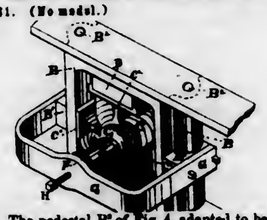
2. An improved device for placing the figures upon the needles of an embroidering-machine, consisting of the guide-bar e, provided with a series of recesses, a, having central apertures, substantially as shown and described.



254,968. GRAIN-DRIER. HENRY R. HOPPNER, Circleville, Ohio. Filed Aug. 23, 1881. (No model.)

Claim.—1. The combination, with the perforated concentric cylinders A B, of the air-pipe G, inner cylinder, H, and the steam-supply pipe I, the latter passing through the air-pipe, entering the lower end of cylinder H, and extending nearly to its upper end, as and for the purpose specified.

2. In a grain-drier, the combination, with the outer cylinder, A, of the two slides F F, concave at the inner ends and overlapping each other, as and for the purpose specified.



254,969. TOBACCO-STEM-CRUSHING MACHINE. CHARLES HENZE, Washington D. C. Filed Oct. 11, 1881. (No model.)

Claim.—1. In a tobacco-stem-crushing machine, the slotted journal-boxes g, provided with projections F and the eccentric adjusting-levers E, in combination with crushing-rollers, substantially as and for the purpose set forth.

2. In a tobacco-stem-crushing machine, the combination of the plain and flanged rollers B C, arranged side by side in a horizontal, or nearly horizontal, plane with the feed-box D, fitting between the flanges of one of the rollers, arranged as shown, and for the purpose set forth.

254,970. PEDESTAL, BOX, AND BEARING FOR AXLES, SHAFTS, AND SPINDLES. THOS. F. HENNICH, Reading, Pa., assignor of one-half to John G. Kalbach, same place. Filed Aug. 27, 1881. (No model.)

Claim.—1. The pedestal B' of Fig. 4, adapted to be used as a car-truck pedestal, and in combination therewith a yoke, G', cast with and forming an integral part of the jaws thereof, and having a set-bolt, H, substantially as shown, and for the purpose described.

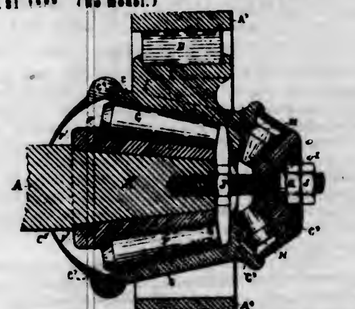
2. The combination of pedestal B' of Fig. 4 with an anti-friction axle-box case, C, by the sliding lugs C', seat C', and spring D, and with the yoke G' by seat C', spring E, cap F, and set-bolt H, substantially as shown, and for the purpose set forth.

3. The axle-box case or seating C, provided with interior chilled wearing-surface, exterior lug-slides, C', vertical spring-seat C', end-thrust spring-seat C', cap C', ears C', opening in cap C', and dirt-discharge C', substantially as shown, and for the purpose specified.

4. The chilled bearing-shell L, provided with head or collar M, its interior adapted, by casting upon a mandrel within a chill, to be fitted upon the end A' of the axle, shaft, or spindle A, and to be retained upon the end of the same by the set-bolt A', substantially as shown, and for the purpose described.

5. The chilled anti-friction rollers K, adapted, by a bevel-chamfer at their base, to contact with the head or collar M of the shell-bearing L, the rollers being so arranged and combined with the case C and shell-bearing L that the thrust or weight of the axle, shaft, or spindle A shall be distributed upon the collar M, the chilled bed of the case C, and the roller guide-ledge K' at truncated end of the case, substantially as described, and for the purpose specified.

6. The combination of case C with the anti-friction rollers K, shell-bearing L, axle, shaft, or spindle A, and pedestal B', substantially as described, shown, and for the purpose specified.



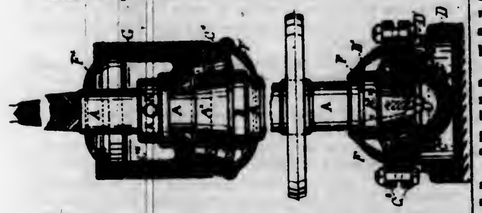
7. The combination of the chilled friction-rollers K with the chilled surface of the case C, and of the chilled shell-bearing L upon the axle, shaft, or spindle A, substantially as shown, and for the purpose described.

8. The combination of the chilled shell-bearing L, having the head M, with the axle, shaft, or spindle A by the reduced portion A', and with the interior chilled surface of the case C by the chilled anti-friction rollers K, substantially as shown, and for the purpose specified.

9. The drum-support N, cut away to form feet B, in combination with the case C, as adapted for a step to a vertical shaft or spindle, A, substantially as shown, and for the purpose set forth.

10. In combination with a vertical shaft or spindle, A, the case C, supported upon the drum N, cast therewith or bolted thereto, and having its interior surface chilled and filled with chilled anti-friction roller K, forming a seat and bearing for the toe L of the spindle A, the toe L being a chilled or case-hardened casting secured to the spindle or shaft by the set-bolt A', substantially as described, shown, and for the purpose specified.

254,971. CAR-AXLE BOX. THOMAS F. HENNICH, Reading, Pa., assignor of one-half to John G. Kalbach, same place. Filed Jan. 31, 1880. (No model.)



Claim.—1. In an anti-friction car-axle box, as described, the ledge or seat C', formed at the apex of the shell C as a bed for the rollers H, in combination with the fixed or loose cap C' and the bolt A', and nuts J K and washer I, substantially as shown, and for the purpose set forth.

2. In combination with an anti-friction-roller axle-box, C, the cap C', constructed, as shown and described, with a roller-bearing on its inner face, and adapted to be either fixed and revolving with the axle A and bolt A' or fitted to revolve independently upon the said bolt and in combination with the rollers H, substantially as and for the purpose described.

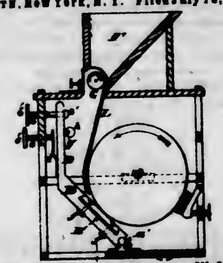
3. In combination with an anti-friction-roller axle-box, as described, the secondary or thrust anti-friction rollers H, constructed as shown, placed between the seat or ledge C' and the cap C', and secured in working-contact therewith by the bolt A', nuts J K, and washer I, whereby the end-thrust upon the axle is taken up and the bearing made positive upon the journal, substantially as shown, and for the purpose specified.

254,972. STEP AND BUSH FOR SPINDLES, &c. THOMAS F. HENNICH, Reading, Pa., assignor of one-half to John G. Kalbach, same place. Filed Nov. 10, 1881. (No model.)

Claim.—1. In combination with a shaft or spindle, A, provided with an anti-friction toe-collar, B', anti-friction rollers E, the case or shell C, provided with a hemispherical base, C', and abutments C', cap F, and internal bed adapted to receive the anti-friction rollers E, the bridge-tree-plate ring, and the screws D', substantially as shown, and for the purpose set forth.

2. The bridge-tree plate D, having a circular rim and ears D' and set-screws D', in combination with a spherical shell-step, C, having abutments C', rollers E, and toe B', of a spindle or shaft A, substantially as shown, and for the purpose described.

3. The exterior mill-bush shell, G, constructed as described, having wings G', cap F', and guide entrances or grooves H, in combination with the interior mill-bush, C', having feathers L, rollers E, collar B, and spindle A, substantially as and for the purpose hereinbefore set forth.



4. The interior mill-bush, C', provided with feathers L and an internal conoidal bed, the anti-friction rollers E, and cap F', in combination with the collar B, collar K, spindle A, and outer bush, G, having guide-entrances H, substantially as shown, and for the purpose described.

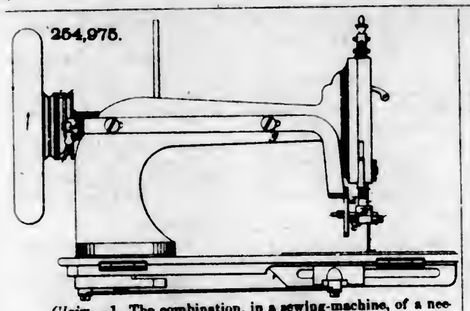
254,973. KITCHEN-RANGE BOILER. THEODOR HOPE, New York, N. Y. Filed Nov. 14, 1881. (No model.)

Claim.—A range-boiler consisting of a sheet-metal body with a suitable top and a sheet-metal bottom having a vertical downward flange adapted to fit the interior of the body, and an outward and upward return-flange of less depth than the downward flange overlapping the lower edge of the body, the downward flange being riveted to the body above the return-flange and the return-flange being calked to the body below the rivets, substantially as described.

254,974. MACHINE FOR REDUCING GRAIN, &c. JOHN HOLLINGSWORTH, New York, N. Y. Filed July 15, 1881. (No model.)

Claim.—1. The combination, in a mill for reducing grain or other substances, of a reducing-roll, a beam, D, carrying a resisting-bed, E, a spring, d, a tension-regulating screw, e, and an adjustable stop-bolt, all substantially as and for the purpose herein set forth.

2. The combination, in a mill for reducing grain or other substances, of a reducing-roll, a beam, D, carrying a resisting-bed, E, a spring, d, a tension-regulating screw, e, an adjustable stop-bolt, and an apron, L, for directing the grain or other substance between the bed E and the reducing-roll, all substantially as and for the purpose herein set forth.



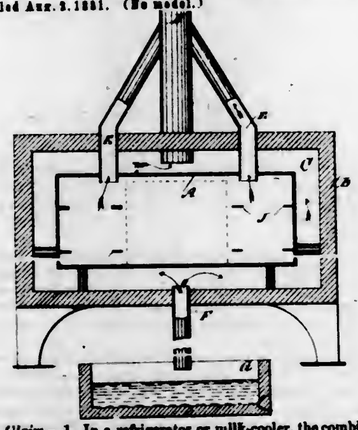
3. The combination, in a mill for reducing grain and other substances, of the series of supporting-beams D, pivoted at their lower ends and adjustable at their upper ends, the stop bolts or screws e, arranged to limit the inward movement of the beams D, the series of resisting-beds E, supported by the said beams, and the reducing-roller composed of parts or sections having surfaces of substantially-different character, all substantially as and for the purpose herein set forth.

4. The combination, in a mill for reducing grain or other substances, of the series of supporting-beams D, carrying the series of resisting-beds E, the springs d, tension-regulating screws e, stop bolts or screws e, and a reducing-roll composed of two or more parts or sections having surfaces of substantially-different character all substantially as and for the purpose herein set forth.

5. The combination, in a mill for reducing grain or other substances, of a cam or equivalent actuating device with the pivoted supporting-beams D, carrying the series of resisting-beds E, a reducing-roller composed of parts or sections having surfaces of substantially-different character, and the springs for holding the beams D and resisting-beds E toward the reducing-roller, all substantially as and for the purpose herein set forth.

254,975. SEWING-MACHINE. CHARLES E. L. HOLMES, New York, N. Y. Filed Feb. 14, 1881. (No model.) Patented in England Mar. 17, 1880, in France Mar. 17, 1880, in Belgium Mar. 16, 1880, and in Germany Mar. 25, 1880.

254,975.



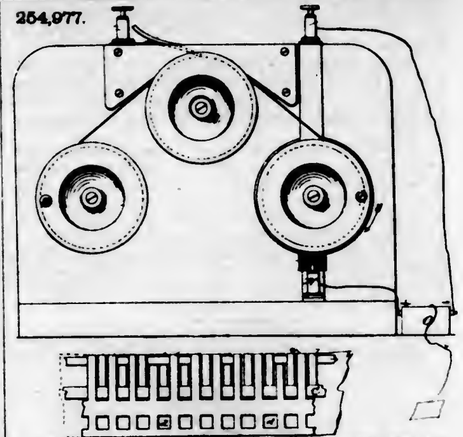
Claim.—1. The combination, in a sewing-machine, of a needle-bar sliding in stationary bearings and extending through and below the head, a needle-carrier sliding on said bar, a cam, and a rigid bar connected to said carrier beneath the head, and interposed between the cam and carrier and serving as a means of communicating motion directly from one to the other, substantially as set forth.

2. The combination of the slotted needle-bar carrier holding a needle in line with the needle-bar and extending through said slot, and appliances, substantially as described, for reciprocating the carrier.

3. The combination, with the needle of a sewing-machine, of a metal head or carrier cast upon the same and adapted to a socket in the part to which it is to be attached, and to guide the needle sliding in said socket, substantially as set forth.

4. The combination of the needle-bar having a transverse socket, open at the under side, formed directly in said bar, as specified, and a needle-carrier adapted to said socket, and appliances, substantially as described, for reciprocating said carrier.

254,976. REFRIGERATOR. GUSTUS H. HUNT, Kiowa, Kans. Filed Aug. 3, 1881. (No model.)



Claim.—1. In a refrigerator or milk-cooler, the combination, with the interior box, A, and the larger exterior box, B, of the draft-pipe D, leading from the exterior box, B, and the branch pipes E E, leading from the interior box, A, into the draft-pipe D, substantially as herein shown and described, and for the purpose set forth.

2. In a refrigerator or milk-cooler, the combination, with the interior box, A, and the exterior box, B, of the draft-pipe D, the branch pipes E E of the same, the pipe F, and the tank G, substantially as herein shown and described, and for the purpose set forth.

254,977. AUTOMATIC TELEGRAPHIC TRANSMITTER. E. L. HUTCHINSON, New York, N.Y. Filed May 18, 1881. (Model.)

Brief.—A message-strip is prepared by weaving a non-conducting strip between the alternate tongues of two conducting-strips, the dots and dashes being dependent upon the relative position of the tongues as to the non-conducting strip. The conducting-strips are insulated from each other, but connected respectively to opposite poles of the transmitting-battery and to ground. If no non-conducting strip were woven in, the stylus would send to line alternate impulses as the transmitting-drum advanced.

254,977.

Claim.—1. A transmitting-fillet for telegraphic purposes, consisting of a series of adjustable conductors connected with a common conductor, but separated from each other by intervening spaces, substantially as described, and for the purpose set forth.

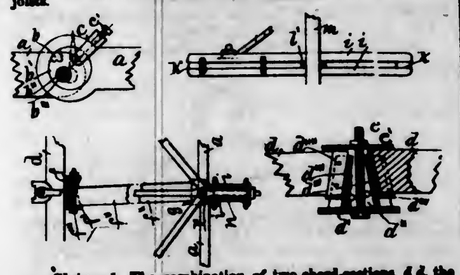
2. A transmitting-fillet for telegraph purposes, consisting of a band or strip of conducting material secured upon a band of non-conducting material, and having projections or tongues separated from each other by intervening spaces and adjustable for arrangement in or out of line with each other, for the purpose of touching or not touching a style under which the fillet is drawn, essentially as described.

3. A flexible transmitting-fillet for telegraphic purposes, consisting of two flexible metallic strips, each having laterally-projecting tongues equally separated by intervening spaces, said strips being secured to a common flexible non-conducting band, with the tongues of one of said metallic strips arranged between those of the other, and means for adjusting the various tongues in or out of line with each other, so that only such as desired may come in contact with a style under which the fillet is drawn.

4. In a transmitting-fillet for telegraphic purposes, the combination, with the two tongued metallic strips and flexible non-conducting base-strip, substantially as described, of the composing-tape arranged to be interwoven between the tongues of said strips, essentially as and for the purpose set forth.

5. In an automatic telegraph transmitting apparatus, the combination, with the transmitting-fillet having the two metallic parts, constructed and adapted for arrangement substantially as described, of the supporting or transmitting drum, the fillet-moving drums, one of which is provided with means for connecting the separate metallic parts of the strips with the opposite poles of the battery, respectively, and a suitable style arranged to come in contact with the fillet in its movements, essentially as set forth.

6. In an automatic telegraphic transmitting apparatus, the combination, with a metallic transmitting-fillet, constructed, substantially as described, of the two reels for supporting and moving said fillet, one end of said fillet being electrically connected to a battery by means of intermediate connecting devices operated by one of the drums, the intermediate drum for guiding the same, and the style arranged adjacent to said intermediate drum, substantially as described.



7. The transmitting-fillet composed of a flexible non-metallic strip, a series of separated conducting plates or pieces secured to said strip, and means for preventing each of said plates or pieces as desired from coming in electrical contact with a style in mechanical contact with which the fillet is drawn.

8. The combination, in an automatic transmitting-fillet for telegraphic purposes, of adjustable contact plates or tongues, with a flexible non-conducting base or band, to which the tongues are attached, and which projects as far as the ends of the adjustable tongues for the purpose of protecting said tongues, substantially as described.

254,978. TRUSS-BRIDGE. WILLIAM IRELAN, Oak Springs, assignor of one-half to C. W. Bowen, Centerville, Iowa. Filed Aug. 12, 1881. (No model.)

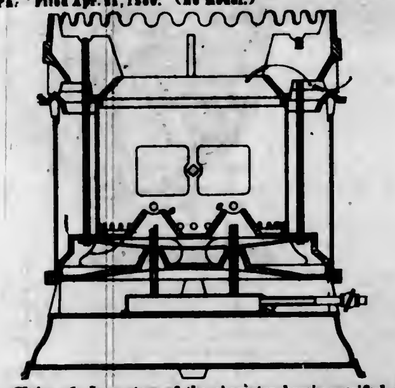
Brief.—A hollow wedge-shaped box with pockets on opposite sides to receive cased ends of chord-sections and a bolt to adjust the parts; an eccentric on a pin as an adjustable connection of

tension-chords and means for adjusting and holding it; counterpart wedges for adjusting posts to chords and braces; girders of channel-iron spaced by blocks, which also serve as sockets for floor-joists.

Claim.—1. The combination of two chord-sections, *d d*, the one having a simple perforation in its end and the other having a circular opening, *b*, adapted to receive a corresponding disk, the disk *b'*, having a perforation in an eccentric position, the bifurcated and pivoted block *c*, the clamping-screw *d'*, and a coupling or bolt, *b''*, substantially as shown and described, for the purposes specified.

2. A keystone-coupling consisting of a metal casting, *d'*, that has a central vertical perforation for the admission of a screw-bolt, side walls, *d''*, vertical and converging connecting-walls *d'''*, and open pockets adapted to receive sockets of corresponding size and shape, to connect the ends of timbers in a bridge, substantially as and for the purposes set forth.

3. The combination of the sliding keystone-coupling *d' d'' d'''*, the sockets *d'''*, the stay-timbers *d d*, the bolt *c*, and washer-plate *c'*, substantially as shown and described, for the purposes specified.

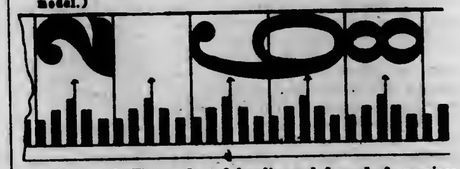


4. The flanged plate *f*, having an outside surface adapted to engage a piece of timber and an inside wedge-shaped surface, and a sliding shoe, *f'*, having a wedge-shaped outside surface, in combination with a rigid stay-piece, *f''*, substantially as shown and described, for the purposes specified.

5. The combination of a pivoted foot-plate, *g g' g''*, a detachable stay, *f''*, having a wedge-shaped sliding shoe, *f'*, on its free end, and a fixed wedge-shaped plate, *f*, substantially as shown and described, for the purposes specified.

6. The flooring joist or rail *m*, in combination with the stay-block *l*, having lugs *l'*, and the skeleton-girder *i i k k*, substantially as shown and described, for the purpose specified.

7. In a truss-bridge, the combination of a lower chord composed of sections flexibly connected, and having a tension and equalizing device, *b b' b'' b''' c c'*, an upper chord composed of detachable timbers *d*, and having a keystone-coupling and adjusting device *d' d'' d c c'*, a series of skeleton-girders *i i k l*, coupling-bolts *s* and *r*, pivoted foot-plates *g g' g''*, and detachable stays and tension-rods, substantially as shown and described, for the purposes specified.

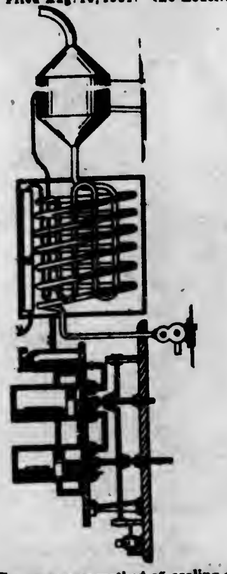


254,979. LAMP OR GAS STOVE. JOHN M. IRWIN, Horton, Pa. Filed Apr. 21, 1880. (No model.)

Claim.—1. In a stove of the character herein specified, the burner or burners for gaseous fuel, consisting of a continuous close-walled conduit or conduits, provided with inlet and outlet for the gas, said outlet being located below the top of the air-deflectors or burner-cones, substantially as shown and described.

2. In a stove of the character herein specified, the burners for gaseous fuel, constructed substantially as shown, and provided with an inlet for gas at bottom, and tight burner-tips or conduits leading therefrom, terminating at a point below the top of the burner-cones or air-deflectors, substantially as shown and described.

254,980. SURVEYOR'S SELF-READING LEVEL-ROD. THOS. H. JACKSON, Clarksburg, W. Va. Filed Nov. 10, 1881. (No model.)



Claim.—1. The graduated leveling-rod formed of one piece having one straight edge, one flat graduated face, a swelled edge, and a swelled back, for the purpose described.

2. A leveling-rod to be used upright, having graduated marks transversely across its face, indicating feet and tenths of a foot, the feet being designated by figures two-tenths of a foot in length, and the even tenths by figures only one-tenth of a foot in length, the long and short bars of different colors indicating hundredths of a foot, and arrow-heads applied to the longest bars indicating the exact center of each tenth of a foot, the whole being arranged as shown and described.

3. A leveling-rod having a beveled straight edge, *a*, the graduating-marks extended only to the inner angle of the said bevel, the swelled back, and swelled right-hand edge, substantially as described.

254,981. AIR-COOLING APPARATUS. RALPH S. JENNINGS, Baltimore, Md. Filed Aug. 19, 1881. (No model.)

Claim.—1. The process or method of cooling air for apartments or buildings by means of a cooling agent, which consists in compressing the air and then expanding it so as to surround and cool a different current of air on its way to the apartment, substantially as described.

2. The method or process of cooling air for apartments or buildings by a cooling agent, which consists in compressing the air and then expanding it so as to cool a body of water and a different current of air on its way to the apartment.

3. The method or process of cooling and purifying air for apartments and similar purposes, which consists, first, in compressing air; second, expanding it in a chamber; third, passing water through the air-expanding chamber, so as to be cooled for saturating or wetting fibrous material in an air-cooling chamber; fourth, in passing currents of different air through a pipe within

an air-expanding chamber; and, finally, in passing the same

pinion *k*, and its system of levers *q q' q² q³*, and the grooved weight

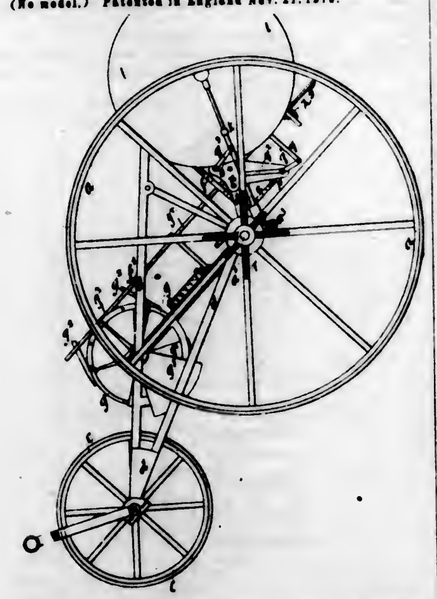
254,982. PENCIL-SHARPENER. FRANZ F. KULLRICH, Berlin.

254,982

an air-expanding chamber; and, finally, in passing the same through an air-cooling chamber for further cooling and purification, substantially as described.

4. In combination with a means for compressing air, a refrigerating-chamber through which passes the supply of air, which is cooled without coming in direct contact with the expanded air, substantially as described.

5. The combination, in an apparatus for cooling air, of one or more air-compressing cylinders and an air-expanding chamber for acting upon the water on its way to an air-cooling chamber, substantially as described.



6. The combination, in an apparatus for cooling air, of one or more air-compressing cylinders, an air-reservoir, and an air-expanding chamber for acting upon the water on its way to an air-cooling chamber, substantially as described.

7. The combination, in an apparatus for cooling air, of one or more air-compressing cylinders, an air-reservoir, and an air-expanding chamber for acting upon the water and air on their way to an air-cooling chamber, substantially as described.

8. In combination with an air-compressing apparatus, an air-expanding chamber provided with coils of pipe, and a water box or pan, substantially as described, and for the purpose set forth.

9. The apparatus for cooling and purifying air, consisting of one or more air-compressing cylinders, an air-reservoir, an air-expanding chamber having arranged therein a water box or pan, an air-cooling pipe, and an air cooling and purifying chamber, said parts being connected together for operation substantially as described.

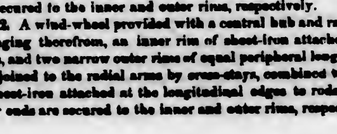
254,982. GRADE-RECORDING INSTRUMENT. ALEXANDER MADDOX RYNER-JONES, London, England. Filed Aug. 23, 1881. (No model.) Patented in England Nov. 21, 1879.

Claim.—1. A self recording and registering level for making sections for railway and other surveys in which the operating devices for recording are actuated primarily from a suspended and weighted wheel hung on a pivoted framing, *d*, and provided with horns or arms for giving motion to a sliding rod, substantially as shown and described.

2. In a recording and registering level for the purpose set forth, the combination of the following devices: a carriage one of whose wheels is a prime motor, the wheel *c*, framing *d*, axle *c'*, worm-wheel a^2, pinions a^2 and *k*, friction-plate *l*, weight *m*, and its described connections, surface-wheel *e*, and lever-motor *f*, the combination operating substantially as set forth.

3. In combination, the suspended and weighted wheel *g* and its curved horns, the vertical wheel or level-motor connected with such wheel, and the horizontal friction-plate, substantially as and for the purpose set forth.

4. In combination, the vertical friction-plate *l*, the friction-pinion *k*, and its system of levers *q q' q² q³*, and the grooved weight *m m'*, for adjusting the speed of the paper to receive the tracings of the level, substantially as set forth.



254,983. CURTAIN-HOOK PIN. HUBERT L. JUDD, Brooklyn, N. Y. Filed Jan. 16, 1882. (No model.)

Brief.—Where the wire is bent to form the hook it is held firmly by a metal clamp.

Claim.—In a curtain hook and pin made of one piece of wire, the combination, with the shield-pin and curtain-hook, of a metal clamp surrounding the wire at the junction of the hook and body of the shield-pin, substantially as specified.

254,984. CAR-COUPLING. LEANDER KISE, Georgetown, Ohio. Filed Jan. 7, 1882. (No model.)

Claim.—1. The combination, with the sliding rod K and the coupling-pin G, of the bent and slotted lever H, the bent strap N, secured to the said slide-rod, and provided with the yoke *e*, and the pin *f*, substantially as and for the purpose set forth.

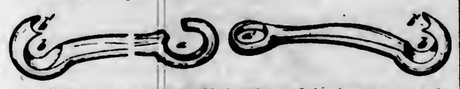
2. The combination, with the sliding rod K and the coupling-pin G, of the bent and slotted lever H, the bent strap N, secured to the sliding rod, and provided with yoke *e*, the pin *f*, and the curved guide *d*, substantially as and for the purpose set forth.

3. The combination, with the sliding rod K, provided with lugs *g*, of the slotted boxes L, provided with the shoulders *h*, substantially as herein shown and described, whereby the lugs on the rod are made to register with the slots of the boxes, as set forth.

254,985. WIND-WHEEL. ROBERT G. KIRKWOOD, Ellicott City, Md. Filed Aug. 3, 1881. (No model.)

Claim.—1. A wind-wheel provided with sheet-metal inner and outer rims supported upon radial arms which spring from a central hub, combined with sheet-metal vanes supported at their longitudinal edges by straining-rods, which at their extremities are secured to the inner and outer rims, respectively.

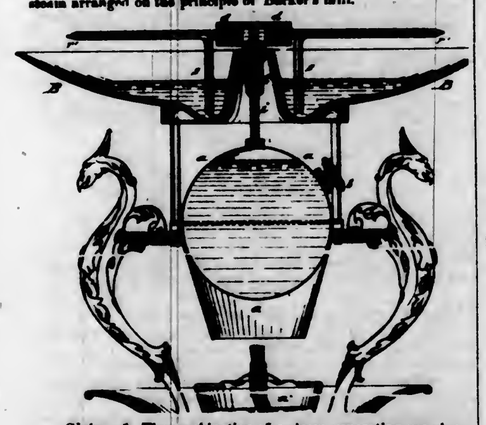
2. A wind-wheel provided with a central hub and radial arms springing therefrom, an inner rim of sheet-iron attached to said arms, and two narrow outer rims of equal peripheral length, united and joined to the radial arms by cross-stays, combined with vanes of sheet-iron attached at the longitudinal edges to rods which at their ends are secured to the inner and outer rims, respectively.



254,986. PENCIL-SHARPENER. FRANZ F. KULLRICH, Berlin, Germany. Filed Feb. 25, 1881. (No model.)

Claim.—1. A pencil-sharpener made substantially as herein shown and described, and consisting of two roughened convex plates attached to each other at one end by a hinge or band-spring, as set forth.

2. In a pencil-sharpener, the combination, with the plates A A, connected by a hinge or spring, of the roughened convex plates C C and the strips D, of cloth or analogous material, substantially as herein shown and described, and for the purpose set forth.



254,987. BRIDLE-BIT. GEO. J. LUTCHWORTH, Buffalo, N. Y. Filed Oct. 8, 1881. (No model.)

Claim.—A cast bit provided with eyes *b*, having concave ends *b'*, closed against the convex body of the bit, substantially as set forth.

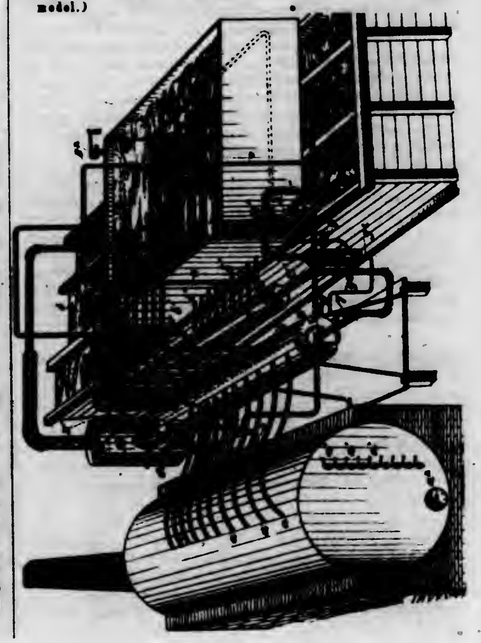
254,988. ATOMIZER. PAUL LOCHMANN, Schkeuditz, Prussia, Germany. Filed Dec. 19, 1881. (No model.)

Brief.—The atomizing-tubes are forced to rotate by a jet of steam arranged on the principle of Barker's mill.

Claim.—1. The combination of a steam-generating vessel, *a*, having a connecting-tube, *i*, a basin, B, for the liquid to be atomized, radial steam-tubes *r r*, communicating with the tube *i*, and suction-tubes *s*, the latter extending from the basin to the nozzles of the steam-tubes, substantially as set forth.

2. The combination of a steam-generating vessel, *a*, an upright connecting-tube, *i*, having a top bearing and openings below the same, a coupling-sleeve, *d b'*, radial steam-tubes *r r'*, secured to the sleeve, and suction-tubes *s*, extending from the basin to the nozzles of the steam-tubes *r r'*, substantially as set forth.

254,989. FISH-TRAP. MAJOR B. MARSHALL, Vienna, Md. Filed Jan. 16, 1882. (No model.)



Claim.—1. The combination, with the stationary poles *a* and runner-poles *h*, each provided with a hole, *m*, near its lower end, of the spear-head-shaped net *k*, closed at its sides and bottom, and having cords *l* at the angles of its bottom, substantially as described, and for the purpose set forth.

2. The combination, with the spear-head-shaped net *k*, provided with the opening *k'*, and secured to the stationary and runner poles *a h*, of oblong figure *c*, inclosed by nets *n n'*, and provided with the opening *c e*, funnel *p*, opening into the oblong figure *c* and spear-head, oblong figure *d*, concentric with the figure *c*, open at both ends, inclosed by the net *r*, and provided with the opening *d'*, and net *a*, extending from the opening *d'* to the bank, and secured to the stationary and runner poles *a h*, substantially as described, and for the purpose set forth.

254,989.

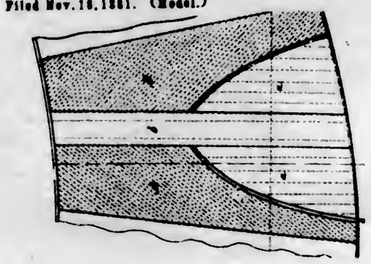
254,990. PROCESS OF AND APPARATUS FOR DISTILLING OIL. JOHN H. MARTIN, Oil City, Pa. Filed Aug. 14, 1880. (No model.)

Claim.—1. The improvement in the process of distilling oil, which consists in separating the primary distillate from the still into oil and vapor, partially or wholly condensing such vapor, then separating the resulting condensed products into oil and light vapor by subjecting them to the action of the primary hot vapor distillate, and finally conducting away and condensing separately the light and heavy products.

2. The combination of a still having a series of goose-neck pipes, *a*, a primary separator, B, receiving said pipes *a*, and provided with escape-pipes *b*, connected with a condenser and a secondary separator, D, placed within the first and connecting conduits between the condenser and such secondary separator, said separator being heated by the vapors surrounding it, substantially as and for the purposes described.

3. The combination of a still, a primary separator connected therewith by pipes, and provided with escape-pipes passing through a condenser and connected with a secondary separator placed within the first, and having its escape-pipe leading into a drum, with a steam-pipe placed within the primary separator and having its escape opening into said drum, substantially as and for the purpose described.

254,991. PORTABLE SWING. GEORGE W. MASON, Washington, D. C. Filed Feb. 7, 1882. (No model.)



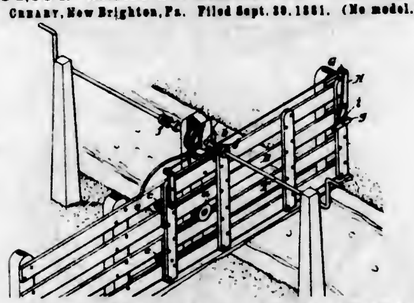
Claim.—1. A portable swing having a base, and permanently attached thereto outwardly-inclined standards, from which the swing is suspended, substantially as described.

2. A swing-frame consisting of a suitable base and standards adapted to sustain the weight of the swing without the use of a connecting-bar or stay above the point at which the swing is attached to the standards, substantially as described.

3. A portable swing having a base and provided with standards inclined outward from a perpendicular line with the base, in combination with a swing attached to the upper ends of said standards, as and for the purpose set forth.

4. A portable swing having a base and provided with standards, in combination with the arms or supports to which the seat of the swing is attached, said arms being adapted to sustain a weight in a line inside of the point at which they are attached to the standards, thereby dispensing with the use of a cross-bar or stay above the swing.

254,992. CORSET. WILLIAM MCCABE, New Haven, Conn. Filed Nov. 19, 1881. (Model.)



Claim.—A corset having the hip-section composed of a stayed body, combined with the corded overlay A B, extending from the top to the bottom of the section, said parts A B of the overlay cut away from the waist-line at the center respectively downward and forward and downward and backward to near the front and rear edges of said overlay, substantially as described.

254,993. BOOT. GEORGE C. MCCOY, Denver, Colo. Filed Dec. 21, 1881. (Model.)

Claim.—The herein-described boot, consisting of the vamp B, the quarters *d*, sewed together in the back and a short distance in front, from the top down, and provided with the hooks *e*, holes *i*, and a suitable lacing device, the strip *f*, secured over the said front seam, and the tongue G, secured to the said leg-pieces and vamp, substantially as set forth.

254,994. SLIDING AND ROLLING GATE. JAMES F. MCCREARY, New Brighton, Pa. Filed Sept. 30, 1881. (No model.)

Claim.—1. The combination, in a sliding gate, of appliances for causing the gate to move back and forth, and a lever, H, pivoted to the gate, arranged to bear on the keeper, and connected with and operated by said appliances to tilt and release the gate from the keeper, substantially as set forth.

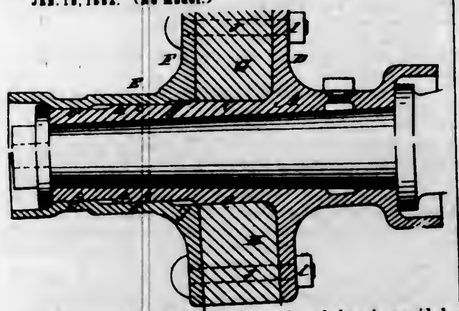
2. The combination of the post G, catch *g*, and sliding gate B, provided with the pin *i* and lever, for the purpose set forth.

3. The combination, with the sliding gate, pin *i*, drum and cord *e*, and with the post G and catch *g*, of the lever H, connected with the cord, and arranged to operate substantially as set forth.

254,995. METHOD OF STEERING TOW-BOATS AND TOWS. DONALD A. MCDONALD, La Crosse, Wis. Filed Jan. 14, 1882. (No model.)

Claim.—1. The method substantially as herein set forth of guiding water-craft propelled by a boat in rear thereof, consisting in shifting or moving the point of bearing of the propelling-boat to one or the other side of the medial line of the propelled craft and turning the propelling-boat about its approximate center.

2. In combination with a raft, float, or other craft, a propelling-boat bearing against the rear of the craft and connected therewith substantially as shown and described, whereby the bearing-point of the propelling-boat may be moved either side of the normal bearing-point and the propelling-boat turned about its approximate center, substantially as and for the purpose set forth.



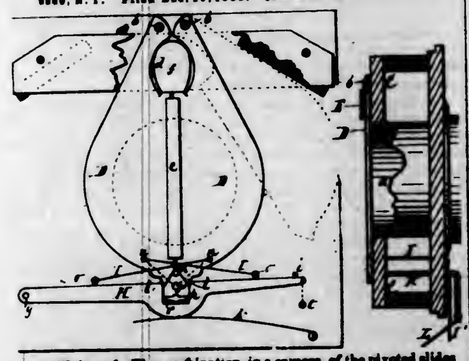
3. In combination with a raft, float, or other craft, a propelling-boat connected therewith substantially as shown and described, and adapted to swing or turn about its approximate center, a capstan or winding-drum mounted upon the propelling-boat, and a cable or hawser wound upon said capstan and having its ends secured to the propelling-craft at opposite sides of the center, substantially as explained, whereby the point of application of the propelling-power may be shifted to one or the other side of the medial line of the propelled craft.

4. In combination with craft B, boat A, cables C, capstan G, and hawser H, all arranged and operating substantially as explained, whereby the operation of the windlass is caused to shift the point of bearing to one side of the medial line of the propelled craft.

5. A boat for propelling and guiding rafts, floats, and other craft, provided with one or more vertical rollers at its bow, whereby the bow is adapted to move freely along the stern of the craft, in combination with mechanism, substantially such as described, for shifting the bow of the boat, as explained.

6. In combination with a boat having eyes or bearings *e e d* on its stem or bow and elongated shaft or axle E, and a roller, *b*, removable from said shaft, as described, whereby it is adapted to be placed at different heights.

254,996. HUB. ANGUS MCKELLAR, Fort Douglas, Utah. Filed Jan. 19, 1882. (No model.)

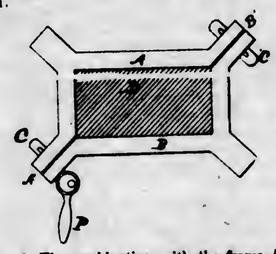


Claim.—1. The combination, with the axle-box A, provided with the flange D, the flat seats *i*, the step *a*, and the straight surfaces *c c*, of the sleeve E, provided with the flange F, the straight surfaces *c' c'*, and the flat seats J, substantially as and for the purpose set forth.

2. The combination, with the axle-box A, provided with the flange D, the flanged sleeve E, and the bolts J, of the spokes G, provided with the grooves *h* and the shoulders *h*, and the wedges H, provided with the grooves *g*, substantially as and for the purpose set forth.

3. The wedges H, formed with the grooves *g*, and the spokes G, formed with the grooves *h*, in combination with the flanged axle-box A, flanged sleeve E, and the bolts J, substantially as described.

254,997. PHOTOGRAPHIC CAMERA. JAY G. HERRELL, Geneseo, N. Y. Filed Dec. 19, 1881. (No model.)



Claim.—1. The combination, in a camera, of the pivoted slides D D, provided with the lugs *l l*, the spring *d*, resting between the slides and serving to throw them apart, the pivoted spring-catch H, provided with the square notch *h*, with which the lugs engage, the cords I I I', attached to the slides and extending out through the case, and the shaft K, provided with the cross-head *r*, resting in the notch *h* and operated by the cord L, as shown and described, and for the purpose specified.

2. The combination, with the pivoted slides D D, of the cross-piece E, extending over the slides and forming guides thereto, and the cushions G G, of cotton or equivalent material, under the cross-piece, as herein shown and described.

3. The combination of the slides D D, pivoted at their tops and having an opening, *f*, between them, the cords I I, attached to the bottom of the slides for operating them, and the spring *d*, placed loosely between the slides in the opening *f*, and serving to open the slides when released by the cords, as herein shown and described.

254,998. PROCESS OF AND MEANS FOR PHOTO-ENGRAVING METALLIC PLATES. ALFRED NICHAUS, Paris, France. Filed Sept. 3, 1881. (No model.) Patented in France July 11, 1881.

Claim.—1. The combination, with the frame A B, provided with the slotted and jointed ends A' B', and the removable plates D, of the slotted cross-pieces C, provided with wedges, and the eccentrical handle P, substantially and for the purpose set forth.

2. The process herein described of producing a metal mold in relief, consisting in applying a gelatine bichromatic proof formed by the process above described to the surface of a melted alloy in a close vessel and subjecting it to pressure, as set forth.

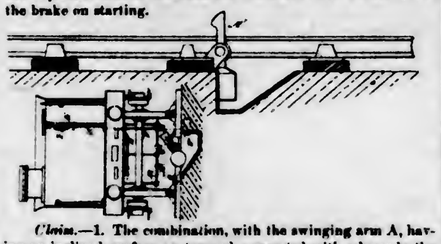
254,999. TREATING TOBACCO-LEAF. JACOB D. MILLER, York, Pa., assignor of one-half to Reuben E. Kayler, same place. Filed Dec. 9, 1881. (No specimens.)

Claim.—1. The mode above described of treating leaf-tobacco to remove the white veins and fox marks, the same consisting in applying to the leaf carbon-black in a suitable liquid vehicle and then resweating the leaf, substantially as set forth.

2. The mixture for treating white-veined and fox-marked tobacco-leaves, consisting of carbon-black and vinegar, as specified.

255,000. DITCHING-MACHINE. SAMUEL E. MORRAL and JOHN MORRAL, Morral, Ohio. Filed Dec. 14, 1881. (No model.)

Brief.—The side cutters, mold-board, and shoe are braced by a block secured upon the shoe and between the mold-board and brace, which is attached to the mold-board and shoe.



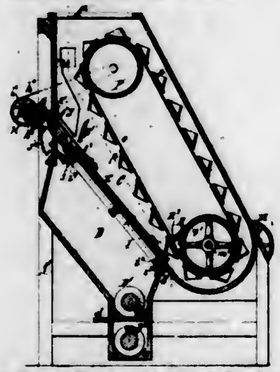
Claim.—1. In combination with the parallel beams *a*, draft-beam *c*, and upright B, the revolving spade-wheel E F G, the curved mold-board I, the shoe H, the brace K and block L, and the cutters M and laterally-delivering plates R, the whole arranged substantially as and for the purposes specified.

2. In combination with the shoe, mold-board, and cutters, the brace secured to the rear of the mold-board and to the shoe, and the block interposed between the shoe, mold-board, and brace, to which block the cutters are bolted, substantially as specified.

255,001. RAILWAY-SIGNAL. HENRY HERMIS, Manchester, County of Lancaster, England. Filed Nov. 26, 1881. (No model.) Patented in England Apr. 26, 1881.

Brief.—A vibrating arm operated by the signal cord or chain is held out of operative position when the signal shows "safety;"

but when at "danger" said arm stands in the path of a tappet on the locomotive, whereby the steam or air brake is applied and an alarm-whistle sounded. A similar independent arm is located on the departure side of a terminus or station, to automatically test the brake on starting.



Claim.—1. The combination, with the swinging arm A, having an inclined surface on top and connected with a lever in the signal-box, of the shaft B, having a tappet, C, and crank E, the rods F G, the spring-catch H, and the spring K, all arranged substantially as and for the purpose specified.

2. The combination, with the rod G, having a catch, O, and arranged in a signal mechanism, substantially as described, of the connected pipes L M and a valve having the handle N, whereby the brake may be operated, as described.

3. The combination, with a railroad-track and a signal and brake mechanism on a locomotive, of a swinging arm, A', arranged on the departure side of a terminus and parallel with the rails, as and for the purpose specified.

255,002. BOLTING APPARATUS. ORVILLE M. MORSE, Springville, N. Y. Filed Oct. 3, 1881. (No model.)

Claim.—1. In a bolting-machine, the combination, with an inclined screen and an elevating mechanism facing the screen, of a wiper or brush bearing against the screen, and mechanism whereby the wiper or brush is caused to move horizontally back and forth over the screen, substantially as set forth.

2. The combination, with the inclined screen B and an elevating mechanism facing the screen, of a wiper or brush frame, E, arranged upon the upper side of the screen, and an endless belt, G, adapted to move the frame E back and forth over the screen, substantially as set forth.

3. The combination, with the inclined screen B, of the wiper or brush frame E, resting upon the screen and provided with hooked bars f, a rail, f', upon which the bars f slide, and mechanism whereby the frame E is moved back and forth over the screen, substantially as set forth.

4. The combination, with the inclined screen B, of a wiper or brush frame, E, resting upon the screen, and guides which support said frame, an endless belt, G, and a cord or chain, g^4, whereby the endless belt is connected with the frame E, substantially as set forth.

5. In a bolting apparatus, the combination, with an inclined screen, B, of brush or wiper frames E and I, arranged respectively above and below the screen, and mechanism whereby these frames are moved horizontally back and forth over the screen, substantially as set forth.

6. The combination, with a bolting-screen, B, of a brush or wiper frame, I, an endless belt, G, and a slack chain or rope, j^3, whereby an intermittent reciprocating motion is imparted to the frame I, substantially as set forth.

7. The combination, with an inclined bolting-screen, B, of a brush or wiper frame, I, arranged on the under side of the screen, cars j, which guide the upper part of the frame, and notches j', formed in the upper part of the frame I, whereby the frame is permitted to recede from the screen, substantially as set forth.

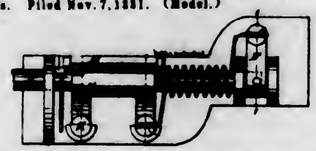
8. The combination, with an inclined screen, B, of an elevating mechanism composed of one or more endless bucket chains or belts arranged to face the screen and converging on its descending side toward said inclined screen from the top toward the bottom thereof, substantially as set forth.

9. In a bolting apparatus, an elevating mechanism composed of two or more endless bucket belts or chains, the buckets being arranged at increasing distances apart on the successive belts or chains from the head toward the tail of the machine, substantially as set forth.

10. In a bolting apparatus, the combination, with the elevator-belt, of buckets p, rivets r, and washers r', applied to the rivets between the buckets and the belts, substantially as set forth.

11. The combination, with the elevator belt or belts and the bottom pulley or pulleys, q q' q^2, of a scraper, R, bearing against the upper side of the bottom pulley or pulleys, substantially as set forth.

12. The combination, with the elevator belt or belts provided with openings R', and the bottom pulley or pulleys, q q' q^2, of a scraper-plate, R, bearing against the upper sides of the bottom pulley or pulleys and inclining toward the descending side of the elevator belt or belts, substantially as set forth.



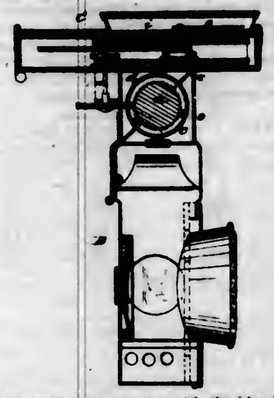
13. The combination, with the elevator belt or belts, of a wiper, R^3, bearing against the inner side of the belt or belts, substantially as set forth.

14. The combination, with the elevator belt or belts, of a bottom pulley or pulleys, of a scraper, R, bearing against the upper sides of the bottom pulley or pulleys, and a wiper, R', attached to the scraper R and bearing against the inner side of the elevator belt or belts, substantially as set forth.

15. The combination, with an inclined bolting-screen, B, of a plate, S, strip S^2, arranged above the upper edge of the screen and receiving the impact of the falling material, an elevating mechanism facing the inclined screen, and a shield or guide-board, S', adapted to prevent the material from falling directly from the elevating mechanism on the screen, substantially as set forth.

16. An inclined bolting-screen provided on its upper side with transverse ribs or cords t, secured to or resting on the bolting-surface, whereby the material is compelled to flow over these obstructions, thereby retarding its descent, substantially as set forth.

255,003. SASH-FASTENER. EPHRAIM S. MORTON, Brockton, Mass. Filed Nov. 7, 1881. (Model.)

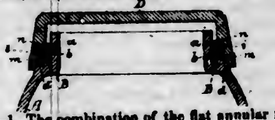


Claim.—1. In a window-sash fastener, the combination of two spring-impelled bolts or catches supported on a suitable plate on the window-casing, each arranged to fasten a different sash, a journaled operating-rod having an arm adapted to retract the inner bolt when said rod is rotated, an operating-sleeve journaled on said rod and provided with an arm adapted to retract the outer bolt when said sleeve is rotated, and means for rotating said sleeve independently of the rod, as set forth.

2. In a window-sash fastener, the combination of two spring-impelled bolts or catches supported on a suitable plate on the window-casing, each arranged to fasten a different sash, and each provided with devices substantially such as herein described, whereby they may be operated independently, and means, substantially such as herein described, for locking said operating devices and bolts either when the latter are projected so as to lock the sashes or retracted so as to be inoperative, as set forth.

3. In a window-sash fastener, the combination of two spring-impelled bolts or catches supported on a suitable plate on the window-casing, a journaled operating-rod having an arm engaged with the inner bolt, the rod being adapted both to swing said arm and to move lengthwise independently thereof, an operating-sleeve journaled on said rod and provided with an arm engaged with the outer bolt, said sleeve being adapted to rotate with the rod, but prevented from moving endwise, a lug on the rod adapted by an endwise movement of the rod to enter either of two notches formed in the sleeve, and a locking device substantially such as herein described, to prevent the operating-rod from rotating when its lug is engaged with either of the notches of the sleeve, thereby causing the operating-rod to hold both bolts either projected or retracted, as set forth.

4. The operating-bolt having a longitudinal key-hole and a lateral slot or opening, combined with a spring locking bolt or tongue adapted to project into said key-hole, and a key adapted to be inserted in the inner end of the operating-rod and disengage the locking-bolt therefrom, as set forth.

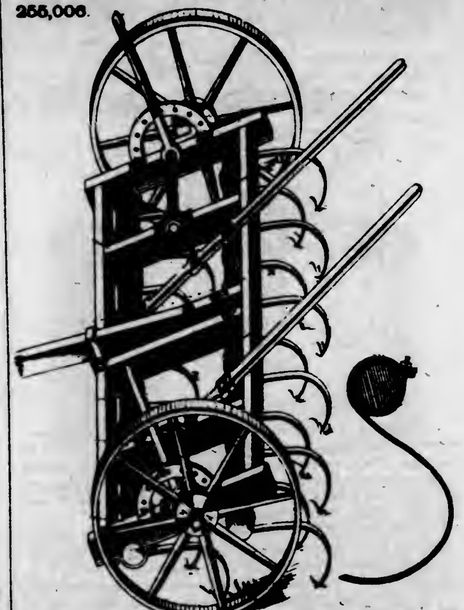


255,004. CYCLOMETER. JOHN J. MORTON, Albion, Mich. Filed June 14, 1881. (No model.)

Claim.—1. The combination, with the bicycle-lamp B and hinged box A, of the odometer C, fixed to the box with its dial facing upward, substantially as shown and described.

2. In combination with a bicycle, an odometer mounted upon the axle of the same, face uppermost, and retained in position by means of a pendulous weight, substantially as specified.

255,005. SEALING FRUIT-JARS. JOSEPH MURPHIN, Malaga, N. J., assignor of one-half to Alfred B. Richman, same place. Filed Jan. 12, 1882. (No model.)



Claim.—1. The combination of the flat annular ring or gasket B, the jar A, having a contracted annular ring-supporting shoulder, a, and immediately below the same a vertical bearing-surface, b, and the cap D, having an internal annular bearing-surface, i, of a radius greater than that of the surface b by about the thickness of the ring B, and a shoulder adapted to bear near the outer edge only upon the ring B when the latter is supported in its horizontal position, whereby on depressing the cap an abrupt quarter-turn is imparted to the ring and the latter is confined in a vertical position between the bearing-surface b on the jar and the bearing-surface i in the cap, as set forth.

2. The combination of the flat annular ring or gasket B, the jar A, having a contracted annular shoulder, a, a shoulder, d, below the same, and between them an annular vertical bearing-surface, b, equal in depth to the width of the ring, and the cap D, having an internal annular bearing-surface, i, exceeding the diameter of the surface b to the extent specified, and a shoulder, m, adapted, when the ring B is supported horizontally, to bear upon said ring near the outer edge only, as set forth.

3. The combination of the flat annular ring or gasket B, the jar A, having a contracted annular shoulder, a, and an annular vertical bearing-surface, b, below the same, and a cap, D, having a shoulder, m, an internal annular bearing-surface, i, and an internal shoulder, n, the shoulder m being adapted, when the ring B is supported horizontally, to bear upon the said ring near the outer edge only, the diameter of the internal bearing-surface, i, exceeding that of the surface b to the extent specified, and the internal shoulder, n, being adapted to bear on the upper edge of the ring B when the latter is turned to a vertical position and confined laterally between the bearings b and i, as set forth.

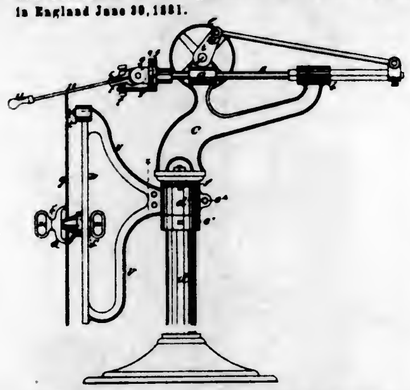
255,006. WHEEL-BARROW. CRAIG MURRAY, Vicksburg, assignor to Spencer J. Wing, Schoolcraft, Mich. Filed Feb. 10, 1881. (Model.)

255,006.

Claim.—1. In a wheel-barrow, the combination, with a rigid frame supported at opposite ends by carrying-wheels, of independent series of rollers or rock-shafts journaled in the supporting-frame at opposite sides of its transverse center, whereby the series of rollers at opposite sides of the supporting-frame may be operated independently of each other, said rollers or rock-shafts having spring-metal teeth secured thereto, and connecting-rods pivotally connected to the rock-shafts of each series, said connecting-rods being jointed at a point between said rock-shafts or rollers, substantially as set forth.

2. In a wheel-barrow, the combination, with a rigid frame supported at opposite ends by carrying-wheels, of rock-shafts provided with spring-metal teeth, said rock-shafts being journaled in the rigid frame, and connecting-rods attached to two of said rock-shafts, said connecting-rods being jointed at a point between the rock-shafts, the joint constructed to cause the connecting-rod to operate as a rigid rod when subjected to end pressure and to fold when either end of the connecting-rod is raised, substantially as set forth.

3. In a wheel-barrow, the combination, with a rigid frame supported at opposite ends by carrying-wheels, of rock-shafts journaled in the rigid frame, and connecting-rods attached to said rock-shafts, said connecting-rods being each provided with a joint located between the rock-shafts, said joint allowing the two portions of the connecting-rod to be depressed and preventing said parts from yielding in an upward direction, the rear portion of the connecting-rod being formed with a handle, substantially as set forth.



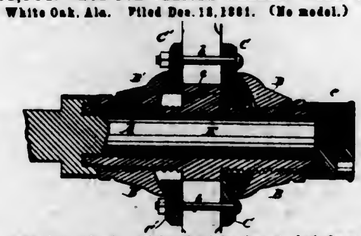
4. In a wheel-barrow, the combination, with independent rock-shafts having spring-metal teeth secured thereto, of a combined connecting-rod and operating-lever located above one rock-shaft and below the other and attached to said rock-shafts by means of spring-metal arms, substantially as set forth.

5. In a wheel-barrow, the combination, with a rigid frame supported at opposite ends by carrying-wheels, of rock-shafts provided with spring-metal teeth, and a connecting-rod attached to the under side of one rock-shaft and the upper side of the other, said connecting-rod being provided with a joint between the two rock-shafts, substantially as set forth.

6. The combination, with a tooth-supporting bar, of a circular harrow-tooth-fastening clip completely encircling the bar and provided with fastening devices on its opposite ends, whereby it may be drawn tightly around the bar and secured thereto in any desired rotary adjustment, substantially as set forth.

7. The combination, with a tooth-supporting bar, of a harrow-tooth-fastening clip constructed to completely encircle the bar, one end of said clip being screw-threaded and the other provided with an open slot, and a nut for drawing the clip tightly around the tooth-supporting bar, substantially as set forth.

255,007. MACHINE FOR FILING SAWS. FREDERICK HYDE, New York, N. Y. Filed Aug. 9, 1881. (No model.) Patented in England June 30, 1881.



Claim.—1. In a saw-filing machine, the file-clamping jaws *r*, pivoted to the ings or head *g* of the adjustable disk *e*, pivoted to the head *f* of the reciprocating shaft *c*, and provided with the arm *s*, and adjusting-screw *t*, said devices being mounted on a standard and combined with a saw-holding device, also mounted on said standard, substantially as described.

2. The face-plate *w*, with steady-rest *c'* and center stud, *y*, combined with bracket *v* and standard *d*, said bracket being laterally adjustable on said standard, and said standard having a reciprocating file-carrier mounted upon it, substantially as described.

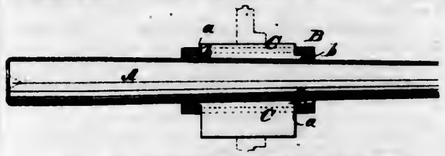
3. The combination of the adjustable conical center stud, *y*, clamp *a'*, screw *s*, and nuts *b'* with the slotted face-plate *w* and steady-rest *c'*, substantially as described.

255,008. HUB FOR VEHICLE-WHEELS. JAMES NEWMAN, White Oak, Ala. Filed Dec. 18, 1881. (No model.)

Claim.—1. A vehicle-wheel having its hub formed of the threaded tube A, provided with the annular flange *a*, the tapering nuts B B', having concave inner ends, and the ring-plates C C', provided with beveled annular projections *d*, and clamped to the spokes by bolts *b*, substantially as shown and described.

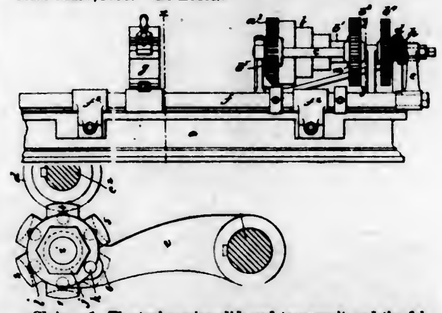
2. In vehicle-wheels, the combination, with the threaded tube A, provided with the annular flange *a*, of the nuts B B', having concave inner ends, and the ring-plates C C', having unequal openings and provided with beveled projections *d*, substantially as and for the purpose set forth.

3. In vehicle-wheels, the externally-threaded tube A, provided with the central annular flange, *a*, having spurs *c*, substantially as and for the purpose set forth.



255,009. MANUFACTURE OF BOOTS AND SHOES. ARTHUR NEWTON, Boston, Mass., assignor, by mesne assignments, to the Newton and Hibbard Machine Company. Filed May 31, 1881. (No model.)

Claim.—1. The anvil *a*, having the inwardly and downwardly receding sides *a²*, and the enlarged angular edge *a³*, formed by the juncture of the top surface and sides, and adapted to be applied to the horn *h*, substantially as shown, and for the purpose described.



2. In a boot or shoe sole nailing machine the anvil or channel-opener corrugated or roughened on its upper surface, as and for the purpose specified.

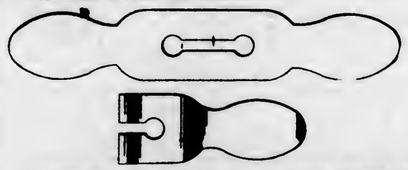
255,010. EXPANDING MANDREL. WILLIAM H. NICHOLSON, Wilkes-Barré, Pa. Filed Sept. 24, 1881. (Model.)

Claim.—The combination of the plain conical arbor A, adapted to be held between the centers of a lathe, the short sleeve B, having longitudinal slots *a*, and the dogs C, tapered on their inner edges to conform to the taper of the arbor, and provided with integral end lugs, *b*, which extend beneath the sleeve and limit their outward projection, substantially as described.

255,011. LATHE. ALEXANDER W. NORTON, Boston, Mass., assignor to the American Tool and Machine Company, same place. Filed Jan. 7, 1882. (No model.)

Claim.—1. The tool-carrier, slide-rod to move it, and the follower-carrying arm, combined with a rotating follower adapted to engage the screw-threaded sleeve or portion *d*, substantially as and for the purpose described.

2. The arm *e* and rotating follower, having screw-threads of different pitch, combined with the nut and bolt and locking device to hold the follower firmly in adjusted position, substantially as and for the purpose described.

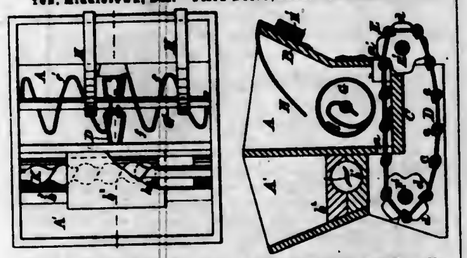


255,012. SHEET-METAL CAN. ERWIN NORTON, Chicago, Ill. Filed Dec. 27, 1881. (No model.)

Claim.—1. In a sheet-metal can, the improved double seam consisting in a seamless exterior flange on the can-body, interlocked and folded with the can-cover, substantially as shown and described.

2. The combination of a can-body with an exterior seamless flange, *d*, provided with inturned edge *d'*, soldered to the can-body, and cover D, folded with said flange into a double seam, substantially as and for the purpose specified.

255,013. SPOON-REST. CHARLES W. OLSEN, Lombard, Ill. Filed Aug. 17, 1880. (No model.)



Claim.—A spoon-rest consisting of a single plate of metal, provided within its body portion, at or near the center thereof, with a longitudinal slot, said plate being doubled or folded upon itself, as described, to form two spring-arms, substantially as and for the purpose described.

255,014. OX-SHOE. WILLIAM PEARCE, Plantsville, assignor of two-thirds to H. H. Woodruff and H. A. Barnes, Southington, Conn. Filed Dec. 27, 1881. (No model.)

Claim.—An ox-shoe having the toe-calk extend across the toe end obliquely to said end and substantially parallel with the heel-calk, substantially as described, and for the purpose specified.

255,015. FERTILIZER-DISTRIBUTER. ALBERT R. PENNINGTON, Middletown, Del. Filed Dec. 6, 1881. (No model.)

Claim.—1. In combination with the hopper of a fertilizer-distributer, the endless chain D, composed of links having the hooked projecting ends *e*, the chain being adjusted to run transversely through the hopper, with the projecting ends of the links inclined toward the bottom of the hopper and in the direction of the movement of the chain, substantially as and for the purposes described.

2. The combination, with the force-feed chain D, of the reverse screw conveyors and agitators, consisting of the spiral rods *f f'*, arranged reversely on the revolving shaft G', adjusted to convey the fertilizers from each end to the middle of the hopper, over the chain, substantially as and for the purposes described.

3. The stirrer consisting of the arms H H, extended into the hopper A, over the agitator, and attached to the bar H', adjusted on the outside of the wall of the hopper to be reciprocated by mechanism, substantially as and for the purposes described.

4. The stirrer consisting of the arms H H, extended into the hopper A and attached to the bar H', adjusted on the outside of the wall of the hopper, in combination with the force-feed chain D, and the reverse screw conveyors and agitators, consisting of the spiral rods *f f'*, arranged reversely on the revolving shaft G', substantially as and for the purposes described.

255,016. METALLIC CHIMNEY-CAP. WALTER J. PUTTINGELL, Lowell, Mass. Filed Nov. 7, 1881. (No model.)

Brief.—The overlapping edges of the several metallic plates of the chimney-cap are so united by bolts as to provide an unperforated upper surface.

Claim.—1. A metallic chimney-cap made in sections adapted to fit upon each other, as described, each section having bolt-holes at one edge, and vertical bolts with protecting-bosses therefor, cast in one with the metallic plate at the overlapping edge, so as to extend downwardly from its under surface through the holes therefor in the adjacent section, whereby an unperforated upper surface is preserved, substantially as and for the purpose set forth.

2. A chimney-cap consisting of a metallic shell made in sections, having a horizontal top, with a vertical protecting-edge at the flue-opening, vertical corners, lutherns and sides, and bevried or oblique intermediate portions, all substantially as shown, and for the purposes set forth.

2. A metallic chimney-cap having interior ribs adapted to hold the body of the cap from contact with the chimney, substantially as and for the purpose set forth.

4. A metallic chimney-cap made in sections which are arranged to overlap each other at the edges, as shown, each section provided with a groove beneath one edge and a corresponding rib above the other edge, for the purpose set forth.

255,017. PACKAGE FOR OYSTERS, &c. CHARLES L. POND, Buffalo, N. Y. Filed Nov. 25, 1881. (No model.)

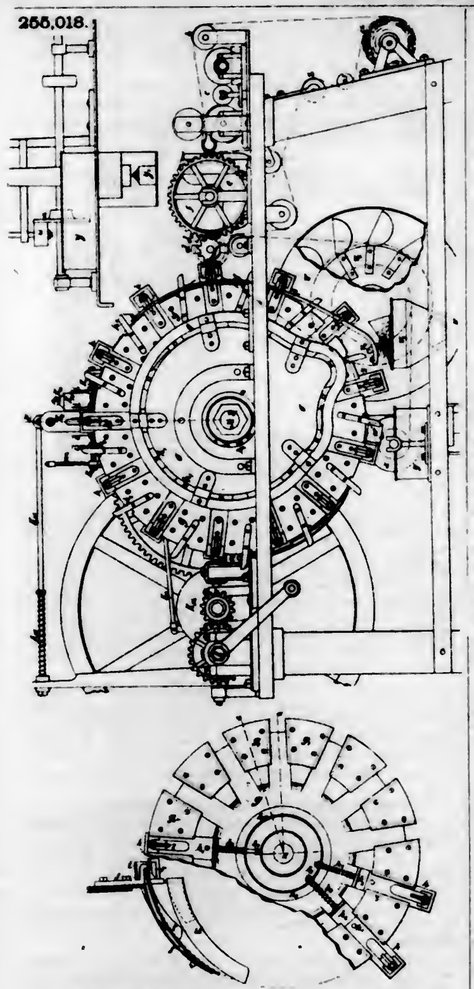
Claim.—1. The combination, with a barrel or tub, A, of a ring, *c*, composed of a strip of wood made of uniform cross-section throughout its length, and sprung into a recess of suitable shape formed in the barrel or tub near its end, substantially as set forth.

2. The combination, with a barrel or tub, A, provided on its inner surface, near its end, with a projecting ring, *c*, of a removable head, B, resting upon the ring *c*, and fastening devices applied to the under side of the head and adapted to be projected under the ring *c*, for securing the head and to be retracted for releasing the head, substantially as set forth.

3. The combination, with a barrel or tub, A, provided with a ring or shoulder, *c*, of a removable head, B, provided with sliding bolts *f f'*, attached to the under side of the head and adapted to engage with their outer ends under the ring *c*, and a lever, F, to which the inner ends of the bolts *f f'* are connected and whereby both bolts are moved in opposite directions, substantially as set forth.

4. The combination, with the removable head B, of the sliding bolts *f f'*, one of which is provided with a projecting tongue, *h*, and the lever F, having an opening, *h'*, substantially as set forth.

5. The combination, with the removable cover B, constructed with a projecting rim, *h*, of a packing-ring, *d*, applied to the under side of the rim *h*, and a hoop, *e*, which surrounds the lower contracted portion of the cover, and bears with its upper edge against the packing-ring *d*, and secures the latter in place, substantially as set forth.



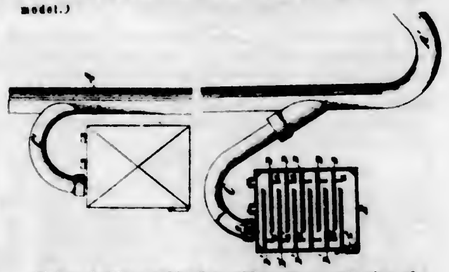
6. The combination, with the cover B, of a turn-button, L, secured to a bolt, *l*, having a head, M, provided with a nose, *m*, and a plate, N, secured to the cover B, and provided with stops *n*, between which the nose *m* swings, substantially as set forth.

255,018. PAPER-BOX MACHINE. CONRAD PRUNER, Wiener-Neustadt, Austria. Filed Nov. 2, 1881. (No model.) Patented in Austria Sept. 15, 1880.

Brief.—The material is taken from the web to pasting-disk *d* and cut into blanks by knives *i m*, that travel with the former-disk while making their cuts. The blanks are then forced into radial recesses in the periphery of former-disk *g* by the formers *h*, actuated by cam-plate *o*, which folds three sides of the box around the former. The projecting ends of the blank that form the remaining side are folded by blade *p'* and stationary turner *s*, and the projecting portions that form the bottom of the box are folded by roller p^3 and stationary turners *r t u*. The closed end of the box is coated with sand by means of the glue-roll *w* and the revolving bucket-wheel r^3, turning in sand-box *v*.

Claim.—1. In a machine for making boxes or tubes from paper, pasteboard, or other suitable material, a former-disk, *g*, provided with a number of recesses or radial slots, in combination with formers and former-slides *h* and spring counter-slides h^3, fitting into and sliding in the slots of said disk *g*, a stationary disk or plate having on its side an irregular eccentric groove moving by pin *h'*, the former-slides in the slots of the disk *g*, a folder or presser-arm, *p*, operated by suitable mechanism, and four stationary folders or pressers, *r s t u*, for the purpose and substantially as herein described and shown.

255,018.

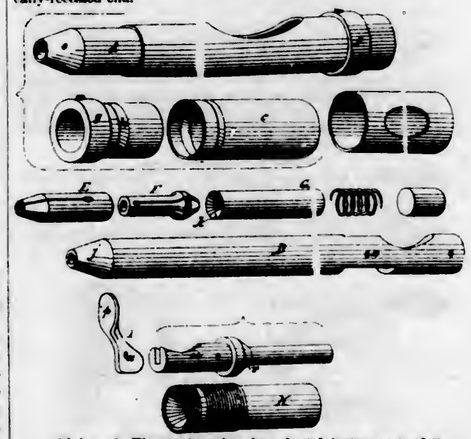


2. In machines for making boxes or tubes from paper, pasteboard, or other suitable material, the combination, with former-disk *g*, of a cutting apparatus, *h*, consisting of a number of cutters or knives, *i m*, for cutting the paper or other material while resting upon the circumference of disk *g*, and of a device, substantially as described, for operating said cutters, the whole cutting apparatus being loosely mounted upon shaft 3 of disk *g*, so that when engaged by catches h^4 of said disk it will move or swing in the same direction as disk *g*, for the purpose and substantially as described.

3. In a machine for making boxes of paper or other material, the combination of a pasting apparatus consisting of a roller, *w*, for applying paste or other adhesive substance to the bottoms of the boxes or tubes, a second roller, *x*, for taking paste or other adhesive substance from a reservoir or receptacle and feeding it to roller *w*, and a lamp underneath said receptacle for keeping the glue, when such is used, warm and soft, with an automatic sanding apparatus consisting of a stationary box and a bucket-wheel revolving inside of the same, for sprinkling sand upon the bottoms of the passing boxes, the superfluous sand falling back into the sand reservoir or box, to be used over again, substantially as described.

4. The combination, in a machine for making boxes or tubes from paper, pasteboard, or similar material, of a paste-roller provided with paste, applying ribs and segments, a former-disk, *g*, with slides and formers for holding and shaping the material, a cutting apparatus which cuts off the blanks and makes the necessary incisions for forming the bottom flaps, a movable folder or pressure-arm, and four stationary folders or pressers for folding the ends and bottom flaps of the blank, all substantially as described and shown.

255,019. APPARATUS FOR DISINFECTING WASTE-PIPES. ABRAM G. W. RASKIN, Jersey City, N. J., assignor of one-half to Walter H. Gilson, same place. Filed July 7, 1881. (No model.)



Claim.—1. The combination, with a soil or waste pipe, of a cabinet or chamber having internal horizontal shelves or pans adapted to contain disinfecting substance, and having an air-inlet and an inwardly-opening valve at the bottom, and a pipe connecting the upper part of said cabinet or chamber with said soil or waste pipe, substantially as and for the purpose specified.

2. The combination of the pipe A, the cabinet or chamber B, constructed with shelves or pans D D', the overflow-pipes *a a'*, the inlet-valve *c* and the outlet valve or valves *e*, and the pipe C, connecting said cabinet or chamber with the pipe A, substantially as specified

255,020. DENTAL HAND-PIECE. GUSTAV RAUPACH, Philadelphia, Pa., assignor to himself, John George Kohlhaas, and Martin O. Kohlhaas, all of same place. Filed Dec. 22, 1881. (No model.)

Brief.—Two slotted and conical ended griping-tubes are used and crowded upon the tool by a rod with a correspondingly conically-recessed end.

Claim.—1. The combination, in a dental instrument, of the following elements, namely: first, an outer casing or tube; second, a tubular shaft contained within the said tube; third, slotted griping-sleeves E and F, for seizing the stem of a dental tool, the said sleeves being contained within the tubular shaft; and, fourth, devices for acting on the said sleeves, all substantially as set forth.

2. The combination of the outer casing, the tubular shaft D, griping-jaws, and rod G with a cam-lever, I, adapted to be depressed within the limit of the tubular shaft, all substantially as set forth.

3. The combination of the outer casing, tubular shaft, griping-sleeves, and rod G with the cam-lever I, block *m*, and spring *n*, substantially as specified.

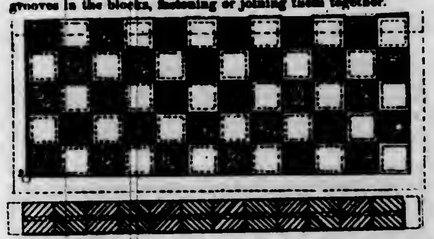
4. The combination, in a dental hand-piece, of the outer casing, its sleeve *d*, having a conical termination, *e*, the shaft D, having a conical termination, *j*, the slotted griping-sleeve E, made conical at one end, the slotted griping-sleeve F, also made conical at one end, and adapted to fit in or on the sleeve E, and mechanism for acting on the said sleeves, all substantially as set forth.

255,021. REFINING AND PURIFYING SUGAR. BERNHARD B. ERNDTES and JOHN WILLIAMSON, Glasgow, County of Lanark, Scotland. Filed Oct. 20, 1881. (No specimens.) Patented in England July 14, 1880.

Claim.—As an improvement in the art of filtering sugar-liquors and oils, the mode herein described of facilitating the filtering process, said mode consisting in mixing vegetable charcoal with the liquid prior to filtration, so as to absorb the mucilage or gum contained therein, substantially as set forth.

255,022. HAME-FASTENER. ALBERT C. RICHARDSON, South Frankfort, assignor of one-half to Christian C. Miller, Frankfort, Mich. Filed Oct. 25, 1881. (No model.)

Brief.—Improvement on Letters Patent No. 237,384, dated May 11, 1880.



Claim.—1. In hame-fasteners, the combination of the frame having sides A B, inclosing-walls C C, bolt or latch K, and spring D, substantially as and for the purpose specified.

2. In hame-fasteners, the combination of frame M, S-shaped hook F, provided with loop I, and hook G, as permanently secured upon rod E', the respective ends of said hooks being inclined downward from the hames, substantially as and for the purpose specified.

3. The frame M, the hook G, pivoted therein and provided near its free end with a catch, J, shaped as described, and a spring-lock provided with a latch, K, arranged to engage at its forward end with the catch, all in combination substantially as and for the purpose described.

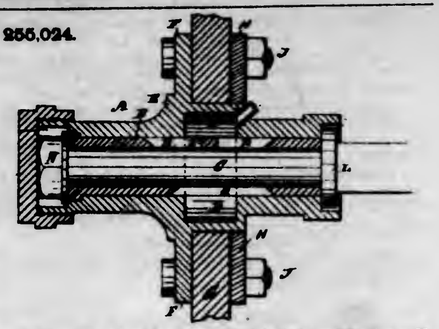
255,023. METHOD OF UNITING WOOD FOR FLOOR-COVERINGS, &c. CHARLES E. RIDER, Rochester, N. Y. Filed Oct. 26, 1881. (No model.)

Brief.—Molten lead or other suitable metal is poured into the grooves in the blocks, fastening or joining them together.

Claim.—1. The herein-described method of uniting wood, which consists in introducing lead or other suitable metal or alloy into grooves in the wood in the molten condition, substantially as and for the purpose described.

2. As a new article of manufacture, the wooden tiles herein described, consisting of wooden blocks united by the introduction of molten metal or alloy into grooves therein, substantially as described.

3. The herein-described method of forming joints in wood, consisting in introducing molten metal into grooves formed in the opposing surfaces of the wood while the latter is in a heated condition, substantially as and for the purpose set forth.



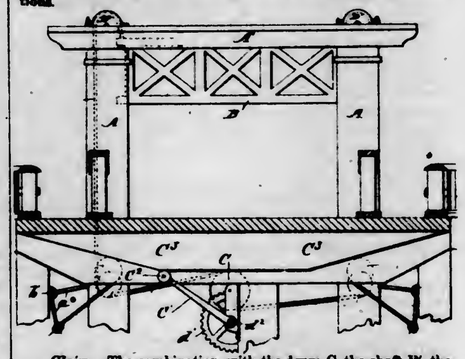
255,024. HUB FOR VEHICLE-WHEELS. FRANCIS T. RINGAL, Philadelphia, Pa. Filed Jan. 5, 1882. (No model.)

Claim.—1. In a vehicle-wheel, the combination, with the hub A, provided with the annular flange F, of the flange H, composed of the semicircular plates bolted to the said flange F, substantially as and for the purpose set forth.

2. In a vehicle-wheel, the hub A, provided with the central raised portion, E, having the annular flange F integral therewith and on the outer end of this hub, in combination with the flange H and the bolts J, substantially as and for the purpose set forth.

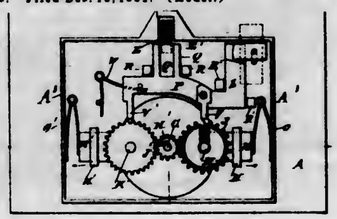
3. In a vehicle-wheel, the combination, with the apertured axle-box B, of the hub A, provided with the annular oil-chamber D', the central raised portion, E, and the annular flange F, integral therewith and on the outer end of the hub, and the flange H, formed of the semicircular plates bolted to the said flange F, substantially as and for the purpose set forth.

255,024.



255,025. SASH-HOLDER. JAMES V. RISK, Point Pleasant, W. Va. Filed Jan. 11, 1882. (Model.)

Claim.—In a sash-fastener, the combination, with the sliding bolt A, provided at one end with a plate, B, and at the other end with a slot, C, and with an offset, *g*, and a stud, *d*, of the pivoted plate J, provided with a handle, K, an eccentric slot, *b*, into which the stud *d* passes, and with an eccentric edge, *c*, substantially as herein shown and described, for the purpose set forth.

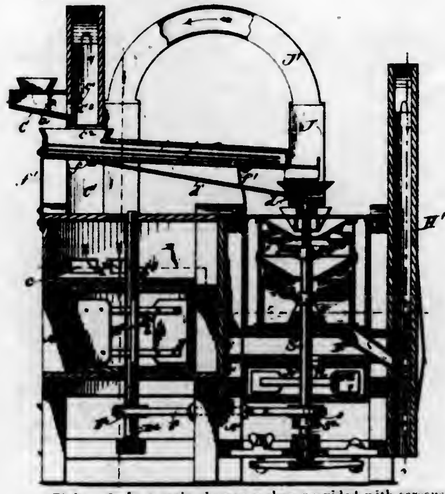


255,026. GUARD-GATE FOR SWING-BRIDGES. FRANK ROSER, Chicago, Ill. Filed Oct. 18, 1881. (No model.)

Brief.—Cam-projections on the bridge in succession actuate the roadway and footway gates by lever, pulley, and cord connections.

Claim.—The combination, with the drum C, the shaft B', the pinion *d*, the gear-wheel *d'*, the gear-wheel shaft d^2, the lever-arm C^1, the friction-roller C^2, the beveled cleat C^3, and the bridge A^3, all constructed, arranged, and operating as herein shown and described.

255,027. PERMUTATION-LOCK. WILLIAM ROWE, Biddeford, Me. Filed Dec. 15, 1881. (Model.)

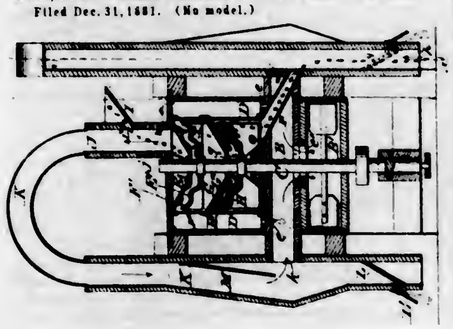


Claim.—1. The combination, with the shaft G, carrying pinion H, the sleeve G', carrying pinion H', and the spur-wheels J J', arranged on pintles K K' and carrying side disks, *k k'*, with notches l, of the bolt P, provided with two projections to fit the recesses of said side disks, as and for the purpose described.

2. In a permutation-lock, the combination, with the spur-wheels J J', having the notched side disks, of the slides M M', clips N N', and springs O O', arranged substantially as shown and described.

3. In a permutation-lock, the combination, with the bolt P, having a recessed tongue, Q, and rectangular arm S, of the studs R R', the hook E, the serrated block T, and the case A, having slot S', as and for the purpose specified.

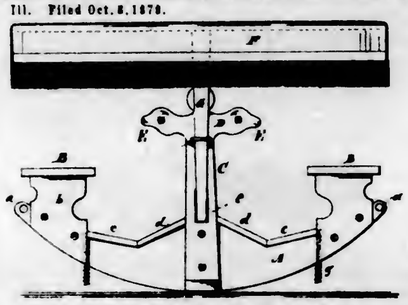
255,028. GRAIN-CLEANER. JOHN RUSSELL, Berlin, Pa. Filed Oct. 22, 1881. (Model.)



Claim.—1. In a grain-cleaner, a shoe provided with screens, means, substantially as described, for subjecting the grain to a reverse draft of air before it reaches the screen, in combination with means, substantially as described, for dividing the current of grain as it leaves the screen and subjecting each stream to a second air-draft, both air-drafts being incited by a single fan and the cleanings in each case being separated, the dust and lighter portions passing to waste through a common fan-box and the heavier portions deflected and fed to proper receptacles for use, as specified.

2. The combination of the fan-case W *b' b'*, fan *b b'*, and fan-box B, having dust-inlets *e j*, with the hopper C, chute C², having bifurcated branches, the shoe F, and chutes J J', provided with the ports *c' c'* and deflector *b'*, as and for the purposes specified.

3. The combination of the fan-boxes B, *e*, *j*, and N, shafts B' *b'* and S *s*, belt *b'*, the shoe F, the fans *b' s'*, the germ-separators and brushes, and the draft-chutes C' J' H, as and for the purposes specified.



255,029. GRAIN-CLEANER. JOHN RUSSELL, Berlin, Pa. Filed Dec. 31, 1881. (No model.)

Claim.—1. The shaft C, carrying undulated concave rubber E' F', undulated brush H H', and the fans *s s'*, combined with the perforated cylinder D', having corresponding undulated rubber E F and undulated brush G G', and with the cylinder D, having dust-ports *e*, as and for the purposes set forth.

2. The fan-box B, having dust-ports *h* and *i*, the fan, and fan-case having dust-ports *c' c'*, combined with the arched chute K, conductor J *j*, chutes R' and R, deflector M, and exits, as set forth.

255,030. ROCKING TEETER. SAMUEL I. RUSSELL, Chicago, Ill. Filed Oct. 5, 1878.

Claim.—1. The rockers A A, in combination with two seats, B B, a floor, *c d*, standards C C, bars D D, and rods or bars E E, substantially as and for the purposes specified.

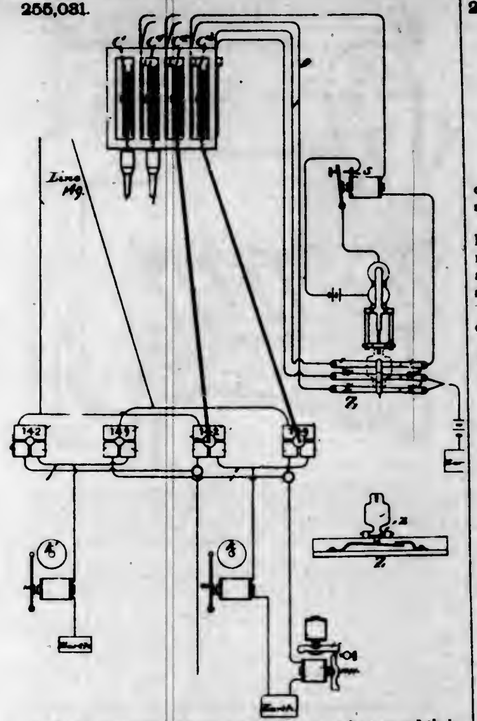
2. A rocking device consisting of rockers A, seats B, and standards C, provided with recesses *e* and bars D, having staples to receive and hold the posts of a canopy, F, all constructed substantially as specified.

3. A rocking device consisting of two rockers, A, provided at each end with a seat, B, the standards C, connected with the rockers intermediate of the seats, and the canopy F, detachably connected with the standards, all as herein shown and described.

4. A rocking device consisting of two rockers, A, a seat, B, at each end of the rockers, a suitable floor, and a spring, *g*, connected with one end of the rockers and adapted to be connected with the floor, all substantially as and for the purposes described.

255,031. TELEPHONE-EXCHANGE CIRCUIT AND APPARATUS. JOHN I. SARIS, San Francisco, Cal. Filed Aug. 6, 1881. (No model.)

Claim.—1. In a telephone-exchange system, the combination of a series of subscribers' lines, a conducting-cord inclosing a wire to connect any two of the said lines, and a second wire to complete the circuit of a local battery and electro-magnet arranged to restore the normal terminal connections of the main line, a single relay included in the main-line circuit of the cord of each pair, and a disconnecting-switch in the circuit of and controlling both main and local circuits, and adapted when operated by said relay to automatically disconnect the lines one from the other and simultaneously open the circuit of the local battery and restoring-magnet, substantially as and for the purposes described.



2. In a telephone-exchange system, the combination of a pair of subscribers' lines, a connecting-cord containing a main-line and a local-circuit conductor, a relay in the main-line circuit of said cord adjusted to respond only to currents of definite character, a sounder or annunciator in an auxiliary local circuit controlled by said relay, and a disconnecting-switch or circuit-breaker included in both main and local circuits, adapted and arranged to automatically and positively disconnect the two lines and simultaneously break the circuit of the restoring-magnet and local battery, substantially as specified.

3. In a telephonic-exchange system, the battery-wire T, open at one end or both, connected with a grounded battery at any desired point and branching to a series of subscribers' stations, in combination with direct wires to substations, substantially as described, and for the purpose set forth.

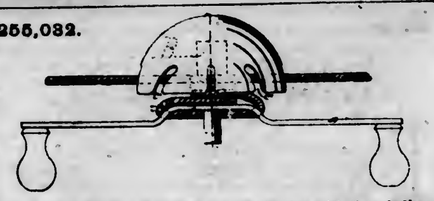
4. The combination, substantially as hereinbefore set forth, of a relay in the main circuit of a cord or wire connecting any two subscribers' lines, a battery-wire common to a series of subscribers' lines or substations, and means, as indicated, for connecting the battery-wire to any subscriber's line, the said relay being adapted to operate only when the battery-wire is so connected, for the purpose described.

5. The combination, substantially as hereinbefore set forth, of a telephone-switch cord inclosing two separate conductors, a reel provided with an automatic take-up, means, as indicated, for establishing connection between the said two conductors and their respective binding-screws, the clearing-out relay R, provided with its local circuit and annunciators, and the automatic circuit-breaking switch Z, acting to break simultaneously the connection between any two subscribers' lines and the local circuits.

255,031.

6. In a telephone-exchange system, the combination, substantially as hereinbefore set forth, of the clearing-out relay R, adapted to operate the disconnecting-switch Z, the double conducting-cord and reel, the three-contact commutators, the subscribers' private wires, and the battery-wire T, all arranged as and for the purpose described.

7. The combination, substantially as hereinbefore set forth, of a commutator having three contacts, one connected to the line, one to an electro-magnetic testing device, and one to an electro-magnet acting to restore the automatic switch of said line to its normal position, with a tripple-acting plug formed mainly of non-conducting material, but having a conducting contact-plate attached to the whole of its upper surface, a second conducting-plate attached to a portion of one side of its lower surface, and a third conducting-plate attached at the extreme end of its lower surface, each conducting-plate being completely insulated from the others, for the purpose specified.

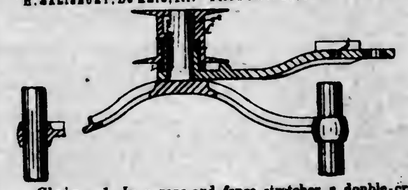


8. The combination of a series of normally-open branch circuits, a series of listening-telephones included therein, an electric switch at each line terminal, actuated automatically by an electro-magnet in the main-line circuit and adapted to transfer the said main-line circuit to the listening-telephone branch, and a switch-board interposed in the branch circuits, whereby all or any number of the electric switches or circuit-changers may be connected to any desired listening telephone or telephones, substantially as and for the purpose specified.

255,032. WIRE-STRETCHER. CHARLES H. SALISBURY, De Kalb, Ill. Filed Aug. 4, 1881. (No model.)

Claim.—1. The fence-stretcher consisting of the crank, the hollow windlass secured to the crank, a locking device mounted upon a stem inserted in the windlass and having a sliding movement therein, and the rope passing through the ends of the crank and the stem of the locking device, substantially as specified.

2. In a fence-stretcher, a locking device adapted to engage with the rope, mounted upon a stem held in the windlass, and secured so as to rotate therewith, in combination with the windlass and rope, substantially as specified.



255,032.

3. In a fence-stretcher, a locking device secured to the windlass so as to rotate therewith, and movable toward and from the rope and adapted to engage the same at both sides of the windlass at the same time, in combination with the windlass and rope, substantially as specified.

4. The fence-stretcher provided with a non-sliding double crank, substantially as set forth.

255,033. WIRE AND CLOTHES-LINE TIGHTENER. CHARLES H. SALISBURY, De Kalb, Ill. Filed Nov. 26, 1881. (No model.)

Claim.—1. In a rope and fence stretcher, a double-crank handle provided with short handles projecting upon each side of the crank, substantially as specified.

2. The crank having the trunnion, in combination with the grappling-arm and the drum, both mounted and secured on said trunnion, the arm being between the crank and the drum, substantially as specified.

3. The combination, with the drum provided with a ratchet upon its side, of the grappling-arm, and the pawl pivoted upon the arm within the circumference of the drum-rim, whereby the pawl is confined on its pivot without riveting, substantially as specified.

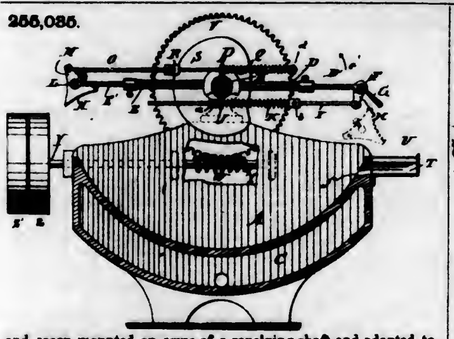
4. The stretcher consisting of a crank having a projecting trunnion, a grappling-arm mounted upon said trunnion, next to the crank, and bearing a pivot for the ratchet-pawl, said pawl, and a drum having a ratchet cast thereon at one side, and secured upon the same trunnion with its ratchet side toward the arm, substantially as specified.

5. The trunnion and its stop, in combination with the drum slipped upon the trunnion and having an interior rim and cam-surface acting in conjunction with said stop to secure it thereon, substantially as specified.

6. In a stretcher, a grappling-arm having an eye, *b'*, at its outer end, substantially as and for the purpose set forth.

255,034. LOOPER FOR BUTTON-HOLE SEWING-MACHINES. FRIEDRICH H. SCHMIDT, Brooklyn, N. Y. Filed Dec. 16, 1881. (No model.)

Claim.—1. The U-shaped looper *b* for a button-hole sewing-machine, having hooks *h i* opposite one another, the whole being so constructed that one-half of the looper is a substantial duplicate of the other half, substantially as and for the purpose specified.



2. The looper *b* for a button-hole sewing-machine, composed of the parts *j m k* and hooks *h i*, the arm *m* being narrower than the shanks *j* and *k* and the shanks being both slotted, substantially as specified.

3. In a button-hole sewing-machine, the combination of a looper, *b*, made of two equal halves and having hooks *h i*, with the spreader *e*, having prongs *f g*, all being so constructed that the distance between the two heads of the hooks *h i* is greater than the distance between the prongs *f g* and less than the width of the entire spreader, substantially as specified.

255,035. BROOM AND SCOOP MECHANISM FOR EVAPORATING-PANS. CARL F. W. SCHRAMM, Brooklyn, assignor to himself and J. Monroe Taylor, New York, N. Y. Filed Jan. 13, 1882. (No model.)

Claim.—1. A brush and scoop for evaporating-pans, made substantially as herein shown and described, and consisting of a brush

255,035.

and scoop mounted on arms of a revolving shaft and adapted to sweep upon and clear the surface of the pan, as set forth.

2. The combination, with the brush and scoop, of devices for pressing the brush and scoop with a yielding pressure against the surface of the pan, substantially as herein shown and described, and for the purpose set forth.

3. The combination, with the evaporating-pan A, of the shaft B, provided with arms D and E, the shafts F and L, and the scoop N and brush G, substantially as herein shown and described, and for the purpose set forth.

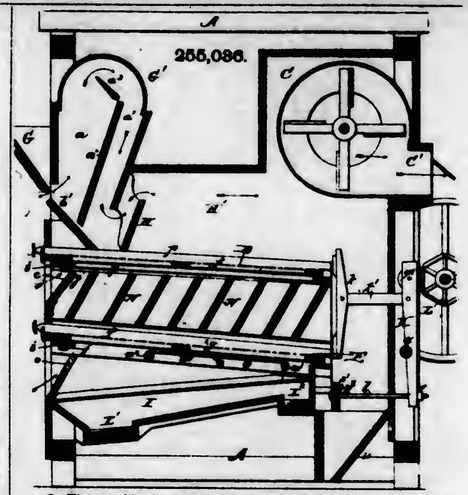
4. The combination, with the evaporating-pan A, of the shaft B, provided with arms E, the scoop N, mounted on the ends of these arms, and of devices for tilting this scoop automatically, substantially as herein shown and described, and for the purpose set forth.

5. The combination, with the evaporating-pan A, of the shaft B, provided with arms D and E, the brush G, and the scoop N, mounted on these arms, respectively, and of devices for pressing the scoop and brush upon the surface or bottom of the pan, substantially as herein shown and described, and for the purpose set forth.

6. The combination, with the pan A, of the shaft B, provided with arms D and E, the rods D' and E', adjustable in these arms, the shafts F and L, the brush G, and the scoop N, the rods I and O, passing through guide-loops on the shaft B, and the spiral springs K and Q, substantially as herein shown and described, and for the purpose set forth.

7. The combination, with the evaporating-pan A, of the shaft B, provided with arms D and E, the rods D' and E', adjustable in these arms, the brush G, the scoop N, the rods I and O, the guide-loops J and P, the springs K and Q, the cam-plates S, and the blocks R, mounted on the rods O, and provided with projections resting against the edges of the cam-plates S, substantially as herein shown and described, and for the purpose set forth.

8. The combination, with the evaporating-pan A, of the shaft B, provided with arms D and E, the rods D' and E', adjustable in these arms, the brush G, the scoop N, the loops J and P, the springs K and Q, the cam-plates S, the blocks R, provided with projections, and the nut *d* on the rods O, and the blocks *a* and *b* on the rods I, substantially as herein shown and described, and for the purpose set forth.



9. The combination, with the evaporating-pan A, of the shaft B, provided with arms D and E, the rods D' and E', adjustable in these arms, the shaft F, provided with arms H, the brush G, the rods I, and the springs K, substantially as herein shown and described, and for the purpose set forth.

10. The combination, with the evaporating-pan A, of the shaft B, provided with arms E, the rods E', adjustable in these arms, the shaft L, the arms or plates M, the scoop N, the rods O, the springs Q, the cam-plates S, and the blocks R, provided with projections resting on the cam-plates S, substantially as herein shown and described, and for the purpose set forth.

255,036. MIDDLINGS-PURIFIER. ANDREW J. SEYLER, Cedarville, Ill. Filed Dec. 12, 1881. (No model.)

Claim.—1. The combination of the feed-hopper G, the upright passages *a a'*, and valve *a²* therein, the air-inlet passage *b*, the chute *b'*, the board H, the shaking-sieve D, and a suction-fan, substantially as described.

2. The combination of the shaking-sieve frame, a cross-strip fixed to its head, the shaking-frame J, a slotted cross-strip fixed to its head, the bolt *j*, the binding-nut for securing the two frames together, and means for shaking the latter, substantially as described.

3. The combination of the stationary inclined chutes N, the shaking-sieves arranged above and below said chutes, the valves *e e*, at or below the heads of the sieves, an adjustable grading device, *c*, below the sieve E, and a suction-fan, C, substantially as described.

4. The combination of the shaking-sieves, the hangers thereof, the knocker *h*, its arm *h'*, lever K, anti-friction wheel *m*, and tappet-wheel L, substantially as described.

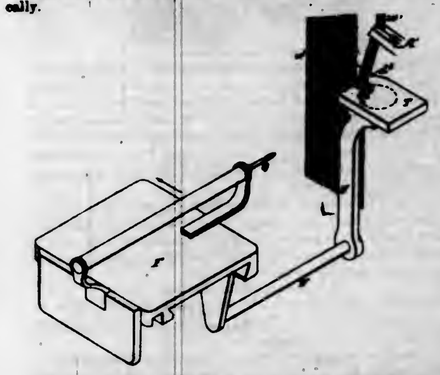
5. The combination of a flexible rolling cut-off apron adjustable at one end, as described, with the shaking screen E, the lower end of said apron terminating near the lower end of said screen, the laterally-discharging spout I', and the shaking-shoe I, all substantially as and for the purpose set forth.

6. The combination of the cut-off apron O, its rollers *m' m''*, strips O' O'', ratchet-wheel *r*, pawls *r'*, strip *n*, pointer *n'*, and a shaking-screen, substantially as described.

255,037. QUILTING-MACHINE. JOHN S. SKELDON, Montville, Conn. Filed July 28, 1881. (No model.)

Claim.—1. The carriage D, secured upon the rods *c c* and moved thereon by the levers *e* and *e'*, connected with the levers E, secured upon the shaft E', the shaft being rocked by the arm F, running in contact with the pattern or form G, substantially as and for the purposes set forth.

2. The carriage D and the shaft E', connected together by levers, substantially as described, in combination with the arm F, held upon the form or pattern by the spring *g*, as and for the purposes specified.



3. The form or pattern G, provided with the gears *j j*, in combination with the shafts J J, provided with the gears *j' j'*, as and for the purposes specified.

4. The combination, with the carriage B, the bent shafts J, and the form or pattern G, and the gear-wheels *j* and *j'*, substantially as and for the purposes set forth.

5. The traveling carriage B, carrying the transverse carriage D, the two carriages being secured together by, and the carriage D moved by, the levers *e e'*, levers E, and rock-shaft E', in combination with the arm F, rigidly fixed upon the shaft and running in contact with the form or pattern G, substantially as and for the purposes set forth.

255,038. MACHINE FOR DRAWING IN WARP-THREADS. LEWIS P. SHERMAN and RICHMOND H. INGERSOLL, Biddeford, and GEORGE MOORE, Berwick, Me. Filed June 11, 1881. (Model.)

Brief.—The threads of the warp are separated and drawn through their appropriate heddle and dent of the reed automatically.

Claim.—1. The combination in an organized machine for drawing in warp-threads, of a frame-work, a slide adapted to guides on the same, a hooked needle carried by and adapted to a guide or guides on the slide, mechanism for imparting the within-described intermittent feed to the slide and reciprocating movement to the needle, with heddle-holders and a reed-holder, whereby the heddles and reed are retained in a position parallel, or nearly so, with each other and presented to the reciprocating needle, all substantially as set forth.

2. The combination of the intermittently-fed slide and the reciprocating hooked needle carried by the slide with mechanism whereby the said needle is caused to turn on its axis as it is concluding its outward movement and to turn back again as it commences its inward movement, substantially as described.

3. The combination of the intermittently-fed slide F, its slotted tubular casing R, and the needle Q with the guided needle-carrier *r²* and mechanism whereby the within-described reciprocating motion is imparted to the said carrier and needle, substantially as specified.

4. The combination of the intermittently-fed slide F, the slotted casing R, the needle and guided needle-carrier, the driving-shaft L, shaft *m²*, wheels *n¹* and *p¹*, and eccentric P on the said shaft *m²* with mechanism through the medium of which the eccentric is caused to reciprocate the carrier and needle, all substantially as described.

5. The combination of the intermittently-fed slide, the slotted casing R on the same, the needle, the needle-carrier adapted to guides on the slide, the driving-shaft L, the eccentric P, and mechanism by which it is driven from the said shaft L, with the eccentric-rod *h'*, arm *i²*, rod *h²*, arm *i'*, and link *f''*, all connected directly or indirectly to the said slide, substantially as set forth.

6. The combination of the slide F, the feed-screw G, and mechanism for intermittently turning the same, the shaft *n*, and the worm-wheel H, constructed to turn with but slide to a limited extent on the shaft, with the devices, substantially as described, through the medium of which the said shaft *n* can be locked and released, as set forth.

7. The combination of the slide F, the feed-screw G, and mechanism for intermittently turning the same, with the worm-wheel H, the shaft *n*, having its bearings in the slide, the hand-wheel I on the shaft, the post *p*, and the nut *k*, adapted to the threaded upper end of the said shaft *n*, all substantially as specified.

8. The shaft L, the wheel N, the belt-pulley thereon, both being loose on the said shaft, the shaft *r*, geared to said shaft, and the friction-wheel *q*, constructed to slide on but turn with the said shaft *r*, in combination with devices whereby the friction-wheel can be moved to and fro on its shaft, all substantially as described.

9. The combination of the shaft L, the wheel N, and its belt-pulley, both loose on the said shaft, the shaft *r*, geared to the said shaft L, the friction-wheel *q* on the said shaft *r*, an arm or lever, P, a spring for causing the arm to move the said wheel N away from the friction-wheel, and a catch, *60*, or other equivalent retainer for causing the said arm P to maintain the wheel N in contact with the friction-wheel, in opposition to the action of the spring, all substantially as set forth.

10. The combination of the driving-shaft L, the slide F, mechanism through the medium of which the slide is intermittently fed by the said shaft, the needle carried by the slide, devices through the medium of which the said needle is reciprocated by the said shaft L, and a device whereby the actuating mechanism of the slide may be disconnected from that which actuates the needle, substantially as set forth.

11. The combination, in an organized machine for drawing in warp-threads, of the following elements, namely: first, the slide F and needle Q; second, mechanism for intermittently feeding the said slide and needle and reciprocating the latter; third, a device for retaining the whole of the warp-threads; fourth, a carrier, T, having a sharp bearing-edge, *d²*, for warp-threads; and, fifth, devices whereby the said carrier is caused to traverse in unison with the slide, all substantially as set forth.

12. The combination of the intermittently traversed and reciprocated hooked needle, a carrier, T, traversed in unison with the needle and provided with a sharp bearing-edge, *d²*, for the warp-threads, and a hook, with mechanism for oscillating the same and causing it to seize a warp-thread directly from the said sharp bearing-edge and move it within range of the needle, substantially as set forth.

13. The intermittently traversed and reciprocating needle Q, a traversed carrier, T, provided with a sharp bearing-edge, *d²*, for warp-threads, a recess, *m²*, in the said carrier, and the horizontal disk B', provided with a hook, in combination with mechanism for operating the disk and causing its hook to seize the last warp-thread of the series bearing against the said sharp edge *d²*, all substantially as set forth.

14. The combination of the traversed carrier T, provided with a bearing-edge, *d²*, the disk B' and pivoted hook, and mechanism for operating the disk, with nippers A' and devices for operating the same and causing them to seize a number of warp-threads and direct them toward the periphery of the disk, all substantially as set forth.

15. The carrier T, having the bearing-edge *d²* and projection *e²*, all being constructed substantially as described.

16. The carrier T, having the bearing-edge *d²* and the projection *e²*, provided with an adjustable shoe, *d³*, all being constructed substantially as set forth.

17. The carrier T, provided with the bearing-edge *d²*, rounded at its outer end, and with the projection *e²* and its shoe *d³*, also rounded at its outer end, all being constructed, as set forth, so as to present a flaring entrance, *c²*, to the space between the said bearing-edge and shoe, substantially as specified.

18. The combination of the within-described disk B', having a curved slot, 58, with the pivoted hook O' and spring *o²* for acting on the same, all being constructed substantially as described.

19. The combination of the within-described disk and its pivoted hook with a carrier, T, having a recess, *m²*, and a groove in the walls of the recess for receiving the point of the hook, all being constructed substantially as set forth.

20. The combination of the disk having a groove in its periphery and a pivoted hook with the carrier T, having the recess *m²* and a groove in the walls of the recess, all being constructed substantially as described.

21. The combination of the disk B', having a groove in its periphery, with the carrier T, provided with a plate, *d⁴*, the edge of which constitutes the bearing-edge *d²* and the inner end of which enters the groove in the said disk, all being constructed substantially as specified.

22. The combination, with the disk B', of the carrier T, having the projection *e²*, provided with a shoe, *d³*, formed with a central notch for the passage of the hook of the disk, and a projection overlapping and another underlapping the same, all being constructed substantially as described.

23. The combination of the oscillated disk with its pivoted hook, and devices, substantially as described, for regulating the extent of the outward movement of the hook, as set forth.

24. The combination of the carrier T, having the bearing-edge *d²*, with a rubbing device connected with the carrier and mechanism for causing the said device to act on the threads below the said bearing-edge, all substantially as set forth.

25. The combination of the carrier T, having the bearing-edge *d²*, with the lever *h²* and mechanism for operating the same, substantially as described.

26. The combination of the nippers A' and mechanism for operating the same, and the carrier T, having the bearing-edge *d²* and projection *e²*, with the pivoted lever *h²* and mechanism for operating the same, substantially as specified.

27. The combination of the nippers A' and mechanism for operating the same with the stops *i²* and *h²*, substantially as specified.

28. The carrier T and the within-described nippers, consisting of a bar, g^{10}, pivoted at F to the said carrier, and a jaw, g^9, pivoted to the said bar, in combination with mechanism, whereby both bar and jaw are vibrated, and whereby the jaw is opened and closed, substantially as described.

29. The combination of the carrier T with the nippers consisting of the bar g^{10}, pivoted to the said carrier, and the jaw g^9, pivoted to the said bar g^{10}, with the shaft a^2, the driving-shaft L, mechanism by which the said shaft a^2 is driven from the shaft L, the cam F, the lever h^2, a spring acting on the jaw, a crank, b^2, on the said shaft a^2, and mechanism whereby a vibrating motion is imparted from the said crank to the bar g^{10} and jaw g^9, all substantially as set forth.

30. The combination of the carrier T, having the recess m^2, the disk B', the fixed shaft n^2, on which the disk is caused to oscillate, the nut p^2 on the shaft, and the spring q^2, all being constructed substantially as set forth.

31. The combination of the reciprocating and traversed needle Q, the oscillated disk B', and its pivoted hook with the plate c^4, substantially as described.

32. The combination of the hooked needle and mechanism for reciprocating and traversing the same and turning it on its axis, and devices for holding the warp-thread, with mechanism for seizing the warp-thread and presenting it to the needle, all substantially as set forth.

33. The combination of devices for holding a heddle with the shaft p^4, mechanism for imparting the within-described intermittent vibrating motion to the shaft, the separating-arm q^4, constructed to slide on and vibrate with the shaft, the intermittently-fed slide F, and grooved attachments thereto for receiving the lower edge of the said separating-arm, all substantially as specified.

34. The combination of the intermittently vibrated and traversed separating-arm q^4 and its finger c^3 with the heddle-holders and mechanism for imparting a reciprocating endwise motion to the said holders, substantially as described.

35. The combination of the reciprocating and intermittently-traversed needle, the heddle-holders, the separating-arm q^4, and finger c^3 with mechanism for vibrating the said arm and finger and traversing both in unison with the traverse of the needle, all substantially as set forth.

36. The combination of the reciprocating and traversed needle Q, the intermittently-vibrated separating-arm q^4, holders for the heddles, the finger b^3, and mechanism whereby the said finger is actuated to operate on a heddle-eye, and is traversed in unison with the needle, substantially as set forth.

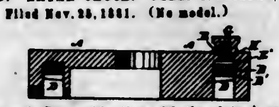
37. The combination of the intermittently traversed and reciprocated needle Q with the fingers c^4 and b^3, and with mechanism for traversing the said fingers in unison with the traverse of the needle, and for imparting the within-described movement to the fingers, substantially as described.

38. The combination of the separating-arm q^4 and the fingers c^4 and b^3 with mechanism for operating the same, substantially as described.

39. The combination of the finger b^3 with the yielding finger c^4, adapted to bear against the said finger b^3, substantially as specified.

40. The combination of the vibrated fingers c^4 and b^3 with the heddle-holders and mechanism for imparting a reciprocating endwise motion to the carrier, substantially as described.

41. The combination of the intermittently-vibrated separating-arm q^4 and the vibrated fingers with the reciprocated needle Q and mechanism whereby the said arm, fingers, and needle are traversed simultaneously, substantially as set forth.



42. The combination of the reciprocating and traversed needle Q with the stripper c^5 and mechanism whereby the said stripper is caused to draw the thread away from the needle, substantially as described.

43. The combination of the heddle-holders and the bar t^5, constructed for attachment to and removal from the lower bar, g, of a heddle, with the bar u^5 and links w^5, substantially as described.

44. The within-described reed-holder, the same consisting of supports carried by the frame-work and adapted to the lower bar of the reed, the shaft e, adapted to bearings in the frame-work, arms on the said shaft, and retractile rods a a, carried by the arms and slotted to receive the ends of the reed, all substantially as set forth.

45. The combination of the reciprocating and traversed needle Q, the weighted lever c^6 and its plate g^6, both traversed in unison with the needle, the wheel N, a friction-wheel through the medium of which the said wheel is caused to drive the machine, an arm for controlling the wheel, a retainer for maintaining it in contact with the friction-wheel, and mechanism whereby the said lever in falling is caused to release the retainer and permit a spring to move the wheel N away from the friction-wheel, all substantially as set forth.

255,039. LATHE-CHUCK. JAMES H. SKINNER, New Britain, Conn. Filed Nov. 25, 1881. (No model.)

Claim.—1. In combination with the plate A and cam-ring B of a lathe-chuck, the clamping device consisting of the pin E, with its plate E', and the head G, said pin being separate from the said ring, and constructed and operating substantially as described.

2. In a lathe-chuck, the plate A, provided with the slot A' and locking-recess H, for holding the head D in position when clamped, in combination with the pin E, head G, and cam-ring B, substantially as described.

3. In a lathe-chuck, an independent pin moving in a groove or slot in the plate A, and adapted to be clamped to said plate, and fitting loosely into a hole in the ring B, whereby said ring may be moved radially and clamped in position without being attached to said pin, substantially as described.

255,040. CORDAGE AND TWINE DESIGNED TO BE USED IN BINDING SHEAVES OF GRAIN. SMITH A. SKINNER, Mechanic Falls, N. Y. Filed Apr. 26, 1880. (Specimens.)

Claim.—An improved cord or twine for binding sheaves of grain, adapted to simultaneously resist attacks of mice, crickets, grasshoppers, and like vermin, by containing among its fibers a deposit of sulphate of zinc or other analogous material, which is repugnant to the taste of such vermin or insects, and to resist the ravages of rot, decay, and spontaneous combustion, by having been treated with a hydrocarbon, substantially as specified.

255,041. WATER AND FIRE PROOF ROOF-PAINT. WILLIAM SLEEPER, Goshen, Ind., assignor of one-half to Llewellyn Wagner, same place. Filed Jan. 16, 1882. (No specimens.)

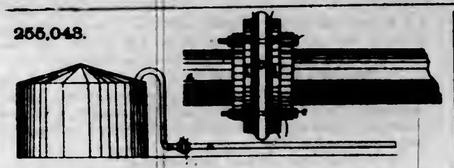
Claim.—A water and fire proof paint consisting of the following ingredients: boiled linseed-oil, Venetian red, plaster-of-paris, coal-tar, shellac, japan, and asbestus, substantially in the proportions named.

255,042. METHOD OF AND APPARATUS FOR BREAKING DOWN OR GETTING COAL, &c. CHARLES SEBASTIAN SMITH, Leicester, County of Leicester, and THOMAS HOOKS, Shipley, County of Derby, England. Filed Feb. 21, 1882. (No model.) Patented in England May 4, 1881.

Claim.—1. The method of breaking down or getting coal and other minerals by the introduction into bore-holes of caustic lime, which, after compression and confining by tamping or otherwise, is brought into contact with water or other suitable liquid along the entire or greater part of the length of the charge, so as by the expansion of the lime and pressure of the steam generated to produce sufficient force for breaking down the mineral, substantially as herein described.

2. For breaking down or getting coal and other minerals, a cartridge formed of compressed caustic lime, having one or more longitudinal grooves or passages to serve as channels for the introduction of water.

3. In combination with cartridges or charges of caustic lime, a perforated or slotted or permeable tube placed along the side or through the body thereof, and serving to bring water into intimate contact therewith, substantially as herein described.

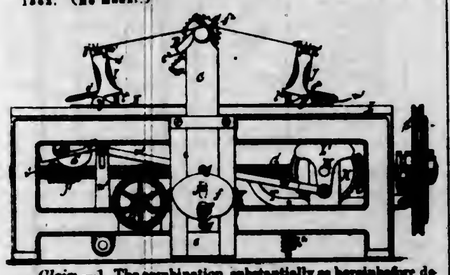


4. In combination with the perforated or slotted tube for lime-cartridges, a covering of woven fabric for preventing the lime from entering the holes of the tube, substantially as described.

255,043. PROTECTING OIL-TANKS FROM LIGHTNING. GEO. O. SMITH, Clear Creek, N. Y. Filed May 31, 1881. (No model.)

Brief.—Between flanged couplings on the inlet-pipe is fastened, by insulated bolts, an insulator, and attached to the pipe at the coupling are conducting-rods extending down to moist earth.

Claim.—1. In an insulating device for protecting oil-tanks from lightning, the combination with the flanged couplings with the insulator secured thereto by insulated bolts, the coupling being



255,043.

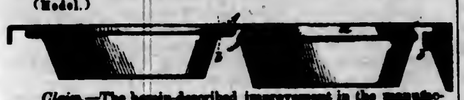
provided with a suitable conductor or conductors, substantially as shown and described.

2. The combination of an oil-tank, its metallic pipe-line, and one or more conducting rods or wires connected to said pipe-line and extending to moist earth, substantially as and for the purpose described.

255,044. MACHINE FOR POLISHING THE EYES OF NEEDLES. IRA T. SMITH, Mount Carmel, Conn. Filed Jan. 28, 1881. (No model.)

Claim.—1. The combination, substantially as hereinbefore described, of the needle-clamp, the thread-clamps, the needle-clamp holder, and mechanism, such as herein described, for imparting to the needle-clamp holder three distinct movements, viz: an up-and-down movement, a lateral reciprocating movement, and a partly-revolving or oscillating movement.

2. The combination, substantially as hereinbefore described, of the needle-clamp, the thread-clamps, the needle-clamp holder, and mechanism, substantially such as herein described, for imparting to the thread-clamps a longitudinal reciprocating movement and to the needle-clamp holder three distinct movements, viz: an up-and-down movement, a lateral reciprocating movement, and an oscillating movement.



3. The combination, substantially as hereinbefore described, of the table K, carrying the thread-clamps I J, mechanism for imparting to this table a reciprocating longitudinal movement, the slides C C', fitted between the guides e, cams f f', and shaft E, the needle-clamp holder B, supported by pivots d, secured in the slides C C', the arm m, engaging with the needle-clamp holder, cam q, acting on said arm, and mechanism connected with the aforesaid shaft for operating the cam.

4. The combination, substantially as hereinbefore described, of the slides C C', the needle-clamp holder B, supported on pivots d, which are fastened in said slides, gear-wheel d', mounted on the needle-clamp holder, segment w, pivoted to the slide C', cam d^2, for imparting to this segment an oscillating motion, a shaft, G, and mechanism connected therewith for operating the said cam.

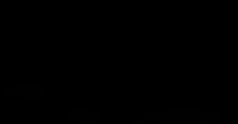
5. The combination, substantially as hereinbefore described, with the needle-clamp, the needle-clamp holder, the thread-clamps, the mechanism for imparting to the thread-clamps a longitudinal reciprocating motion, the mechanism for imparting to the needle-clamp holder three distinct movements of the cam-disk E, having pins f^3, a clutch mechanism controlled by said cam-disk for automatically stopping all the movements at the desired intervals, and a disk, U, having pins t^3, said parts being organized for operation substantially as described.

6. The combination, substantially as hereinbefore described, of the thread-clamp constructed of two jaws, I w', a pivot, t', on which said thread-clamp swings, the tension-springs t^3, the cam u', and the eccentrics v^3.

255,045. PATTY-PAN. JOSEPH SMITH, Portland, Conn., assignor to John H. Ingersoll, same place. Filed Dec. 30, 1881. (Model.)

Claim.—The herein-described improvement in the manufacture of patty-pans, consisting in the plate A, constructed with the flange a turned downward around the pan-opening, the pan, constructed with the shoulder b near its upper edge to set on over the downwardly-projecting flange of the plate, and then the edge of the pan and the flange struck together, to close the flange between the edge of the plate and the shoulder and secure the parts to the under side of the plate, substantially as described.

255,046. LATHE-CHUCK. JOHN C. STEVENS, New Haven, Conn. Filed Nov. 25, 1881. (No model.)



Claim.—1. The combination, with the shell of a chuck having recessed enlargements, of spindles provided with collars to bear against the inner walls of the recesses in the enlargements, and bushings secured in said recesses and arranged to bear against the said collars and hold the spindles in position.

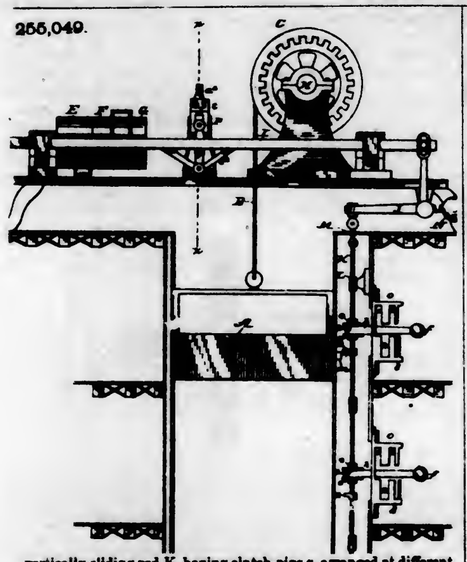
2. The combination, with the shell of a chuck having recessed enlargements, of spindles provided with collars to bear against the inner walls of the recesses in the enlargements, bushings to bear against the said collars, and dowel-pins to hold the bushings in position.

255,047. FIRE-EXTINGUISHER. CHAS. W. TALCOTT, Woonsocket, R. I. Filed Dec. 10, 1881. (No model.)

Brief.—A rose-distributer for fire-extinguishers, having a cone-shaped plug, H, soldered at C, to retain the water in the pipe. In case of fire the fusible solder melts and the plug H falls to the bottom of the distributer, where, presenting a concave surface to the water, it assists in throwing the water outwardly.

Claim.—In an automatic fire-extinguishing nozzle, the pointed cone-shaped plug H, having the concave rear face, l, and the guide-stem s, rigidly attached thereto, these parts being adapted to operate in connection with the pipe A, having the annular bearing b, and the perforated cross-bar d, and the perforated bulb or cap D, substantially as specified.

255,048. TIMBER-RAFT. ROBERT E. TERRY, Bay Minette, Ala. Filed July 18, 1881. (No model.)



Claim.—A raft of logs bound together by the rods C and D and the tie-rods or wire a, the rod C passing through all of the logs of the raft near the ends of the logs, the rod D passing through the outside logs and over the center logs, the center logs being tied to the rod D by the rod or wire a, substantially as and for the purpose set forth.

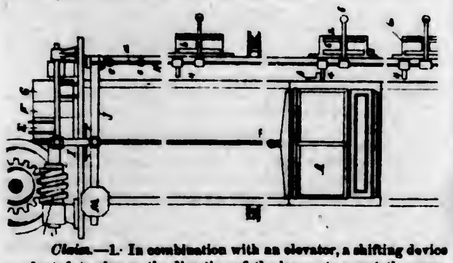
255,049. ELEVATOR. GEORGE C. TEWKESBURY, Lynn, Mass. Filed Oct. 3, 1881. (No model.)

Claim.—1. The combination of the lever J, pivoted as shown, the pulleys E F G and intermediate belt-shifting devices, the revoluble vertically-sliding rod K, having suitable clutch-pins, a, arranged at different points on the rod, to project in different directions therefrom, the handles f, fulcrumed as shown, and the intermediate gearing mechanism, whereby the rod K may be turned and vertically reciprocated, substantially as described.

2. The combination of the lever J, pivoted as shown, the pulleys E F G and intermediate belt-shifting devices, the revolable

255,049.

vertically-sliding rod K, having clutch-pins *a*, arranged at different points on the rod, to project therefrom in different directions, substantially as described, the lever-handles *f*, fulcrumed as shown, the indicators O, for determining the relative position of the clutch-pins *a*, and the intermediate gearing mechanism, whereby the rod K may be turned, substantially as set forth.



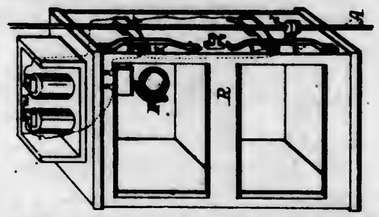
3. In an elevator of substantially the construction described, the combination of the revoluble vertically-reciprocating rod K, provided with clutch-pins *a*, gear-wheels *b*, and suitable disks *c*, said pins, gears, and disks being arranged upon the rod at different points, with the pins *a* projecting therefrom in different directions, substantially as described, the centrally-pivoted lever-handles *f*, having toothed plates on one end to mesh with the gears on the rod, and suitable indicating mechanism for locating the relative position of the clutch-pins *a*, substantially as set forth.

4. The combination, substantially as described, of the elevator-box A, the detachable block 12, the lever pivoted to the detachable block and provided with projecting tongues, as shown, and mechanism for pushing forward the lever, so as to keep the tongues in position, substantially as described.

5. The combination, with the movable lever on the elevator-box, of the stud-pins 15, attached to the wall of the building, adapted to automatically engage with the tongue 14 on the lever when the box is reciprocated, so as to throw the tongue 10 on the lever out of engagement with the clutch on the rod K, substantially as described.

6. The within-described indicator O, which consists of a semi-cylindrical case having two systems of vertical slots, one on each side of a central horizontal opening, with the vertical slots on one side communicating with the horizontal opening alternately with the vertical slots on the other side thereof, all of said openings being adapted to receive the handle *f*, and the vertical slots being numbered, as shown.

255,050. ELEVATOR-STOP. GEORGE C. TOWKSBURY, Lynn, Mass. Filed July 14, 1881. (No model.)



Claim.—1. In combination with an elevator, a shifting device adapted to change the direction of the box or to arrest the same, and an automatic stop mechanism adapted to be set for any given station or floor and to be acted on by the box to arrest the same when it reaches that point, all substantially as described.

2. The combination of the lever I J, pivoted as shown, the pulleys E F G, and the intermediate belt-shifting devices, the vertically-sliding rod K, and the handles 5 5 5, arranged at different points on the shaft and provided with suitable locking mechanisms, substantially as described.

3. In combination with a connecting-rod, K, provided with handles 5, and suitable projecting pins 4, an indicator, substantially as set forth, whereby the position of said pins may be regulated, as and for the purposes described.

255,051. ELEVATOR. GEORGE C. TOWKSBURY, Lynn, Mass. Filed Jan. 18, 1882. (No model.)

Claim.—1. In combination, an elevator-car, a shipper-rod having radial projections, an indicator, a handle for giving rotary motion to the said shipper-rod, and an independent pivoted lever for moving the said rod vertically, whereby the belts are shipped.

2. The combination of the shipper-rod having radial projections, the indicator-box having a gage or scale, and a handle having an index-hand and adapted to move horizontally in the slot in the indicator-box.

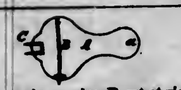
3. In an elevator, the combination of the shipper-rod having the elongated pinion, the handle D, having the rack, and the pivoted lever connected to the shipper-rod.

4. The described indicator consisting of a box or case having a double gage or scale and a central horizontal slot, in combination with the handle having an index-hand for each of said gages.

5. In combination with the shipping-lever having projections adapted to be set in the path of the elevator-dog, a device carried by the car, adapted to close an electric circuit by contact with one of the said projections, and thereby operate an alarm.

6. The combination of the plates 12, the spring 7, the battery, the alarm, and suitable electrical connections with the spring 9 and the shipper-rod.

255,052. SAFETY-LAMP. CELESTUS G. TINGLY and GEORGE A. SIPPAIT, Portland, Oreg. Filed Dec. 1, 1881. (No model.)



Claim.—A glass lamp formed with the inner and outer shells, A B, connected with each other at the top and with the pedestal at the bottom, but diverging from these points toward the middle, thereby surrounding the upper and lower parts of the sides of the oil-reservoir with the gas-chamber, as shown and described.

255,053. WORK-HOLDER. GEORGE B. TYLER, Palmyra, N. Y. Filed Dec. 16, 1881. (No model.)

Claim.—As an improved article of manufacture, a holder for materials upon which work may be done by hand, consisting of a back plate, A, having a pin or pins, B, set at right angles to the main line of said plate, and holding-brads C, said pin or pins B being nearer to the holding-brads C than to the rear end, *a*, of said back plate, substantially as and for the purposes herein set forth.

255,053.

255,054. CAR-STARTER. CHARLES B. UNDERHILL, Lancaster, N. Y. Filed Aug. 6, 1881. (No model.)

Claim.—1. A car-starter constructed substantially as herein shown and described, consisting of a wedge-shaped lever working between a pair of wedge-shaped clamps to which the lever is attached by a fulcrum-bolt, as set forth.

2. In a car-starter, the combination, with the sectional clamp E E, of the lever A, having a wedge-shaped section and pivoted between the said clamp-sections, substantially as and for the purpose set forth.

3. In a car-starter, the combination, with the sectional clamp E E, of the pivoted lever A, having a wedge-shaped section and provided with the roller B, substantially as and for the purpose set forth.

4. In a car-starter, the combination, with the lever A and the bolt D, of the sectional clamp E, having inclined inner faces, slotted holes *f f*, and outward-inclined outer faces, *g g*, above the slotted holes, substantially as and for the purpose set forth.

255,055. SULKY. JOHN V. SPINGTON, Lexington, Ky., assignor of one-half to James T. Spington, same place. Filed Jan. 16, 1882. (No model.)

Claim.—1. In a sulky or two-wheeled vehicle having shafts attached to the axle, the combination, with cross-pieces connecting said shafts, and provided with rubber cushions or springs, of seat-spring supports the forward ends of which bear upward against the springs on the forward cross-piece and downward on the springs attached to the rear cross-piece, and an adjustable foot-brace attached to said seat-supports, substantially as shown and described.

2. In a sulky, the combination, with shafts connected by cross-pieces and provided with slotted plates, of spring-seat supports having an adjustable foot-brace attached thereto and provided with pivot-plates adapted to engage with the slotted plates on the shafts, whereby the seat-supports and foot-brace may be adjustably secured in any desired position, substantially as shown and described.

3. In a sulky, the combination, with the shafts having suitable front and rear cross-bars and provided with plates having a series of slots or notches, of spring-seat supports arranged to bear upward against the front cross-piece and downward on the rear cross-piece, and provided with pivot-plates adapted to engage with the slotted plates on said shafts, whereby the supports may be adjusted forward or back, substantially as shown and described.

4. In a sulky, the combination, with the spring-seat supports H H, having slotted plates K K, of the suspended foot-brace I, having sliding bolts K' K', whereby said foot brace or support may be adjusted to regulate the distance between it and the seat, substantially as shown and described.

5. In a sulky, the combination, with the shafts C C, connected by cross-pieces D E, and having slotted plates M and springs F F', of the spring-seat supports H H, having pivot-plates N, adapted to engage with the slotted plates on the shafts, and an adjustable foot-brace, I, consisting of curved bars *a a* and cross-pieces *b b*, substantially as shown and described.

255,056. ELECTRICAL SWITCH-BOARD. THEODORE N. VAIL, Boston, Mass. Filed Dec. 14, 1881. (No model.)

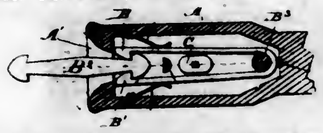
Brief.—Improvement on Letters Patent No. 249,874, dated November 15, 1881, granted to Francis Blake. The plates are made very thin, and the contacting surfaces of the plugs are wider than the thickness of the plates to insure a connection. To prevent contact with two or more plates at the same time, their contacting portions are so arranged that no two consecutive plates are in the same vertical line.

Claim.—1. In an electric switch-board, the combination of the perforated connection-plates, the interleaved insulating-plates correspondingly perforated, and the switch-plugs constructed and arranged substantially as described, so that said plugs, when inserted, have a bearing extending over two or more such connection-plates, but in electrical contact only with the desired one of said connection-plates, as set forth.

2. In a series of connecting-plates separated by interleaved insulating-plates and piled one upon another, holes provided with conducting segmental contact-pieces, each of said contacts forming the arc of a circle and so arranged that the contacts in the holes of each plate shall occupy a relatively-different position in the said circle to that of the segmental contact in the holes of the conducting plate or plates adjacent thereto on either side, for the purpose specified.

3. In a switch-board of the class hereinbefore described, the combination of line-plates having the specially conformed or slotted holes and the connecting-plates having corresponding holes, each provided with a segmental conducting-surface differing in position for each consecutive plate, with the plug-connector, corresponding in shape at its shoulder to the conformation of the line-plate hole, and having its inner extremity adapted to make contact electrically with the desired connecting-plate only at that point of its peripheral surface which, when the plug is properly inserted, faces the said segmental conducting-projection of the connecting-plate hole, for the purpose specified.

4. The hereinbefore-described connecting-plug, adapted by a specially-conformed conducting-shoulder to fit and make contact with the line-plate only when properly inserted therein, and by a conducting-strip at one portion of the longitudinal surface of its foot or inner end (all other portions of said surface being insulated) to make a complementary contact to the required connection-plate, and consisting of the said conducting-shoulder, a contact-maintaining device therefor, the said foot or inner extremity, a conducting-shank, electrically connecting the said shoulder with the foot or opposite end, and a handle, substantially as and for the purpose specified.



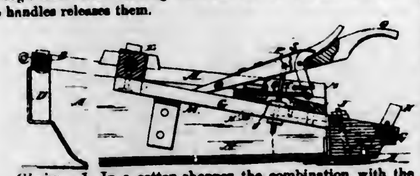
5. In a switch-board comprising a series of conducting-plates, each separated from its contiguous conducting-plate by an alternating succession of non-conducting plates or diaphragms, the whole piled one upon another, conducting-plates perforated with holes extending through the series and provided with segmental contact-pieces, each of said contacts forming the arc of a circle and so arranged that the contacts in the holes of each plate shall occupy a relatively-different position in said circle to that of the contact-piece in the holes in the connecting plate or plates adjacent thereto on either side, combined with a connecting-plug having at its inner extremity a conducting-strip opposite the projection in the hole of the desired connecting-plate, but being at all other points of the longitudinal surface of said inner extremity faced with non-conducting material, whereby contact is made only with the required connecting-plate, the contact-pieces of other contiguous connecting-plates impinging only upon the non-conducting face of the plug end, as described.

6. In a switch-board, the combination, substantially as hereinbefore described, of the connecting-plates, piled alternately with non-conducting plates or dielectrics, and having holes extending through the series fitted with conducting segmental projections, as specified, the line-circuit plates, each perforated with a hole corresponding to and forming part of the holes through the connecting-plates, but specially adapted to fit the shoulder of the plug-connector when properly inserted, and a connecting-plug, constructed as indicated, to make contact when properly placed in the line-plate hole and with that connecting-plate only which presents

a conducting-projection opposite and on the same plane as its own conducting-surface.

7. The combination, in a switch-board of the class specified, of the line-plate *c*, having the specially-conformed hole extending through the same, a circuit-closer, and a connecting-plug adapted to fit accurately in the specially-conformed hole when properly inserted therein, and by the act of insertion to operate the said circuit-closer and break the continuity of the line, substantially as described.

255,057. CAR-COUPLING. CHARLES VAN SMITH, South Bend, Ind. Filed Dec. 26, 1881. (No model.)



Claim.—1. In an automatic coupling device, the combination, with the draw-head A and the coupling-jaws B B', of the double elongated cams C C', whereby the process of uncoupling may be performed from the top of the car or from either side, substantially as described.

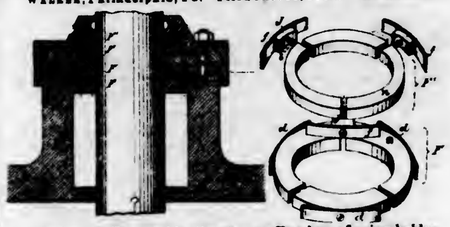
2. The combination, with the elongated cams C C', of the dowel-pin P, whereby the cams are retained in their proper position relative to each other and each adapted to be rotated independently of the other, substantially as and for the purpose set forth.

255,058. COTTON-CHOPPER. JOHN M. WALDEN, Fort Valley, Ga. Filed Dec. 13, 1881. (No model.)

Brief.—A runner-frame—a central rock-shaft rigidly secured to the front ends of the drag-bar frame. Half the drag-bars carry horizontal hoes, and each alternate bar a pair of guard-plates. Sprieg-latches hold the drag-bar frame down. An elbow-lever at the handles releases them.

Claim.—1. In a cotton-chopper, the combination, with the runners A and the rock-shaft E, of the beams F, carrying the chopping-hoes H I J, and alternating beams G, carrying the guard-plates K, substantially as herein shown and described, whereby the plants are chopped to a stand and the plants left for a stand are protected from injury, as set forth.

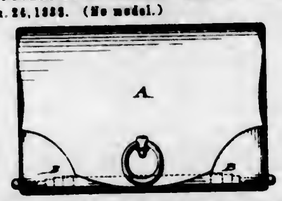
2. In a cotton-chopper, the combination, with the runners A, the rock-shaft E, and the intermediate beams, G, of the plates K, substantially as herein shown and described, whereby the crust of the soil is cut at the opposite sides of the plants left for a stand and the said plants protected from the soil moved by the chopping-hoes, as set forth.



3. In a cotton-chopper, the combination, with the handles O, the side beams, F, and the runners A, of the bent lever R, the spring S, the rods T, and the latches U, having pins V, substantially as herein shown and described, whereby the beams can be locked in place and unlocked, as set forth.

255,059. ANIMAL-TRAP. ADDISON W. WALKER, Erie, Pa. Filed Jan. 6, 1881. (No model.)

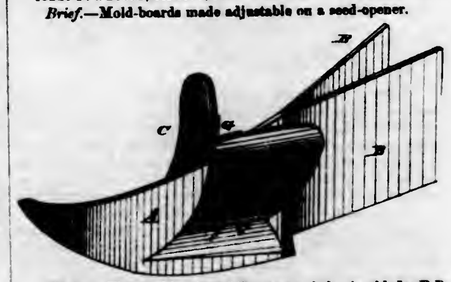
Claim.—An animal-trap consisting of a base-block, A, having a block, B, of less diameter attached centrally thereto, thus forming a circumferential ledge or shelf, in combination with a series of spring-falls which have their triggers on said block B, and when sprung fall upon said ledge, substantially as shown.



255,060. STUFFING-BOX FOR STEAM-ENGINES. THOMAS WALKER, Philadelphia, Pa. Filed Jan. 13, 1882. (No model.)

Claim.—1. The combination, in a stuffing-box, of a ring-holder or cap, with a pair of segmental packing-rings, F F', arranged one above the other, the ring F' being of less width than the ring F and having its joints closed by external caps, J, which have a bearing upon said ring F, as set forth.

2. The combination of the ring-holder or cap, the segmental ring F and its springs *d*, the segmental ring F', and the caps J with springs *f* and projecting pins or bolts *i*, as set forth.

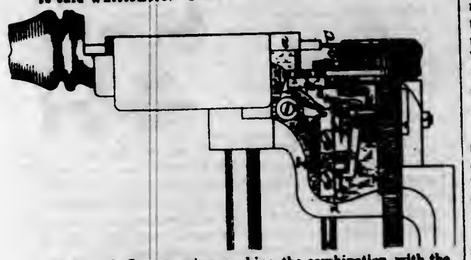


255,061. POCKET-BOOK. HERMANN WALTHER, New York, N.Y. Filed Jan. 26, 1882. (No model.)

Claim.—In a pocket-book, the combination, with the body A of a recessed barrel, B, having a spring-actuated slide-piece, *b*, the barrel being arranged near the bottom of the body, and of a locking-hook, C, secured to the cover and adapted to pass through a recess or perforation of the body A, in front of the recess of the barrel, into the latter, so as to be locked or released by the slide-piece of the barrel, substantially as set forth.

255,062. FURROW ATTACHMENT FOR SEED-PLANTERS. ISAAC P. WATSON, Clifford, Ind. Filed Jan. 5, 1882. (Model.)

Brief.—Mold-boards made adjustable on a seed-opener.



Claim.—The combination of the runner A, having blades B P and bolts D, with the mold-boards C C, having brackets F, provided with vertical slots E, and the bridge-piece G, substantially as and for the purpose set forth.

255,063. SAMPLE-DISPLAYING LID. WILLIAM H. WEBELER and THOS. F. WEBELER, Cape Girardeau and JOHN B. WEBELER and CHARLES M. BLACK, Jackson, Mo. Filed Nov. 1, 1881. (No model.)

Claim.—In combination with a packing-case, K, a sample-displaying lid consisting of the frame A, having the upper glass slide, B, and the lower slide, C, the said frame being hinged to a detachable strip, D, as shown and described.

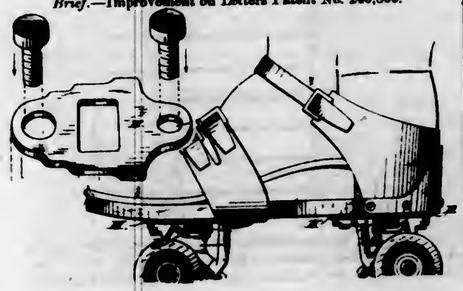
255,064. PEGGING-MACHINE. DAVID WHITTEMORE and ANDREW EPPLER, Jr., Quincy, Mass.; said Eppler, assignor to said Whittemore. Filed Jan. 9, 1882. (No model.)

Claim.—1. In a pegging-machine, the combination, with the peg severing and driving mechanism, of the movable carrier adapted to hold two peg-strips, means for reciprocating said carrier, so as to cause it to present either strip to the severing and driving mechanism, two feed-rolls, one for each strip, feed-operating mechanism operated by the power of the machine, and automatic means whereby said operating mechanism is connected at each movement of the carrier with the feed-roll of the strip presented to the driver and disengaged from the other feed-roll, as set forth.

2. In a pegging-machine, the combination, with the peg severing and driving mechanism, of the movable carrier I, adapted to hold two strips of peg-wood, and provided with the guide-plates H H, projecting into a recess in the fixed head in which the driver reciprocates, as set forth.

3. In a pegging-machine, the combination, with the peg severing and driving mechanism, of the movable carrier adapted to hold two peg-strips, means for reciprocating said carrier, so as to cause it to present either strip to the severing and driving mechanism, two feed-rolls, J J, supported by and moving with the carrier, and the bent spring K, adapted to press each strip of peg-wood against its feed-roll, and pivoted to a fixed support, whereby the spring is enabled to swing back and forth and accommodate itself to the movements of the carrier, as set forth.

4. The combination of the peg severing and inserting mechanism, the movable carrier I, having the feed-rolls J J', the block Q, pivoted to a sliding support, R, and provided with pawls P P', adapted to engage respectively with the ratchets of the rolls J J', the arm U, attached to the carrier I and engaged with the pivoted block Q, whereby when the carrier I is moved one or the other of said pawls is automatically engaged with its ratchet, according to the direction in which the carrier I is moved, and mechanism for reciprocating the sliding support R and the pawls P P', as set forth.



5. The movable carrier I, having duplicate feed-rolls J J' and pressure-spring K and the duplicate adjustable edge-guides M M', as set forth.

6. The combination, with the movable carrier I, having the duplicate strip holding and feeding devices and the slotted arm *e*, of the means for moving or adjusting said carrier, said means consisting of the pivoted lever *g*, engaged with the slotted arm *e*, and the rock-shaft *k*, having the crank *j* and connecting-rod *i*, as set forth.

7. The combination of the movable carrier I, the pivoted lever *g*, adapted, when turned on its pivot, to move the carrier I, and the vertically-reciprocating bar *p*, adapted to insure the proper adjustment of the movable carrier in either direction.

255,065. ROLLER-SKATE. SAMUEL WIELLOW, Worcester, Mass. Filed Jan. 25, 1882. (Model.)

Brief.—Improvement on Letters Patent No. 240,890.

Claim.—1. In a roller-skate, the combination, essentially as hereinbefore described, of the foot-piece, two depending front and rear stationary brackets or hangers supporting an inclined pin arranged substantially coincident with a central longitudinal line through the foot-piece, a roller-support arranged on said pin, a flat metallic plate interposed between the said stationary brackets or hangers and the under side of the foot-piece and constituting a broad plane bearing for the said brackets or hangers, and attaching screws or bolts passing through both the brackets or hangers and the flat plate, for the purposes set forth.

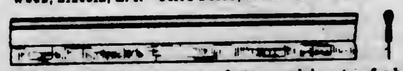
2. In a roller-skate, the metal bed-plate secured to the under side of the foot-piece and interposed between the said foot-piece and the hanger supporting the inclined pin upon which the rocking roller-carrier is mounted, said bed-plate being formed with an opening for an elastic block that is located between the foot-piece and the rocking roller-carrier, substantially as described.

3. In a roller-skate, the elastic block located between the foot-piece and the rocking roller-carrier, and provided with a tenon received in a recess in the under side of the foot-piece, substantially as described.

4. The combination, in a roller-skate, of the foot-piece with the long and short hangers supporting the inclined pin upon which the rocking bearing is mounted, and the metal bed-plate H, secured directly to the foot-piece and interposed between the foot-piece and the hangers, said bed-plate being formed at one end with an opening receiving a boss upon one of the standards, substantially as described.

255,066. PLOW ATTACHMENT. THOMAS P. WICH, Richmond, Va. Filed Dec. 9, 1881. (No model.)

Brief.—A land-side cutter to scrape the weeds and surface earth, with a vine-lifter serving as a guard, its curved rear end conducting the litter into the furrow behind the plow.



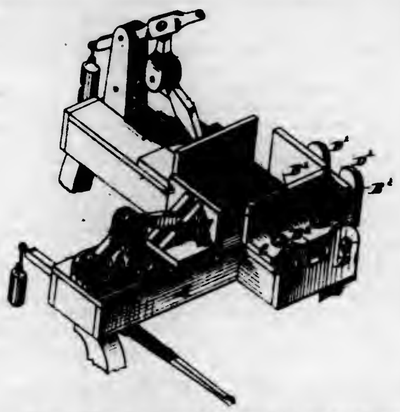
Claim.—1. The combination, with a plow, of an inclined blade, *a*, having its outer end slightly elevated above its inner end, and adjustably secured to the standard of the plow, and bent wing *h h'* at right angles to the blade and secured thereto and having its upper edge rounded, substantially as described, and for the purpose set forth.

2. The plow attachment herein described, consisting of the inclined blade *a*, provided with the shoulder *c*, arm *d*, and threaded bolt *e* at its inner end, bent wing *h h'*, secured to the outer end of the blade and having its upper edge rounded and provided with the downwardly-projecting hook *h'* at its front end, substantially as described, and for the purpose set forth.

3. The combination, with a plow-standard, *g*, provided with a series of adjusting-holes, *i*, and recesses *j*, opposite the adjusting-holes, of the inclined blade *a*, having its outer end slightly elevated above its inner end and provided with the shoulder *c*, arm *d*, and threaded bolt *e* at its inner end, and bent wing *h h'*, secured to the outer end of the blade and having its upper edge rounded, and hook *h'*, secured to or integral with the front end of the wing, substantially as described, and for the purpose set forth.

255,067. PIPING FOR BOOTS AND SHOES. CHARLES D. WOOD, Lincoln, R. I. Filed Feb. 6, 1882. (No model.)

Claim.—As an article of manufacture, a piping-strip for boot and shoe uppers, composed of a strip of leather folded on and cemented to a strip of cloth, the latter projecting at one edge of the piping-strip, substantially as and for the purpose specified.

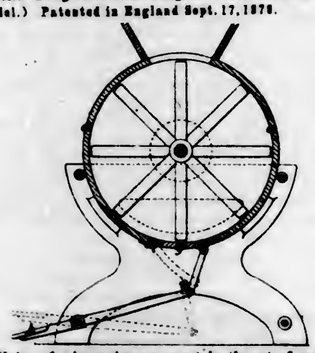


255,068. STOVE-RACK. WILLIAM H. WOODARD and LAURIE D. BRENDICE, Cleveland, Ohio. Filed Feb. 6, 1882. (No model.)

Claim.—1. A rack for the purpose described, consisting of longitudinal and end bars formed of wrought metal channeled and secured together, substantially as described.

2. The combination of lipped fastenings *b* with a rack composed of wrought-metal channeled bars, substantially as described.

256,069. BOX-PRESSING CLAMP. Charles W. Woodford, Essex, N. Y. Filed Dec. 28, 1881. (No model.)



Claim.—1. In a box-squeezing-up machine, the movable jaws, substantially at right angles to each other, operated independently through toggles by separate levers, and drawn back by counterbalance-weights, substantially as herein set forth.

2. In a box-squeezing-up machine, the movable jaws carried on dovetails resting loosely in dovetail grooves substantially at right angles to each other formed in the frame, combined with fixed abutments, as and for the purposes set forth.

3. In a box-squeezing-up machine having movable followers, the fixed plates B B', secured in position substantially at right angles to each other by adjusting-screws attached to same and working in bearings D D', substantially as herein described.

4. The combination, in a box-squeezing-up machine, of movable jaws, arranged at right angles to each other and operated independently through toggle-levers, and adjustably-secured jaws, as herein shown and described.

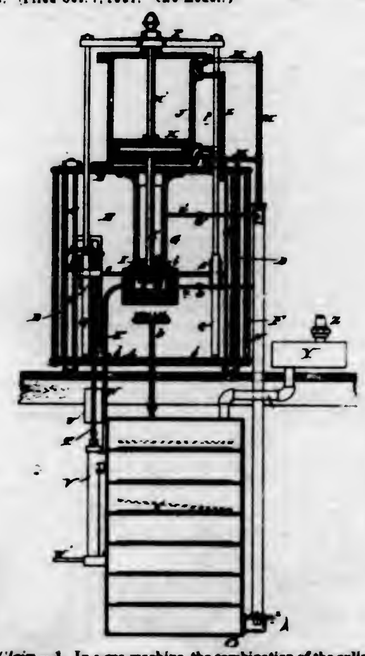
256,070. MANUFACTURE OF SOAP-POWDER AND APPARATUS THEREFOR. William Wright, Droylsden, and Thomas Bintliff, Manchester, County of Lancaster, England; said Bintliff assignor to said Wright. Filed Oct. 20, 1881. (No model.) Patented in England Sept. 17, 1878.

Claim.—1. As an improvement in the art of making powdered soap, the mode herein described of cutting, pulverizing, and mechanically compounding together the hard soap and alkali in their ordinary dry state, substantially as set forth.

2. The herein-described soap cutting and mixing apparatus, consisting of a cylinder with a feed-hopper on the top and a discharge-opening below closed by a removable door, and a rotary shaft carrying cutting-knives parallel with their lines of movement, all substantially as set forth.

3. The combination of the rotary knife-shaft and a cylinder having a hopper and a discharge-opening with a door for closing said discharge-opening and a treadle under the control of the operater for opening and closing the door, as described.

256,071. STEAM-RADIATOR. James C. Ashbrook and John F. Sutherland, Philadelphia, Pa. Filed Nov. 15, 1881. (No model.)



Claim.—The combination of the radiators A A A, provided with centrally-arranged partitions *k*, joints D, consisting of the plates *s s*, having arms upon opposite sides and cast to the sections A, the washers *e* and bolts *x x*, and the blocks M, said washers and blocks being adapted to keep the sections separate and readily detachable from each other, as shown and described.

256,072. CAR-COUPLING. Enoch H. Brooks and James H. Brooks, Jenkinsville, assignors of one-third to H. L. Bates and John H. Williams, Griffin, Ga. Filed Jan. 30, 1882. (No model.)

Claim.—In combination with the shouldered and weighted lever fulcrumed in the draw-head, the coupling pin and link, the lever being provided with an aperture at its lower end, to be engaged by the pin so as to hold the lever back and keep the shoulder away from the link, substantially as specified.

256,073. GAS-MACHINE. Edward C. Burgess, Philadelphia, Pa. Filed Oct. 7, 1881. (No model.)

Claim.—1. In a gas-machine, the combination of the cylinders G and J with their pistons I and K and piston-rods H H', cross-head P, rods *p*, carrying racks Q at their bottoms, ratchet-wheels R and R', pawls *r* and *r'*, pinions S, chain T, weight U, pump V, pipe W, and constant exhaust pipe *n*, substantially as and for the purpose specified.

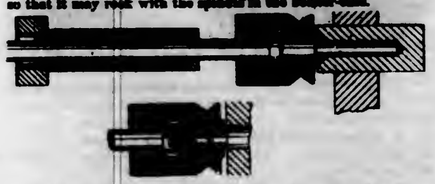
2. In a gas-machine, the sheet-iron casing D and closed head B, in combination with the hydrocarbon-vapor generator G, means to heat the same located within the casing, blast-cylinder J, and pipes L and M with their respective check-valves, substantially as shown, the suction-pipe L, opening into the casing D, as and for the purpose specified.

3. In a gas-machine, the combination of hydrocarbon-vapor-generating cylinder G, piston I, gas-main N, pipes *n* and *n'*, provided respectively with valves O and O', and oil-supply pipe W, substantially as and for the purpose specified.

4. In a gas-machine, the generator-cylinder G, provided at the bottom with a chamber, *g*, in combination with the piston I and a continuous exhaust, *n* O, for gas, and intermittent supply pipe W, for oil, substantially as and for the purpose specified.

5. In a gas apparatus, the casing D, solid head B, and perforated head or plate A, in combination with means to heat the air within said casing, cylinders G and J, with their pistons, the cylinder J being provided with suction-pipes communicating with the hot-air chamber, whereby hot air is supplied to the blast-cylinder before being mixed with the hydrocarbon vapor, and wooden casing F, as shown and described.

6. In a gas-machine, the sheet-iron casing D and closed head or plate B, in combination with the hydrocarbon-vapor generator G, means to heat the same located within the casing, blast-cylinder J, pipes L and M, with their respective check-valves, the suction-pipe L, opening into the casing D, gas-main N, and pipes *n* and *n'*, provided with valves, substantially as and for the purpose specified.



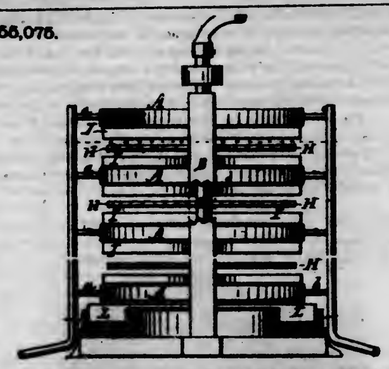
7. In a gas-machine, the generator-cylinder G, having the piston I, provided with a valve, *i*, in combination with the constant exhaust pipe *n*, for the hydrocarbon vapor, and the intermittent exhaust *n'*, substantially as shown and described.

8. In a gas-machine, the generator-cylinder G and its piston I, in combination with chamber E and its top plate, B, the hot-blast cylinder J, located above it, both of said cylinders being bolted to the said plate, hot-blast suction-pipes L, opening into the chamber E, surrounding the cylinder G, and piston K, both of said pistons being rigidly connected together by rod H, substantially as and for the purpose specified.

9. In apparatus for supplying oil to gas-machines, the combination of gear-wheel S, double ratchet-wheel R R', chain T, weight U, pump V, pawls *r'* and *r*, springs *r²*, rod *p*, rack Q, and stop *q*, substantially as and for the purpose specified.

256,074. SPINDLE. William T. Carroll, Worcester, assignor to George Draper & Sons, Hopedale, Mass. Filed July 25, 1881. (No model.)

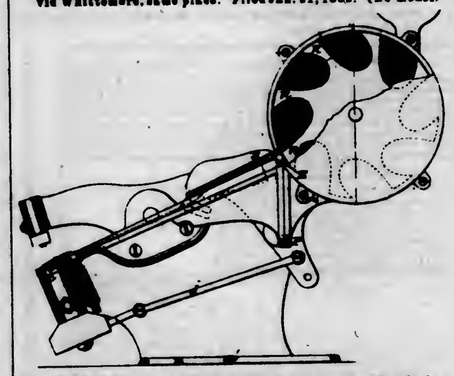
Brief.—The whirl is sustained during its rotation by a short pintle below it, either connected therewith or loosely inserted therein. The lower end of the spindle is held and supported laterally by means of a washer of rubber or other yielding material fitted closely within a cavity at the upper end of the whirl. The bolster is made elliptical externally in the direction of its length, so that it may rock with the spindle in the bolster-cone.



Claim.—The whirl, its cap, and a pintle, and yielding washer or block fitted closely therein and to the spindle, combined with the independent spindle, bolster-cone, and yielding or rocking bolster therein, substantially as shown.

256,075. SALT-EVAPORATOR. Sprout Dodge, Rochester, N. Y., assignor of one-half to William D. Clark, same place. Filed Aug. 24, 1881. (No model.)

Claim.—1. In an apparatus for evaporating salt, the combination of the series of evaporating-drums A A, the rotary water-pipe E, the perforated spray-pipes H H, attached to the rotary pipe and resting between the drums, the scrapers or brushes I I, also attached to the rotary pipe and resting between the drums, the annular trough K, resting below the drums, and the scrapers or brushes L L, attached to the rotary pipe and resting in the trough, as herein shown and described.



256,075.

2. In an apparatus for evaporating salt, the combination of a series of heating-drums having flat surfaces, a rotary water-pipe passing centrally through openings in the drums, a series of rotary spray-pipes arranged between the drums, and a series of rotary scrapers or brushes, also located between the drums, and serving to clear the flat surfaces of the drums of the deposit, as herein shown and described.

3. The spray-pipe H, consisting of an exterior pipe, *f*, and interior pipe, *g*, provided with coincident spray-holes, *l l*, the exterior pipe being provided with a stuffing-box at its outer end and the interior pipe being provided with an extension passing out through the stuffing-box, whereby the interior pipe may be turned axially to regulate the discharge through the spray-holes, as herein shown and described.

256,076. MACHINE FOR FEEDING AND SETTING LACING HOOKS. Andrew Eppler, Jr., Quincy, Mass., assignor to David Whittemore, same place. Filed Jan. 21, 1882. (No model.

Claim.—1. In a machine for feeding and attaching lacing-hooks, the reservoir having the rotary feeding-plate provided with arms, substantially as described, adapted to collect and discharge lacing-hooks, as set forth.

2. The reservoir having upon one of its sides an inwardly-projecting shoulder, whereby the lacing-hooks, when improperly placed upon the rotary feeding-plate, are dislodged from said plate, as set forth.

3. The combination of the reservoir having an aperture, I, the inclined guide or roadway set edgewise and projecting at its upper end into said opening, and the substantially vertical intermittently-rotating feeding-plate having arms E, adapted to collect lacing-hooks in the reservoir, each arm coinciding with the roadway when in an inclined position, whereby the hooks collected upon said arms are caused to slide upon the roadway, as set forth.

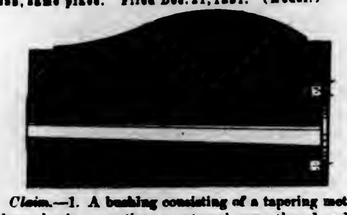
4. In a machine for feeding and attaching lacing-hooks, the reservoir having the substantially vertical intermittently-rotating feeding-plate having arms E, and the fixed tufts of bristles, whereby the accumulated hooks are prevented from interlocking and impeding the action of the feeding-plate, as set forth.

5. The combination, with the rotary feeding and supporting plates, of the spring-impelled yielding wedge, adapted to insert itself under the neck of a pronged lacing-hook, when the latter is

moved forward by said plate, and thereby firmly hold and support

Claim.—1. In a breast-drill adapted to be temporarily converted into a machine-drill, the combination with the supporting-

3. In combination with the arms C C and socketed portions

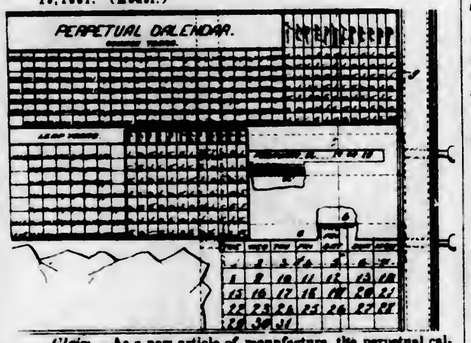


to fit upon the rotary shaft when the casing is in place upon the main casing, substantially as and for the purpose specified.

moved forward by said plate, and thereby firmly hold and support said hook for the action of the compressor, as set forth.

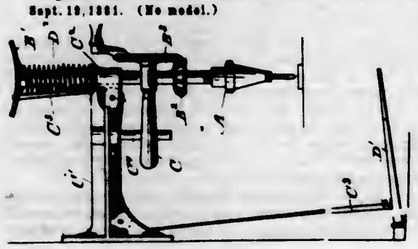
6. The reservoir having the rotary armed feed-plate J and a groove, 5, receiving the outer ends of the arms of said feed-plate, whereby the lacing-hooks are prevented from clogging the plate and from wearing the outer ends of the arms thereof, as set forth.

7. The reservoir having the rotary feed-plate J, the groove 5, receiving the outer ends of the arms of said feed-plate, and the cover 3, secured to the body of the reservoir by screws, whereby the space between the outer side of the plate J and the cover 3 may be regulated, as set forth.



255,077. AXLE-BOX FOR VEHICLE-WHEELS. JESSE T. GARDNER, Valden, Miss., assignor of one-half to Reddon Thompson, same place. Filed Dec. 21, 1881. (Model.)

Claim.—1. A bushing consisting of a tapering metallic tube or sleeve, having a continuous external screw-thread, and an annular flange at its inner end, the sleeve being adapted to be screwed into the hub and bind its fibers together from end to end, and the flange to brace and bear against its inner end, as shown and described, and for the purposes set forth.



2. In combination with the externally-tapering threaded bushing flanged as described and recessed diametrically, the internally-tapered and screw-threaded hub having a seat for the flange on the sleeve, the two being secured together substantially in the manner and for the purpose specified.

255,078. CALENDAR. GEORGE F. GODDELL, Morrison, Ill., assignor of one-third to Charles Bent, same place. Filed Feb. 19, 1881. (Model.)

Claim.—As a new article of manufacture, the perpetual calendar having printed on its face the names of the week and month columns *g*, the common-year columns arranged in the relation thereto as specified, the leap-year columns, the days-of-the-week and days-of-the-month columns therefor, the monthly-calendar *f*, the days-of-the-week and days-of-the-month rollers, all combined and arranged substantially as specified.

255,079. DRILLING-MACHINE. D. BURT HARTLEY, Chicago, assignor of one-half to Frank F. Peats, Rockford, Ill. Filed Sept. 19, 1881. (No model.)

Claim.—1. In a breast-drill adapted to be temporarily converted into a machine-drill, the combination, with the supporting-bracket C, of the spring D', the drill stem or stock B, the breast-plate F, the cord C', and the treadle-board D, substantially as described.

2. The combination, with the hand-grasp C, of the locking-bolt C' and the supporting-bracket C, substantially as described.

255,080. LATHE-CHUCK FOR TURNING POLYGONAL BODIES. HENRY C. HUMPHREY, New York, N. Y., assignor of three-fourths to Siegfried Black, same place. Filed Aug. 31, 1881. (No model.)

Claim.—1. In a lathe-chuck for turning polygonal bodies, the combination of a revolving center spindle having laterally-adjustable flanged heads, with fixed exterior concentric rings secured thereto, said rings having stop-pins and the heads radial set-screws for securing the sticks, substantially as and for the purpose set forth.

2. The combination of the head B, having a circumferential flange, *a*, and radial set-screws *a'*, with a concentric ring, C, secured thereto, said ring having inwardly-projecting stop-pins *d*, substantially as set forth.

3. The combination of a revolving spindle and flanged laterally-adjustable heads provided with means for attaching the sticks, with one or more flanged disks arranged intermediately between the heads and being made of less diameter than the same, said disks having angular strips and set-screws below said strips for supporting the sticks at one or more intermediate points, substantially as specified.

4. In a lathe-chuck for turning polygonal bodies, the intermediate disks D, having a circumferential flange, with radial set-screws *f* and exterior angular strips, *f''*, which are attached at one end to the flange and adapted to be set to the sticks by their outer angular ends, substantially as set forth.

5. In a lathe-chuck for turning polygonal bodies, the combination of the head B at one end of the spindle, said head having a circumferential flange, *a*, and radial set-screws *a'*, with an exterior concentric ring, C, having inwardly-extending stop-pins *d* and a rectangular stop-flange, *e*, at the outer edge, as and for the purpose set forth.

255,081. ROLLING COLTER. FRANKLIN B. HUNT, Richmond, assignor of one-half to D. B. Robbins, Economy, Ind. Filed Dec. 8, 1881. (No model.)

Claim.—1. The arms C, provided with the recess E and holes F', in combination with the shank B, provided with the neck F, and elongated head D, and bolts G, substantially as set forth.

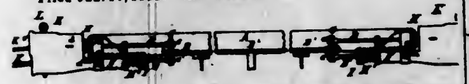
2. In combination with the journal of the rolling colter A, the cups H, cushions I, bearings K, and screw-plugs L, substantially as set forth.

3. In combination with the rolling colter and the socketed part P, the cushions I, wooden bearings K, and screw-plugs L, substantially as set forth.

4. In combination with the rolling colter and socketed part P, the wooden bearings K K, hollow screw-plugs L L, and bolt N, substantially as shown and described.

5. In combination with the socketed part P' and the bearings J of the rolling colter, the wooden bearings K, cushions I, and screw-plugs L, substantially as set forth.

6. The cups H, arranged to pass beyond the cushions I and embrace the flanges of the bearings J, in combination with said cushions, bearings K, and screw-plugs L, substantially as shown and described.



7. The cups H, arranged to pass beyond the cushions I and embrace the flanges of the bearings J, in combination with said cushions, bearings K, screw-plugs L, and bolt N, substantially as set forth.

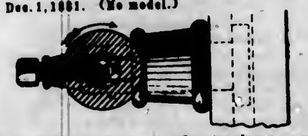
8. In combination with the arms C C and socketed portions P P, provided with the screw-plugs L L, the bolt N, substantially as shown and described.

9. In combination with the arms C C and socketed portions P P, provided with the screw-plugs L L and cups or recesses H H, the bearings J K, cushions I I, and bolt N, substantially as set forth.

10. In combination with the socketed portions P P', provided with the recesses H and cushions I, the screw-plugs L L, and bolt N, substantially as shown and described.

255,082. CAR-COUPLING. JOHN R. LAWRENCE, Cincinnati, Ohio, assignor of one-third to Charles E. Parker, same place. Filed Jan. 17, 1882. (No model.)

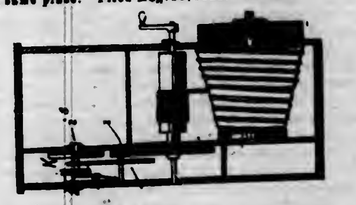
Claim.—1. The combination, with a draw-head having two horizontal throats, J J', in one vertical plane for as many coupling-links secured by a single vertical coupling-pin, L, of the pair of draw-bolts D D' in the planes of said throats, pivoted in rear to a vertical cross bar or plate C, which is pivoted to the draw-bar, substantially as set forth.



2. In combination with the double-throated draw-head E, the draw-bolts D D', cross bar or plate C, draw-bar B, brace-bolts *g g'*, and the vertical abutments *g''* I on the bed-frame, the helical springs H H', interposed between said abutments and the rear wall of the draw-head and occupying sockets *e e'* in the latter, substantially as set forth.

3. The draw-head E, having the two horizontal coupling-link throats J J', one above the other, and having that portion *e''* of its front wall which surrounds the upper throat and is in the plane of the car-bed frame projecting forward of the portion which surrounds the lower throat, substantially as and for the purpose set forth.

4. The additional or supplementary spring H', occupying socket *e'* in the rear end of a rear prolongation, F, from the lower portion of the draw-head in the described combination with abutment I and guiding and retaining strap G.



5. The support for the supplementary spring H', consisting of the abutment I and the double-headed or duplex bolt *g g'*, secured to the end sill, A, of the car-bed frame, as represented.

255,083. LATHE-TOOL. HENRY O. LUND, Bridgeport, Conn. Filed Dec. 1, 1881. (No model.)

Claim.—A tool for internal-surface turning or screw-cutting, consisting of the body A, having a V-shaped groove the entire length of the upper side of the same, and with a bridge, B, secured to one end, having a set-screw, C, passing through it, the boring-bar D, having seats at one or both ends of the same to receive the cutting-tips E and E', said boring-bar being secured in its proper position in the groove of the body A by means of the set-screw C, the whole being secured to the tool-post of a lathe and arranged to operate substantially as shown and described, for the object set forth.

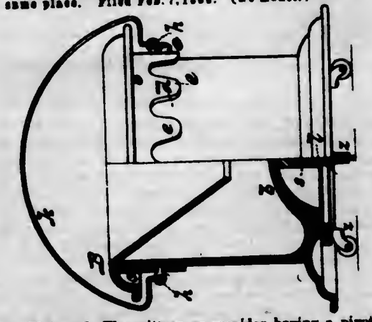
255,084. SEWING-MACHINE MOTOR. CHARLES NICHOLSON, Washington, D. C., assignor of one-half to Robert M. Thompson, same place. Filed Aug. 16, 1881. (Model.)

Claim.—1. In combination with a rotary shaft and suitable winding mechanism, the main driving-spring secured in a suitable movable casing, and the hollow rotary hub, the latter being adapted to fit upon the rotary shaft when the casing is in place upon the main casing, substantially as and for the purposes specified.

2. In combination with the conical drum and the winding-drum and connecting-rope, the auxiliary spring secured to the shaft of the conical drum and to a suitable casing, and adapted to operate to rewind the conical drum when the small casing is removed, substantially as and for the purposes set forth.

3. In combination with the winding-drum provided with clutches on its inner end, the hub provided with similar clutches and a bearing for the shaft of the drum, and the collar and stop for holding the drum unclutched during the operation of winding, substantially as specified.

4. The combination, with the clutch or wheel loosely mounted upon a rotating shaft, and the gearing for transmitting power to said clutch or wheel, of the spring located in said clutch or wheel and secured thereto and to the shaft for the purpose of storing up power for the initial movement of the parts, substantially as set forth.



5. In combination with the clutch or wheel, its shaft and spring, and the gearing for imparting motion to said shaft, the friction-brake adapted to hold the clutch or wheel, and the mechanism for operating the said brake to release the clutch or wheel, substantially as specified.

6. In combination with the clutch or wheel, its shaft and driving mechanism, the ratchet on said shaft, and the pawl and cord for operating the ratchet to give a positive initial movement to the shaft, substantially as specified.

7. The clutch or wheel provided with a beveled recess on its face adapted to receive the driving-wheel of a sewing-machine, in combination with a spring interposed between the hub and clutch, and rotate the same directly by frictional contact, substantially as specified.

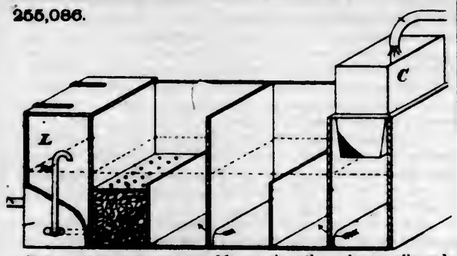
8. The combination of the fly-wheel K, shaft *i*, clutch R, and spring *r*, all arranged in such manner as to store up sufficient power to give the initial movement to the apparatus in starting, substantially as specified.

255,085. SPITTOON. ABNER B. NOTT, Fairhaven, Mass., assignor of two-thirds to James Parr and Benjamin F. Beetle, same place. Filed Feb. 7, 1882. (No model.)

Claim.—1. The spittoon or cuspidor having a pivoted base plate or ring on which it rests, and casters attached to said base plate or ring, substantially as specified.

2. A spittoon or cuspidor having an internally-convex bottom and a cover with an inclined inner flange, substantially as specified.

3. A spittoon or cuspidor having a pivoted base-ring, C, and casters *s*, and an externally-flanged cover, B, having rim-hooks *c*, to engage the eyes or studs *b* of the bowl, substantially as specified.



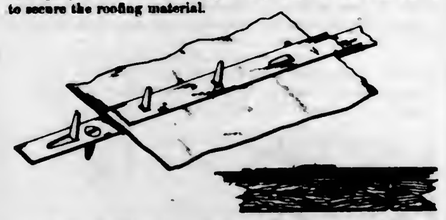
4. The spittoon or cuspidor having the pivoted base-ring C and casters *s*, the cover B, its outer rim, *c*, and fastenings, the eyes *b*, and the bail *b*, substantially as specified.

255,086. APPARATUS FOR PURIFYING THE WATER FROM CONDENSERS. JOHN B. RESNORD, Baltimore, Md., assignor of one-half to Edward Wilson, same place. Filed Dec. 13, 1881. (No model.)

Brief.—The base of each alternate diaphragm is perforated to draw off the fluid. The water in all the compartments will be on a level with the highest point on the goose-neck pipe *n*, which oscillates in a quadrant.

Claim.—1. In an apparatus for separating grease from the water discharged from steam-engine condensers, a horizontal case divided by walls into compartments having the same level or plane,

255,086.



all the compartments connected by openings through the walls, and the said case provided at one end with a pivoted draw-off or overflow pipe, *n*, as shown and described.

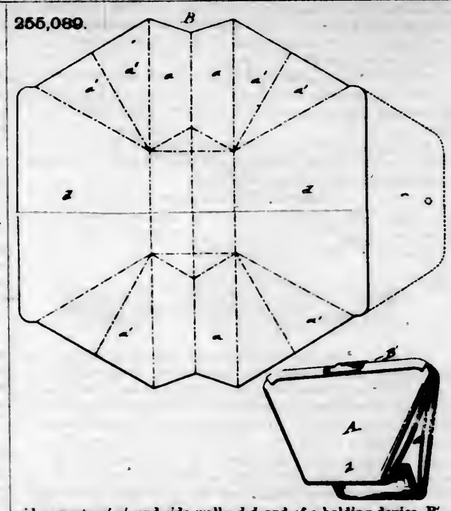
2. An apparatus for separating grease from the water discharged from steam-engine condensers, having at one end a detachable strainer-box, C, at the opposite end and on the same level or plane a purified-water-receiving chamber, L, provided with a pivoted draw-off or overflow pipe, *n*, and between the said ends one or more compartments provided with a dam across the center of its bottom and openings for the passage of the water into and out of the compartment, as set forth.

255,087. DEVICE FOR SECURING ROOFING MATERIAL UPON ROOFS. L. LEWIS SACHSENMAIER, Cincinnati, Ohio, assignor to the New York Iron Roofing and Paint Company, New York, N. Y. Filed Dec. 13, 1881. (No model.)

Brief.—The projections on the under strip, which is fastened to the roofing-frame, project up through the roofing material and through perforations in the upper strip, and are then bent down to secure the roofing material.

Claim.—1. The combination, substantially as hereinbefore set forth, of a sheet-metal strip having a series of flexible points normally projecting at right angles from its surface, means, substantially as described, for securing said strip permanently to a roof or other structure, and a second strip perforated with a series of apertures corresponding to the projecting points of the first strip, whereby the edges of a roofing fabric may be secured to each other and to the roof by the interlocking of the two metallic strips between which they are placed.

2. The combination, substantially as hereinbefore set forth, with the edges of one or more pieces or sections of roofing fabric, perforated in such manner as to leave a burr, of two parallel clamping plates or strips of sheet metal, one of the latter being provided with a series of points, which pass through the fabric, and the other being perforated with a corresponding series of apertures of sufficient size to permit the said points to enter, together with a sufficient portion of the fiber of the fabric, to serve as a water-tight packing, the whole being afterward compressed together by bending down or clinching the projecting points of the first clamping-strip.



255,088. PROCESS OF MANUFACTURING ROOFING MATERIAL. L. LEWIS SACHSENMAIER, Cincinnati, Ohio, assignor to the New York Iron Roofing and Paint Company, New York, N. Y. Filed Nov. 26, 1881. (No specimens.)

Claim.—The hereinbefore-described process of manufacturing roofing material, which consists in saturating a fibrous or textile fabric with a liquid mixture composed of metallic substance and oils, substantially such as described, in subjecting the saturated fabric to pressure while in a plastic state, and in coating the surface thereof with hydraulic cement in a dry pulverulent condition.

255,089. POCKET-BOOK. PAUL SCHRADER, New York, N. Y., assignor to Schrader & Stahl, same place. Filed Jan. 21, 1882. (Model.)

Claim.—A pocket-book consisting of a body, A, made of a folding bottom, *b b*, central side gussets, *a a*, connecting triangular

255,089.

side gussets, *a' a'*, and side walls, *d d*, and of a holding device, B', applied to the side walls of the body, substantially as set forth.

255,090. TOY SAVINGS-BANK. CHARLES G. SHEPARD and PETER ADAMS, Jr., Buffalo, N. Y.; said Adams assignor to Walter J. Shepard, same place. Filed Feb. 4, 1882. (No model.)

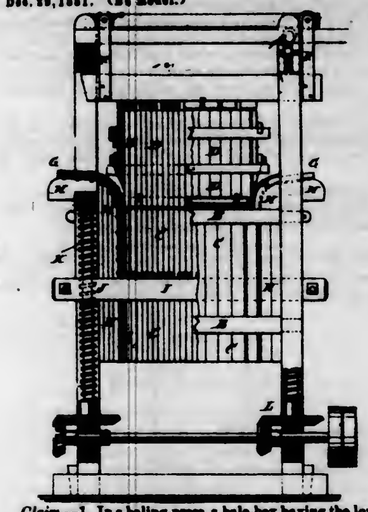
Claim.—1. The combination, with a receptacle, A B, having an open mouth, *a*, of a pivoted arm, C, adapted to receive the coins and convey the same to the open mouth.

2. The combination, with a receptacle, A B, having an open mouth, *a*, of a pivoted arm, C, mounted on a horizontal shaft, I, and a thumb-piece, *i'*, whereby the shaft is actuated.

3. The combination, with a receptacle, A B, having an open mouth, *a*, of a pivoted arm, C, a pivoted tongue-plate, E, and means whereby the arm and tongue-plate are simultaneously actuated, substantially as set forth.

4. The combination, with a receptacle, A B, having an open mouth, *a*, of a pivoted arm, C, rock-shaft I, provided with an arm, J, and a pivoted tongue-plate, E, provided with an arm, H, adapted to be actuated by the arm J of the rock-shaft.

5. The combination, with a receptacle, A B, having an open mouth, *a*, of a pivoted tongue-plate, E, provided with an overhanging arm, H, whereby the lower edge of the tongue-plate is pressed forwardly against the mouth, and a lip, *g'*, formed on the tongue-plate, whereby the forward movement of the tongue-plate is limited.



6. The combination, with a receptacle, A B, having an open mouth, *a*, of a pivoted arm, C, shaft I, provided with an arm, J, a pivoted tongue-plate provided with an arm, H, and a pivoted eye-plate, K, provided with a projection, L, adapted to be actuated by the arm H of the tongue-plate.

7. The combination, with the head A, provided with eye-openings *b* and a stop, *F*, of the hinged eye-plate K, having a depression, *l*, into which the stop *F* projects, and whereby the downward movement of the eye-plate is limited.

8. The combination, with the head A, provided with eye-openings *b*, of the hinged eye-plate K and a stop, *F*, arranged on the inner side of the head above the eye-plate, whereby the upward movement of the eye-plate is limited.

9. The combination, with the head A and body B, connected by a throat or contracted passage, *b*, of a hinged plate, M, hung in said throat to obstruct the same when the figure is placed in a horizontal position.

255,091. BALING-PRESS. WILLIAM F. SMITH, Overton, Tex., assignor of one-half to Andrew J. Gilliam, same place. Filed Dec. 19, 1881. (No model.)

Claim.—1. In a baling-press, a bale-box having the lower part of its ends made flexible and adapted to be elevated with the follower, substantially as and for the purpose set forth.

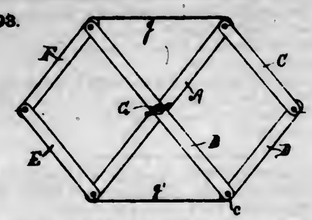
2. In a baling-press, the combination, with a bale-box having stationary sides and upper ends, the guide bars or plates H, and the follower I, of the flexible lower ends, G, substantially as and for the purpose set forth.

3. In a baling-press, the combination, with the bale-box C D, having stationary sides and flexible lower ends, and provided with doors E, having beveled lower edges, of the guide bars or plates H and the follower I, substantially as and for the purpose set forth.

4. In a baling-press, the combination, with the frame and the lower part, C, of the baling-press, having flexible ends G, of the guide bars or plates H, attached to the said frame and having their upper ends curved outward, substantially as and for the purpose set forth.

255,092. TUBULAR WELL. RANSOM E. STRAIT, Galesburg, Mich. Filed May 16, 1881. (No model.)

Claim.—1. The herein-described tubular-well packing-lock, consisting of the combination of the valve-joint having the packing-lock recess, with said packing device composed of the metal collar with the upper rim integral therewith, the thick rubber band or equivalent, the outer band, with its integral rim, under the lower edge of the rubber band, and the metallic washer movably located on the lower end of the metal collar, all constructed and adapted to operate substantially as set forth.



2. A leader or battering cap to a tubular-well pipe, having the rib on its inner surface, substantially as set forth, for the purpose specified.

3. The herein-described packing for locking valve-joints with the outer pipe of tubular wells, consisting of the metal collar with upper rim, the rubber band, the outer band, with its integral rim, under the lower edge of the rubber band, and the metal washer on the lower end of the metal collar, all in combination, substantially as described and shown.

4. A plunger-cylinder and connection which is designed for location at given points in the main well-pipe, in combination with the outer well-pipe, provided at its lower end with a battering or leader cap or joint having the internal rib, substantially as forth, whereby all danger of losing said cylinder and connections is obviated.

255,093. CANOPY-FRAME. CHARLES WITTENBERG, Indianapolis, Ind., assignor to Norman S. Byram and Edward C. Carnoline, same place. Filed Aug. 9, 1881. (No model.)

255,093.

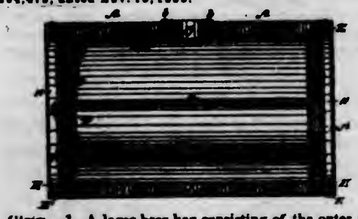
Claim.—The two bars A B, pivoted together in the center by the pivot G, and having the short bars C D E F pivoted to their ends, combined with the cords *g g'*, adapted to be extended or folded up, substantially as shown and described.

255,094. METHOD OF AND APPARATUS FOR SHAKING THE COTTON FROM NAPPED HATS. GEORGE YULE, Newark, N. J. Filed Dec. 21, 1881. (No model.)

Claim.—1. The method herein described for removing the cotton from the fur of a hat after the same has been stuck and scalded upon a hat-body, consisting in hanging the same in hot water, without any interior cone or other support, and subjecting them to a continued shaking or other alternating movement to and fro, substantially as set forth.

2. The combination, in a machine for shaking napped hats, of a tank of hot water, a vibrating shaft or bar carrying a series of clamps for holding the hat-bodies, and mechanism, substantially as described, for shaking the shaft and clamps, as and for the purpose set forth.

3. The combination, in a hat-shaking clamp, of a pair of jaws pivoted together, and provided with a spring for automatically closing and a handle for voluntarily opening the jaws, substantially as herein described.



4. The combination, with a hot-water tank, of a series of clamps secured to a shaft, arranged to vibrate and to turn for lifting the hat-bodies from the water, and a movable plank arranged to slide under and support the hats when thus lifted, substantially as and for the purpose set forth.

5. The combination, with a series of clamps arranged to operate as herein described, of a series of connected wedges, cams, or equivalent devices for opening or closing the jaws of the clamps simultaneously, substantially as herein set forth.

6. In combination with a shaft mounted upon a hot-water tank and carrying a series of clamps for the purpose set forth, an adjustable crank, as E', and suitable connection to vibrate the shaft radially or longitudinally by the rotations of the crank, substantially as herein set forth.

REISSUES.

10,061. LAGER-BEER KEG. JOEL B. HAYDEN, Hempstead, assignor, by mesne assignments, to the Universal Beer Keg Company, New York, N. Y. Filed Jan. 13, 1882. Original No. 234,473, dated Nov. 16, 1880.

Claim.—1. A lager-beer keg consisting of the outer metallic can or keg, A, and the inner metallic can or keg, B, connected

together by the bushings C and D, and having the space between them filled with flexible strips of wood mixed with a compound of glue and plaster-of-paris in sufficient quantity to make it adhesive, substantially as described.

2. In a metallic lager-beer keg, the heads H H, secured to the angle-irons E E by the rivets *b*, the flange F' of said angle-irons being riveted to the outer casing to form the chine of the keg, substantially as described.

10,062. CLOCK-MOVEMENT. ARTHUR E. HOTCHKISS, Cheshire, Conn. Filed July 19, 1881. Original No. 221,310, dated Nov. 4, 1879. Reissue No. 9,656, dated Apr. 12, 1881.

Claim.—1. In a clock-movement having a frame consisting of three plates suitably connected together, a train which is divided into two parts, a front part and a back part, the front part arranged between the front and middle plates of the frame and the back part arranged between the middle and back plates of the frame, the point of division being between the center wheel and center pinion, the said center wheel and center pinion being arranged on the center arbor carrying the minute-hand, as set forth.

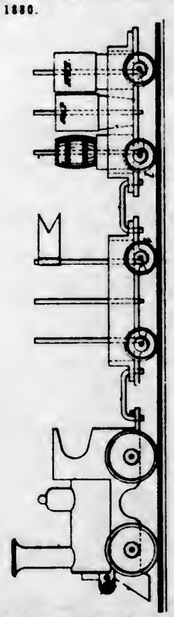
2. In a clock-movement having a frame consisting of three plates suitably connected together, the middle plate of the frame, the said middle plate dividing the train into two parts between the center wheel and center pinion, the said center wheel and center pinion being arranged on the center arbor carrying the minute-hand, as set forth.

3. In a clock-movement, a frame consisting of three plates suitably connected together, the middle plate of which divides the train into two parts between the center wheel and center pinion, the said center wheel and center pinion being arranged on the center arbor carrying the minute-hand, and the frame having the parts of the divided train arranged between its three plates, as set forth.

4. In a clock-movement having a frame consisting of three plates suitably connected together, a center arbor carrying the minute-hand and provided with a center wheel and center pinion, the wheel arranged between the front and middle plates of the frame and the pinion arranged between the middle and back plates of the frame, as set forth.

5. The improvement in a clock-train, consisting of three wheels suitably fastened on arbors carrying pinions, and arranged between the escape-wheel and its arbor carrying a pinion and the center arbor carrying the center wheel and center pinion, as set forth.

6. The improvement in a clock-train, consisting of three wheels having the same number of teeth and the same diameters, suitably fastened on arbors, the pivots of which are arranged in the circumferences of circles concentric with the center arbor, the several arbors carrying pinions having the same number of leaves and the same diameters, all the said parts arranged between the escape-wheel and its arbor carrying a pinion, and the center arbor carrying the center wheel and center pinion, as set forth.



7. The improvement in a clock-train, consisting in the arrangement of the pivots of the escape-wheel arbor and of the pivots of the three arbors carrying the three wheels and the three pinions between the escape-wheel arbor and the center arbor carrying the center wheel and center pinion in a semicircle, as set forth.

8. In a clock-movement, the combination, with a train divided into two parts, a front part and a back part, by the middle plate of a frame having three plates, the division being made between the center wheel and center pinion, the said center wheel and center pinion being arranged on the center arbor carrying the minute-hand, the escape-wheel being arranged in the front part of the train and near the top of the frame, and the pivots of the front part of the train being arranged within a semicircle, of a pendulum attached to an arbor near the top of the frame and vibrating in a plane passing between the front and middle plates of the frame, as set forth.

9. In a clock-movement provided with a circular rack, the circular disk F, rotated by the mainspring and carrying the planet-wheel E only, which connects the rack with the center pinion, as set forth.

10. In combination with a pendulum-rod provided with the plate S, fastened to the rod, a spring arranged on the rod to hold the pendulum-ball against the adjusting-nut, as set forth.

10,063. TOY RAILWAY-TRAIN. FRANCIS W. CARPENTER, Harrison, N. Y. Filed Feb. 17, 1882. Original No. 227,956, dated May 25, 1880.

Claim.—1. In a toy, the combination, with the wheels and axle, of a body with the bottom and sides of one piece of cast metal, substantially as set forth.

2. In a toy, the combination, with the wheels and axle, of a body open at the top, with the bottom, sides, and bearings for the axle of one piece of cast metal, substantially as set forth.

3. In a toy, the combination, with the wheels and axles, of a box-body open at the top, with the bottom, sides, and end platform of one piece of cast metal, substantially as set forth.

4. In a toy, the combination, with the wheels and axles, of an open body and end platforms of one piece of cast metal, and coupling-staples passing vertically into holes in the end platforms, substantially as set forth.

5. In a toy, the combination, with the wheels and axles, of an open box with bottom and sides in one piece of cast metal, and the rods *g*, extending upwardly from the bottom, substantially as set forth.

THE ELIOTYPE PRINTING CO. BOSTON

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

EX PARTE FAIRCHILD.

Decided August 10, 1881.

TRADE-MARK—PROPER NAME OF APPLICANT.

The mere name of a person does not form a proper subject for trade-mark registration, although it appears that such name, by long association with a certain line of goods, has come to be applied as a name or title to such goods.

TRADE-MARK.

APPEAL from the Examiner of Trade-Marks.

Messrs. Dodge & Son for Fairchild.

MARBLE, *Commissioner:*

Appeal is taken in this case from the decision of the Examiner of Trade-Marks, who refused to register the word "Fairchild" as a trade-mark because it was "merely the name of the applicant."

Applicant alleges that the Examiner erred in refusing to register his alleged trade-mark, first, because the word "Fairchild" has been used as a trade-mark in connection with his manufacture and sale of pens and pencils for twenty years and upward, and is well known to the commercial world as the trade-mark of the applicant; second, because said word was registered as a trade-mark in this Office under the act of July 8, 1870, which act contained similar prohibitions to the act of March 3, 1881.

It appears by the records and files of the Office that Mr. Fairchild did register his name as a trade-mark in this Office in July, 1879. The proofs at that time submitted showed that the word "Fairchild" had been used by applicant as a trade-mark long prior to the passage of the act of June, 1870. While the act of 1870 in terms prohibited the Commissioner of Patents from registering as a trade-mark merely the name of a person generally, it also contained the following clause, as an exception to the general provisions of the statute:

But this section shall not prevent the registry of any lawful trade-mark rightfully in use on the 8th day of July, 1870.

Under this exception to the general provision of the statute the word "Fairchild," on the proofs presented, was registered as a trade-mark. The act of 1870, and all acts and things done under it, have been swept away by the decision of the Supreme Court declaring the law unconstitutional, and therefore void.

The application as now presented therefore comes before the Office the same as if no application had ever been made for the registration of the word "Fairchild," excepting that, having registered it under the act of 1870 and paid the fees then required by law to be paid for the registration of trade-marks, the applicant is now entitled to re-register without payment of additional fees, providing he has a legal trade-mark.

The act of March 3, 1881, provides—

That owners of trade-marks used in commerce with foreign nations or with the Indian tribes, provided such owners shall be domiciled in the United States or located in any foreign country or tribe which, by treaty, convention, or law, affords similar privileges to citizens of the United States, may obtain registration of such trade-marks by complying with the following requirements.

Then follows the necessary steps to be taken in order to secure registration.

By the third section it is provided that—

But no alleged trade-mark shall be registered unless the same appear to be lawfully used as such by the applicant in foreign commerce or commerce with Indian tribes, as above mentioned, or is within the provision of a treaty, convention, or declaration with a foreign power, *nor which is merely the name of the applicant.*

There is no saving clause in the act excepting from its prohibitions any particular class of cases, as there was in the act of 1870. The act does not define what shall constitute a legal trade-mark, but it does declare what shall not be registered as such. Among the prohibitions is "merely the name of the applicant." It is argued that the word "Fairchild," by reason of its long use on the goods of the applicant to distinguish them from others of like character, is not now applicant's name merely, but the name of a particular kind of goods. It is undoubtedly true that the goods manufactured by applicant, and upon which his name is stamped, are known as the "Fairchild" pens or pencils, as the case may be. The name as presented for registration, however, is not the name of a pen or pencil, but merely the name of the applicant, unconnected with any sign, mark, or illustration of any kind whatever. "Merely the name of the applicant" means, as I understand it, the name of the applicant separate and alone. The name of one person may be better known in the commercial world than another by reason of its use and identity with a certain line of business, trade, or class of goods, but that fact does not make it registrable as a trade-mark. It is, after all, the name of the person merely, and not the name of the business, trade, or kind of goods.

While it may be true that the name of the applicant in his trade is of great value, it cannot receive registration in this Office as such in violation of the prohibition of the statute. The prohibition of the statute was intended to prevent any person from using his name in any trade as a trade-mark to the exclusion of other persons of the same name in the same or any other avenues of trade. This intention of Congress would not be carried out if registration was permitted of the name of any person as a trade-mark, however long it may have been used.

The decision of the Examiner of Trade-Marks is affirmed.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the United States.

STOW v. THE CITY OF CHICAGO.

Decided January 9, 1882.

1. PATENTEE ENTITLED TO ALL USES OF INVENTION.
   A patentee who is the first to make an invention is entitled to his claim for all the uses and advantages which belong to it, and it is immaterial whether he perceived and stated such advantages in his patent.
2. REISSUE NO. 3,274—STREET-PAVEMENTS—ANTICIPATING.
   So the wood pavement described in Reissue Patent No. 3,274, *Held* to be anticipated by the patent of Stead, which does not in terms say that the purpose of driving the wedge-shaped block or pile through the space left by the octagonal blocks is to pack the earth or sand foundation, it appearing that such a result must follow from the construction described.
3. LETTERS PATENT NO. 134,404—WANT OF INFRINGEMENT.
   When every other part of the invention described in Letters Patent No. 134,404 was shown to be old, doubted whether it can be called invention to have the ground in the spaces between the blocks more compactly rammed, so as to drive it below the under surface of the pavement into the earth foundation; but the evidence failing to show that the defendant used this feature of the invention the bill is dismissed.

APPEAL from the Circuit Court of the United States for the Northern District of Illinois.

Mr. L. Hill for the appellant.

Mr. L. L. Bond for the appellee.

Mr. Justice WOODS delivered the opinion of the Court.

The appellant, Henry W. Stow, who was complainant in the court below, filed his bill in equity against the appellee, the City of Chicago, charging it with infringement of four certain letters patent for improvements in street-pavements, in which he was either the original patentee or of which he was the assignee. The City of Chicago denied infringement, denied the novelty of the inventions covered by the patents, and alleged license and payment of royalties. Upon final hearing the court below dismissed the bill and the complainant appealed. In this Court the appellant relies exclusively on the first and fourth patents set out in his bill of complaint. They will be separately considered. The first patent relied on is the Reissue No. 3,274, dated January 19, 1869, of an original patent granted to him, numbered 72,110, and dated December 10, 1867.

The invention covered by the reissued patent is thus generally described in the specification:

> The nature of my invention consists in putting down a pavement of wood or other suitable material upon a foundation-bed of sand or loose earth and packing the sand or earth by means of wedge-blocks driven down into the same and forming a part or whole of the pavement.

The pavement described in this reissued patent consisted essentially of blocks of wood or other material set upon end in rows across the street, with spaces between the rows, in which were driven narrow and probably wedge-shaped blocks, which, when driven down, extended a considerable distance below the under surface of the blocks first named into the foundation-bed of sand on which they rested. The claims were as follows:

> 1. A pavement composed of alternate tiers of square-ended and wedge-shaped blocks, the wedge-shaped ends of the latter being driven into a foundation-bed of sand or earth, substantially as and for the purpose described.
> 2. A pavement composed of blocks with lower ends wedge formed, and all driven down into a foundation-bed of sand or earth, substantially as shown and described.
> 3. A pavement composed of wood, or, in whole or in part, of other suitable material, laid on a foundation-bed of sand or loose earth, as described, and a portion of the blocks driven down into said foundation-bed to pack the same, substantially as and for the purpose specified.

The appellant does not contend that the second claim is infringed.

A cursory reading of the first and third claims will show that they cover the same invention, the third claim simply including with wood other suitable material, out of which the pavement may be constructed.

The invention described in these claims does not cover the making of a street-pavement of wood. The use of wood for that purpose is as old as the English patent of David Stead, granted August 23, 1839. The Nicholson patent, which bore date August 8, 1854, and which is referred to in the specification of the reissued patent under consideration, also covers a device for the construction of a pavement by the use of wooden blocks. Nor does the invention consist in laying the pavement upon a foundation-bed of sand or earth. This is as old as cobble-stone pavements. (*Stead* v. *Williams*, 7 Man. & G., 818.) The appellant does not claim either of these devices as a part of his invention. No particular form of block is described in the claims, except that some of the blocks used have their lower ends made wedge shaped. All, therefore, that there is left for the invention described in the first and third claims to cover is the making of the lower ends of a portion of the blocks of which the pavement is composed in wedge shape and the driving of these wedge-shaped blocks below the general under surface of the pavement into the sand or earth bed on which it rests, so as to pack it and render it solid and unyielding.

When thus reduced to what it really is the invention of the appellant is clearly and distinctly anticipated by the English patent issued to David Stead, dated April 23, 1839, which is set out in full in the record.

One of the drawings which accompanies Stead's specifications shows a pavement laid with contiguous rows of octagonal blocks, so placed as to leave rows of square unfilled spaces. In these square spaces were placed square blocks, longer than the octagonal blocks and wedge shaped at the lower end, and these were driven down into the earth foundation, upon which the octagonal blocks rested.

That part of Stead's specification which these figures illustrate is as follows:

> Figs. 18 and 19 are a plan and side view of a portion of a roadway formed by a series of octangular blocks, L L, placed with the fiber vertical, so as to leave a square recess or interval between them, into which may be inserted a corresponding piece, m. When this kind of paving is laid upon a road formed upon a newly-made embankment or shrinking base I should recommend a pile, to be driven into the earth through the square recess or interval, of about the size and form represented by the dotted lines, Fig. 19, in order to support and keep the blocks firm in their position. When the octangular-block paving is used for acclivities I should recommend the before-mentioned cavities either to be left unfilled or not filled up to the surface, to afford an assistance to animals ascending the same, as before described.

It is true this specification does not in terms say that the purpose of driving the wedge-shaped block or pile through the space left by the octagonal blocks is to pack the earth or sand foundation, but that it does so as effectually as the use of similar blocks in a similar way under the patent of appellant is too clear for argument.

A patentee who is the first to make an invention is entitled to his claim for all the uses and advantages which belong to it. (*Woodman* v. *Stimpson*, 3 Fish., 98.)

It is shown that Stead invented this device. Whether

he perceived and stated all its advantages is immaterial. (*Tucker* v. *Spaulding*, 13 Wall., 453; Mr. Justice Clifford in *Graham* v. *Mason*, 5 Fish., 1.)

Stead's specifications, it is clear, cover (to use the language of Stow's reissued patent) "a pavement composed of wood laid on a foundation-bed of sand or loose earth" and having "a portion of the blocks of which it is composed driven down into said foundation-bed."

Everything, therefore, in the first and third claims of appellant's reissued patent which he sets up as new was anticipated nearly thirty years by Stead's English patent. Appellant's patent, therefore, so far as it covers these claims, is void, and cannot be the foundation of any relief against the appellee.

The other patent which appellant insists that the appellee has infringed is No. 134,404, dated December 31, 1872, issued to appellant as the original inventor.

The invention covered by this patent is described in the specifications thus:

> The nature of my invention relates to that class of wooden pavements in which the blocks are laid directly upon the sand foundation; and it consists in laying the blocks in rows with spaces between the rows and in filling or partially filling said spaces with sand or gravel and driving or swaging the same into the sand foundation below in order to pack or compress the sand under the blocks for the purpose of sustaining the weight of heavy vehicles passing over the pavement.

The claim is as follows:

> A pavement composed of blocks laid in rows directly upon the sand foundation with spaces between the rows filled with sand or gravel, which is swaged or driven into said foundation, substantially as and for the purpose specified.

The use of wood for street-payments, the laying of the blocks directly upon a sand foundation, the placing of the blocks in rows, leaving spaces between the the rows, are all old devices. As already shown, they are all to be found substantially in the English patent of Stead, issued April 23, 1839, and they are found in the English patent to Lillie, dated October 13, 1860, and the American patent to Richard H. Willett, No. 114,895, and dated May 16, 1871, all of which are put in evidence by the appellee. Nor is the filling with sand or gravel of the spaces between the blocks or rows of blocks of which the pavement is composed a new device. It was part of the invention of Nichlson, (*Elizabeth* v. *Pavement Company*, 97 U. S., 126,) and, as appears by the record, was mentioned in the specification of the Letters Patent No. 112,945, issued to Gordon A. May, March 27, 1871. And in the specifications of the patent granted to W. H. Chappell, No. 42,347, dated April 19, 1864, set out in the appellee's evidence, it is stated that—

> Wooden pavements have been constructed on the continent of Europe and in the United States by laying wood blocks endwise of the grain in parallel rows with openings or channels between, into which gravel or gas-tar was placed.

All, therefore, that is left for the patent of the appellant now under consideration to cover is the ramming of the gravel between the blocks of which the pavement is composed, so as to drive the same into the sand foundation below the blocks, in order to pack it so that the pavement may sustain the weight of heavy vehicles without giving away. And this is all which seems to be claimed by appellant's counsel as the invention covered by this patent. The evidence is distinct and clear that the invention thus defined was anticipated by the pavement laid by J. K. Thompson, city superintendent, in the year 1864, at the intersection of North State and Kinzie streets, in the city of Chicago. This piece of pavement was made of wooden blocks, six inches square, set in rows on an earth foundation, with spaces between the rows, and the spaces were filled with fine gravel and the gravel rammed. This pavement was put down by Thompson as an experiment. It proved successful. It was in use until the great fire in Chicago in 1871.

The record further shows that in the fall of 1870, at the instance of Thompson, there was laid at the north end of the La Salle-street tunnel, in Chicago, a piece of pavement five hundred yards in length, constructed in the same manner precisely as that laid by him in 1864 at the intersection of North State and Kinzie streets. It was made with similar wooden block, placed in rows on an earth foundation, with spaces between the rows. The spaces were filled with gravel, which was rammed with an iron rammer made expressly for the purpose. We have here every part of the invention described in the letters patent under consideration, except that it does not appear that the gravel in the spaces between the rows was so compactly rammed as to drive it below the under surface of the pavement into the earth foundation. All, therefore, that is left for the appellant's patent of 1872 to cover is the giving of a few more strokes with the rammer, whereby the gravel-filling may be forced into the earth-foundation of the pavement. Can this be called invention?

The testimony shows that the pavements which the appellant charges to be infringements of his patent of 1872 are constructed according to the plan adopted by Thompson in 1864, and it fails to show that in their construction the gravel filling was forced by the ramming into the earth foundation, on which the pavements were laid. So that if there is anything new or patentable embraced in the appellant's patent of 1872, that part of his device is not infringed by appellee.

Therefore, without noticing the other defenses, we declare our opinion to be that the appellant is not entitled to any relief against the appellee upon either of the patents on which his demand for relief is now based. His case as presented here has no ground to stand on. The decree of the circuit court dismissing his bill must therefore be affirmed.

Mr. Justice FIELD did not sit in this case and took no part in its decision.

U. S. Circuit Court—Southern District of New York.

HART v. THAYER.

Decided February 13, 1882.

REISSUED PATENT NO. 7,909—NECKTIES—INFRINGEMENT.

The improvement in neckties set forth in Reissued Letters Patent No. 7,909, which consists in securing a straight pin to the shield by means of metallic fastenings—*i. e.*, metallic rivets either separate from or struck out from the body of the pin, which pass through the shield and are clinched or headed on the opposite side—is not infringed by a mode of securing pins to the shield, which dispenses with separate fastenings, and which consist in forming two bends in the length of the pin, so that by passing through suitable holes in the shield the pin may fasten itself.

Mr. F. H. Betts and *Mr. J. Van Santvoord* for the plaintiff.

Mr. J. P. Fitch for the defendant.

BLATCHFORD, *J.*:

This suit is brought on Reissue Letters Patent No. 7,909, granted to the plaintiff, William H. Hart, Jr., October 9, 1877, for an improvement in neckties, the original Patent No. 159,921 having been granted to him February 16, 1875.

The specification of the reissue is as follows, reading what is outside of brackets and what is inside of brackets, omitting what is in italics:

Figure 1 is a face view of the device embodying my invention. Fig. 2 is a side view thereof, partly in section. Fig. 3 is a side view, enlarged, of a detached part.

Similar letters of reference indicate corresponding parts in the several figures.

In the class of neckties wherein the front bow, which is made long and lies on the chest, is held in position by a band which passes around the neck, it is necessary to secure said band in some manner to prevent displacement of the tie. For this purpose pins have been sewed to the shields or supporting-plates of the ties and the neckbands engaged therewith; but this is objectionable, since the pin soon loosens and is lost. Again, the cost of thus attaching the pins is a matter of considerable moment.

My invention is designed to remedy these defects; and consists in securing the pins to the shields by metallic fastenings, whereby the pins are firmly retained in place, longer service is rendered thereby, and there is a cheapness in the product.

Referring to the drawings, A represents a shield or supporting-plate for a necktie, which consists of a long bow or knot, *a*, constituting the front portion, and a band, *b*, which passes around the neck, the two parts being shown in dotted lines.

To the bottom portion of the shield or plate I secure a pin, B, which projects downwardly, so that the band *b* may be attached thereto, in order that the band will not disengage from the neck and release the tie. I secure the pin to the shield by metallic rivets [or projections] C, which readily clinch on the shield and firmly connect the two parts. These rivets [or projections] are attached to the pin in any suitable manner, and they may be parts of the pin itself, or they may be separate pieces of metal fastened to it. Thus they may be passed through the flattened body of the pin *and the shield* and headed, or [they may be] punched out of the said [body] *body*. [The metallic rivet or projection is passed through the shield,] and [is] bent over [and] *or* clinched [upon the opposite side] *on the shield*.

It will be seen that the connection of the pin and shield is firm and [durable] *durable*, [whereas] *I overcome loosening of the pin due to cutting of* the threads [formerly] *which, heretofore* in use, [passing] *have been passed* through openings in the pin, [were cut by their edges or rotted away from corrosion of the pin through,] *or rotting of said thread consequent to* perspiration, [and the pin was soon lost or loosened,] *corroding the pin*.

Again, as the work can be performed by machinery, instead of stitching or sewing by hand, labor is materially reduced, whereby there is [a] great saving in the [cost of production] *product*.

[I do not claim any particular method of attaching the metallic fastenings to the pin, since any of the well-known methods of attaching metals together may be employed, either cohesion by welding or soldering, or forming both pin and fastenings out of one piece of metal, or adhesion and pressure by making one metal inclose the other.]

Reading in the foregoing what is outside of brackets, including what is in italics, and omitting what is inside of brackets, gives the text of the original specification.

The claims of the reissue are as follows:

1. The pin B and necktie-shield A, in combination with the metallic fastening C, substantially as and for the purpose set forth.
2. The pin B, formed with the fastening C, in combination with the necktie-shield A, substantially as and for the purpose set forth.
3. A metallic fastening or metallic fastenings, C, attached to and projecting from the pin B, substantially as and for the purpose set forth.

The original patent had only two claims. The first was the same as claim 1 of the reissue. The second was the same as claim 2 of the reissue, with the words "punched out" inserted between "the" and "fastening."

It is claimed that the defendant has infringed claim 2 of the reissue by making and selling necktie-shields with pins such as are described in Letters Patent No. 206,673, granted to Albert M. Smith and Hiram Thayer, April 23, 1878.

The pin is of metal, pointed at one end. In its length are two bends, which are nearly at right angles to the length of the body. One bend is farther from the point than the other bend is from the opposite end. Each bend is made by two right-angled deflections of the body of the pin. From the bend near the end farthest from the point the body of the pin proceeds on in a line not continuous with the line of the pin the other side of said bend, but parallel therewith. The other bend is so made as to bring back the line of the pin between said bend and the point to the line of the pin the other side of the first-named bend. The shape of the pin is thus: ⌐¬.

The pin is attached to the shield by passing it through two holes in the shield, one hole at each bend, so that the two ends of the pin are on one side of the shield and the middle part or body is on the other side of it. The bends are abrubt or short, and form shoulders, which bear in the holes and keep the pin from moving or slipping back and forth.

The pin, after it is in the shield, is flattened, especially at the unpointed end, so that it will lie more closely and firmly to the shield and not project from its surface.

The pin is put into the shield and fastened by springing its ends together sufficiently to put them through the holes made for them in the shield and then springing the pin back again.

The claim of the patent is to the combination of the shield with the pin, constructed and arranged to operate substantially as and for the purpose thus set forth.

The original Patent No. 159,921 speaks of only two ways of forming the fastenings of the pin. One is to have metallic rivets passing through the body of the pin and headed. The other is to have the rivets punched out of the body of the pin and bent over or clinched on the shield.

The first claim of that patent is for a combination of three things—the shield, the pin, and the separate rivet-fastening. The second claim is for a combination of the shield and the pin having rivets punched out of its body. But with either form of fastening the entire pin, when in place, is on one side of the shield and the bent over or clinched or headed ends of the fastenings are on the other side of the shield. The body of the pin is straight and continuous aside from the supplementary fastenings.

In the defendant's pin the body is not straight and there are no supplementary fastenings. The body of the pin by being bent fastens itself.

Manifestly the effort in the specification of the reissue is to enlarge the scope of the patent beyond what is warranted by the original. The reissue says that the projections may be "parts of the pin itself." No way is shown in the original of making the projections parts of the pin itself, except by punching them out of its body. That means partly detaching part of the body and letting it form a pin or projection, to be bent down and clinched on the other side of the shield. The defendant's bends are parts of the pin itself, but they are not projections from the body, as in the plaintiff's pin, but are projections of the whole body in its devious path.

The second claim of the reissue, if construed to mean anything more than the second claim of the original, so as to cover the defendant's pin, covers new matter not found in the original, and is for an invention not shown in the original. That defense is set up in the answer. The only pin with a fastening forming part of its body, a pin formed with a fastening which is part of the pin itself, is a form of description ingeniously devised to cover a punched-out fastening and also such bent fastenings as those in the defendant's pin; but the claim cannot be construed to cover any fastening but a punched-out fastening or one that is its equivalent. The defendant's bent fastenings are not equivalents. They are an invention in a new direction not based on the plaintiff's idea. As against the plaintiff's pin, the defendant's is patentable, and not an infringement of claim 2 of the plaintiff's reissue.

The radical difference between the two pins is that the principle of the fastening is different in the two. The defendant's pin dispenses with all fastenings that are separate from the pin itself or that are partly-detached parts of the body as fastening devices separate from the whole body.

As an incident of the difference in structure, and illustrating it, no two portions of the defendant's pin on opposite sides of the shield are directly opposite to each other. The parts do not form the jaws of a clamp, as in the plaintiff's. The shield is held by virtue of the strength of the cross-section of the pin, and not by the clamping action of two directly-opposite parts.

The bill is dismissed, with costs.

DISCLAIMER.

98,727.—*William M. Welling*, New York, N. Y., dated January 11, 1870. IMPROVEMENT IN COMPOSITION RESEMBLING HORN. Disclaimer filed March 14, 1882, by the assignee, *The Welling Compressed Ivory Manufacturing Company*, (Limited,) and by the patentee.

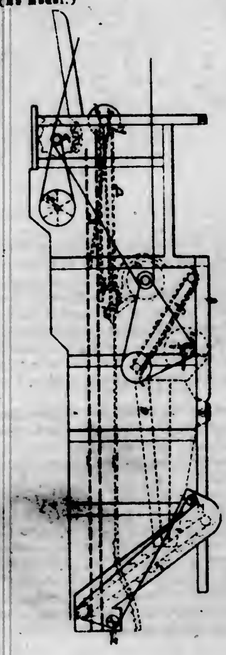
Enter their disclaimer "to such parts as include or claim, or may be construed to include or claim, any composition in which any animal or vegetable fiber other than cotton or wool, or their equivalents, in short pieces or in the form of flock, are a part of the elements of said composition."

PATENTS

GRANTED MARCH 21, 1882.

255,095. MANUFACTURE OF FRICTION-MATCHES. HALSEY H. BARBR, Plainfield, N. J. Filed June 18, 1881. (No specimens.)

Brief.—A quantity of the explosive compound sufficient to protrude slightly beyond the end of the splint is placed in the cavity in the end of the splint. The end is then dipped in paraffine or other suitable material.

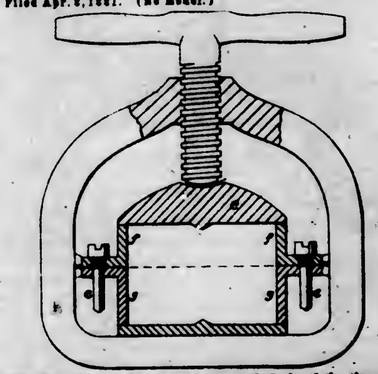


Claim.—1. The match-splint *c*, formed with the cavity *a* in its end for the reception of the explosive compound *c*, substantially as described.

2. A match having the explosive compound inserted in a cavity in the end of the splint, as a new article of manufacture.

255,096. MANUFACTURE OF OIL. GEORGE W. BARBR, Brooklyn, N. Y. Filed Dec. 12, 1879.

Claim.—The herein-described composite oil, composed of castor-oil, corn-oil, and heavy oil produced from petroleum or paraffine oil, in nearly equal proportions.



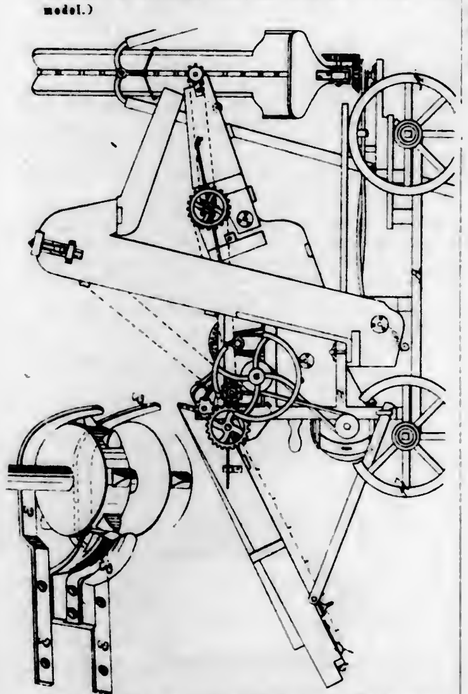
255,097. COMBINED CLOVER THRASHING AND HULLING MACHINE. J. BENJAMIN BIRDSELL, South Bend, Ind. Filed July 18, 1881. (No model.)

Claim.—1. In a combined clover thrasher and huller, the combination, with the bolting devices and hulling mechanism, of the tight shaking floor under the bolts, arranged to carry the materials passed through the bolts to the huller, and the elevating and conveying devices, substantially as described, arranged to take the tailings from the tailings-spout of the huller and deliver them upon said tight floor, to be reconveyed to the huller.

2. In a combined clover thrasher and huller, the tight conveying-floor having its outer end bowed downward, in combination with the huller, the elevator J, and the spiral conveyers I and E', the latter of which is arranged over said bowed end of the conveying-floor, substantially as and for the purpose set forth.

255,098. DENTAL FLASK. THOMAS W. BROWER, Delhi, N. Y. Filed Apr. 8, 1881. (No model.)

Claim.—The combination, in a dental flask, of the threaded-screw dowel or guide pins *e e*, with the cope *f*, and bowel *g*, constructed as and for the purpose herein set forth.



255,099. GRAIN-DRIER. JAMES H. GAYNOR, REUBEN FOSTER, and WILLIAM E. GRAHAM, Nebraska City, Nebr. Filed Aug. 27, 1881. (Model.)

Claim.—1. In a grain-drier, the drum-shaped boiler D, pierced by the exit-pipe C and provided with the steam-pipes E E', in combination with the double-conical steam-chamber F and the grain-chamber surrounded on the one side by the steam-chamber and on the other side by the hot-air chamber and the outer wall, A, substantially as shown and described.

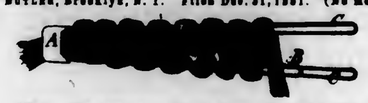
2. The hopper G and the steam-chamber F, whose walls are in the form of a double cone, in combination with the grain-chamber, whose outer walls are equidistant from the said steam-chamber F, the hot-air chamber, and its outer wall, A, said outer walls of the air and grain chambers conforming to the conical shape of the steam-chamber, substantially as shown and described, and for the purposes set forth.

255,100. CORN-SHELLER. MILO S. COOK, Elwood, assignor to Andrew H. Shreffler, Joliet, Ill. Filed Dec. 27, 1880. (No model.)

Claim.—1. The combination, with the trough and the endless chain traversing the same, of the metal track *d*, sunken in the bottom of the trough and conforming to the under surface of the chain, substantially as set forth.

2. The combination of the sprocket-wheels secured to the same shaft, the pulleys mounted on separate shafts, adjustable blocks having shanks or slides at one end supporting straps secured to the bottom of the frame, and adjusting-screws connecting said blocks at the other end to the frame, substantially as specified.

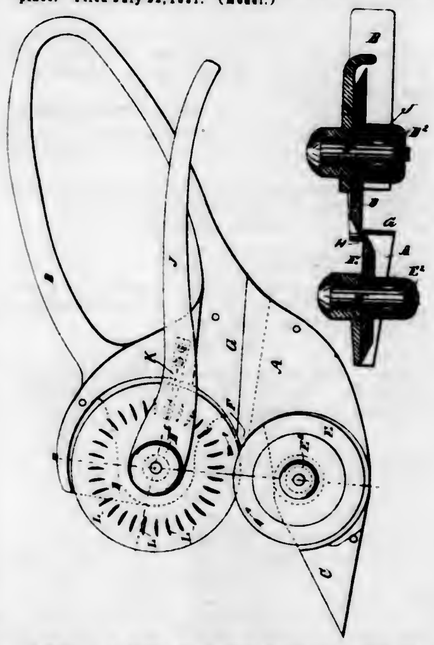
3. The combination of curved guard E with the sprocket-wheel, elevator-trough, and feed-chain provided with projections to carry the corn-ears, substantially as specified.



4. The combination of upper curved guard, E, with under curved guard, E', the sprocket-wheel, elevator-trough, and feed-chain provided with projections to carry the corn-ears, said guards forming a continuation of the trough to guide the corn-ears over the sprocket-wheel into the feed-holes of the machine, substantially as specified.

5. The vibratory back provided at its lower end with a flexible flap, in combination with the separator-screen and movable combs, substantially as described.

6. The combination of the elevator-troughs with the feed-chains provided with projections to carry the corn-ears, upper sprocket-wheels secured to the same shaft, and lower pulleys mounted in separate blocks or bearings adjustable independently of each other.



7. The combination of the endless chains having some of their links provided with ears, with combs riveted to said ears and provided with short teeth on their lower edge, and a screen of fixed rods on top of which said combs move or ride, substantially as specified.

255,101. HAIR-CRIMPER. JOHN M. CORWIN and HENRY D. BUTLER, Brooklyn, N. Y. Filed Dec. 31, 1881. (No model.)

Claim.—In combination with a crimping-pin having looped prongs C, made of wire or other suitable material, attached to shield A, the clamping loop-spring B, shorter than prong C and attached to said shield, and adapted to hold the end of the hair after being intertwined on the crimper, substantially as shown and described, and for the purpose set forth.

255,102. CUTTING MECHANISM. SANDOR DARNSIN, New York, N. Y., assignor of one-fourth to John S. Holmes, same place. Filed July 22, 1881. (Model.)

Claim.—1. A frame for a cutting mechanism, constructed, substantially as herein shown and described, with depressions or grooves in the sides, forming shoulders G and H, to prevent an undue spreading, bending, and buckling of the material, as well as prevent undue friction on the frame, as set forth.

2. In a cutting mechanism, the combination, with the frame A, provided with shoulders G and H on the sides thereof, of the disks D and E and the knife C at the lower end of the frame, substantially as herein shown and described, and for the purpose set forth.

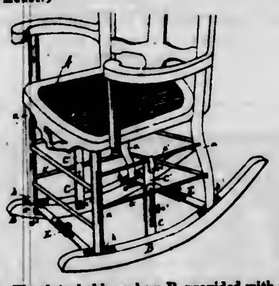
3. In a cutting mechanism, the combination, with the frame A, provided with shoulders G and H on the sides, of the disks D and E, the knife C at the lower end of the frame, and of the projection F, substantially as herein shown and described, and for the purpose set forth.

4. In a cutting mechanism, the combination, with the frame A, of the cutting-disk E, the cutting-disk D, provided with notches or recesses L, the lever J, and the spring-pawl K, substantially as herein shown and described, and for the purpose set forth.

5. In a cutting mechanism, the combination, with the frame A, of the handle B, the point C, the projection F, the cutting-disk E, the cutting-disk D, provided with notches or recesses L, the lever J, and the spring-pawl K, substantially as herein shown and described, and for the purpose set forth.

255,103. SHAFT-COUPLING. FRANCIS O. DESCHAMPS, Philadelphia, Pa. Filed Aug. 19, 1881. (No model.)

Claim.—1. A coupling attachment, A, composed of sections A' A', having semi-spherical ends *b' b'*, with flanges *b² b²*, provided with adjustable pins or plugs F F, having semi-spherical cavities *f f* in their ends, substantially as shown and described.



2. The combination, in a shaft-coupling, with the sections A' A', constructed and secured together substantially as shown and described, of shafts or rods D D', provided with grooved balls C C', and keys or spheres G G, substantially as and for the purpose set forth.

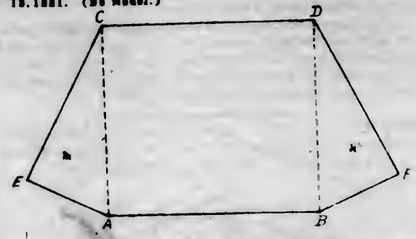
3. The coupling A, composed of sections A' A', having socketed ends *b² b²*, and flanges *b² b²*, provided with openings *f f*, which receive adjustable plugs or pins F F, in combination with means, substantially as shown and described, for locking said sections together, substantially as set forth.

4. The coupling A, composed of sections A' A', having ends *b' b'*, with sockets *b² b²*, and openings *f f* in flanges *b² b²*, adjustable plugs F, with cavities *f'*, balls C C', formed with grooves, key-spheres G G, and means for locking said sections together, substantially as shown and described.

5. The twin coupling device herein shown and described, composed of sections A' A', having the socketed ends *b² b²*, flanges *b² b²*, formed integrally therewith, and provided with adjustable plugs F, with socketed ends *f''*, and, in combination therewith, balls C C', grooved, as shown, for the reception of the keys or spheres G G, substantially as set forth

255,104. ROCKING-CHAIR. HENRY DEUPOSS, SAMUEL STRAUSS, and RAPHAEL STRAUSS, Chicago, Ill. Filed June 8, 1881. (No model.)

Claim.—1. The detachable rockers B, provided with mortises *b*, for the reception of the legs of the chair, in combination with adjustable braces C C', consisting of two strips of iron adjustably secured together, and adapted to be attached at one end to a round of the chair and at the other to the rocker, for the purpose of securing the rockers to the chair, substantially as specified.



2. The combination, with rocker B, provided with metal-lined mortises *b* and buttons *c'*, of adjustable braces C C', provided with button-holes *c* and hooks *c²*, and adjustable cross-braces E, substantially as specified.

255,105. HOG-RINGING DEVICE. JOHN P. KWAN, Donovan, Ill. Filed Jan. 13, 1882. (Model.)

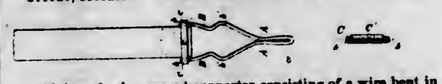
Claim.—A hog-ringing device consisting of a pair of pinchers or tongs the component parts of which A B A B are provided upon their inner adjoining sides with V-shaped recesses extending from the jaws toward the pivot-hole to receive a loop formed upon the ring blank, substantially as and for the purpose set forth.

255,106. TENT. EDWARD S. FARROW, U. S. Army. Filed Sept. 19, 1881. (No model.)

Claim.—An improved tent made up of the form and dimensions substantially as represented by letters A, B, C, D, E, and F, with the triangular ends *a a*, and having three (3) of its faces closed, all adapted for use as shown an described.

255,107. STEAM-GENERATOR. CHARLES GORTER, Albany, N. Y. Filed Oct. 13, 1881. (No model.)

Brief.—Two independent water-chambers are concentrically arranged, the inner one forming a fuel-reservoir, and located above the combustion-chamber, within the main flue of the outer boiler. An annular flue-space is left between them. They are connected together by hollow stay-bolts, through which circulation is maintained. The combustion-chamber is conical, and terminates at the lower end of the fuel-reservoir.



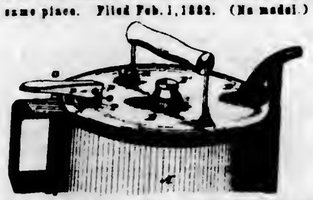
Claim.—1. The combination, in a steam-generator, of two independent water-chambers concentrically arranged, the bottom of the outer chamber being angular in cross-section, forming a conical combustion-chamber, and the central water-chamber forming a fuel-magazine and located at or near the apex of said combustion-chamber, in the manner shown and described.

2. The combination, in a steam-generator consisting of the outer water-chamber provided with a conical bottom, forming a conical combustion-chamber, of the inner water-chamber located at or near the apex of said combustion-chamber, and which forms a fuel-magazine, and the annular flame-flue formed by and between the inner and outer water-chambers, in the manner set forth.

3. The combination, in a steam-generator, of the two independent water-chambers, as described, the combustion-chamber, the annular flame-flue formed between said chambers and terminating at the lower end of the reservoir, and the upper and lower water-connecting pipes or hollow stay-bolts, constructed and arranged substantially as shown.

4. In a steam-boiler, the combination of the inner and outer water-chambers, connected as described, and forming the annular flame-chamber and the conical fire-box, a segmental portion of the inner wall of the outer chamber projecting above the steam-space, the horizontal and vertical partition, and the casting C, forming the top of the return-smoke flue, all arranged to compel the products of combustion to take an up-and-down and return course, for the purpose described.

255,108. GARMENT-SUPPORTER. ALBERT C. GREENE, Providence, R. I.: William B. Wightman, Administrator of said Greene, deceased. Filed June 10, 1881. (No model.)



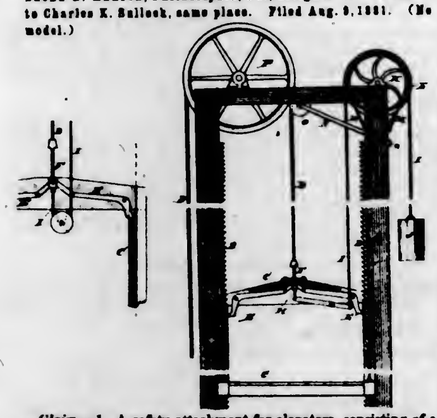
Claim.—1. A garment-supporter consisting of a wire bent in its middle to form a spring-clamp, with parallel sides A A, and adjacent to its free ends to form a tapering neck, B B, combined with a movable collar, C, which opens and closes said jaw as it is moved

to and fro along the neck B B, between the outwardly-turned ends *b b* and the shoulders *b' b'*, and holding the cloth by the clamping together of the parallel jaw-sides A A.

2. In a garment-supporter, a spring-clamp having a tapering neck, B B, provided with outwardly-turned ends *b b* and shoulders *b' b'*, combined with a movable collar, C, provided with recesses *c c*, to engage said ends *b b*, and adapted to slide to and fro along said neck, between said ends *b b* and shoulders *b' b'*.

255,109. OIL-CAN. LEWIS A. HARKER, Columbus, Ohio, assignor of two-thirds to Charles H. Amann and William Ewing, same place. Filed Feb. 1, 1882. (No model.)

Claim.—1. In an oil-can, the combination, with the discharge-spout constructed with an enlarged portion, D', at its lower end, said enlarged portion being secured to the top of the can over the oil-discharge opening formed therein, whereby the top of the can serves as a valve-seat, of a downwardly-closing valve loosely arranged within said enlarged portion of the spout or nozzle, and suitable levers for actuating the valve, substantially as set forth.

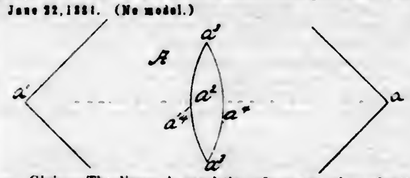


2. In an oil-can, the combination, with the discharge-spout constructed with an enlarged portion, D', at its lower end, said enlarged portion being secured to the top of the can over the oil-discharge opening formed therein, whereby the top of the can serves as a valve-seat, of the downwardly-closing valve loosely arranged within the spout, and levers I and O and connecting devices, the rod *b*, and universal joint connecting the valve stem and rod, substantially as set forth.

3. In an oil-can, the combination, with the bracket secured to the under side of the top of the can and the vent-valve stem working through the lower end of the bracket, of an angle-shaped lever, I, and a spiral spring encircling the valve-stem, one side of the spring having a bearing on the side of the bracket and the other side of the spring having a bearing on the vertical portion of the lever, substantially as set forth.

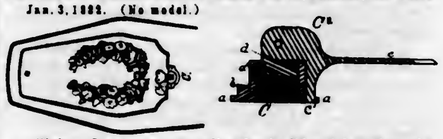
4. The combination, with the vent-valve and stem, of the supporting-bracket, the two spiral springs, and the thumb-lever, substantially as set forth.

5. The combination, with the vent-valve stem and spiral spring N, encircling its upper end, of the thumb-lever O and standard P, the latter constructed to form a stop and limit the upward movement of said lever, substantially as set forth.



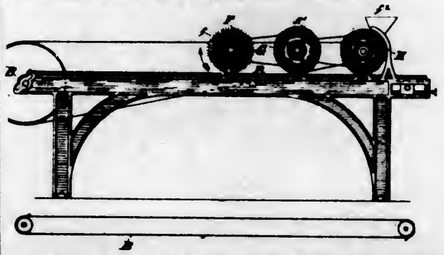
255,110. SAFETY ATTACHMENT FOR ELEVATORS. PHINEAS D. HARTER, Philadelphia, Pa., assignor of two-thirds to Charles K. Sullock, same place. Filed Aug. 9, 1881. (No model.)

Claim.—1. A safety attachment for elevators, consisting of a cable one end of which is secured to and combined with the latching mechanism adapted to arrest the descending cage and the other to a weight, in combination with a grooved wheel, over which said cable travels upon the ascent or descent of the cage, a brake to arrest or retard the rotation of said grooved wheel, and means to put said brake in action upon the falling of the cage, substantially as and for the purpose specified.



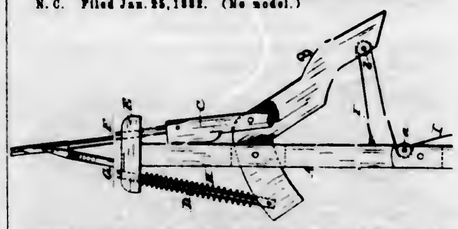
2. In a safety attachment for elevators, the sheave P, elevating-cable D, cage C, with its safety-latch, in combination with the safety-cable I, means to connect said cable with the latch, grooved pulley K, weight J, lever N, carrying on its end an idler-pulley, O, and a brake adapted to be operated by any movement of said lever to arrest the movement of the grooved pulley, substantially as and for the purpose specified.

255,111. DIAPER. HARRIET MORGAN, Washington, D.C. Filed June 22, 1881. (No model.)



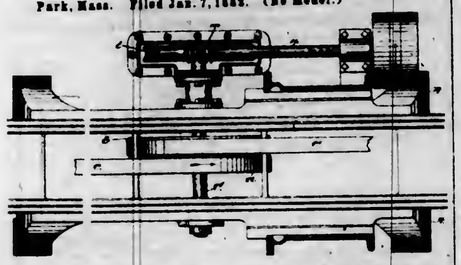
Claim.—The diaper A, consisting of a square piece of cotton or other suitable material woven, overlapped, or having cut therein an ellipsoidal opening, a^3, the sides a^4 a^4 being stitched together, whereby the desired form of the diaper is attained.

255,112. COFFIN. CHRISTOPHER H. OLSON, Decatur, Ill. Filed Jan. 3, 1882. (No model.)



Claim.—In a two-part coupling for the lid and face-plate of a coffin, the part C, having annular flange *a*, annular elevation *b*, with low portion in front and high portion in the rear, and made hollow to receive the shaft *d*, to which is pivoted the part C^2, carrying the foot *c'*, and the part *c*, attached to the face-plate, as set forth.

255,113. PAN-CLEANING MACHINE. WALTER S. OWEN, Buffalo, N.Y., assignor to Charles E. Benedict and George B. Webster, same place. Filed Aug. 15, 1881. (No model.)

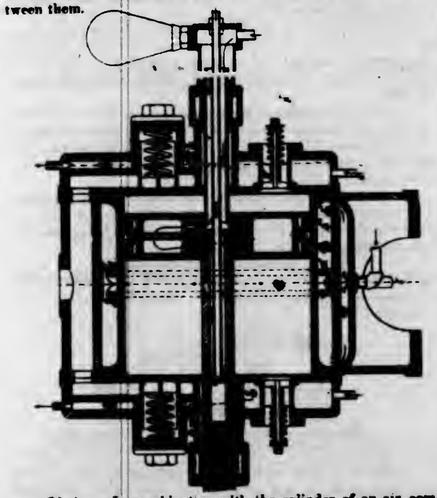


Claim.—In a machine for cleaning pans, the combination of a cleaning roller brush, F *f*, with a greasing roller brush, H *g*, an oil-reservoir, and an endless apron, B, and their operating gearing, substantially as described.

255,114. PRUNING-KNIFE. WARD C. PERLAND, Asheville, assignor of one-half to James M. Brockshier, Buncombe County, N.C. Filed Jan. 25, 1882. (No model.)

Claim.—A pruning implement consisting of the handle A, provided with the sheave *a*, pivoted bell-crank lever B, having sheave *b*, and perforated cross-bar E, in combination with the pivoted arm C, with inwardly-projecting enlargement, rods D, G, and F, provided with suitable knives, the coiled spring H, and operating-cord I, all constructed and adapted to operate substantially in the manner and for the purpose specified.

255,115. METAL-PLANER. BENJAMIN F. RADFORD, Hyde Park, Mass. Filed Jan. 7, 1882. (No model.)



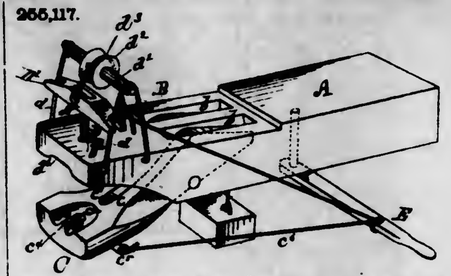
Claim.—1. In a metal-planer, the planer-bed and the drums *a b*, combined with the metal bands connected at one end with and passed about the drums in opposite directions, and secured at their other ends to the planer-bed.

2. The planer-bed, the drum *a*, and the sheet-metal band *c*, combined with the bolt and spring to form a yielding connection between the bed and band, substantially as and for the purpose described.

3. The planer-bed, the sheet-metal bands connected therewith at one end, and the slotted drums *a b*, combined with the cam-plates within the said drums, with which the other ends of the said bands are connected, substantially as shown and described.

255,116. AIR-COMPRESSOR. ANDREW C. RAND, New York, N.Y. Filed Nov. 5, 1881. (No model.)

Brief.—There are two independent water-chambers respectively upon the opposite ends of the cylinder, and a third water-chamber upon the body of the cylinder. The latter chamber is divided into two compartments, each of which is supplied with cold water at the bottom near the ends of the cylinder; but they have a common outlet through an annular passage arranged between them.



Claim.—In combination with the cylinder of an air-compressor, two independent water-chambers arranged respectively upon the heads of the cylinder, and a third water-chamber surrounding the body of the cylinder, each of the said chambers being provided with inlet and outlet passages for the admission and discharge of the cooling-water, substantially as and for the purposes described.

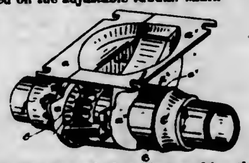
255,117. CAR-COUPLING. WILLIS J. ROBERTS, Eaton Rapids, Mich. Filed Feb. 3, 1882. (No model.)

Claim.—The combination of slotted bar A B, provided with

255,117.

uprights *d*, shaft *d'*, pulley d^3, cross-head D', carrying pin D, cord d^2, and lever E, with the bifurcated jaw C, weight F, and cord c^2, substantially as shown and described.

255,118. HASP-LOCK. JOSEPH F. ROBINSON, Verona, Pa. Filed Oct. 15, 1881. (No model.)



Claim.—1. In a hasp-lock, the combination of a hammer pivoted to one of the rivets securing the front plate of the lock to the body of the hasp, the elastic locking-bar to engage the forward end of the hammer, and the screw-threaded key-pintle to release the locking-bar, all constructed and arranged to operate substantially as herein set forth.

2. The combination of the hammer pivoted as specified, the elastic locking-bar to engage the forward end of the hammer, the threaded key-pintle and a pawl adapted to retain the locking-bar in a fixed position when relieved from the forward end of the hammer, constructed and arranged to operate substantially as and for the purpose set forth.

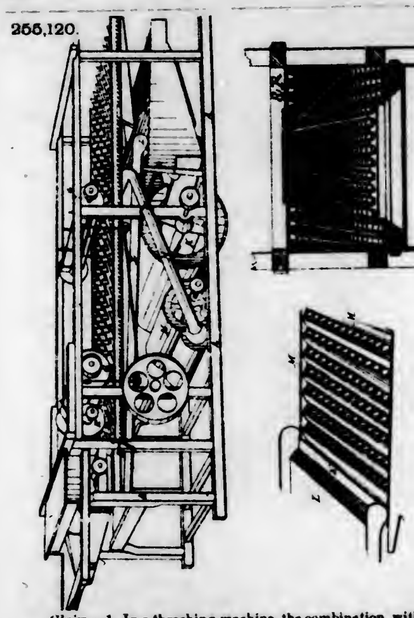
255,119. FORCE-FEED FOR SEEDING-MACHINES. SAMUEL ROTAN, Brownsville, Ind., assignor of one-half to John L. Riter, same place. Filed Apr. 8, 1881. (Model.)

Brief.—The feed-wheel and follower with the double cut-off are all mounted on the adjustable tubular shaft.

Claim.—1. In a force-feed seeding-machine, the combination of an enlarged tubular shaft working in contact with the grain and a feed-wheel, substantially as described.

2. In a force-feed seeding-machine, the combination of an enlarged tubular shaft working in contact with the grain, a feed-wheel, and cut-offs, substantially as set forth.

3. In a force-feed seeding-machine, the combination of a feed-cup having side openings and an elevated discharge-orifice, an enlarged tubular shaft passed through the side openings of the feed-cup and working in contact with the grain, a fluted feed-wheel, and upper and lower cut-offs, substantially as described.



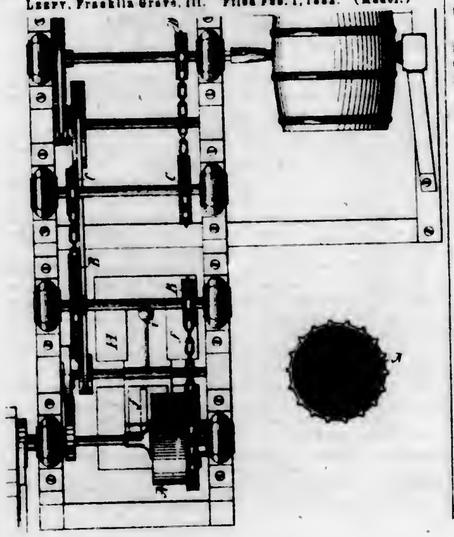
4. In a force-feed seeding-machine, the combination of a feed-cup having a side opening or passage and an enlarged tubular shaft with an exterior diameter fitting closely the said opening or passage of the feed-cup and revolving in contact with the grain, substantially as set forth.

5. In a force-feed seeding-machine, the combination of the feed-cup, the enlarged tubular shaft with the fluted feed-wheel fitted thereon, the independent cut-offs, and a rose-washer, said parts being arranged for operation substantially as described.

6. In a force-feed seeding-machine, the cut-offs consisting of the collar C, the lower cut-off, *c*, and upper cut-off, *d'*, with the longitudinal groove d^5, substantially as shown and described.

255,120. THRASHING-MACHINE. ALLEN A. RUSSELL, Indianapolis, Ind. Filed May 31, 1881. (No model.)

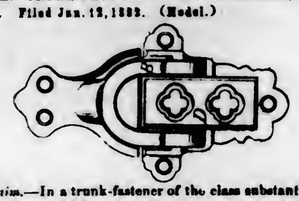
256,120.



Claim.—1. In a thrashing-machine, the combination, with the straw-shaker, of a blast-fan, the air-casing, and the pipe supported by the frame of the machine below the shaker for sending a blast up through it, substantially as set forth.

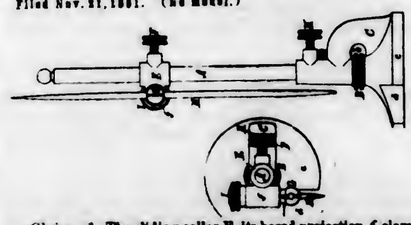
2. The combination, with the riddle M, of the grain-table L, having its rear end imperforate and downwardly curved at L', the parts being arranged, as described, to cause the downwardly-projecting portion L' to move over and in close proximity to the upper end of the riddle M, substantially as set forth.

3. The combination of a toothed cylinder and concave sections arranged to form a central feed-opening and formed with ribs converging upwardly from said opening, a concave section over the cylinder provided with ribs converging rearwardly, and a concave section in rear of the cylinder arranged to leave a discharge-opening at each end and formed with ribs diverging toward said discharge-openings, substantially as set forth.



256,121. CHURN-MOTOR. ANTON SCHOTT and THEODORE LEEPY, Franklin Grove, Ill. Filed Feb. 1, 1882. (Model.)

Claim.—1. The coiled spring for a churn-motor and the chain-gear A, B, C, and D, combined substantially as and for the purpose set forth.

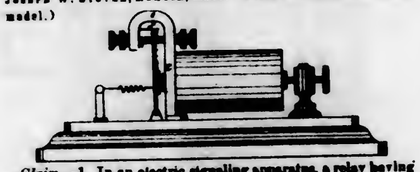


2. In a churn-motor, the combination of the coiled spring, chain-gear A B C D, fan H, with balls *i i*, and flanges *f f*, constructed substantially as and for the purpose herein set forth.

256,122. TRUNK-FASTENER. JOHN H. SESSIONS, Jr., Bristol, Conn. Filed Jan. 12, 1882. (Model.)

Claim.—In a trunk-fastener of the class substantially such as is herein shown and described, the plate and spring-box cast in one piece, with the snap-loop-receiving recesses and the thin lugs by the side of said recesses, said lugs being adapted to be bent for holding the snap-loop in place, substantially as described, and for the purpose specified.

256,123. SURFACE-GAGE. LAROY S. STARRETT, Athol, Mass. Filed Nov. 21, 1881. (No model.)



Claim.—1. The sliding collar E, its bored projection *f*, clamp-screws F G, and nut I, in combination with the pointer H, arranged in the screw G, and also with the grooved standard A and the stand C, adjusting-nut B, and guide-screw D, adapted to and arranged with each other, as set forth.

2. The standard C, provided with the notch *d*, arranged in its base, as set forth, in combination with the standard A, and with the pointer H, sliding collar E, bored projection *f*, clamp-screws F and G, and nut I, all arranged and adapted substantially as explained.

3. The sliding collar E, its tapering bored projection *f*, clamp-screw F, split and tapering screw G, and its nut I, in combination with the pointer H, arranged in the said screw G, and with the standard A, extending through the said collar, all being substantially as set forth.

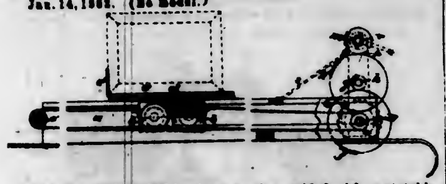
4. The cylindrical standard A, provided with the longitudinal groove *e*, adjusting-screw *a*, and nut B, in combination with the stand C and the guide D, and clamp-screw K, all being arranged and adapted substantially as set forth.

256,124. APPARATUS FOR SIGNALING BY ELECTRICITY. JOSEPH W. STOVER, Newton, Mass. Filed Nov. 18, 1881. (No model.)

Claim.—1. In an electric signaling apparatus, a relay having a movable armature and retractor and a device for alternately breaking and closing the circuit thereof, combined with a local battery and circuit for operating registering apparatus the terminals of which are controlled by the said relay-armature, as described, whereby the condition of the said local circuit is changed both at the movement of the relay-armature from and at its movement toward the poles of its magnet, and a record is thus made both of the opening and closure of the main or relay circuit, substantially as and for the purpose set forth.

2. In a relay, the combination, with the relay-armature, of the local-circuit terminals controlled thereby and arranged as described, by means of which the local circuit is closed in the movement of the armature in either direction, but retained open at the end of the said movements, substantially as and for the purpose set forth.

3. The combination, with a relay-armature lever forming a portion of the local circuit, and insulating-stops therefor, of a contact-spring, also forming a portion of the local circuit, it being located, as described, relative to the armature-lever, whereby it is touched by the said armature-lever only in its movement from one to the other of the said stops, substantially as described.

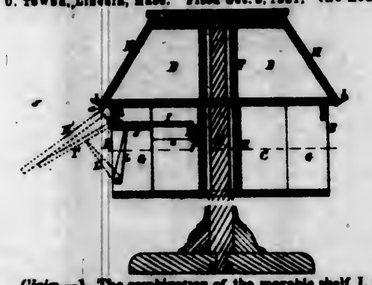


256,125. GUIDER FOR SEWING-MACHINES. E. F. THOMAS, New York, N. Y., assignor to the Gold Medal Sewing Machine Company, Orange, Mass. Filed Nov. 11, 1880. (No model.)

Brief.—The cord-delivering hub is provided with several eyes of different sizes, and one of which may be brought into use at the pleasure of the operator.

Claim.—The cord-delivering hub *c*, provided with a plurality of carried ends forming eyes 1 2 3, combined with the pivot *d*, upon which it may be rotated to bring either of its eyes into position, the detaining-spring *f*, arranged to bear against the periphery of the said hub to hold it in position, and carrier-arms *b b'*, substantially as shown and described.

256,126. SKID. GUSTAV TISCHER, Wilmington, Del. Filed Jan. 14, 1882. (No model.)

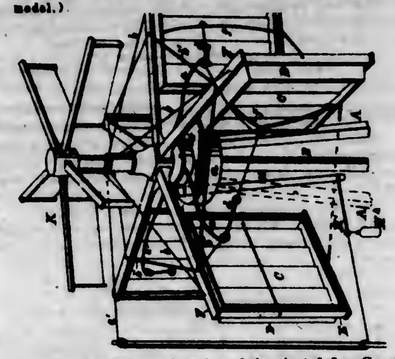


Claim.—1. The skid having a truck provided with a rotatable platform, substantially as and for the purpose set forth.

2. The frame, truck, and conveyer, in combination with the two squared shafts E F and the gearing, substantially as and for the purpose set forth.

3. The frame, truck, conveyer, and rollers, in combination with the pivoted uprights *p*, substantially as and for the purpose set forth.

256,127. ROTARY STUDY-TABLE OR BOOK-CASE. ALFRED O. TOWNE, Lincoln, Mass. Filed Oct. 8, 1881. (No model.)



Claim.—1. The combination of the movable shelf I, its carrier K, having the ledge *f*, and tripper *e*, with the rotary case B, applied to the standard A, and provided with the cross-bars *d* and *g*, arranged as set forth.

2. The combination of the pivoted arm L with the case B, provided with the bars *d* and *g*, and with the movable shelf I and its carrier K, all being arranged and adapted to operate substantially as described.

3. The combination of the turn-down leaf or cover H, applied, as described, to the rotary case B, with such case, and with the movable shelf I, its carrier K, and arm or strut L, arranged in and adapted to such case, substantially as specified.

4. The rotary case B, having the two separate chambers C D, the tubular parts E F, prismatic posts G, and the covers H, arranged substantially as set forth.

256,128. HORIZONTAL WINDMILL. WILLIAM H. ACE, Jordan Township, Monona County, Iowa. Filed July 15, 1881. (No model.)

Claim.—1. The combination of the pivoted fans C and the pivoted frames D, carried below the radial arms F, with the check-wheel G and the friction-lever H, operated by mechanism substantially as and for the purposes described.

2. The combination of the pivoted fans C and the pivoted frames D, carried below the arms F, with the check-wheel G, having the arms *e*, connected with the chain *d*, attached to the pivoted frames, and the friction-lever H, connected with and operated by the governor-wheel K, substantially as and for the purposes described.

3. The combination, with the pivoted fans C in the pivoted frames D, of the rods *f'*, attached to the frames and bent and arranged to form stops to the fans, substantially as described.

256,129. MACHINE FOR WAXING PAPER. GEORGE W. BANCROFT, Lynn, Mass. Filed Oct. 17, 1879.

Claim.—1. The combination of the metallic roller D, and the elastic-surfaced roller D', located over the waxing-pan C, with the waxing-pan C, and with the steam-pipe, located near the bottom of the same, and operated together substantially as described.

2. The pressure-rolls D D', located above the waxing-pan, in combination with said pan, and with the steam pipe or bar *e*, submerged in the wax, and beneath which the paper passes from the grid to the pressure-rolls, substantially as set forth.

3. As a paper-waxing apparatus, the combination of a heated waxing-pan provided with a bar beneath its surface, with a pair of distributing, compressing, and calender rolls located above or nearly over said pan, and an independent smoothing and cleaning device located on the delivery side of said rollers, substantially as described.

4. The combination, in a machine for waxing paper, of the grid B with the bar *e*, pan C, and rollers D D', substantially as and for the purpose described.

5. The combination, in a machine for waxing paper, of the grid B with bar *e*, pan C, and smoothing device E E', substantially as described.

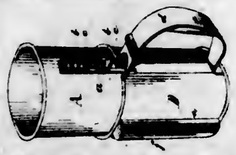
6. The combination, in a machine for waxing paper, of the grid B with bar *e*, pan C, and reel F, substantially as described.

256,130. CONTOUR GAGE AND TOOL. HENRY C. BARBER, Sedalia, assignor to Thomas T. Clifford, Pettis County, Mo. Filed Aug. 4, 1881. (No model.)

256,130.

5. An armature for dynamo-electric machines, composed of a

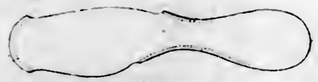
255,130.



Claim.—In a contour lathe-tool, the combination of the frame A, thumb-screw C, rigid strips *a a*, and strips B, having shoulders S, substantially as shown, and for the purpose described.

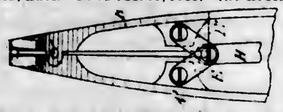
255,131. WHIP-CORE. VIRAL B. BARSTOW and STANTON H. MALLORY, Westfield, Mass. Filed Feb. 3, 1882. (No model.)

Claim.—An improved whip-core consisting of a rattan piece having longitudinal saw-kerfs made therein, combined with thin flat rawhide strips glued into said saw-kerfs, substantially as described.



255,132. LIQUID MEASURE AND SCALES. CHAS. C. BECKER and PHILIPP JACOB, Chicago, Ill. Filed Oct. 29, 1881. (No model.)

Claim.—1. The combination of the vessel A, having dovetailed slide *a* and vertically-adjustable lugs *b* and set-screws *c*, and the frame D, having wire *h*, suspended therefrom by coiled springs *i*, all substantially as and for the purpose set forth.



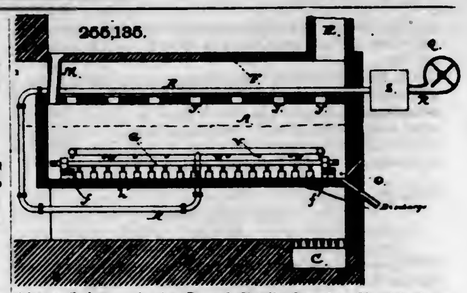
2. The combination, with vessel A, having dovetail slide *a*, vertically-adjustable lugs *b*, and set-screws *c*, of the frame D, having slotted handle *d*, tubes *f*, spring-inclosing tubes *g*, transverse connecting-wire *h*, and springs *i*, all substantially as and for the purpose set forth.

255,133. SHOE. JOSIAH C. BENNETT, Lynn, Mass. Filed Dec. 13, 1881. (No model.)

Claim.—The herein-described shoe, composed of the upper and outer sole and the inner sole, *c*, stitched to the upper and outer sole about its toe and heel, but cut away at its sides and not connected with the upper and outer sole along the sides of the inner sole, all substantially as described, whereby the toe of the inner sole, the sides of which at the ball of the foot are not connected with the outer sole by stitches, is made available to keep the toe of upper distended, substantially as described.

255,184. HORN AND PEG CUTTER. JOHN E. BICKFORD, South Abington, Mass. Filed Jan. 13, 1882. (No model.)

Claim.—In a shoe pegging or nailing machine, the combination of the supporting-horn A A' B, in which the part B operates as a cutting-jaw, in connection with the part A', with the operating mechanism H E E', all operating together substantially as described, and for the purpose set forth.



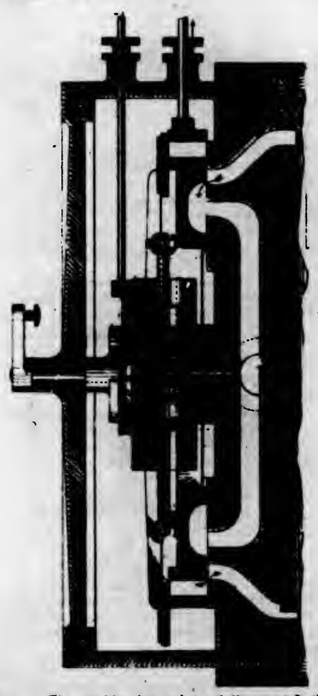
255,185. DESULPHURIZING-FURNACE. AMBROSE BLATCHLY, San Francisco, Cal. Filed May 11, 1881. (No model.)

Brief.—The air, before being admitted into the roasting-chamber, is dehydrated by being forced through a body of common salt.

Claim.—1. The process of desulphurizing ores, consisting of the following successive steps: first, drying the ore; second, subjecting the dried ore in a close chamber to thorough agitation; third, subjecting the ore to the action of heat; and, fourth, injecting hot air which has been dehydrated or deprived of its moisture, substantially as described.

2. A desulphurizing-furnace consisting of the closed chamber, retort, or muffle A, mounted over the fire-place C, and having the flue D, leading underneath, around the rear end, and over the top of the chamber to a stack, E, at the front of the furnace, the drying-floor F, arranged over the chamber and flue, the stirrers *h*, the

255,185.



blower Q, box *s*, air-pipe R, and distributing-pipes V, with their perforations or nozzles *w*, all combined and arranged to operate substantially as above described.

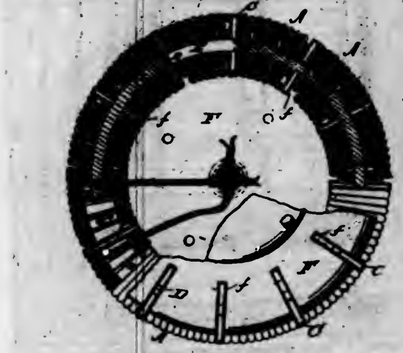
3. In an ore-roasting muffle or retort furnace, the automatic stirring apparatus consisting of the beam G, with its plows or stirrers *h*, operated by the chains S and automatic reversing-gear, in combination with the bridge-walls or tracks *f*, with their vertical inclined planes K and horizontal inclines *i*, substantially as and for the purpose described.

4. The combination, in a furnace for desulphurizing ores, of the ore-chamber having holes through its top wall, the perforated air-injecting pipes arranged across the furnace to inject air downward into and against the ore on its bottom, and a dehydrating-box connected with the said injecting-pipes, and an air-forcing engine, substantially as described.

255,186. CUT-OFF VALVE. BENJAMIN BRASELLE, St. Louis, Mo. Filed Dec. 1, 1881. (No model.)

Claim.—1. The combination, substantially as set forth, of an open-ended cylinder having a central division or partition and a steam and an exhaust port on each side thereof, a pair of pistons fitted to said cylinder on opposite sides of its central partition, and a stationary controlling-valve which fits over the steam-ports of the cylinder and is adjustable, so as to regulate the period of admission of steam thereto.

2. The combination, substantially as set forth, of an open-ended cylinder having a central division or partition and a steam



and an exhaust port on each side thereof, a pair of pistons, each fitted to said cylinder on one side of said partition, a slide-valve effecting the opening and closing of the steam and exhaust ports, and an adjustable controlling-valve regulating the period of admission of steam through said slide-valve.

3. The combination, substantially as set forth, of a double-ported slide distribution-valve, an open-ended cylinder connected to said valve and having a central division or partition, a pair of steam-supply ports leading into said cylinder on opposite sides of said partition, a pair of exhaust-ports extending from said cylinder through the distribution-valve to its working-face on opposite sides of said partition, and a valve-face upon the main steam-cylinder having channels or grooves leading to its eduction-passages, with which channels the exhaust-ports in the distribution-valve leading to the open-ended cylinder are adapted to be alternately brought into communication by the reciprocation of the valve.

4. The combination, substantially as set forth, of a double-ported slide distribution-valve, an open-ended cylinder having a central division or partition and a steam and an exhaust port on each side thereof, a pair of pistons fitted to said cylinder on opposite sides of the central partition, a cut-off valve connected to the rods of said pistons and governing the ports of the distribution-valve, a slide-valve governing the ports of the open-ended cylinder, and an adjustable controlling-valve regulating the admission of steam through said slide-valve to said ports.

255,187. ARMATURE FOR DYNAMO-ELECTRIC MACHINES. GUSTAV H. BROWN, New York, N. Y., assignor to Charles A. Cheever, same place. Filed Nov. 14, 1881. (No model.)

Brief.—The core of the armature has a section cut out, leaving a space, through which the separately-wound bobbins may be slipped to place them on said core. The ends of the core are dovetailed, and a section correspondingly dovetailed completes the ring. Before placing this section in place a bobbin is slipped thereon to complete the annular series of bobbins.

Claim.—1. An armature for dynamo-electric machines, consisting of a ring the ends of which are secured together by a removable key, and of a series of bobbins placed thereon, the sides of which overlap the cores of the bobbins, so as to interlock with wooden or other diamagnetic disks constituting the sides of the armature, substantially as shown and described.

2. A ring or band for holding the bobbins of the armature of a dynamo-electric machine provided with a removable key or section, whereby the placing of the bobbins on said ring or band is facilitated and they are more readily removed therefrom to obtain access to and replace burned or destroyed bobbins, substantially as shown and described.

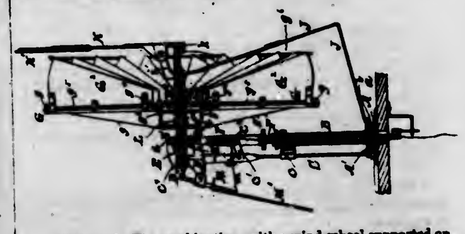
3. An armature for dynamo-electric machines, consisting of a ring or band provided with a removable key, a series of bobbins the cores of which are composed of two or more bars of soft iron joined together, so as to have intervening air-spaces, and two disks or sides, said parts inclosing or forming an air-chamber which communicates with the external air, whereby during the revolution of said armature air will be drawn into said chamber and circulate into and through the air-spaces in the cores of the bobbins or sections, substantially as shown and described.

4. In a ring-armature, the combination of the following elements, viz: a bobbin holder or ring provided with a removable key, a series of bobbins the cores of which are composed of a series of soft-iron bars slightly separated from each other to form air-spaces, diamagnetic perforated disks or armature-sides, and an intervening air-chamber, substantially as shown and described.

5. An armature for dynamo-electric machines, composed of a series of bobbins the cores of which are formed of a series of bars secured together to form intervening spaces, each of such bobbins having two sides or ends projecting beyond the remaining sides or ends of its core, and a ring provided with a removable key and means for securing the same to said ring, substantially as shown and described.

6. The bobbin or section A, the spool or core of which is composed of a series of soft-iron bars with intervening air-spaces and enlarged or extended ends C C, having flanged edges, substantially as shown and described.

7. The bobbin or section A, having core A', composed of bars *a a* and ends C C, and provided with central slot or recess, A*, substantially as shown and described.



8. The bobbin or section A, having core A', composed of a series of bars with intervening spaces and of side plates, C C, the ends of which project beyond the core A', substantially as shown and described, and for the purpose set forth.

9. The combination of ring D, key or bar E, bobbins or sections A A, and sides F F, recessed or slotted at *f f*, substantially as shown and described.

10. An armature-bobbin ring or band provided with a removable key carrying a bobbin, whereby when said band is filled with bobbins its ends are locked by the insertion therebetween of said key, and at the same time completes the continuity or consecutiveness of the bobbins, substantially as shown and described.

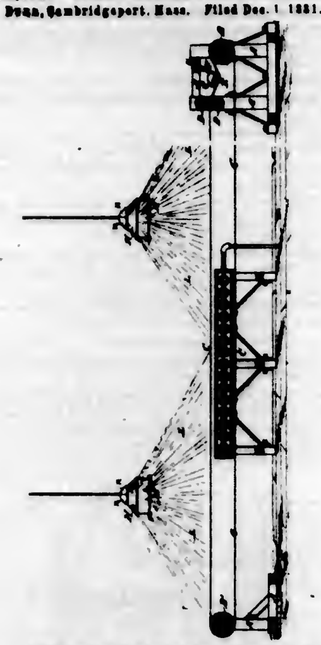
255,188. WIND-WHEEL. EDMOND BUCKLEY, Swan, Iowa. Filed Dec. 17, 1881. (No model.)

Brief.—The wheel is provided with two vanes, K' and M', that are operated by the wind to regulate the working of the wheel. The trough N is also adapted to control the operation of the wheel by tilting and pulling on the cord *m*.

Claim.—1. The combination, with a wind-wheel supported on a hollow shaft and having its sails pivoted to turn into or out of the wind, of the vane placed in a vertical position in the rear of and pivoted to move to and from the sails, a wind-lever placed in front of the sails, a central connecting-rod put through the hollow shaft and connected to the arm of the wind-lever and bearing against the end of the arm of the vane, and the necessary mechanism connecting the central rod with the sails, substantially as set forth.

2. The combination, with the sails of a wind-wheel grouped in sections or series and pivoted to the spokes of the wheel to turn into or out of the wind, of the sliding head H, provided with arms A, cranks g', extended and forming spokes in the wheel, and having sails fastened thereto, and rods or links g^2, connecting the outer corners of the sails in the series, substantially as set forth.

3. The combination, with the wind-wheel having a hollow shaft, of the tilting trough N, cord *m*, lever M, pivoted to the frame, and pitman I', put through the hollow shaft of the wheel, and having one of its ends connected to the end of lever M and its other end connected by suitable mechanism to the pivoted sails in the wheel, substantially as set forth.



4. The combination of the shaft E, the wheel G, having the hinged sails G^2, with their spokes or shafts provided with cranks g', the spring L, the sliding head H, having arms A, the piston *l l'*, having the bar *k'*, and the governor K K', substantially as and for the purpose set forth.

5. The combination of the shaft E, the wheel G, having the hinged sails G^2, with their shafts provided with cranks g', the spring L, the sliding head H, having arms A, the piston *l l'*, the rod I', connected to the piston *l l'*, governor K', and the wind-lever M, substantially as and for the purpose set forth.

6. The combination of the shaft E, having the wheel G and the eccentric or cam E', the lever D, having its pivotal point at the convergent ends of its arms, while their divergent ends are provided with concaved bearings *c*, and the pitman F, substantially as and for the purpose set forth.

7. The combination of the trough-lever N, having the several adjustments, with the wheel G, having the hinged nails provided with cranks, the armed sliding head H, the piston *l f*, rod I', connected to the piston, lever M, and cord n or its equivalent, substantially as and for the purpose set forth.

255,139. CURING RUBBER-COATED FABRICS. HENRY W. BEAN, Cambridgeport, Mass. Filed Dec. 1 1881. (No model.)

Claim.—1. The art of curing rubber coatings applied to fabrics by subjecting them to the action of the electric light, substantially as described.

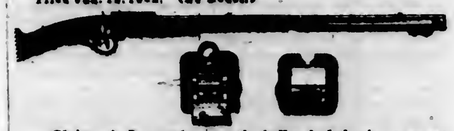
2. The described improvement in the art of curing rubber coatings on fabrics, the same consisting in subjecting said coatings to the action of the electric light while said fabric is in motion through the field of illumination of such light, substantially as set forth.

3. The improvement in the manufacture of rubber-coated fabrics, consisting in applying the rubber coating in successive layers while the fabric is moving through the coating-machine, subjecting each coating to the action of the electric light during each movement, and subsequently curing the rubber by means of said light before removal from said machine, substantially as set forth.

4. An apparatus for curing rubber coatings on water-proof fabrics, consisting of one or more electric lights and mechanical means for moving the rubber-coated fabric through the field of illumination, substantially as set forth.

5. The frame, the carrying-rollers B B', adapted to support and move the fabric C, and the calender-roller D D, in combination with the electric lights L L and suitable reflectors, N, for the purpose set forth.

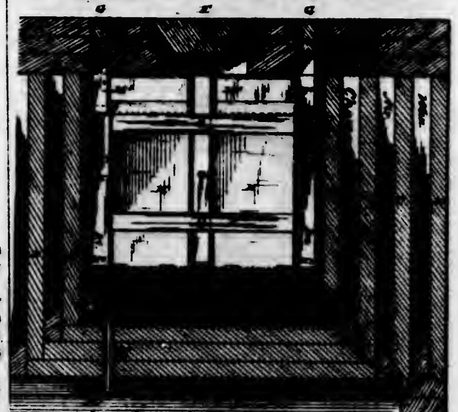
6. The combination of the electric lights L and the glass shield M, for the purpose set forth.



255,140. AUTOMATIC WAGON-BRAKE. BENSON I. BURTON, Washington, Iowa, assignor of one-half to William B. Adair, same place. Filed Nov. 7, 1881. (No model.)

Claim.—1. In an automatic wagon-brake, the combination of the bent shaft B, having upon it arms B² and B³ and brake-shoes B', the rod D, cross-head C, and spring C², the parts being arranged substantially as described, whereby the brake-shoes are released from the wheels in backing the wagon, substantially as set forth.

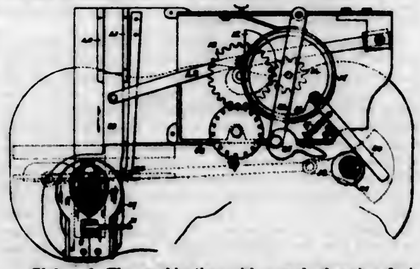
2. In an automatic wagon-brake, the combination of the double-tree, the sliding bar D', the rope or chain E, the rod D, the spring C², and the bent shaft B, carrying upon its ends brake-shoes B' B', the parts being arranged substantially as shown and described, and for the purpose set forth.



255,141. SPRING-GUN. FREDERICK CASPAR, Plainfield, N. J. Filed Jan. 12, 1882. (No model.)

Claim.—1. In a spring-gun, the hollow body having a groove and slot in its upper surface, in combination with a projector traveling in such groove and having a shank in the hollow body, and a contractile rubber spring attached at the forward end of the body, and a stop-pin across the hollow body and above the spring, for the purposes and substantially as set forth.

2. In a spring-gun, the hollow body formed of two grooved pieces of wood connected together at their lower edges and at the back end to the stock, in combination with the spring within such body, and the projector traveling in a groove in the top edge of such body, substantially as set forth.



255,142. REFRIGERATOR. JAMES GASWELL, Macon City, Mo., assignor to James B. Helene and Thomas Edwin Sharp, same place; said Helene and Sharp assignors of one-third to John Shepherd, same place. Filed Nov. 23, 1881. (No model.)

Claim.—1. In a refrigerant-room and refrigerator, the walls B O D E, having an intermediate dead-air chamber and an intermediate space filled with boiled resin and tallow, lids G, and ice-pans H, having brackets H' inserted therein, substantially as shown, and for the purpose described.

2. The ice-pan H, having removable perforated bottom H', resting on cross-pieces of the pan, substantially as and for the purpose set forth.

255,143. BUTTON-HOLE SEWING-MACHINE. HENRY CHAMBERSBURY, Newark, N. J. Filed Mar. 29, 1881. (Model.)

Claim.—1. The combination, with a work-clamping device constructed and mounted to slide with and rotate upon its driving-bar, of means for imparting a step-by-step movement to the latter and a rotative movement to the former, substantially as described.

2. The combination, with a work-clamping device constructed and mounted to slide with and to rotate upon its driving-bar, and means for imparting a step-like movement to the latter, of a toothed segment connected with the work-clamping device and a rack carried by the driving-bar, whereby the onward movement of the said bar will impart both an onward and a rotative movement to the said work-clamping device, all substantially as described.

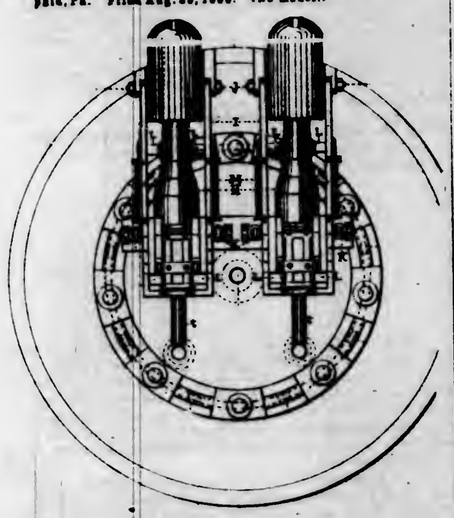
3. The combination, with the work-clamping device and its toothed projection, of the driving-bar 30, carrying said clamping device, and having the rack, as 4, and a mechanism for moving said driving-bar with a step-like action, all substantially as described.

4. The combination, with the work-clamping device and its projection, having toothed segment 9, with elongated teeth or surfaces 7 8, of the driving-bar 30, having rack 4 and surfaces 30 28, and means for moving said driving-bar with a step-like action, all substantially as described.

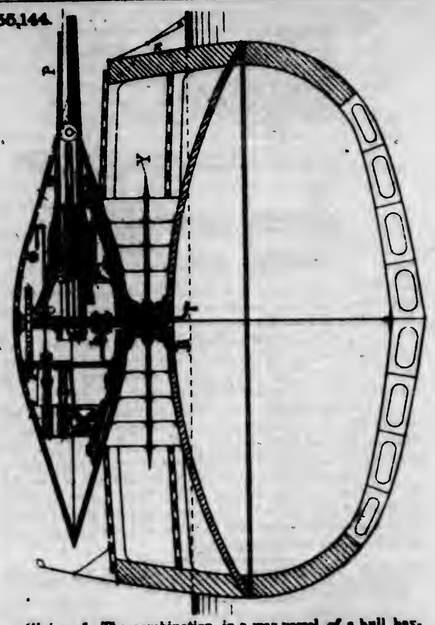
5. The combination, with the work-clamping device, its guide-opening 10, having an enlarged circular end, and a projection carrying a toothed segment provided with elongated teeth 7 8, of the guide-post 5, the intermittingly-moved driving-bar 30, having rack 4, surfaces 30 28, and a cam-like edge, 27, acted upon by a guide, as 28, substantially as described.

6. The combination, with the intermittingly-moved actuating-cam, and the lever transmitting motion from said cam to the driving-bar of the work-clamping device, and the lever for actuating said cam, of an adjusting device, as 55, whereby the throw if both levers is simultaneously adjusted, substantially as described.

7. The combination, with the work-clamping device, its driving-bar, the intermittingly-moved actuating-cam, a train of gearing transmitting motion from a driving clutch-wheel to said cam, the lever 20, and the bell-crank 44, of means for varying the point at which the power of said bell-crank shall be applied to the lever 20, substantially as described.



8. The combination, with the work-feeding clamp, the cam 12, its wheel 13, pinion 14, and the clutch-wheel 15, of the swinging bar 34 and cam 35, substantially as described.



9. A work-clamp for sewing-machines, consisting of the plates 21 22 and the spring-tongue 6, having one of its ends rigidly secured to the end of the plate 22, substantially as described.

10. A work-clamp for sewing-machines, consisting of the plate 21, the divided plate 22, and the divided spring-tongue 6, having one of its ends rigidly secured to the end of plate 22, substantially as described.

11. The combination of the cam, as 52, the swinging needle-bar 56, having the slotted guide 100, the rock-arm 53, and adjustable connections, substantially as described.

255,144. ARMOR-CLAD SHIP. NAVAH B. CLARK, Philadelphia, Pa. Filed Aug. 23, 1880. (No model.)

Claim.—1. The combination, in a war-vessel, of a hull having a deflecting-shield, B, with a turret or gun-shield presenting to horizontal, or substantially horizontal, shots an acute-angled deflecting-surface only, said turret or gun-shield being elevated above the shield B, as described, whereby a practically-unobstructed passage for shot between the two is afforded, as set forth.

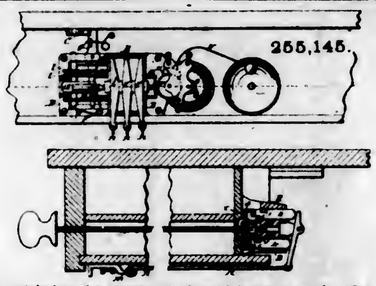
2. The combination, in a war-vessel, of a turret or gun-shield shaped exteriorly as described with an armored hull above which the said turret or gun-shield is elevated, whereby a practically-unobstructed passage for shot beneath the turret is afforded, as set forth.

3. The combination, in a war-vessel, of a hull having a shield, B, of deflecting form, with a turret or gun-shield elevated above the said shield B, shaped so as to present to horizontal shots an acute-angled deflecting-surface and capable of turning independently of the hull, as set forth.

4. A war-vessel in which a double-convex or plano-convex gun turret or shield is supported above a hull-protecting shield, B, of deflecting form, so as to provide a passage for shot between the two, as specified.

5. The combination, in a war-vessel, of a hull having a shield, B, of deflecting form, with a deflecting turret or gun-shield elevated above the same, and with one or more armored and hollow columns crossing the space between the shield B and elevated turret, as set forth.

6. The combination of the main hull-protecting shield B, of deflecting form, with the deflecting-turret supported above the same by a series of concentric tubes through which shot can pass without materially affecting their supporting properties, as set forth.



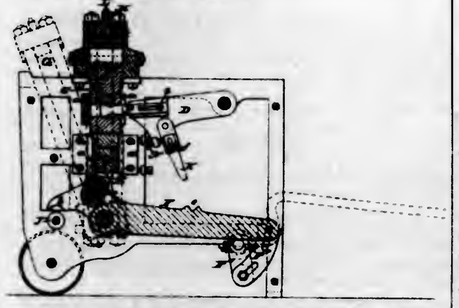
7. The combination, in a war-vessel, of a hull having a deflecting-shield, B, and a plate, A, supported above said shield, with a turret or gun-shield supported by and turning upon said elevated plate A, which forms part of the under surface of the turret, as set forth.

8. The supplementary deflectors P, of convex cross-section, secured to the projecting portions of the guns, to protect the latter from injury by side shots, as set forth.

9. The combination of the main hull-protecting shield of deflecting form, the deflecting turret or shield elevated above the same, and the intermediate deflectors, Y, as set forth.

255,145. TILL-ALARM. GEORGE A. COLTON, Oneida, N. Y. Filed July 27, 1881. (Model.)

Claim.—1. The combination, with a drawer, of a latch operated by a sliding bolt, a cam connected with the drawer-handle and operating the sliding bolt, tumblers engaging with said bolt



and restricting the movement thereof, levers operating the tumblers and manipulating handles or keys connected with said levers, substantially as set forth.

2. In a till-alarm, the push-rod *c*, provided with a cam, *e*, bolt *a*, provided with beveled shoulder *b*, and the pivoted latch *g*, having one end in the path of the bolt, all combined to operate with the catch in the manner set forth and shown.

3. The combination of the bolt *a*, provided on its sides with notches *h h*, the tumblers *k*, having notches *i j* and moving in guides in the case B, the levers *l* over the end of said tumblers, and the keys *m*, combined with the levers, as set forth and shown.

4. In combination with the bolt *a*, provided with notches *h h*, the tumblers *k*, having notches *i j*, the levers *l*, keys *m*, rods *n*, spring-arm *o*, provided with lug *p*, the escapement-wheel *r*, having the stud *y*, and the escapement provided with the hammer *v*, and the bell *w*, all as described and shown.

255,146. BRICK-PRESS. JOHN CHARVANS, Philadelphia, Pa. Filed Jan. 21, 1882. (No model.)

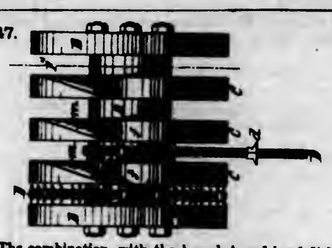
Claim.—1. The head-carrying frame G, the fulcrum J, the two-part plunger C, and the lever D, having a leg, in combination with the lever F, formed with a notch or serration, *e*, with which the lever D is adapted to engage, substantially as and for the purpose set forth.

2. The plunger in combination with the lever D, provided with an adjustable tongue, substantially as and for the purpose set forth.

3. The leg K, connected to the lever D, and adjustable thereon in angle and length, substantially as and for the purpose set forth.

4. The frame G and head H, provided with the bridge M, in combination with bent stay rod or bolt and the nuts *d*, substantially as and for the purpose set forth.

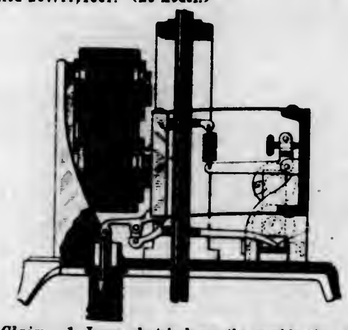
5. The face-plate of the plunger, formed of adjustable sections, substantially as and for the purpose set forth.



6. The face-plate having sections *g g' g''*, constructed as described, and the bolts *h*, combined and operating as stated, for the purpose set forth.

7. The mold formed of the side and end pieces, *k k'*, the bolts *m*, the facing or lining pieces *o o'*, and keys *p*, said pieces *k* having lips *n*, substantially as and for the purpose set forth.

255,147. SPOOL FOR WINDING BARBED FENCING. JOHN D. CURTIS, Worcester, Mass. Filed Dec. 27, 1881. (No model.)



Claim.—1. A spool for winding flat-barbed fencing material, constructed with a series of grooves or spaces with intervening flanges or separating-disks, provided with inclines, guides, or passways for facilitating the transfer of the fence-strand from one groove or space to the next, as hereinbefore set forth.

255,147.

2. The combination, with the barrel A and head-disks B, of the intermediate disks or flanges, C, having passways E, with flat supporting-surfaces *e* and inclines *m*, substantially as and for the purpose set forth.

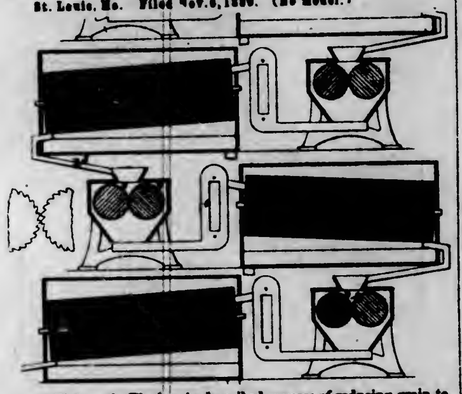
255,148. ELECTRIC LAMP. LEONARD E. CURTIS, New York, N. Y., and EDWARD WESTON, Newark, N. J., assignors to the United States Electric Lighting Company, New York, N. Y. Filed Nov. 11, 1881. (No model.)

Claim.—1. In an electric lamp, the combination, with the feed-controlling magnets, of a carbon-carrier, a clamp or clutch, a closed shunt of high resistance, and an electro-magnet, independent of the feed-controlling magnets, included therein, and mechanism adapted to be operated by the said magnet, and thereby liberate the said carrier from the clutch, as set forth.

2. In an electric lamp, the combination, with the feed-controlling magnets, of a carbon-carrier, a clutch by means of which the carrier is controlled, a shunt-circuit of high resistance, and a magnet, independent of the feed-controlling magnets, included therein, by the action of which the clutch is caused to release the carrier, substantially as set forth.

3. In an electric lamp, the combination, with the feed-regulating mechanism and carbon-carrier controlled thereby, of two electro-magnets independent of the feed-regulating mechanism, one in the main circuit, the other in a shunt about the lamp, and mechanism controlled by the differential action of said magnets for the purpose of releasing the carbon-carrier from the control of the feed mechanism, substantially as set forth.

255,149. SAFETY-VAULT FOR COFFINS. BENJAMIN G. DEVOE, Easton, assignor of one-half to John H. Ayers, Urbana, Ohio. Filed Nov. 14, 1881. (Model.)

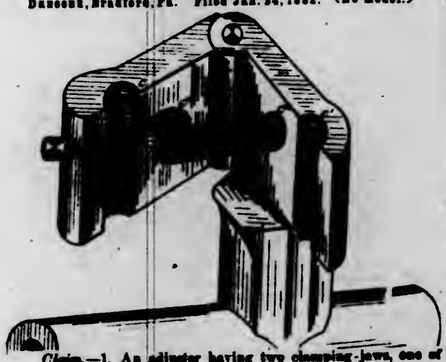


Claim.—1. The method of constructing the body or cap of coffin safes or vaults, which consists in first forming a blank, A, by stamping from a piece of sheet metal; second, forming a longitudinal crease or bend in said blank to form the ridge of the roof; third, folding down the end flaps 3 4 and the sides *a a'*, respectively; fourth, folding the end flaps 2 and 5 over the flaps 3 and 4, and, lastly, connecting said flaps together, substantially as and for the purpose specified.

2. In a coffin safe or vault, the combination, with the cap or body A', of the base B, provided at its edges with a downwardly-projecting flange, or its equivalent, constructed to form a support for said base-plate, and having a channel or groove for the reception of the edges of said cap and a guide at each corner to guide the cap into proper position, substantially as and for the purpose specified.

3. In a coffin safe or vault, the combination, with the cap or body A', of the base B, provided with a channel, or its equivalent, around its edges, and a lock-case at each corner, constructed to form guides and automatically lock said cap to the base when applied thereto, substantially as shown and described.

4. In a coffin safe or vault, the body or cap provided with stops or keepers *o o'*, in combination with the base provided with a groove or stirrup along its edges, the lock-cases D, and gravity-bolts D, all arranged for operation substantially as and for the purpose specified.

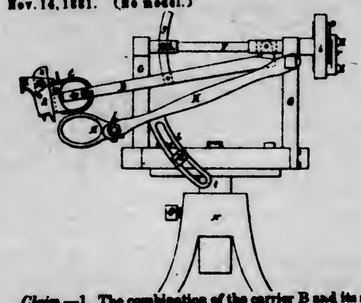


255,150. MANUFACTURE OF FLOUR. ROBERT L. DOWTON, St. Louis, Mo. Filed Nov. 6, 1880. (No model.)

Claim.—1. The herein-described process of reducing grain to flour and middlings, consisting in passing it through a series of sets of rolls revolving at differential speeds and in the same direction at their point of nearest approach to contact, and of successive degree of fineness of dress, the first part of said series of rolls having a dress of round or oval flutes and the latter part of said series having a dress of sharp or serrated flutes arranged at an inclination to the axis, and through belts arranged intermediate of each set and the succeeding set of rolls, substantially as and for the purpose specified.

2. In the manufacture of flour and middlings, a series of sets of rolls of successive degrees of fineness of dress arranged to revolve in the same direction at their point of nearest approach to contact and at differential speeds, the first part of said series of rolls having a dress of round or oval flutes and the latter part of said series of rolls having a dress of sharp or serrated flutes arranged at an inclination to the axis, in combination with belts arranged intermediate of each set and the succeeding set of rolls, substantially in the manner as and for the purpose herein shown and described.

255,151. ADJUSTER FOR OIL-WELL PUMPS. SOLOMON R. DUNCAN, Bradford, Pa. Filed Jan. 24, 1882. (No model.)

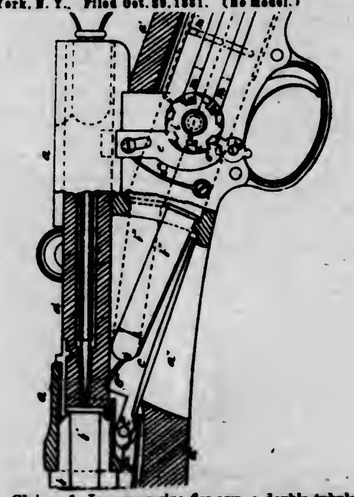


Claim.—1. An adjuster having two clamping-jaws, one of which is formed integral with the trunnions, and both hinged together and provided with clamping-faces having a device for holding the rod therein, and a bolt and nut for holding the jaws together.

2. An adjuster, a movable jaw having an oval hole for the purpose set forth, in combination with a fixed jaw having a clamping-bolt, substantially as described.

3. In an adjuster, a clamping-bolt having its head seated upon a ledge formed upon one of the clamping-jaws, as and for the purpose set forth.

255,152. MACHINERY FOR BURNISHING THE SOLE-EDGES OF BOOTS AND SHOES. HYRICK DUDLEY, Lynn, Mass., assignor to himself and Ruel E. Hickerson, same place. Filed Nov. 14, 1881. (No model.)



Claim.—1. The combination of the carrier B and its spring C, with the fore-part finisher A, adapted thereto as described, and with the shank-finisher E, supported by or fixed to the finisher A, all being substantially as set forth.

2. The combination of the finisher-carrier B and the rocker-shaft F with the arm B, applied to them, substantially as described, the mid shaft and arm having clamp-screws attached to them, as explained.

3. The combination of the connecting-rod *r* and the driving-pulley *o* and disk *i*, provided with crank-pins *l* and *q*, adjustable in them, as set forth, with the shafts m F and with the finisher-carrier supporting-arm D, applied to the rocker-shaft F, so as to be adjustable therewith, substantially as specified.

4. The combination of the ear I and the radial arm K, its slotted bar L, and clamp-screw M with the finger-rest H, all being arranged substantially as set forth.

255,153. MAGAZINE FIRE-ARM. WILLIAM H. ELLIOT, New York, N. Y. Filed Oct. 29, 1881. (No model.)

Claim.—1. In a magazine fire-arm, a double tubular magazine located in the butt-stock, and a reciprocating and oscillating bolt for opening and closing the arm, provided with the longitudi-

nal groove *d'*, and in combination therewith a revolving-pawl, *e*, provided with the bent end *e'* to work in said groove, a ratchet-disk, *i*, provided with cams *i''*, and the feed-pawls *m*, whereby a cartridge is released from the tubular spaces alternately, substantially in the manner shown and described.

2. In a magazine fire-arm, a stock or receiver provided with an opening, *a''*, in the lower side of the arm, a tubular magazine located in the butt-stock, a reciprocating bolt for closing the chamber, which moves in a line with the barrel, and in combination therewith a carrier, *c*, pivoted to the receiver under the rear end of the barrel, and provided with a cam, *c''*, located near its forward end, and with a spring, *c'''*, whereby the carrier is depressed by the forward end of the bolt into the opening *a''* to receive a cartridge from the magazine, raised again by its spring to carry the cartridge into the receiving-chamber, and is forced up into the receiving-chamber in the act of passing a cartridge into the magazine, constructed and operating substantially as described.

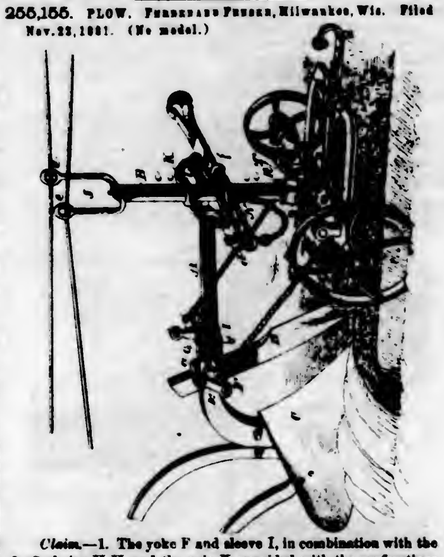
3. In a magazine fire-arm, a tubular magazine located in the butt-stock, a reciprocating bolt for closing the chamber, which moves in a line with the barrel, and in combination therewith a carrier pivoted to the receiver under the barrel, and provided with the cam *c''*, recess *c'*, and spring *c'''*; said recess being arranged upon the carrier at such distance from the forward end of the magazine that until the bolt is withdrawn the head of the first cartridge remains in the mouth of the magazine, and after it is withdrawn it is thrown upon the carrier and raised to the receiving-chamber, substantially as specified.

4. In a magazine fire-arm, a double tubular magazine located in the butt-stock, a bolt for closing the chamber, which moves in a line with the barrel, and in combination therewith a carrier pivoted to the receiver under the barrel, and provided with the cam *c''*, the two points *w* and *w'*, and a spring, *c'''*, whereby the carrier is depressed by the bolt to receive a cartridge from the magazine, raised to make room to charge the magazine, used as a guide to direct the cartridges into either tubular space, and returned by the spring to a proper position to serve as a bottom to the receiving-chamber, substantially as specified.

5. In a magazine fire-arm, a double tubular magazine located in the butt-stock, provided with the usual cartridge-propelling devices, and having a mortise through its rear end, and in combination therewith the key *s'*, screw *s''*, and washer *s'''*, whereby the magazine may be assembled, passed through the butt-stock, and fastened upon the arm, substantially as specified.

6. In a magazine fire-arm, a magazine located in the butt-stock and provided with the usual cartridge-propelling spring, and in combination therewith a follower provided with the shield *r''* and guide-pin *r'''*, whereby the point of the feed-pawl is prevented from catching the spring, substantially as specified.

7. In a magazine fire-arm, a double tubular magazine located in the butt-stock, a bolt for closing the arm, which moves in a line with the barrel, a revolving-pawl, *e*, which is actuated by said bolt, disk *i*, provided with ratchet-teeth *i'*, cams *i''*, and feed-pawls *m*, and in combination therewith the cut-off *v''*, whereby the magazine may be locked by moving the cut-off so as to prevent the pawl *e* from engaging the ratchet-teeth on the disk *i*, substantially as specified.



8. In a magazine fire-arm, the arrangement and operation of devices, as follows: a bolt for closing the chamber, which moves in a line with the barrel, a tubular magazine provided with the usual cartridge-propelling devices, a carrier pivoted below the line of the barrel and provided with the recess *c'*, and a feed-pawl for releasing the column of cartridges, so arranged in relation to the carrier and the recess thereon that the shock of arresting the movement of the column of cartridges is received upon the bolt and carrier before the feed-pawl engages the head of the second cartridge, substantially as and for the purpose specified.

255,154. CAR-COUPLING. WALTER H. FARRA, WILLIAM J. CLANAHAN, and JOHN BILLER, Mount Jackson, Va. Filed Jan. 26, 1882. (Model.)

Claim.—As an improvement in car-couplings, the draw-head A, having neck B, openings C, recess F, cap-plate G, recess J, lugs M, pivoted latch K, and transverse beveled or hook-shaped ridge O, in combination with the pin D, having flange E, all constructed and operating as set forth.

255,155. PLOW. FERDINAND FRESER, Milwaukee, Wis. Filed Nov. 22, 1881. (No model.)

Claim.—1. The yoke F and sleeve I, in combination with the draft-chains H H, and the axle X, provided with the perforations *n*, the said chains being rigidly attached at one end in perforations in the outer ends of the yoke F, and adjustably attached at their other ends in any two of the perforations *n*, as desired.

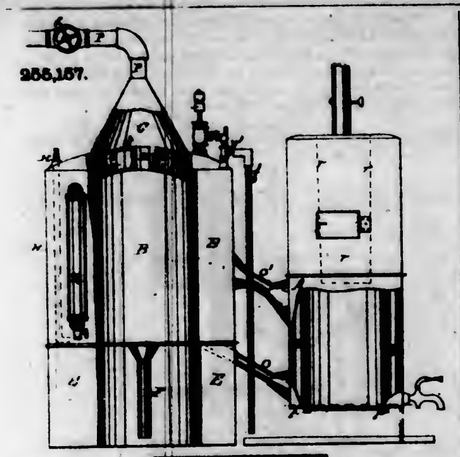
2. The beam A, having open head L, in combination with cross-piece N, having yoke K, the standard B, having perforations *e e*, and a supporting device adapted to enter the perforations.

3. The head L, having an open horizontal extension in which is a threaded opening, in combination with cross-piece N, screw-bolt *d*, and standard B, as set forth.

4. The axle X, having uprights *g g*, perforated to receive the rock-bar T, in combination with standard B, adjustably secured thereon by means of square slot in lower end of said standard, and the wedge *s* and set-screw, as described.

255,156. MANUFACTURE OF SCISSORS. NICHOLAS FINCK, Elizabeth, N. J. Filed July 25, 1881. (No model.)

Claim.—1. The herein-described improved method of manufacturing scissors or shears, consisting in casting the handles of iron and rendering them malleable, preparing the steel blades in the usual manner, welding the steel blades to the malleable-iron handles by hammers or dies acting upon the parts that are welded together, and then subjecting each handle and blade when cold to a powerful pressure between dies that act upon the malleable-iron portion to consolidate the metal, smooth the surface, and remove any imperfections in the shape, substantially as set forth.



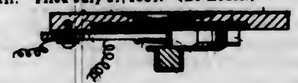
2. The dies A and B, having recesses corresponding to the shear or scissor handle and blade, in combination with the pins *b*, placed around the edges of the recessed portion of one die to guide the handle of the shear into the recess, the other die having openings for the said pins to pass into, substantially as set forth.

255,157. STEAMER. JACOB FOUSE, Lancaster, Pa. Filed Dec. 29, 1881. (No model.)

Claim.—1. The water-check D, having a perforated top and valves *v*, in combination with a boiler, B, and dome C, substantially as and for the purpose specified.

2. In a steamer, the combination of the boiler B, annular base E, and the expansion-foot F, as and for the purpose set forth.

255,157.



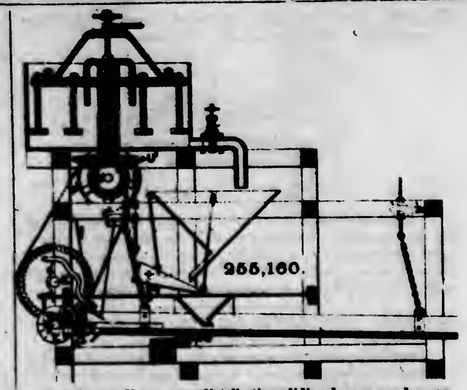
255,158. ELECTRIC TELEPHONE. JAMES P. FREEMAN, Chicago, Ill. Filed Sept. 24, 1881. (No model.)

Claim.—1. The combination, substantially as before set forth, of the diaphragm, the two electrodes, the mainspring for forcing one electrode against the other and the latter against the diaphragm, and the compensating-springs for modifying the action of the mainspring.

2. The combination, substantially as before set forth, of the diaphragm, the electrodes, two pivoted arms supporting the electrodes, the mainspring acting on both said arms for forcing one electrode against the other and the latter against the diaphragm, and a compensating-spring for each arm for modifying the action of the mainspring.

255,159. ELECTRIC TELEPHONE. JAMES P. FREEMAN, Chicago, Ill. Filed July 21, 1881. (No model.)

Claim.—1. The combination, substantially as before set forth, of the diaphragm, the fixed permanent magnet, the flat oscillatory keeper in constant contact with said magnet, and the electrode carried by the keeper and held in contact with the diaphragm solely by magnetic attraction exerted on the flat side of the keeper.



2. The combination, substantially as before set forth, of the diaphragm, the fixed permanent magnet, the flat oscillatory keeper in constant contact with said magnet, the electrode carried by the keeper and held in contact with the diaphragm solely by magnetic attraction exerted on the flat side of the keeper, and the fixed electrode.

3. The combination, substantially as before set forth, of the diaphragm, the electrode operated thereby, and the oscillatory keeper of a permanent magnet carrying said electrode, the fixed electrode, the cross-bar supporting said fixed electrode, and the elastic cushions interposed between the cross-bar and the door or side to which the cross-bar is secured by screws.

255,160. ORE CONCENTRATOR AND SEPARATOR. JOHN GARVIN, Philadelphia, Pa., assignor to William H. Myers, same place. Filed Sept. 28, 1880. (No model.)

Claim.—1. In an ore concentrator and separator, the combination of a laterally and horizontally oscillated spreading-pan, a sliding distributing-hopper, and a longitudinally-oscillating trough, substantially as described.

2. In an ore concentrator and separator, the combination of a mixing-trough, a receiving-hopper, a horizontally and laterally

255,160.

oscillated spreading-pan, a distributing sliding hopper, and an oscillating trough or tray, substantially as described.

3. The combination, with an oscillating trough or tray, of hanging and swinging flexible supports adjustable vertically and horizontally, substantially as set forth.

4. The combination, in an ore concentrator and separator, of an oscillating trough or tray provided with horizontally-adjustable supports, of an abutment and an adjustable cam, substantially as set forth.

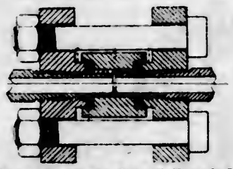
5. The combination, in an ore-separator, of an oscillating trough or tray provided with hanging and swinging flexible supports, and of stops adjustable vertically and horizontally, substantially as described.

255,161. SKATE. SAMUEL C. SAULT, Cincinnati, Ohio. Filed Aug. 22, 1881. (No model.)

Claim.—1. In a skate, the combination, with the foot-plate A of a pair of double runners, E E and F E, connected to said plate by a universal-joint connection which has its vertical movement limited by an interposed spring, substantially as and for the purposes set forth.

2. In a skate, the combination, with the foot-plate A, of a pair of double runners connected to said plate by a universal joint which has its vertical and horizontal movements in planes inclined to the plane of said runners and has its vertical movement limited by an interposed spring, substantially as shown.

3. In a skate, a joint for connecting the runners to the foot-plate, consisting of the clip D, with pin *b*, post B, with flared opening *b'*, rubber block C, plates *c' c'*, and set-screws *c c*, substantially as shown.



4. A skate having a pair of runners, one under the heel and the other under the ball of the foot, and each composed of two blades lying parallel with each other.

255,162. FAUCET. JOHN GIBLOW, Chicago, Ill. Filed Mar. 21, 1881. (No model.)

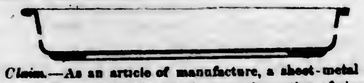
Claim.—The faucet-casing A, constructed at one side with the laterally-projecting closed chamber E, having its wall provided with a stuffing-box, G, in combination with the spring-impelled plunger C, formed with the recess *b* in one of its sides, and the lifter F, consisting of a stem extending transversely through the said stuffing-box and through the lateral chamber at one side of the plunger, and having the lateral projection *f* extending into the side recess in the plunger, all substantially as described and shown.

255,163. PIPE-COUPLING. THEODORE J. GOLDSCHMIDT, Philadelphia, Pa. Filed Dec. 6, 1880. (No model.)

Claim.—The combination, substantially as before set forth, of the cross-sectionally circular pipe ends, the flanges or plates secured thereto and having projecting collars concentric therewith, the loose socket snugly fitting and concentric with the pipe ends as well as the collars of the flanges, and the packings.

255,164. PERMUTATION-PADLOCK. CHARLES F. GROUT, New York, N. Y. Filed May 16, 1881. (Model.)

Brief.—The invention consists in the combination of an outer and inner ring, each having in it an opening or notch, and the inner ring having a toothed periphery and a nut surrounding the inner ring and engaging the toothed periphery thereof for operating it within the outer ring.



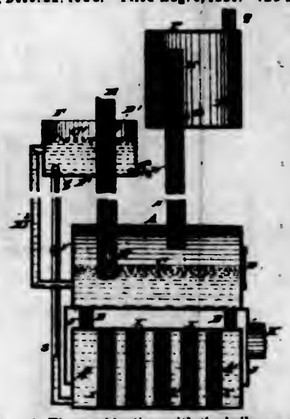
Claim.—1. The combination of an outer and an inner ring, each having in it a notch or opening, and the inner ring having a toothed periphery and a nut surrounding the inner ring and engaging with the toothed periphery thereof for turning or moving it within the outer ring, substantially as and for the purpose specified.

2. The combination of the outer ring, A, having the notch or opening *a* and the notch *c*, the inner ring, B, having the notch or opening *b* and a toothed periphery, the nut C, fitting in said notch *c*, and the crescent-shaped block *d*, for retaining it therein, substantially as specified.

3. The combination, with the outer and inner rings, each having a notch or opening and means for turning or moving the inner ring within the outer ring, of two or more permutation locking-rings engaging with said inner ring, substantially as and for the purpose specified.

4. The combination of the outer ring, A, having a notch or opening, *a*, and notches *f*, the inner ring, B, having a notch or opening, *b*, and notches *g*, means for turning or moving said inner ring within said outer ring, and the permutation locking-rings D, each having a rib or flange, *e*, in which is a notch, *d*, all substantially as specified.

255,165. SHEET-METAL VESSEL. JOSEPH HALL, Cheboygan, Mich. Filed Dec. 14, 1881. (No model.)



Claim.—As an article of manufacture, a sheet-metal vessel of iron or other metal subject to the corrosive action of air or liquids, having around its upper portions a ring of zinc held in position by bending over it the upper edge of the body of the vessel and upon its lower surface a ring of zinc covered and held in position by a plate of sheet metal soldered to the vessel, all substantially as shown and described, and for the purpose set forth.

255,166. HANDLE-FASTENER. ROBERT W. HARRIS, Albany, N. Y. Filed Nov. 3, 1881. (No model.)

Claim.—A handle-fastener consisting of the notched handle adapted to be inserted through the eye and to project therefrom at the outer side, the locking wedge piece or pieces *f*, fitted thereto, in combination with the flaring eye of the tool, whereby when the parts are all in place the centrifugal force is made to wedge the tool upon its handle, substantially as described.

255,167. STEAM HEATING APPARATUS. MARVIN P. HATHAWAY, Decorah, Iowa. Filed Aug. 6, 1881. (No model.)

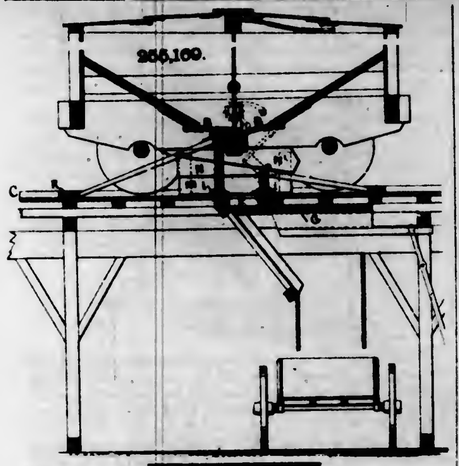
Claim.—1. The combination, with the boiler or steam-generator A' A, having steam-pipe H, of the vertical open tube or pipe E, having aperture D', and open overflow-receptacle F, arranged and combined to operate in the manner and for the purpose shown and set forth.

2. The herein-described steam-generator for heating purposes, composed of the boiler A A', connecting-pipes B B, jacket J, flues I I and K, steam-outlet H, and vertical overflow-pipe E, having aperture D' and open overflow-receptacle F, the whole constructed and arranged as shown, for the purpose set forth.

3. The combination, with the steam-generator A A' and its steam-pipe H, having aperture R, and steam-drum P, provided with the steam-outlet Q, of the vertical overflow-pipe E, having aperture D', open receptacle F, having faucet W, and pipes E' and S, the latter provided with stop-cock V, the whole constructed and combined to operate substantially as and for the purpose herein shown and specified.

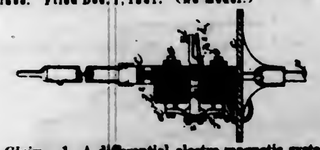
255,168. MANUFACTURE OF PAPER PLAQUES. GEORGE P. HULTMAN, Boston, Mass., assignor to Louis Prang, same place. Filed Nov. 21, 1881. (No model.)

Claim.—1. As a new or improved article of manufacture, a plaque having a body consisting of paper or pasteboard, and a re-enforcing plate of metal, arranged therein and completely covered thereby, and both rendered concavo-convex simultaneously between and by dies, as set forth.



2. As an improved article of manufacture, a plaque composed of layers of paper or pasteboard and a foraminous or perforated metallic plate or meshed re-enforce, arranged as described, and rendered simultaneously concavo-convex and smoothed by means of dies, as set forth.

255,169. APPARATUS FOR DELIVERING COAL FROM CARS. LEVI HUTFIELD, Plainfield, N. J. Filed Dec. 31, 1881. (No model.)



Claim.—1. The combination, with an elevated railway-track, a flooring between the rails of the track, and a suitable screen or chute arranged under the track to deliver coal from the flooring into the wagons or other receptacles beneath, of removable side boards, J J', and end boards, M N N', adapted to inclose the space about the opening into the chute between the flooring and the bottom of the car standing upon the track, substantially in the manner and for the purpose herein set forth.

2. The combination, with each other and with an elevated railway-track, a flooring laid between the rails of said track, a coal-chute beneath said flooring, and an inclosure about the mouth of said chute above the flooring, of one or more gates or slides, G, adapted to control the opening into the chute, substantially as and for the purpose herein set forth.

255,169.

255,170. ELECTRIC LAMP. ALPHEO G. HOLCOMBE, New York, N. Y., assignor to the Standard Electric Light Company, same place. Filed Dec. 1, 1881. (No model.)

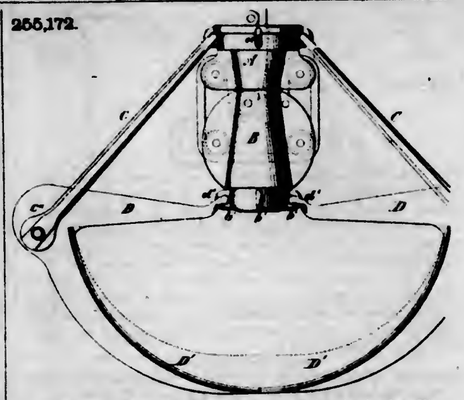
Claim.—1. A differential electro-magnetic system composed of a horseshoe-magnet having coarse-wire helices and a horseshoe magnet having fine-wire helices, the cores of the two magnets being joined together by pole-pieces, in combination with an armature adapted to move in front of the pole-pieces from one magnet to the other, substantially as set forth.

2. In combination, the differential electro-magnetic system *a*, *a'*, *a²*, *b*, *d*, *d'* *d²*, *e*, *f*, and *f'*, lever *h*, armature *i*, carbon-rod *j*, and a clamping device, substantially as described, connecting the lever *h* and carbon-rod *j*, as and for the purpose set forth.

3. The coarse-wire electro-magnets *a b*, the fine-wire electro-magnets *d d e*, and connecting pole-pieces *f* and *f'*, in combination with the armature *i* and rocking lever *h*, substantially as set forth.

4. The rocking lever *h*, having a rounded surface at its end, in combination with the armature *i*, connected to said rounded surface by means of screws, substantially as and for the purpose set forth.

255,171. ELECTRIC LAMP. ALPHEO G. HOLCOMBE and LEVI H. COLBURN, New York, N. Y., assignors to the Standard Electric Light Company, same place. Filed Dec. 1, 1881. (No model.)



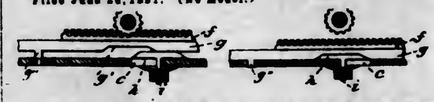
Claim.—1. In a clamping and feeding device for electric lamps, a rocking frame or lever provided with a supporting-edge, upon which rests the tail-piece of a ring-clamp embracing the carbon-holding rod, and a contact-point located on the frame or lever, so as to come in contact with the end of the tail-piece of the clamp, for releasing the carbon-rod held by the clamp, in combination, as hereinbefore set forth.

2. In combination, the frame or lever *g'*, provided with the supporting-edge *g* and adjustable screw *h*, the clamp composed of ring *f* and tail-piece *f'*, the carbon-rod *e*, and an electro-magnetic actuating device, by means of which the frame or lever *g'* is caused to rock on its bearings, substantially as set forth.

3. The lower-carbon-holding socket *l*, provided with the flange *r*, the set-screw *m*, and flange or washer *m'*, and the lower bar, *o*, having a large hole, through which the set-screw passes, in combination, substantially as set forth.

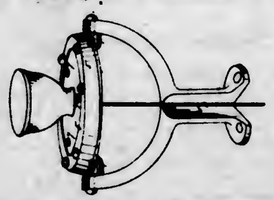
255,172. AUTOMATIC GRAPPLING-BUCKET. FRANK G. JOHNSON, Brooklyn, N. Y. Filed Aug. 15, 1881. (No model.)

255,172.



Claim.—1. In connection with the semi-globular bucket, Fig. 1, the sheave-blocks A and B, consisting of single pieces and having the form of a frustum of a cone, substantially in the manner and for the purposes set forth.

2. In connection with the semi-globular bucket, Fig. 1, the staple and eye joints consisting of the staples *b' b' b'* and the eyes *d' d' d'* and key-bolts *e e*, substantially in the manner and for the purposes described.



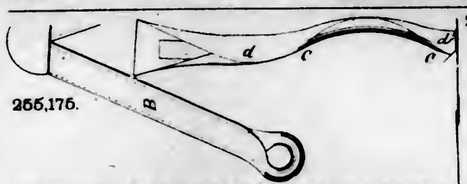
3. In connection with the semi-globular bucket, Fig. 1, the staple and eye joints *b' b' b'* and *d' d' d'*, as described, in combination with the conical sheave-blocks A and B and carrying-arms D D, substantially as and for the purpose set forth.

255,173. LATHE-CHUCK. SAMUEL J. KIRK, Windsor Locks, Conn., assignor to the E. Horton & Son Company, same place. Filed June 28, 1881. (No model.)

Claim.—In a chuck of the character hereinbefore described, the combination of the annular gear *f*, adjusting-ring *g*, provided with cam-mortises *g'* and guide-pins *g''*, chuck-body half *b*, having slots *c*, and cams *h*, provided with operating-pins *i*, all substantially as set forth.

255,174. ACOUSTIC TELEPHONE. JAMES A. LAKIN, Westfield, Mass. Filed May 2, 1881. (No model.)

Claim.—1. The combination of a bracket adapted to be secured in a permanent position upon a table or wall, and terminating in two supporting-arms, one opposite the other, and a telephone suspended between said arms upon pivots secured thereto, so as to tilt to any desired inclination therein, substantially as described.



2. The combination, in a telephone, of the diaphragm and the front disk or cover supporting the mouth-piece, and provided with sound-apertures through said front disk for the diffusion of the sound from the sound-chamber, substantially as described.

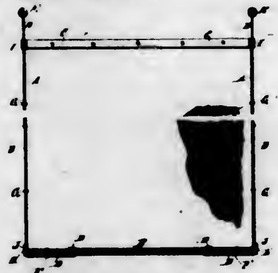
3. The combination of the diaphragms of two telephones and a series of sound-conducting wires intertwined or braided together, and connecting said diaphragms by suitable means of attachment of said wires thereto, substantially as described.

255,175. SUSPENDER-END. JOSEPH LAUFFERTY, New York, N. Y. Filed Aug. 30, 1881. (No model.)

Claim.—1. The method hereinbefore more fully described and set forth of making suspender-ends for suspenders, which consists in taking a rectangular-shaped piece of leather or other suit

255,176.

able material, as described, and folding one side over on the other, and then pasting them together, then in bending said piece of leather at or near the center, so as to form the part indicated by *c c*, and, lastly, in laying the parts *d* and *d'* of said piece of leather on top of each other and sewing them, so that in the operation the part *c c* shall form the button-loop of the suspender-end.



2. The suspender-end B, composed of one continuous piece of leather or other material, arranged as described, having at either end the parts indicated by *d* and *d'* and in the middle the arc-shaped portion *c c*, adjusted and arranged in the manner described, and for the purposes set forth.

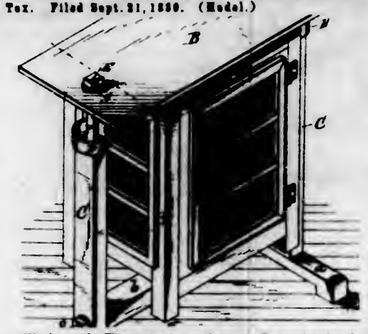
255,176. PREPARATION OF YEAST. SAMUEL LEVY, Denver, Colo. Filed June 9, 1881. (Specimens.)

Brief.—Ferments a mixture of rye, corn, and malt with ten pounds of starch per bushel by addition of water and yeast. When this becomes exhausted restores with a mixture of rye and malt in water at 150° Fahrenheit, which is cooled to the same temperature as the wort before addition. The yeast produced can be compressed and dried without farinaceous additions.

Claim.—The process of preparing compressed yeast, consisting in mixing starch with a mash of rye, corn, and malt in a fermenting-tub, adding from time to time to the mixture as the fermentation grows weak a warm mixture of rye and malt, skimming the yeast from the surface as it rises, settling it in water, and then drying it, making the process continuous, substantially as set forth.

255,177. BASKET, &c. GEORGE S. LONG, Hartford, Conn., assignor, by mesne assignments, to P. J. Darcy, same place. Filed Nov. 27, 1880. (No model.)

Claim.—1. The vessel described, having a seamless body of woven material with a warp of wire extending up and down and a filling of fiber extending around horizontally, as herein specified.



2. In a vessel composed of woven material with the warp of wire extending up and down and the filling of fiber extending horizontally, the bottom B, of wood or analogous rigid material, hoops C I J, and stout wires D, with suitable fastenings F G H, combined and arranged to serve as herein specified.

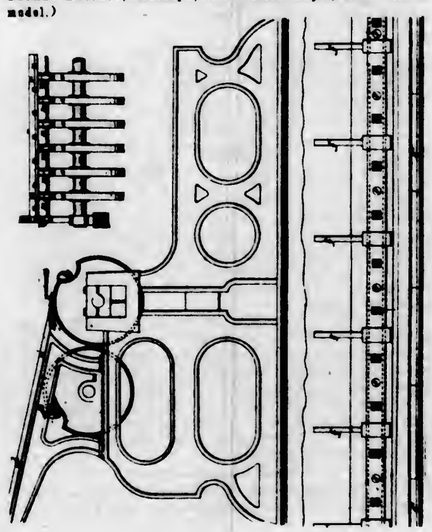
255,178. MACHINE FOR CRIMPING SEAMLESS BOOTS AND SHOES. THOS. T. MARSHALL, Jarvis, Ontario, Canada. Filed Nov. 10, 1881. (No model.)

Claim.—In a crimping-machine for crimping the uppers of boots or shoes wherein the upper consists of a single piece, the halved block A, having recess B, in combination with last-block C, press-screw F, frame G, screw-bolts E E, and screw J, substantially as described.

255,179. SUSPENDED SAFE, &c. SANFORD MASON, Galveston, Tex. Filed Sept. 21, 1880. (Model.)

Claim.—1. The safe A, having top B, projecting beyond its sides, as shown, in combination with the upright posts C, having liquid-cups D, the rods E, and sleeves F, for suspending the safe from contact with any object, substantially as and for the purpose set forth.

2. The safe A, having top B, extending beyond its sides, in combination with the liquid-cups D, rods E, sleeves F, packing-rings *d*, and washers *e*, as a means of connecting the projecting ends of the top B to the upright posts C, substantially as and for the purpose set forth.



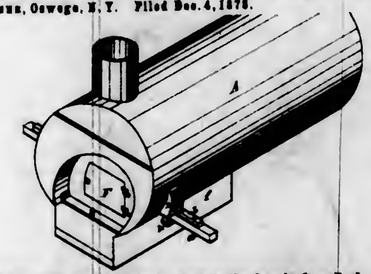
255,180. ELASTIC STOCKING. DAVID D. M. MASTEN, Flushing, N. Y. Filed Feb. 4, 1882. (No model.)

Claim.—1. An elastic stocking provided on each side with a series of loops or straps, C, substantially as and for the purpose set forth.

2. An elastic stocking provided on each side with longitudinal, flexible, but non-elastic stays, in combination with loops or straps attached to said stays, as set forth.

255,181. GRIPER ATTACHMENT FOR PRINTING-PRESSES. THOMAS MCILROY, Brooklyn, N. Y. Filed May 2, 1881. (No model.)

Claim.—1. The combination, with the impression-cylinder and its gripers, of a hinged feed-board, adjustable fingers, a bar carrying the same, and an indicator at the under side of each feed-board to denote the positions of the gripers, substantially as set forth.



2. The combination, in a printing press, of the impression-cylinder and gripers, a delivery-cylinder and gripers, and an indicator having marks that denote the positions of the gripers on the impression-cylinder, substantially as set forth, whereby the gripers of the delivery-cylinder can be placed so as to avoid contact with the gripers on the impression-cylinder, substantially as specified.

255,182. WRENCH. MILTON H. MCNAIR, Meadville, Pa. Filed Aug. 24, 1880. (No model.)

Claim.—The combination and arrangement of lever A with recess G and casing B, spring C, lever D, guide E, button F, and serrated-faced cam H, forming with recess G the knuckle-joint 4, as and for the purpose set forth.

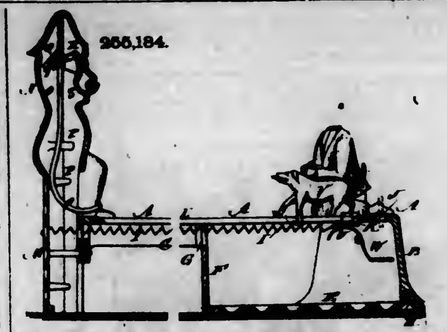
255,183. PORTABLE STEAM-BOILER. WILLIAM R. MICHENER, Oswego, N. Y. Filed Dec. 4, 1876.

Claim.—1. The improved steam-boiler herein described, consisting of the outer or main shell, A, of segmental form in cross-section, the inner segmental shell, B, of smaller diameter, united at its bottom edges with those of the main shell, and the independent flat bottom plate, C, secured to the edges of one of the segmental shells aforesaid and constituting the bottom of the main fire-flue, substantially as described.

2. The combination, with the bottom plate, C, of the removable plate G, corrugated longitudinally and confined laterally between the sides of the flue B, substantially as described and shown.

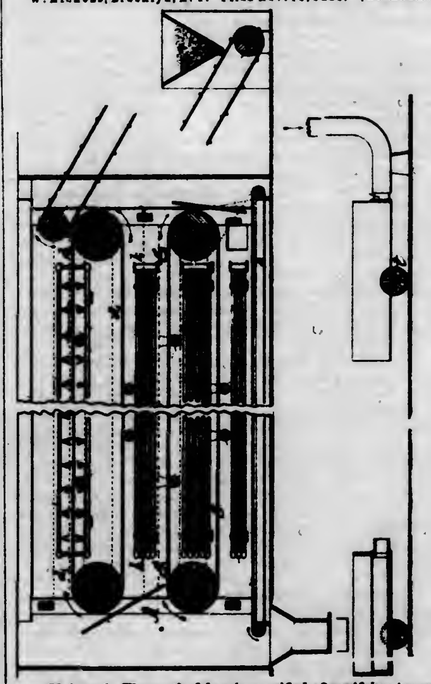
3. The combination, with the crescent-shaped boiler and its main flue, formed of the segmental plates A and B and bottom plate, C, and having at the end the fire-grate and the subjacent ash-pan *f*, as described, of the plate H, extended across the front of the latter and attached to the bottom edges of the boiler-shell, substantially as and for the purpose set forth.

4. The combination, with the segmental boiler-shell A, of the cheek-pieces I, secured to the exterior thereof and resting on the axle *a*, and the block L, attached to the latter and abutting against the cheek-pieces aforesaid, substantially as described, for the purpose set forth.



5. The combination, with the segmental boiler-shell A, of the cheek-pieces I, secured to the exterior thereof and having pendent bolts engaging a clip-bar, *k*, on the under side of the axle *a*, and the blocks L, attached to the top of the latter, substantially in the manner described and shown, for the purpose set forth.

255,184. TOY BANK. JOHN MURRAY, New York, N. Y. Filed Aug. 26, 1881. (No model.)

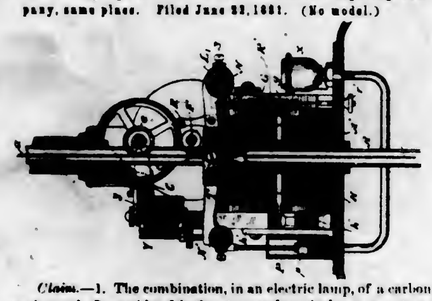


Claim.—1. A toy savings-bank constructed, substantially as herein shown and described, of a slotted platform, A, having a figure, X, of a man and a money-receiving compartment at its rear end and the figure of a hen-coop, M, and a man, N, at its other end, and carrying the figure V of a dog, connected with it by a slide, U, and spiral spring I, the trip-bar O, the pivoted eccentric block R, and the trip-lever W, as set forth.

2. In a toy savings-bank, the combination, with the slotted platform A and the figures M N of a hen-coop and of a man sitting upon the hen-coop, of the figure V of a dog connected with the platform A by a slide, U, and spring I, the trip-bar O, the eccentric block R, and the trip-lever W, substantially as herein shown and described, whereby the weight of a coin dropped upon the said trip-lever will release the dog and the forward movement of the dog will cause the figure of the man to roll his eyes and draw in his tongue, and will project chicken-heads from his hat, as set forth.

255,184.

255,185. METHOD OF PURIFYING AND DRYING TEA. ISAAC W. NICHOLS, Brooklyn, N. Y. Filed Nov. 16, 1881. (No model.)



Claim.—1. The method herein specified of purifying tea and similar materials, consisting in bringing steam into direct contact with such material while spread in a thin layer upon a moving apron, the steam being blown down upon the material as well as passing up through the apron, and then drying the same, and driving off volatile impurities by the action of heat, substantially as set forth.

2. The method herein specified of purifying, agitating, and drying tea and similar material, consisting in spreading the material on a moving apron, carrying the same into contact with jets of steam blown down upon the material, passing the material from one apron to another, and exposing the same to the action of heat for drying the same, substantially as set forth.

3. The method herein specified of purifying, drying, and cool-

ing tea and similar materials, consisting in exposing a thin layer to the direct action of steam blown down upon the material, then to the action of heat, and then to the action of cool atmospheric air, substantially as set forth.

255,186. ELECTRIC LAMP. JOSEPH OLMSTED, New York, N. Y., assignee to the United States Electric Lighting Company, same place. Filed June 22, 1881. (No model.)

Claim.—1. The combination, in an electric lamp, of a carbon-carrier, a shaft capable of both rotary and vertical movement, and carrying one or more brake-wheels whose rotation is made to depend upon the movement of the carrier, an electro-magnet and pivoted armature for controlling the vertical movement of the said brake-wheels, and one or more friction-wheels placed in a position to intercept the downward movement of the brake-wheels at a predetermined point and release them from engagement with the armature, as and for the purpose set forth.

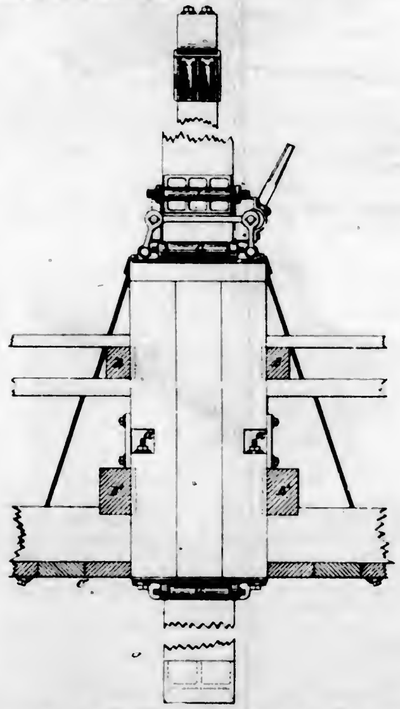
2. The combination, in an electric lamp, with a pinion-shaft or its equivalent connected with the carbon-carrier, and capable of both rotary and vertical motion, of a second shaft capable of a retarded rotary motion only, and an electro-magnet having an armature arranged to raise and lower the pinion-shaft, so as to prevent the rotation of the same when raised, but to permit it to revolve when lowered into engagement with suitable friction-wheels on the second shaft, as and for the purpose described.

3. In an electric lamp, the combination of a carbon-carrier, one or more brake-wheels carried by a swinging frame and connected with the carbon-carrier, so as to be revolved by the movement thereof, an electro-magnet and an armature adapted to control the vertical movement of the said brake-wheels, and rotary retarding devices placed in such position with reference to the brake-wheels that the latter when brought by the movement of the armature into contact therewith will be freed from engagement with the said armature and allowed to slowly revolve for a sufficient length of time to effect the necessary feeding together of the carbons, as described.

4. In an electric lamp, the combination, with a pivoted armature and the feed mechanism connected therewith, of an electro-magnet the cores of which form a U having its ends bent back upon themselves and wound with coarse wire included in the main circuit, the portions of the cores adjacent to the connecting-bar or neutral point being wound with fine wire in a shunt about the lamp, and exerting an opposite magnetic effect to that produced by the main coils, as and for the purpose set forth.

5. The combination, with an electro-magnet composed of cores G G′ and H H′, magnetically connected in pairs, as described, of an armature-bar and armatures N N′, the bar being pivoted at or near a point midway of the length of the main cores G G′, so that the attraction of both poles of the said cores may be utilized, as set forth.

6. The combination, with the armature-bar T, of a dash-pot composed of two chambers, I′ and *x*, the interior spaces within which are filled with oil or a similar heavy fluid and connected by means of a narrow duct or opening, as described.



7. In an electric lamp, the combination of a carbon-carrier, a shaft carrying a pinion or its equivalent engaging therewith, electro-magnetic detent mechanism controlling the revolution of the shaft, an armature connected with the pinion or its shaft, and an electro-magnet included in a normally-open shunt-circuit about the lamp and operating by its attraction for the armature on the closing of the said circuit to release the pinion from engagement with the detent mechanism and allow the carbon-carrier to fall, as and for the purpose set forth.

8. In an electric lamp, the combination of a carbon-carrier, one or more brake-wheels carried by a swinging frame and connected with the carbon-carrier, so as to be revolved by the movement thereof, electro-magnetic detent mechanism for maintaining the movement of the brake-wheels proportionate to the consumption of the carbons, and an electro-magnet in a normally-open shunt or derived circuit about the lamp operating on the closing of said circuit to raise the brake-wheels out of engagement with the detent mechanism by its attraction for an armature attached to the swinging frame, substantially as and for the purpose set forth.

9. The combination of pinion-shaft E, carried by a swinging frame, wheels B B, and a shaft, F, journaled in fixed or adjustable bearings and provided with rotary retarding devices, with an electro-magnet and armature-bar, T, having a projecting arm, K, for raising or lowering the shaft E, as and for the purpose set forth.

255,187. SPUD-FIXTURE. RALPH R. OSGOOD, Troy, assignor to Osgood & MacNaughton, Albany, N. Y. Filed Dec. 12, 1881. (No model.)

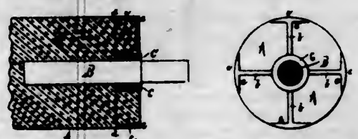
Brief.—Each end of the spud-well is protected by a cap carrying friction-rollers, which bear against the spud, the top cap also having clamp devices to secure the spud and an automatically-acting lever for elevating the spud.

Claim.—1. In combination with the spud-well constructed substantially as described, the bottom casting secured thereon and carrying the friction-rollers for bearing against the sides of the spud-post, substantially as and for the purposes set forth.

2. In combination with the spud-well constructed substantially as described, the top casting or cap mounted thereon and carrying the friction-rollers for bearing against the sides of the spud-post, substantially as and for the purposes set forth.

3. In combination with the removable flanged cap secured upon the spud-well timbers and carrying the friction-rollers, the two-part clutch mechanism mounted upon said cap, and constructed and arranged to operate in connection with the spud, substantially as shown and described.

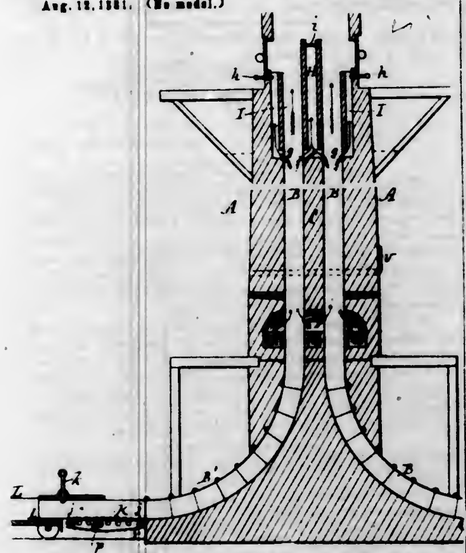
4. In combination with the spud-well, the top and bottom castings, each carrying friction-rollers for bearing against the faces of the spud-post, the parts being mounted and arranged substantially as set forth.



5. The combination of the cap-piece carrying the friction-roller, the spud-well timbers, and the inclined stay-rods, all united and secured substantially as shown.

6. The combination of the cap-piece for the spud-well, flanged as explained, the friction-rollers journaled thereon, the two-part friction-clutch mechanism, the links uniting the clutch with the cap-piece, and the eyebolts connecting two parts of the clutch, substantially as shown and described.

7. The spud-well timbers projecting above the deck and secured at top by a cap having a depending flange, which cap carries the friction-rollers and the holding-clutch mechanism, substantially as and for the purposes set forth.



8. In combination with a spud-post, an automatic hoisting-clamp composed of two parts, one part carrying one or more pulleys for the application of the hoisting chain or cable and both parts united by suitable links or side bars, substantially as shown and described.

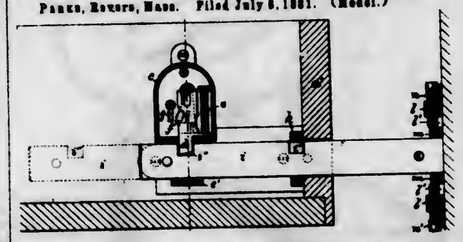
255,188. COMBINED FERRULE AND GUDGEON FOR WOODEN ROLLERS. JOHN LLOYD OWENS, Minneapolis, Minn. Filed Dec. 27, 1881. (No model.)

Claim.—The central collar, C, arms *b*, T-heads *c*, and gudgeon B, separately or in one piece therewith, in combination with a wooden roller, A, substantially as and for the purpose set forth.

255,189. BRICK-KILN. CLARK D. PAGE, Rochester, N. Y., assignor of one-half to De Witt C. Ellis, same place. Filed Aug. 12, 1881. (No model.)

Claim.—1. In a brick-kiln, the combination, with the two cupolas B B, of the four furnaces D D D D, arranged on opposite sides, two of said furnaces being located centrally opposite each other, communicating with an arch, E, which feeds the heated air to the inner sides of the cupolas, and two being located one side the center and communicating with arches F F, which feed the heated air to the outer sides of the cupolas, as herein shown and described.

2. In a brick-kiln, the combination, with the two cupolas B B, of the flue H, arranged centrally between the two cupolas, and the two side flues, I I, arranged outside the cupolas, said flues having ports or passages *f f f* at the bottom communicating with the cupolas and provided with the valves *h h i*, for controlling the draft through said flues, as herein shown and described.

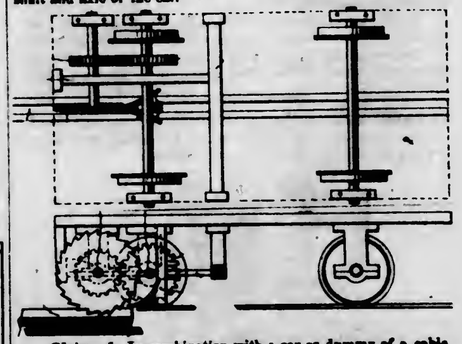


3. In a brick-kiln, the apron K, composed of cross-slats connected with endless chains at their ends, and provided with the longitudinal serrations or notches *w w*, as shown and described, and for the purpose specified.

4. The combination, with the endless apron provided with serrated cross-slats, of the cam *p*, resting under the upper length of the apron and serving as a brake, as herein shown and described.

5. In a brick-kiln, the combination of the car L, provided with the hooks *e*, and the pivoted arms M M, having hook ends *t t*, engaging with the hooks *e*, as herein shown and described.

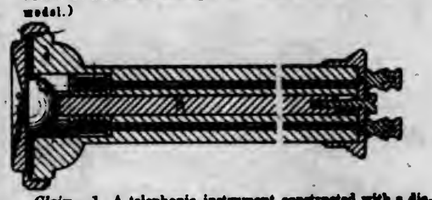
6. In a brick-kiln, the combination, with the chute B′, provided with a valve, *k*, closing its passage, of a car, L, open at its inner end and telescoping or passing under and outside the end of the chute when in position to receive the load, as herein shown and described.



255,190. LOCKING-BOLT FOR SHIPS' BERTHS. GEORGE A. PARKS, Revere, Mass. Filed July 6, 1881. (Model.)

Claim.—In combination, the lock *c*, its spring-bolt *d*, the adjustable notched locking-bar *i i′ i″*, the striker-plate *l*, its adjustable striker *m*, and regulating-screws *n n*, as and for the purpose described.

255,191. MEANS OF CLEARING SLOTS OF WIRE-ROPE RAILWAYS. JOHN POWERS, San Francisco, Cal. Filed Aug. 19, 1881. (No model.)

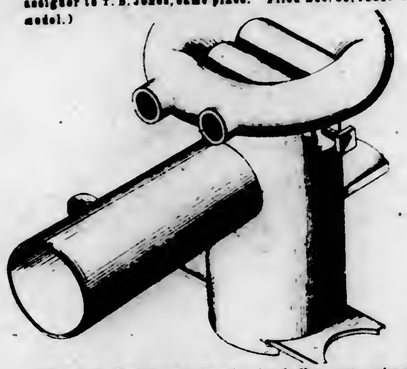


Brief.—A supplemental shaft is secured to a car or dummy, and is provided with a toothed wheel operating in the slot of a cable-railway, the whole being operated by spur-gearings upon the shaft and axle of the car.

Claim.—1. In combination with a car or dummy of a cable or wire-rope railway, the toothed or bladed wheel operating in the slot or groove in said railway upon a spindle, shaft, or mandrel, and connected in any suitable manner with the driving or propelling gear of said dummy or car, arranged and operating substantially in the manner as herein set forth and specified.

2. The combination and arrangement of a spindle or shaft having a toothed wheel or cutting and breaking edge upon its inner end, adapted to rotate or move in the slot of a cable-railway, with the driving-axle of a car or dummy, to which it is geared, and operating in a reverse manner from that of the tread of the wheels of said dummy or car, for the purpose substantially as specified.

255,192. ELECTRIC TELEPHONE. THEAT T. PROCTOR and JAMES P. FREEMAN, Chicago, Ill. Filed July 21, 1881. (No model.)

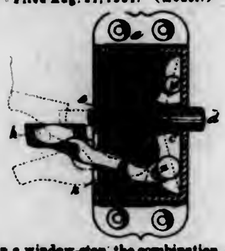


Claim.—1. A telephonic instrument constructed with a diaphragm the unsupported vibratory area of which is composed of a

flat annulus and a central hemispherical depression, substantially as before set forth.

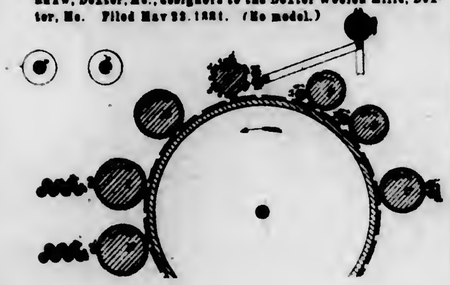
2. The combination, substantially as before set forth, of the helix, the permanent magnet, and the diaphragm whose unsupported vibratory area is composed of a flat annulus and a hemispherical depression.

255,193. TUYERE. GEORGE W. RIGGS, Madisonville, Ky., assignor to T. B. Jones, same place. Filed Dec. 30, 1881. (No model.)



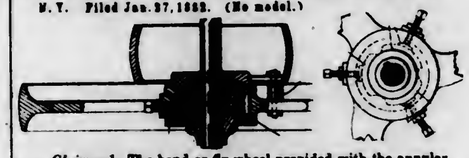
Claim.—1. In a tuyere, the circular hollow water-chamber formed with hollow transverse grate-bars connecting and opening therein, and pipe-connections, substantially as described.

2. In a tuyere, the circular hollow water-chamber formed with hollow transverse grate-bars, pipe-connecting means, and fastening-lugs, in combination with the chamber and tuyere-pipes, substantially as described.



3. The tuyere herein described, consisting of the circular hollow water-chamber formed with connecting transverse grate-bars, the tuyere-pipe and chamber formed with the projecting piece, and the movable bottom, substantially as and for the purpose set forth.

255,194. SASH-FASTENER. HERBERT L. ROBERTSON, Brookfield, assignor of one-half to James B. Hankins, West Brookfield, Mass. Filed Aug. 31, 1881. (Model.)



Claim.—In a window-stop, the combination, with case *a*, perforated to receive bolt *d*, and having the slot *a* therein, of the rocking lever *c*, provided with arm A, bolt *d*, having the cut *c* therein, in which said lever *c* engages, and spring *e*, substantially as set forth.

255,195. METHOD OF MANUFACTURING WOOLEN ROPING OR SLIVERS. RICHARD W. ROBINSON, Boston, Mass., and JOHN SHAW, Dexter, Me., assignors to the Dexter Woolen Mills, Dexter, Me. Filed May 23, 1881. (No model.)

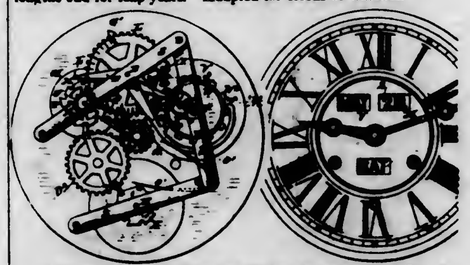
Claim.—The mode, substantially as described, of making slivers composed of wool of one color and wool of a different color, such consisting in separating or dividing crosswise of it a lap or bat of wool of one color into sections or fillets, and laying them, with intervals between them, and crosswise, upon another or ground sheet or lap of wool of a different color, and subsequently separating the whole lengthwise of the said ground-lap into strips or slivers, all being substantially as explained.

255,196. SAND OR FLY WHEEL. ELMORE W. ROSE, Fulton, N. Y. Filed Jan. 27, 1882. (No model.)

Claim.—1. The band or fly wheel provided with the annular groove on the inner face of its hub, in combination with the friction-gibs moving radially in said groove and the set-screws for uniting the wheel to its shaft, said parts being arranged and operating substantially as described.

2. The band or fly wheel provided with the annularly-grooved hub, in combination with the radially-moving friction-gibs arranged therein, and provided with the bosses on their outer faces and the flat-ended set-screws for uniting said wheel to its shaft with a frictional grasp, said parts being arranged and operating substantially as described.

255,197. SLED. ASA S. RUSSELL, Ellisville, N. Y. Filed Jan. 19, 1882. (No model.)



Claim.—1. A sled consisting of the combination of the board C with a frame, A, the latter consisting of a bar or bars bent to form runners B B, and having diagonal portions *g g*, extending close beneath the board, meeting each other, and inclined diagonal portions A A, extending from the point of intersection forward, outward, and downward to the runners, terminating thereon and fixed thereto, whereby a diagonal brace is formed to stiffen the runners, substantially as and in the manner set forth.

2. A sled consisting of the combination of a board, C, and two runners, B B, attached to the board at its opposite ends, and each runner prolonged beyond its rear point of attachment, extending thence diagonally close beneath the board, crossing the prolongation of the other runner, and descending thence diagonally forward and outward to the opposite runner, terminating thereon and fixed thereto, substantially as and for the purposes set forth.

255,198. TIME-PIECE CALENDAR. GEORGE ELMER SAFFORD, Geneva, N. Y. Filed July 14, 1881. (Model.)

Brief.—Indicates the hour and the day of the week and month, making the necessary corrections for months of different lengths and for leap years. Adapted for clocks or watches.

Claim.—1. In a time-piece calendar, the gage-wheel L and spring R, arranged to be wound upon the shaft of said wheel during the month or while the gage-wheel advances, and to react upon said wheel when released, in combination with mechanism for automatically releasing said wheel at the end of the calendar-month, as set forth.

2. In a time-piece calendar, the gage-wheel L, having arm G' and stopped flange H', substantially as set forth.

3. The combination of the units-wheel having projecting arm N with the tens-wheel P, having notches O, the toothed tens-disk Z, the regulator-wheel A', having crank B', the pitman D', and the spring S', all substantially as and for the purpose set forth.

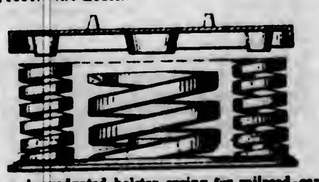
4. The combination of the year-wheel having a notched rim, W, with the lever T, having spring K', the gage-wheel L, and the toothed wheel or units-wheel I, all substantially as shown, for the purpose specified.

5. The gage-wheel L, having arm G' and stopped flange H', in combination with the units-wheel I, the drive-wheel D', having arms E' F', and the week-wheel X, as herein described, for the purpose set forth.

6. In a calendar time-piece, the driving-wheel D', placed loosely upon one of the winding-posts, engaging the dial-wheel C', and having arms E' F', for simultaneously actuating the day-wheel and the unit-disk of the month-register, as herein shown and specified.

7. The combination of the year-wheel having rim W, provided with teeth W' and notches 28 30, the lever T, having spring K', and curved arm provided with hook M' and teeth N', and the gage-wheel L, having stopped flange H, substantially as set forth.

8. The combination of the units-wheel I, having teeth or ratchets J, the gage-wheel L, the lever T, having arm L', and the spring O', substantially as set forth.



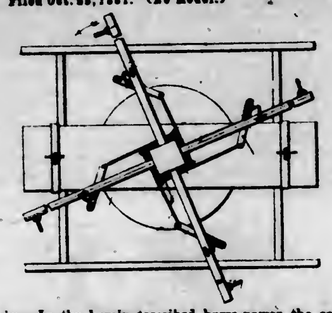
9. The combination of the year-wheel having notched rim W, the four-year wheel having projection R', the gage-wheel L, and the lever T, all arranged and operating substantially as and for the purpose herein shown and specified.

255,199. SPRING-BOLT. WILLIAM SCHENKEN, Denver, Colo. Filed Dec. 14, 1881. (No model.)

Claim.—A screw-bolt having longitudinal recesses D, lips F, and springs E, substantially as and for the purpose set forth.

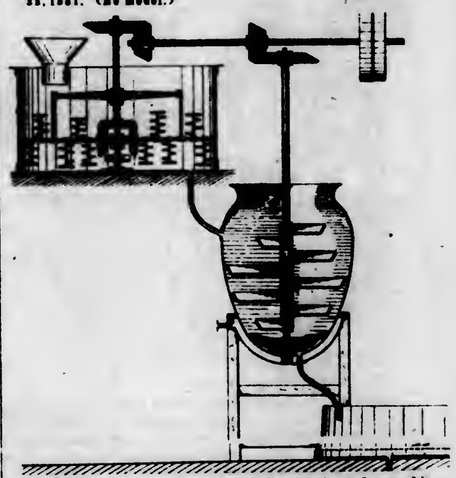
255,200. CAR-SPRING. CHARLES T. SCHENK, Philadelphia, Pa., assignor of one-half to Charles Scott, same place. Filed Nov. 21, 1881. (No model.)

Claim.—A graduated bolster-spring for railroad-cars, composed of a group of spirally-coiled bars placed side by side, and in which the spiral or spirals having the greatest bearing and carrying capacity is not acted on by the load till after the other and weaker spirals of the group have been brought into action, and in which all the spirals under a given pressure shall become solid at the same time, all substantially as set forth.



255,201. TAPING FURS. CONRAD SCHOENBURN, New York, N. Y. Filed Feb. 9, 1882. (Model.)

Claim.—1. The within-described method of taping furs, consisting in cutting the skin into narrow strips, applying the strips by an intermediate layer or sheet of caoutchouc or other adhesive material to a backing of a light textile fabric, next sewing the strips to the fabrics, and finally rubbing the entire piece to give it the required pliability, substantially as set forth.

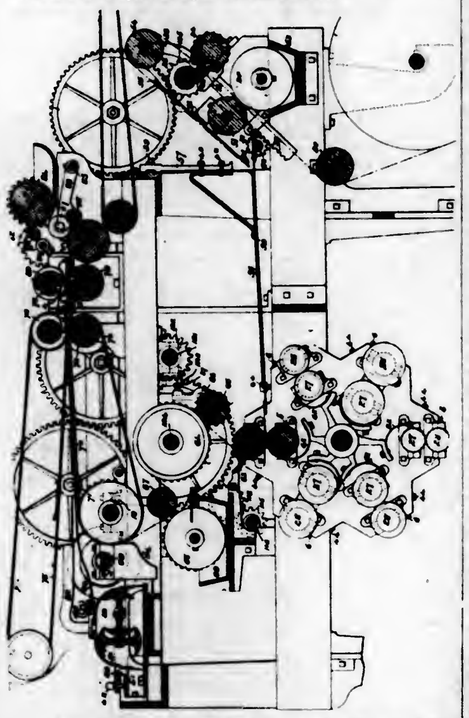


2. As a new article of manufacture, the within-described fur, consisting of narrow strips of fur which are cemented by an intermediate layer of caoutchouc or other adhesive material to a backing of light textile fabric, and secured thereto by sewing, substantially as specified.

255,202. HORSE-POWER. JOHN SCHWEIGER, Beaver Dam, Wis. Filed Oct. 28, 1881. (No model.)

Claim.—In the herein-described horse-power, the combination of the main shaft or post carrying the large pulley C, the removable sweeps or horse-levers, the metal plates passing through lateral slots in the sweeps and the wedges for securing them in adjusted position, the brace-rods connected to the metal plates, and the metal loops or eyes on the main shaft with which the hooked ends of the brace-rods engage, the whole being arranged and adapted for operation substantially in the manner described.

255,203. METHOD OF AND APPARATUS FOR MASHING MALT AND MALT SUBSTITUTES. GEORGE SEITZ, deceased; Mary C. Seitz, New York, N. Y., Administratrix. Filed July 22, 1881. (No model.)



Claim.—1. As an improvement in apparatus for mashing malt or malt substitutes, the combination of a steam-jacketed saccharification-vessel having an interior stirring mechanism, an auxiliary mash-tun arranged above the level of the vessel, also provided with a stirring mechanism, a settling and drawing-off tun arranged below the level of the saccharification-vessel and provided with a perforated false bottom, and pipes connecting the vessel and mash-tun and vessel and settling-tun, substantially as described.

2. The process of mashing malt and unmalted malt substitutes, consisting in first steeping the malt in lukewarm water under agitation, then allowing it to stand for an hour or so, then mixing a portion thereof with a quantity of raw unmalted grain and subjecting the mixture, under continual stirring, to a boiling temperature at the ordinary atmospheric pressure, then adding the unboiled portion of the original mash and mixing the whole together until the temperature is reduced below a saccharification temperature, then slowly increasing the heat of the entire mass to a temperature of 160 to 170° Fahrenheit, and finally conducting off and draining the mass, substantially as described.

255,204. PAPER-BAG MACHINE. CHARLES B. STILWELL, Watertown, N. Y., assignor to the Union Paper Bag Machine Company, Philadelphia, Pa. Filed Oct. 21, 1881. (No model.)

Brief.—For making bags of varying size a series of different-sized interchangeable opening feeding-rollers provided with cutters and slitters are mounted in a rotatable carrying-frame, so that any one of the series, according to the size of bag to be made, can be brought into position for use. By means of the sliding frame 90, interchangeable gear 96, and an adjustable shaft-coupling the relation of the mechanisms for the final cutting, pasting, and creasing are adjusted to conform to the size of opening feeding-rollers used, said mechanisms either adjustable or interchangeable for the same purpose. The former is interchangeable to make different-sized tubes, and the cutters and slitters on the opening feeding-rollers are made to register with the primary transverse cut by means of the adjustable take-up roll 54. An air-blast is employed to insure the proper closing of the first final fold.

Claim.—1. In a machine for making paper bags, a carrying-frame supporting two or more interchangeable sets of mechanisms which operate in forming the bag-bottom, said frame being arranged to rotate in moving a set of said mechanisms into operative position, all substantially as described.

2. The combination, with interchangeable opening feeding-rollers having cutters and slitters, and an interchangeable creaser, as 3, of a primary cutting mechanism and an adjustable final cutting and creasing mechanism, all substantially as described.

3. The combination, with interchangeable opening feeding-rollers having cutters and slitters, and an interchangeable creaser, as 3, of a primary cutting mechanism, an adjustable final cutting and creasing mechanism, and an adjustable take-up roll, substantially as described.

4. The combination, with interchangeable opening feeding-rollers, an interchangeable creaser, as 3, a primary cutting mechanism, and an adjustable final cutting and creasing mechanism, of connecting-gearing driving the same, a movable frame carrying the shaft of creaser 3, an interchangeable gear, 96, and an adjusting crank-pin, as 45, coupling the shaft 89 to the stud of pinion 97, substantially as described.

5. The combination of the adjustable take-up roller with the cutting and creasing mechanisms, whereby the extent of paper stretched between two operating mechanisms is governed and a perfect register of the portion operated upon by one mechanism is secured with respect to the operation of the succeeding mechanism or mechanisms, all substantially as described.

6. The combination, with the opening feeding-rollers and means providing for interchanging one set for another of different size, and with cutting and creasing mechanisms and interchangeable gearing causing their movements to coincide with that of the said rollers, of the adjustable take-up roller controlling the extent of paper stretched between two operating mechanisms, whereby the concerted reaction of the various mechanisms is accomplished in the production of the bag-bottom by operations successively performed upon it, all substantially as described.

7. The combination, with interchangeable opening feeding-rollers, of the breaker constructed to be adjusted into different positions suited to the operation of forming different sizes of bags, all substantially as described.

8. The combination, with interchangeable opening feeding-rollers, cutting and creasing mechanisms, and an adjustable final pasting device, of means for changing their rotative movements to provide concerted action during the formation of a number of different sizes of bags, all substantially as described.

9. The combination, with a creasing-cushion and an adjustable frame carrying a creaser-blade co-operating with said cushion, of interchangeable opening feeding-rollers, substantially as described.

10. The combination, with a machine for making paper bags, of an air apparatus supplying one or more currents of air directed so as to impinge upon the free flap of the bag-bottom and turn it forward, substantially as described.

11. The combination, with means for feeding onward bag-lengths having rearward-projecting bottom flaps that require folding forward in forming the bottom, of a creaser, as 3, operating to define the line of folding, and one or more conductors, as 92, emitting an air-current to impinge upon and bend or fold said flap, all substantially as described.

12. In a machine for making paper bags, the combination, with guides operating to sustain the outer edges of the bag-bottom in place, of a belt the operating-surface of which is arranged to travel at greater speed and with increasing proximity to the surface of and in the same direction as the onwardly-fed material, said belt thus operating to engage with and gradually fold or lay each rearward bottom flap onto the partially-formed bag-bottom as the same passes beneath it, substantially as described.

13. The combination, with means for feeding onward bag-lengths having projecting bottom flaps that require to be folded in forming the bag-bottom, of guides operating to control the sides of the bag-bottom, and one or more conductors emitting an air-current to impinge upon and bend, lay, or fold said flap, all substantially as described.

14. The combination, with means for feeding onward bag-lengths having projecting flaps that require folding in forming the bag-bottom, of a creaser, as 3, operating to define the line of folding, guides operating to control the sides of the bag-bottom, and one or more conductors, as 92, emitting an air-current to impinge upon and lay, bend, or fold said flap, all substantially as described.

15. The combination, with means for feeding onward bag-lengths having rearward bottom flaps that require to be folded, of the inclined belt, as 75, and one or more conductors, as 92, emitting an air-current, the conjoint action of which secures the perfect laying or folding of such rearward bottom flap into proper position to be secured onto the bag-bottom, all substantially as described.

16. The combination, with means for feeding onward bag-lengths having rearward bottom flaps that require to be folded, of a creaser, as 3, operating to define the line of folding, an inclined belt, as 75, and one or more conductors, as 92, emitting an air-current, all substantially as described.

17. In a machine for making satchel-bottomed paper bags, the combination, with a guiding-roller, over which is carried the tube having its body partially severed to form bottom flaps, of one or more disks automatically supplied with paste, by the conjoint action of which each bottom flap is carried into contact with the periphery of the pasting disk or disks and pasted by the simple spring of the paper while the body of the tube or bag-blank is held out of such contact, all substantially as described.

18. The combination, with pasting-disks revolving upon fixed bearings, and with two fixed guides for conducting the material past said pasting-disks, of an adjustable guide hung in such relation to said fixed guides that it may be adjusted to guide the material more or less distant from the pasting-disks without increasing or diminishing the length of the path of travel, and thus distend or slack the material, all substantially as described.

19. The combination, with interchangeable opening feeding-rollers and devices they carry for forming bag-bottoms having rearward bottom flaps, of a guide and the laterally-adjustable pasting-disks 68, substantially as described.

20. The combination, with severing mechanism, of mechanism for creasing the front point of the diamond preparatory to folding, said mechanisms being adjustable with relation to each other, so as to operate upon bags of varying sizes, all substantially as described.

21. A combined creasing and cutting mechanism consisting of an arbor provided with a creaser-holding socket, upon which is mounted a sleeve that supports the cutting-blade, said sleeve being arranged to turn upon the arbor to adjust the relation of its cutter to the creaser, and provided with means, substantially as described, for securing its adjusted relation.

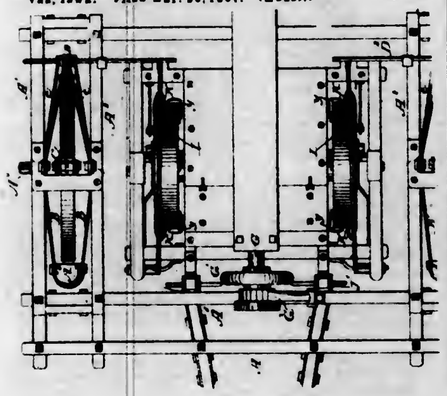
22. The combination, with the primary cutting mechanism and interchangeable opening feeding-rollers, of final creasing and cutting mechanisms the blades whereof are relatively adjustable, all substantially as described.

23. The combination, with the adjustable creaser-blade 4, operating to define the line of folding of the last bottom flap, of laterally-adjustable wheels 87 and interchangeable roller 88, which mechanisms are adapted to form the last bottom flap of various sizes of bags, substantially as described.

24. The combination, with the creaser-blade 4, of the wheels 87 and roller 88, the same constituting the mechanism for folding the last bottom flap, substantially as described.

255,205. FOUNTAIN PEN-HOLDER. MARVIN C. STONE, Falls Church, Va. Filed Aug. 30, 1881. (No model.)

Brief.—The open cylindrical holder that receives the pen contains a feeder made of fine wire-gauze, one end of which comes in contact with the pen and supplies it with ink. Air enters the reservoir in the handle of the pen-holder through the feeder to supply the place of the ink used.

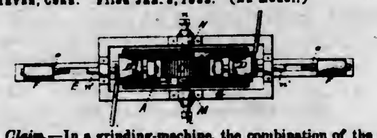


Claim.—A fountain pen-holder constructed substantially in the manner described, having a wire-gauze ink-feeder to provide for the automatic flow of ink to the pen and air to the reservoir, substantially as shown and described.

255,206. HORSE-COLLAR. JACOB STRAUS, St. Louis, Mo. Filed Jan. 21, 1882. (No model.)

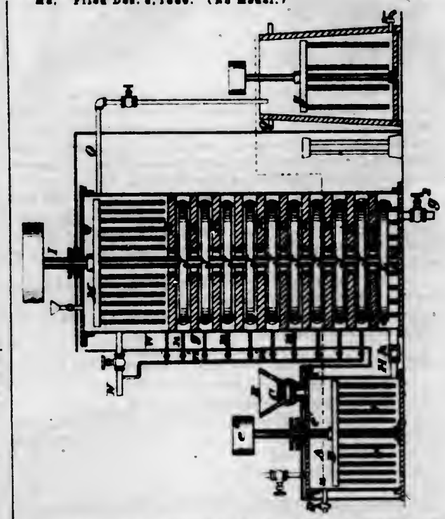
Claim.—In an improved horse-collar, the combination, with the fore wale and after wale of the collar, of an intermediate strengthening-band secured to the two portions by stitches or other suitable means, whereby the hame-receiving crease or groove may be made wide or narrow, all substantially as described.

255,207. CHECK-ROW CORN-PLANTER. JOHN STUART, Bellevue, Iowa. Filed Mar. 26, 1881. (Model.)



Claim.—1. The combination, with the frame A and the wheels C, of the fulcrum-block A^1, frames or arms B, carrying the fulcrum-block A^2 and pivoted on the axles of the wheels, the bar D', and levers *e*, pivoted to the frame A and to the bar D', and operating substantially as and for the purposes set forth.

2. The combination, substantially as set forth, of the hollow dropping-wheel I, having the chute K open at both ends and arranged diametrically across it, the plunger L, provided with the lug *m*, projected through the face-plate, the cam V, and the spring S, substantially as set forth.



3. The combination, with the hollow dropping-wheel, of the diametrical chute K, the lateral chutes E E, connected at the opposite ends of the chute K, and divided into two channels by central partitions, the plunger L, and shuttle *q q*, substantially as set forth.

255,208. GRINDING-MACHINE. JOHN HENRY TAYLOR, New Haven, Conn. Filed Jan. 5, 1882. (No model.)

Claim.—In a grinding-machine, the combination of the pulley A, having a central portion, C, and beveled flanges M N of unequal thickness, the mandrels *a' a'*, provided with suitable chucks and having cones D, adapted to be rotated by the flanged pulley, the adjustable tail-blocks F, having spindles *e*, and suitable supporting and operating mechanism, substantially as described.

255,209. AMALGAMATOR. HUGH M. THOMPSON, St. Louis, Mo. Filed Dec. 8, 1880. (No model.)

Claim.—1. The chamber G, having the inlet N and outlet O, the shaft I, and stirrer M, combined substantially as described, and for the purpose set forth.

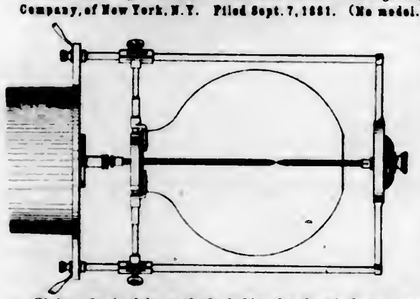
2. The combination of the chamber A, mixer E, hopper B, valve C, and pipes D and F, substantially as described, and for the purposes set forth.

3. In an amalgamator, the chambers A and G, connected by the pipe H, the latter enlarging, as described, from the mixing-chamber to the amalgamating-chamber.

4. The combination of the amalgamating-chamber G, having the inlet at the bottom thereof, and the shaft I and stirrer L, together with the disks K K K and J J J, substantially as described.

255,210. ILLUMINATED TILE. LOUIS C. TIFFANY, New York, N. Y. Filed Nov. 11, 1881. (No model.)

Claim.—A perforated glass or pottery tile having a portion or the whole of its openings filled with a thin layer of colored, iridescent, opalescent, metallized glass, metal, or pottery, or a combination of any of these substances, substantially as described.

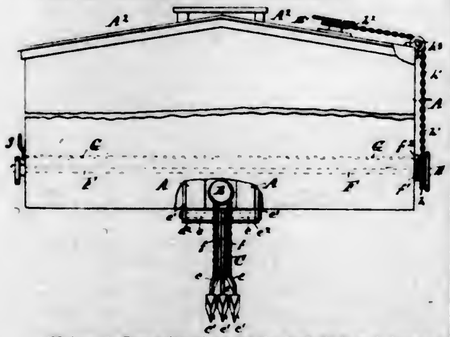


255,211. VEHICLE-SPRING. HENRY TIMKEN, St. Louis, Mo. Filed Dec. 23, 1881. (No model.)

Claim.—1. In a vehicle, a longitudinal spring rigidly attached at one end and pivoted at the other, in combination with a transverse spring attached by one end to a side bar and by the other to the longitudinal spring at or near the pivoted end, all substantially as described, and for the purpose set forth.

2. In a vehicle, longitudinal springs arranged in pairs, rigidly attached at one end and pivoted at the other, in combination with transverse springs attached by one end to a side bar and by the other to the pivoted end of the longitudinal spring, substantially as described, and for the purpose set forth.

255,212. GLOBE-SUPPORTER FOR ELECTRIC LAMPS. JOHN TRESCOTT, Philadelphia, Pa., and LEWIS H. LATIMER, New York, N. Y., assignors to the United States Electric Lighting Company, of New York, N. Y. Filed Sept. 7, 1881. (No model.)



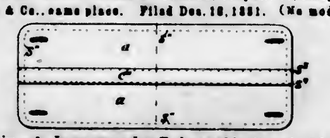
Claim.—1. A globe or shade holder for electric lamps, consisting of a cross-bar or frame formed to permit the passage of the carbon or carbons, and provided with end clasps, by which it may be adjustably fastened to the side rods of the lamp, in combination with spring-closing yokes or jaws, which receive and clasp between them the globe, substantially as hereinbefore set forth.

2. The cross-bar provided with central ring and end split spring sleeve and clamping-screws, in combination with the globe-holding jaws or yokes mounted on said bar, and the jaw or yoke actuating springs, under the arrangement and for operation as shown and described.

3. The combination, substantially as hereinbefore set forth, of the side rods of the electric lamp, the globe-holder adjustably connected with and supported by said side rods, and the globe carried by and suspended from said globe-holder.

255,213. CAR-COUPLING. GUSTAVUS TURREISCH, East St Louis, Ill. Filed Dec. 19, 1881. (No model.)

Claim.—1. In combination with the draft-timbers A, hangers or standards e', the transverse shaft e, the couplers C, each consisting of a series of draft-bars, c, formed each with arrow-heads c', the chain f, the main shaft F, having ratchet-wheel, pawl, and hand-wheel parts, by means whereof the said couplers can be raised or lowered and coupled or uncoupled, substantially as and for the purposes set forth.



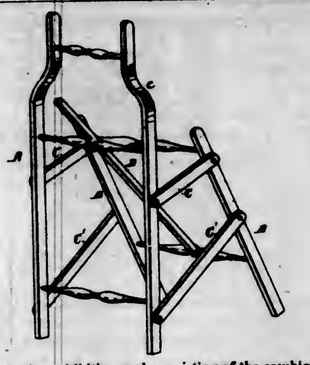
2. In combination with the bottom timbers of a car, the coupler C, secured to a transverse shaft, e, hangers e', chain f, main shaft F, carrying ratchet-wheel f', the pawl f'', made to engage the square end of a shaft, G, both said shafts F and G extending transversely across the car, by means whereof the said pawl can be disengaged from the ratchet-wheel from both sides of the car and the coupling as well as uncoupling of the couplers C can also be made from both sides of the car.

3. In combination with the draft-timbers A, the couplers C, consisting of the draft-bars c, having arrow-heads c', the transverse shaft e, hangers or standards e', chain f, main shaft F, arranged transversely across the bottom of the car, having hand-wheels F H, the pawl and ratchet-wheel, the former capable of being actuated by the separate shaft G, arranged similarly across the bottom of the car from side to side thereof, by means whereof the said pawl can be disengaged from its ratchet-wheel from either side of the car, also the said couplers C can be raised or lowered from either side of the car, substantially as and for the purposes set forth.

4. In combination with the draft-timbers A, the couplers C, consisting of draft-bars c, having arrow-heads c', the transverse shaft e, hangers e', chain f, main shaft F, having hand-wheel and ratchet-wheel, the pawl, with a lift-rod, extending along the side of the car to its top or roof, the endless chain passing around a lower chain-wheel on the end of said shaft F, also passing round an upper chain-wheel, with hand-wheel on the roof of the car, by means whereof from the top or roof of the car the said pawl can be disengaged from the ratchet-wheel and the couplers C be raised or lowered, as and for the purposes set forth.

5. In combination with the draft-timbers A, the couplers C, consisting of the draft-bars c, formed with arrow-heads c', the shaft e, hangers e', chain f, main shaft F, extending completely across the bottom of the car, the hand-wheels F H, the ratchet-wheel f', the pawl f'', capable of being actuated by the shaft G, which extends also across the car, the lift-rod G', the chain-wheel below on shaft F, the chain-wheel and hand-wheel on the roof of the car, the endless chain h', by means whereof the pawl can be disengaged from the ratchet-wheel, either from the roof or both sides of the car, also the couplers be raised or lowered by the operator either from the roof or top of the car or from either side thereof, substantially as set forth.

255,214. CUFF. ISAAC F. TURNER, Troy, N. Y., assignor to Coon & Co., same place. Filed Dec. 19, 1881. (No model.)



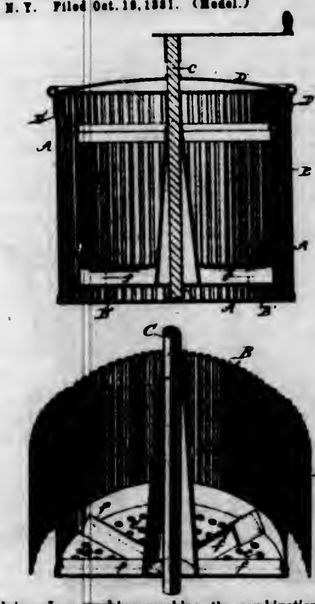
Claim.—1. In an apparel-cuff, the combination of a fabric ply-blank having a central longitudinal box-plait and a turning-slit in its face inside of the edge where sewed to be turned, an exterior fabric blank of the same width and length as the ply-blank when its box-plait is folded, two fabric facing half-blanks having the same length as the exterior blank, but half its width, and the aforesaid parts united by placing the exterior blank next to the plaited face of the ply-blank, and then inserting between them, on each side of the box-plait, one of the facing half-blanks, with its inner edge beneath the fold of the box-plait, then border-stitching the parts as placed, turning them through the slit in the plaited ply-blank, and stitching them longitudinally along the edges of the box-plait to secure the inner edges of the half-blanks and around the edge of cuff, as shown and described.

2. In combination, in an apparel-cuff, the exterior fabric blank B, the fabric ply-blank A, the fabric ply-blank C, the latter having the longitudinal box-plait C', and the turning-slit O, the two fabric facing half-blanks a a, and the aforesaid parts united by first laying the ply-blank A upon this the exterior blank C, with its plaited side down and one of the facing half-blanks inserted next beneath the blank C, upon each side of the box-plait, and its inner edge beneath the fold of the box-plait, the parts in this position being border-stitched and turned through the slit O and stitched along the edges of the half-blanks and around inside of the cuff-edge, as shown and described.

3. In an apparel-cuff, a cuff-facing, in combination, consisting of the two fabric half-blanks a a, the box-plait C', and the latter formed on a thickness of the intermediate filling-ply, with the inner edges of each one of the half-blanks beneath one of the plait-folds, and the rows of stitching b^3 b^4 connecting the inner edges of the half-blanks with the plait and ply on which the plait is formed, as shown and described.

255,215. EXHIBITING-RACK. JOSEPH W. TUTTLE, Chicago, Ill., assignor of three-fourths to Percival B. Palmer and Walter Proby, same place. Filed Jan. 16, 1882. (No model.)

255,215.

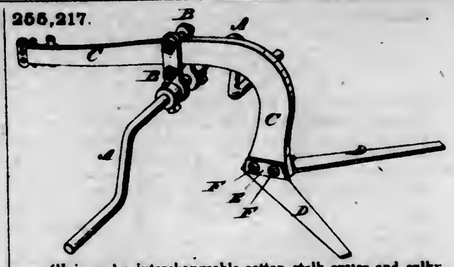


Claim.—1. An exhibiting-rack consisting of the combination of the frames A and B, the pivoted or hinged tongue or support D, and the bars C and C', substantially as and for the purposes specified.

2. An exhibiting-rack consisting of the frame A, in which are the shoulders e e, the frame B, the tongue D, hinged to the frame B, and the bars C and C', jointed to the said frames, all combined and adapted for operation together substantially as and for the purposes specified.

3. The combination of the frames A and B, the non-parallel bars C and C', hinged to each side of the said frame, and the tongue D, hinged at one end to the frame B and left free or loose at the other, substantially as and for the purposes specified.

255,216. WASHING-MACHINE. VAN VAN DEUSENBURG, Bacon Hill, N. Y. Filed Oct. 19, 1881. (No model.)

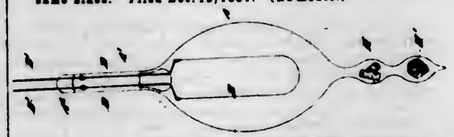


Claim.—In a washing-machine, the combination, with the cylinder A, of the disk B', having the shaft C e, the perforations e, and the radial bars or ribs f, and the bottomless cylinder B, having affixed to the inside of its lower end inverted-V-shaped arms or sockets a, fitted upon the ribs or bars f of the disk B', substantially as and for the purpose set forth.

255,217. COTTON-STALK AND WEED CUTTER. JAMES H. VARNEY, Farmington, Tex. Filed Nov. 2, 1881. (No model.)

Brief.—A curved beam adapted to receive a common turn-plow is hinged to the bail of an ordinary sulky-plow, and has inclined cutters detachably secured to its rear end, whereby the machine may be converted into a stalk-cutter or sulky-plow at will.

255,217.



Claim.—An interchangeable cotton-stalk cutter and sulky-plow consisting of the bail A, the clamp B, the curved plow-beam C, adapted to receive a plow at its rear end, and inclined cutters D, provided with perforated flanges E, and detachably secured by bolts F to the opposite sides of the lower end of said beam, substantially as herein shown and described.

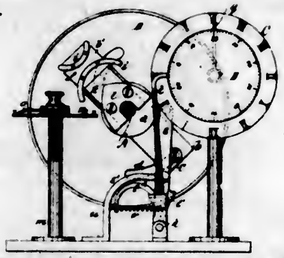
255,218. HARNESS-SADDLE. PETER J. VEHLEN, Michigan City, Ind. Filed Jan. 18, 1882. (No model.)

Claim.—In a harness-saddle that is flexible over the back of the horse, the stiff iron plates A, having socketed holes a and c for the terret and screw nuts, and being secured under the skirting D of flaps D of the saddle, as and for the purpose set forth.

255,219. INCANDESCENT ELECTRIC LAMP. WILLIAM L. VOELKER, Morton, Pa., assignor to John M. Irwin, Trustee, same place. Filed Dec. 13, 1881. (No model.)

Claim.—1. The herein-described method of attaining a perfect vacuum in incandescent electric lamps—that is to say, by forming the main bulb of the lamp with two small bulbs having free communication with said main bulb containing the incandescing filament of carbon, placing in one of said bulbs hydrate of potassa and in the other pumice-stone saturated with sulphuric acid, exhausting and sealing the lamp in the usual manner, and then heating the carbon gradually from a low red heat to incandescence, and finally sealing the main bulb of the lamp and removing the small bulbs, substantially as shown and described.

2. The main bulb A, incandescing filament of carbon B, connections D D', bulb H, for holding hydrate of potassa, and bulb H', for holding pumice-stone saturated with sulphuric acid, the whole combined and arranged to operate substantially as shown and described.



255,220. POWER INDICATOR AND RECORDER. GEORGE WALH, Paterson, N. J. Filed July 12, 1881. (Model.)

Brief.—By two sets of mechanism attached to arms of the main shaft an indicator denotes the amount of power being used and a registering mechanism makes a permanent record of the power taken from a main driving-shaft.

Claim.—1. In power indicating and recording mechanism, the combination of shaft A, carrying arms b b', pulley B, provided with eccentric slot h, spring c, connecting the arm b and pulley, and the slide f, engaging slot h of the pulley, substantially as shown and described.

2. In power indicating and recording mechanism, the com-

255,220.

bination of radially-moving slide *f*, cam-flanges *i*, and pointer *o*, placed for engagement with the cam-flanges of the slide, substantially as shown and described.

3. In power indicating and recording mechanism, the combination of radially-moving slide *f*, cam *l*, rock-shaft *r*, and arm *t*, substantially as shown and described.

4. The combination, in power-recording mechanism, of revolving dial D, arm *t*, arm *s*, shaft *r*, provided with stop-pin *t'*, cam *l*, and slide *f*, carrying the cam, substantially as shown and described, for operation as set forth.

5. The combination, in power-recording mechanism, of a graduated dial, revolved by friction-connections, a retarding-arm hung adjacent to the dial, and a cam operated by the driving-shaft to press the retarding-arm in contact with the dial with a varying pressure, substantially as shown and described.

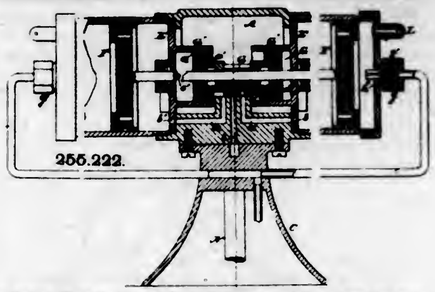
6. The combination, in power-recording mechanism, of a recording-dial, a time-piece moving in unison with the dial, and a dynamometer acting to retard the dial, substantially as shown and described.

255,221. CANVAS BAG FOR HAMS. LUCIUS V. WALKLEY, Plantsville, Conn., assignor of one-half to Pults & Walkley Company, same place. Filed Feb. 24, 1879.

Claim.—The herein-described article, consisting of a flat ham bag or case having its two sides sewed together for about two-thirds of the way around their edges, said seamed edges being substantially of the contour shown in Fig. 1, and having also the open oblique mouth at one corner of its largest end, the length of which mouth is about equal to the greatest width of the bag, substantially as and for the purpose specified.

255,222. AIR-COMPRESSOR. WILLIAM WAHL, Philadelphia, Pa. Filed Jan. 7, 1881. (No model.)

Brief.—G is a balanced piston, and moves in either direction as the water is alternately admitted to either end of the valve through ports *f''* and *e'*. These ports are made coincident by the pistons F at the end of their strokes striking the plunger-valve K, in which is the groove or port *f''*. The exhaust takes place through the ports *e f f'* and *b*.



Claim.—1. Stationary cap E, cast in one piece with a cylinder, G', and a valve-chamber, J, in combination with a plunger or valve moving in said chamber and recessed to afford a passage, said cap closing said passage in one position of said plunger, substantially as set forth.

2. The caps or plates E, each having a valve-chamber, J, and a cylinder, G', cast with it on its inner side, the inner ends of said cylinders being open, in combination with a piston working in said cylinders, substantially as set forth.

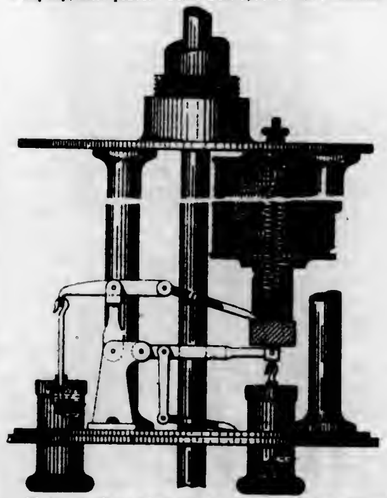
3. In combination with chamber A and the two compressing-cylinders, the independent valve-cylinders G', arranged within said chamber and opening inwardly, and the hollow balanced piston G, reciprocating in said cylinders, substantially as set forth.

4. The piston-rod D, having hollow balanced piston G fitted to slide thereon and passing through stationary caps E and open-end cylinders G', in combination with said piston, caps, and cylinders, and the central packing, *a'*, substantially as set forth.

5. In combination with chamber A and the cylinders B B', arranged at the ends thereof, the caps E, having inwardly-opening

255,222.

cylinders G' on their inner faces, the piston-rod D, passing through the said chamber, caps, and cylinders, and the pistons F and G, carried by said rod, arranged and operating substantially as set forth.



6. The plunger-valve K, with port *e* and neck *f''*, the valve-chambers J, the cylinders G', with ports *e'*, the caps E, with ports *f*, the seat with port *f'*, and the exhaust-port *b*, combined and operating substantially as and for the purpose set forth.

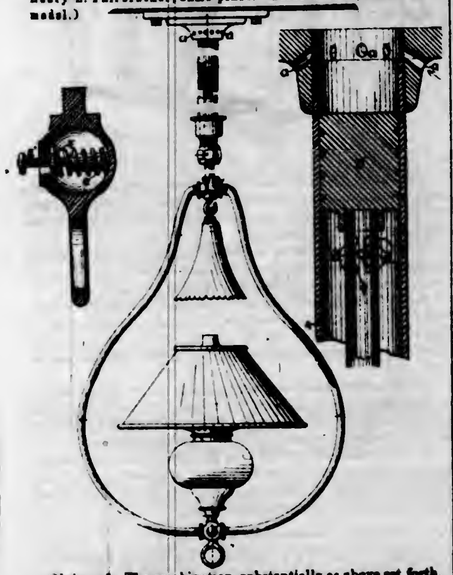
7. The cylinders B B' and chamber A, in combination with the separating-caps E, having openings *b'*, the valve H, and valve-seat H', with ports *a a b*, substantially as and for the purpose set forth.

8. The plunger-valves, with ports *e*, the cylinders G', with ports *e'*, the caps E, with ports *f*, the balance-piston G, the cylinders, and chamber, combined and operating substantially as and for the purpose set forth.

9. The chamber A and cylinders B B' at the ends thereof, in combination with the piston-rod D, provided with balanced piston G within said chamber, and pistons F within said cylinders, and the outwardly-opening valves *g* in the ends of said cylinders, substantially as set forth.

255,223. ELECTRIC LAMP. ADDISON G. WATHENHOUSE, New York, N. Y., assignor to the United States Electric Lighting Company, same place. Filed Dec. 3, 1881. (No model.)

Claim.—1. In an electric lamp, the combination of a carbon-carrier, an electro magnet or magnets, a feed-controlling clamp connected therewith, and a supplementary clamp, in conjunction with suitable retarding mechanism, arranged to engage with the carrier when the same is released by the magnets, substantially as set forth.

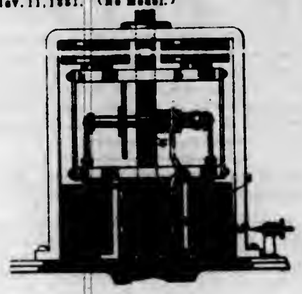


2. The combination, with a carbon-carrier, an electro magnet or magnets, and a feed-controlling clamp connected therewith, of a supplementary clamp pivoted or suspended above the first, and a retarding device for limiting its movement in one direction, substantially as set forth.

3. The combination, with a carbon-carrier, an electro magnet or magnets, and movable armature therefor, of a clamp adapted to engage with and raise the said carrier, and a pivoted or suspended

clamp, in conjunction with suitable retarding mechanism, and adapted to engage with the carrier and impede its descent, substantially as set forth.

4. The combination, with a carbon-carrier, of a clamp or clutch composed of two perforated plates of resilient metal connected together at one edge, substantially as shown.

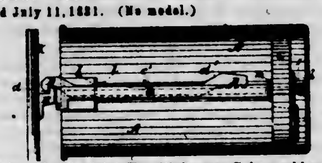


255,224. EXTENSIBLE DROP-LIGHT. CHARLES S. WHITLAND, Providence, R. I., assignor to Addison H. White and Henry L. Fairbrother, same place. Filed Oct. 12, 1881. (No model.)

Claim.—1. The combination, substantially as above set forth, of a pendent tube, a pipe arranged to slide within the bore of said tube, a piston attached to said sliding pipe, a stuffing-box preventing the escape of air from the mouth of the pendent tube, apertures in the sliding pipe connecting the annular space within the tube with the interior of the sliding pipe, and a relief-valve to permit the escape of any excess of air-pressure when the drop-light is lowered, and to permit the admission of air when the light is elevated.

2. The combination, substantially as above set forth, of a pendent tube, a sliding piston attached to a pipe arranged to move within the bore of the pendent tube, air-apertures to maintain an equilibrium of pressure located in the pendent tube above the range of movement of the piston, a stuffing-box to prevent the escape of compressed air at the mouth of the tube when the drop-light is extended downward, apertures in the sliding pipe connecting the annular space within the tube with the interior of the sliding pipe, and a relief-valve to permit the escape of any excess of air-pressure when the drop-light is lowered, and to permit the admission of air when the light is elevated.

255,225. ELECTRIC LAMP. EDWARD WESTON, Newark, N. J., and LEONARD H. CURTIS, New York, N. Y., assignors to the United States Electric Lighting Company, New York, N. Y. Filed Nov. 11, 1881. (No model.)



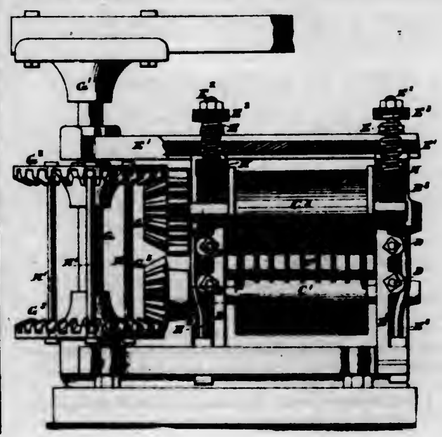
Claim.—1. In an electric lamp, the combination, with the feed-regulating mechanism and carbon-carrier controlled thereby, of a shunt-circuit of high resistance, and an electro-magnet included therein, and a releasing device adapted to be actuated by said magnet, and thereby release the carrier from the regulating mechanism, as set forth.

2. The combination, in an electric lamp of the kind described, of a train of wheels constituting the feed mechanism, a carbon-carrier engaging therewith by means of suitable connecting-gear, a closed shunt of high resistance, and an electro-magnet included therein, and mechanism independent of the feed mechanism adapted to be actuated by said magnet, and thereby release the said connecting-gear from the train, substantially as and for the purpose set forth.

3. The combination, in an electric lamp, with the pinion G, and a friction-clutch arranged to be held against said pinion by a spring, of a closed shunt of high resistance, an electro-magnet included therein, and an armature-lever adapted to be actuated by said magnet, and thereby withdraw the clutch from said pinion, substantially in the manner described.

255,226. DOOR-CHECK. JESSE W. WETMORE, Erie, Pa. Filed July 11, 1881. (No model.)

Claim.—1. The latch D, with its cam *d'*, in combination with the piston, piston-rod, and cylinder on the casing, and the catch on the spring-door, substantially as described.



2. The air-cylinder, in combination with the detachable piston-rod, latch, and catch, constructed and operated substantially as described.

255,227. PEN-HOLDER. JESSE W. WETMORE, Erie, Pa. Filed July 11, 1881. (No model.)

Claim.—In combination with a pen-holder, the sleeve or case composed of sections A B C, said sections being recessed at their lower ends to afford rests for the thumb and fingers, and rabbeted at their upper ends so as to be independently adjustable longitudinally, and all held in place by the same ring in which they are also partially adjustable concentrically.

255,228. CANE-MILL. DANIEL WILDS, Washington, Iowa. Filed Dec. 2, 1881. (No model.)

Claim.—1. In a mill or machine for grinding or crushing sugar-cane, sorghum, and other similar substances, the combination of the beveled driving-wheels G^2 G^3, placed on a vertical shaft, the beveled wheels G^4 and G^5, and the grinding or crushing rolls C' and C^2, placed one above the other and driven by separate gears, substantially as and for the purpose set forth.

2. The combination of the grinding or crushing rolls C' C^2 and the bagasse-discharging rolls, the latter being arranged with reference to the grinding or crushing rolls substantially as described, whereby it is made to give an upward inclination to the bagasse, and thus effectually separate it from the juice, as described.

3. In combination with the grinding or crushing rolls of a cane-mill, the feed-roller E, which is capable of being rotated by the cane as it is fed to the mill, substantially as set forth.

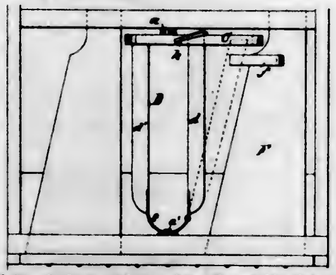
4. The combination of the gear-wheels G^2, G^4, J, and J', and the discharging-roller C, the parts being arranged for joint operation substantially as and for the purpose set forth.

5. The combination of the grinding or crushing roller C^2, the springs E E, the bolts E^2, caps E^3, boxes B^2, and washers H, the parts being substantially as set forth, whereby they are made to control the vertical rise and fall of the upper crushing-roller, as set forth.

6. The combination of the vertical shaft G, the gear-wheels G^4 and G^5, and the adjusting-bolts H', they being arranged substantially as and for the purpose set forth.

7. In combination with the driving-gear G^4 and G^5 of a cane-crushing mill, the driving-shaft G, having upon it driving-wheels G^2 and G^3, and having a vertical as well as a rotary movement imparted to it, said vertical movement being simultaneous with and caused by the vertical movement of the upper crushing-roller, all substantially as described, and for the purpose set forth.

255,229. HAND-STAMP. CHARLES C. WILSON, Washington, D. C. Filed Jan. 20, 1881. (No model.)

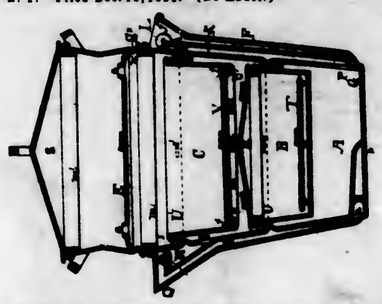


Claim.—1. In a hand-stamp, the plate F, having a type-receiving slot and catch-lugs, in combination with the type and detachable spring-catches for engaging said lugs, substantially as shown and described.

2. The type-plate F, journaled in the frame E and provided with the type-receiving slot, and having catch-lugs on its rear side, in combination with the detachable bearing W, carrying the endless bands, from which project type-strips s', and provided with spring-catches arranged, substantially as described, to engage the lugs on the type-plate, substantially as shown and described.

255,230. COMPOUND FOR ABSORBING OILS FOR BURNING AND ILLUMINATING PURPOSES. JOHN A. WRIGHT, Keene, N. H. Filed Feb. 3, 1882. (Specimens.)

Claim.—A compound made of infusorial earth, clay, and asbestus in the manner and proportions substantially as herein described, and for the purposes set forth.



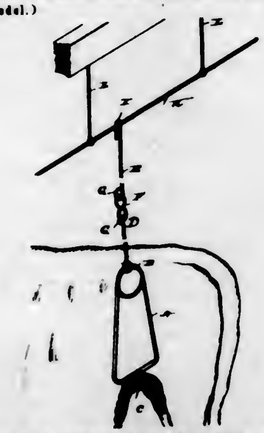
255,231. STANCHION. STEPHEN J. ADAMS, Willett, N. Y. Filed July 30, 1881. (No model.)

Claim.—1. In a cattle-stanchion, the combination, with the slotted top plate, C, having extension and pivoted at *a*, of the bars *d d'*, hinged and pivoted metal plate *e*, and keeper *f*, substantially as herein shown and described.

2. The pivoted stanchion D, in combination with the upright F, provided with the keeper *f*, as and for the purposes set forth.

255,232. STEAM-COOKER. ALEXANDER M. ADDS, Syracuse, N. Y. Filed Dec. 19, 1881. (No model.)

Claim.—1. The combination, in a steam-cooker, of the ball N, which is placed over the aperture *k* in the spout M, with the aperture J, tube K, having an aperture, P, and a whistle, L, substantially as set forth and described.



2. The combination of the tube K within the tube F, having an aperture, P, above the aperture G, and a whistle, L, within the spout *f*, substantially as shown, and for the purpose set forth.

3. The combination, in a flaring steam-cooker, of the ring C, having a flange, *c*, with perforations *i i*, and a movable bottom, V, with a flange, *j*, movable ring U', having perforations *s'*, the dish B, and movable ring U, substantially as and for the purpose set forth.

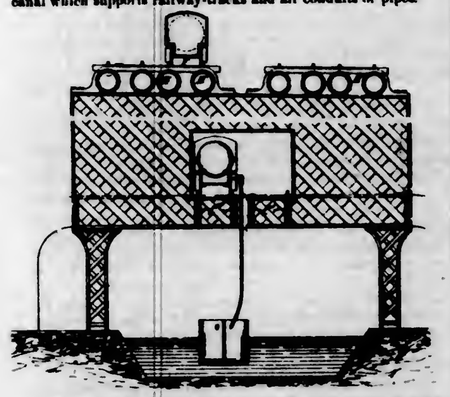
4. The combination, in a flaring steam-cooker, of the ring D, flaring from the center upward and downward, and having a rim, *m*, corresponding with the rim *m'* of the cover S, and binding on the lower extremity, substantially as shown and described.

5. The combination of the ring D, having a movable bottom, E, with a flange, *a*, resting on the bead *g''*, and having raised perforations *e e*, the rim *m*, cooker A, ring C, dish B, and cover S, substantially as and for the purpose set forth.

255,233. COW-TAIL HOLDER. THOMAS O. ANDRUS and NAPOLEON B. PRIEST, North Wolcott, Vt. Filed Dec. 21, 1881. (No model.)

Claim.—An improved device for holding and supporting cows' tails, consisting of the wire spring-clamp A, bent into a loop, B, at its center, and provided with rectangular crossed interlocking hooks C at its lower ends, and the links D F E, connected as described, the latter having an open hook, I, adapted to slide on the horizontal rod K, supported by the rods L, for the purpose specified, all being arranged as herein set forth.

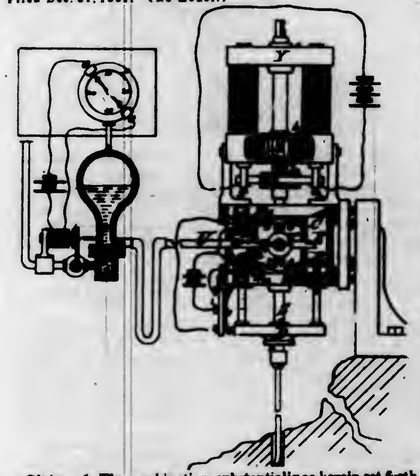
255,234. HEEL-PLATE FOR BOOTS AND SHOES. HENRY W. ARNOLD, Utica, N. Y. Filed Oct. 29, 1881. (No model.)



Claim.—1. In combination with the hinged heel plate or creeper constructed substantially as described, the strap B, substantially as set forth.

2. A removable heel-plate or ice-creeper having upward-projecting tongues on its edge, in combination with band B, the said tongues being constructed to be passed between the band B and the shoe and to extend over the upper edge of the band, substantially as and for the purposes described.

255,235. COMBINATION OF ELEVATED RAILWAY AND CANAL. BENJAMIN T. BARRITT, New York, N. Y. Filed July 23, 1881. (No model.)



Brief.—Consists of an elevated-railway structure spanning a canal which supports railway-tracks and air conduits or pipes.

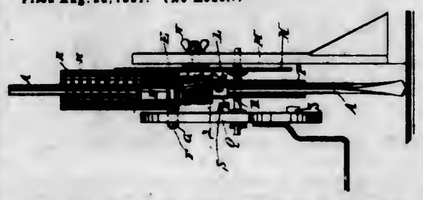
Claim.—1. The combination, with a canal, of an elevated-railway structure spanning the canal, railway-tracks supported thereon immediately over the canal, and pipes or conduits supported on or in said structure, and adapted for conducting compressed air, substantially as and for the purpose herein described.

2. The combination, with a canal, of an elevated-railway structure spanning the canal, railway-tracks supported thereon immediately over the canal, pipes or conduits for conducting compressed air arranged in groups on said structure, and railway-tracks supported upon said pipes or conduits, substantially as and for the purpose herein described.

255,236. ELECTRIC DRILL. CHARLES E. BALL, Philadelphia, Pa., assignor to Charles A. Cheever, Trustee, New York, N. Y. Filed Dec. 31, 1881. (No model.)

Claim.—1. The combination, substantially as herein set forth, of an electromotor, a drill stock or tool rotated thereby, mechanism for alternately advancing and retracting the tool, and electro-magnetic feed mechanism controlling said movements.

2. The combination, substantially as herein set forth, of a generator of electric currents, an electromotor, circuit-wires connecting said generator and motor, a drill stock or tool rotated thereby, a hydraulic feed mechanism, and automatic electro-magnetic regulating mechanism controlling said feed mechanism.



3. The combination, substantially as herein set forth, of a drilling-tool, an automatic hydraulic feed mechanism, a feed-valve, electro-magnets controlling said valve, a generator of electric currents, and circuit-connections between said generator and magnet to actuate said valve.

4. The combination, substantially as herein set forth, of the hydraulic feed-cylinders, the water-supply pipe, the feed-valve, its stem or handle constituting an armature, electro-magnets on opposite sides thereof to reverse the feed, a generator of electric currents, and circuit-wires connecting the generator and magnets.

5. The combination, substantially as herein set forth, of a generator, an electromotor, a drill rotated thereby, automatic hydraulic feed mechanism interposed between the drill and motor, a feed-valve, electro-magnets controlling said valve, and electrical connections between the valve and motor automatically to reverse the feed.

6. The combination, substantially as herein set forth, of an electromotor, a drill rotated thereby, hydraulic feed mechanism interposed between the motor and tool, a water-supply pipe, a compression-chamber, a valve, an electro-magnet controlling said valve, an electric circuit, a gage included therein, and mechanism actuated by pressure in the compression-chamber automatically to open or close said circuit to operate said valve, and thereby to regulate the water-supply, and consequently the feed.

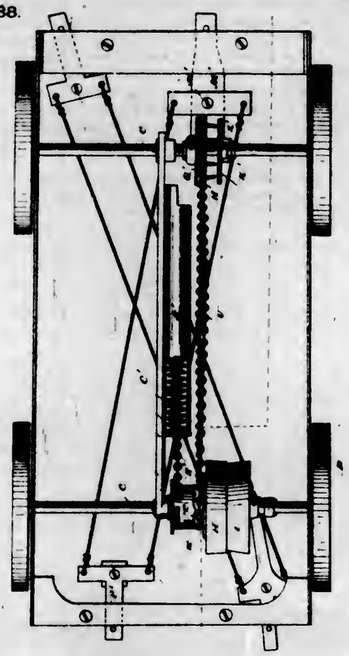
255,237. ROCK-DRILL. WILLIAM J. BARBER, Covington, Ind. Filed Aug. 23, 1881. (No model.)

Claim.—1. The combination, with the drill A, of the stock B, provided with spiral grooves D, the loose ring E, provided with a projection, F, and the cam-wheel Q, provided with studs S, substantially as herein shown and described, and for the purpose set forth.

2. The combination, with the drill A, of the stock B, provided with spiral grooves D, the loose ring E, provided with a projection, F, the spring K, the casing H, and the cam-wheel Q, provided with a series of studs, S, substantially as herein shown and described, and for the purpose set forth.

3. The combination, with the drill A, of the stock B, the casing H, the adjustable plate L, the cam-wheel Q, the projection F of the drill-stock, and the standard M, substantially as herein shown and described, and for the purpose set forth.

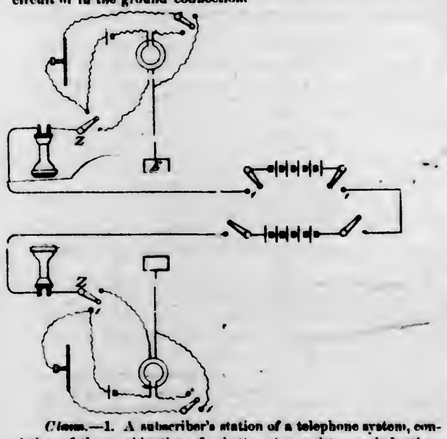
4. The combination, with the drill A, of the stock B, the casing H, the adjustable plate L, the tubular guide P, the projection F of the stock, the cam-wheel Q, and the frame or standard M, substantially as herein shown and described, and for the purpose set forth.



5. The combination, with the drill A, of the stock B, the casing H, the plate L, provided with a slot, N, the screw *e*, the nut M', the tubular guide P, the projection F of the stock B, the cam-wheel Q, and the standard or frame M, substantially as herein shown and described, and for the purpose set forth.

6. In a frame for a drill, the combination, with the frame or standard M, of the pivoted adjustable plate L, the casing H, and the tubular guide P, substantially as herein shown and described, and for the purpose set forth.

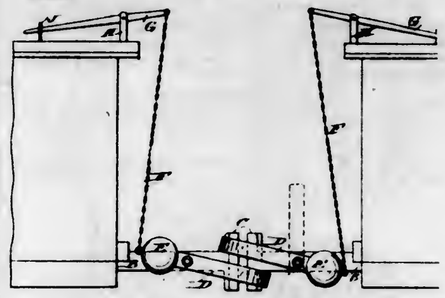
255,238. CAR-STARTER. JOHN L. BARNES and WILLIS D. SLAUSON, Racine, Wis. Filed Jan. 21, 1882. (Model.)



Claim.—The combination of the drum E, its disk and rim H, and the friction-wheel I, mounted loosely on one of the axles C, the slotted hub M and the pin N, and mechanism for throwing the parts into and out of gear, with the sprocket-wheel G', provided with pins on its face, and the disk K', provided with apertures for the pins, the mechanism for operating the disk to clutch the sprocket-wheel, and the chain U, spring C', and chain E', the whole arranged to operate substantially in the manner specified.

255,238.

255,239. TELEPHONE SYSTEM. EMILE BERLINER, Boston, Mass. Filed Dec. 15, 1881. (No model.)

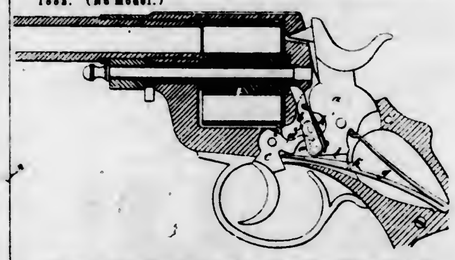


Brief.—By means of appropriate switches the line-battery, which is located at the central office, may be connected either through the transmitter or through the secondary of the induction-coil to ground, and the transmitter can be put either into the local circuit or in the ground connection.

Claim.—1. A subscriber's station of a telephone system, consisting of the combination of a battery-transmitter, an induction-coil, a local battery, a receiving-telephone, and switch Z, substantially as described, and so arranged that the line-circuit can by means of this switch be directed either through the secondary coil or through the transmitter to the ground.

2. A subscriber's station of a telephone system, consisting of the combination of a battery-transmitter, an induction-coil, a local battery, a receiving-telephone, and switch Y, substantially as described, and so arranged that the transmitter-circuit can be directed by this switch either through the local battery or to the ground.

255,240. CAR-COUPLING. JOAB BILLON, JAMES BILLON, and ROBERT L. SENSER, St. James, La. Filed Jan. 31, 1881. (No model.)



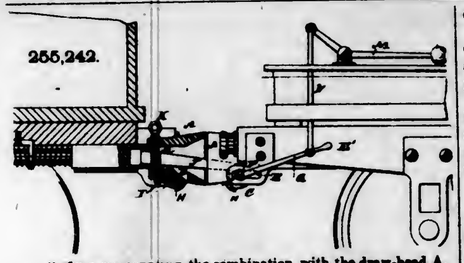
Claim.—1. A car-coupling made substantially as herein shown and described, and consisting of a draw-head provided at its outer end with a vertical projection, to which draw-head a bow is pivoted, provided at the ends of its shanks with weights, as set forth.

2. In a car-coupling, the combination, with the draw-head B, provided at its outer end with a cross-head, C, of the pivoted bow D, provided with weights E at the ends of the shanks, and of the chain or equivalent, F, for operating the bow, substantially as herein shown and described, and for the purpose set forth.

3. In a car-coupling, the combination, with the draw-head B, provided at the outer end with a cross-head, C, of the pivoted bow D, provided with weights E, the chain F, or equivalent, and the lever G, substantially as herein shown and described, and for the purpose set forth.

4. In a car-coupling, the combination, with the draw-head B, provided at the outer end with a cross-head, C, of the pivoted bow D, provided with weights E, the chain F, or equivalent, the lever G, and the locking-hook J, or equivalent, for securing the inner end of the lever G, substantially as herein shown and described, and for the purpose set forth.

255,241. LOCK FOR FIRE-ARMS. EDOUARD BLED, Paris, France, and JEAN WARDANT, Liege, Belgium. Filed Jan. 30, 1882. (No model.)



Claim.—In combination with the hammer, the mainspring, and the trigger having a projection, *d*, arranged for operation as described, the pawl *b*, pivoted to the hammer and provided with a projection, *f*, against which the trigger, by its projection *d*, exerts a lifting action, and from which it subsequently escapes, and the trigger is allowed to return to its normal position by the yielding of the pawl, essentially as herein set forth.

255,242. CAR-COUPLING. GEO. F. BOSS, Troy, N. Y. Filed Jan. 23, 1882. (No model.)

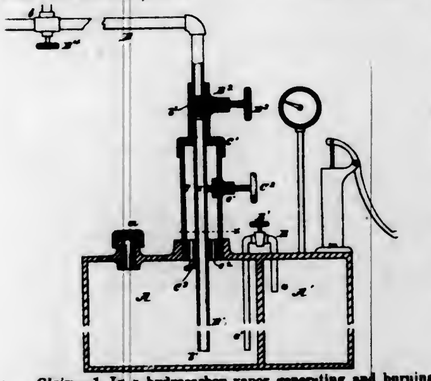
Claim.—1. In a car-coupling, the combination, with the draw-head A, provided with an aperture, B, in the bottom, of the cam-block C in this aperture, this cam-block being mounted on a transverse shaft, D, extending to the sides of the car, and provided with handles G at the ends, and of guide-plates F, provided with guide-slots E for the shaft D, substantially as herein shown and described, and for the purpose set forth.

2. In a car-coupling, the combination, with the draw-head A, provided with an aperture, B, in the bottom, of the swinging cam-block C in this aperture, the shaft D, the handles G, the connecting bar N, and the angular lever M, pivoted on the top of the car, substantially as herein shown and described, and for the purpose set forth.

255,242.

3. In a car-coupling, the combination, with the draw-head A, provided with an aperture, B, in the bottom, of the swinging cam-block C, provided at the inner end with a transverse check-ridge, I, substantially as herein shown and described, and for the purpose set forth.

4. In a car-coupling, the combination, with the draw-head A, provided with an aperture, B, in the bottom, of the swinging cam-block C, provided on the inner end with a transverse check-ridge, I, and at the outer end with a guide-ridge, H, extending from top to bottom, substantially as herein shown and described, and for the purpose set forth.



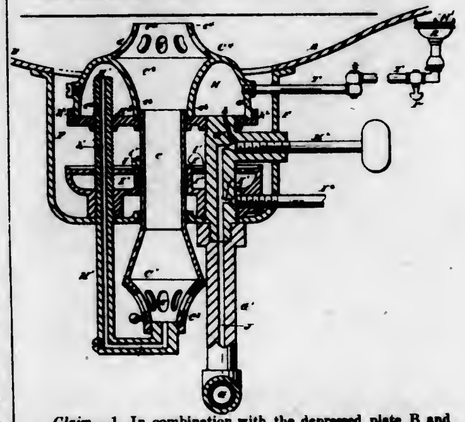
255,243. PERFORATING ATTACHMENT FOR PRINTING-PRESSES. JOSEPH M. BOWMAN, Jersey City, N. J. Filed July 13, 1881. (No model.)

Claim.—The perforating device or attachment herein described, comprising the stock K, having the opening E' and clamp-screw *b*, to permit it to be detachably secured to a rod or bar, the wheel or knife F, the spring G, the bearing *e* upon said spring, and the screw *f*, for adjusting said bearing, substantially as specified.

255,244. APPARATUS FOR SUPPLYING HYDROCARBON TO BURNERS. ADELBERT M. BRAINARD, Chicago, Ill. Filed Nov. 12, 1881. (No model.)

Brief.—Either carbureted air or oil may be supplied to the burner by adjusting the valve C⁵.

Claim.—1. In a hydrocarbon-vapor generating and burning apparatus, the combination, with a chamber for liquid, with a chamber for compressed carbureted air in open communication with the chamber for liquid, and with a generator and burner, of a single pipe leading from the said chamber for liquid, and through said air-chamber to supply the generator and burner, and suitable valves, whereby air or liquid may be successively supplied through the said pipe, substantially as described.



2. In a hydrocarbon-vapor generating and burning apparatus, the combination, with the close reservoir A and chamber C for liquid and compressed carbureted air, of a valved outlet-pipe, B B', leading from near the bottom of the reservoirs, and provided with an aperture, *c*, within the air-space above the liquid-level, and with a valve for opening and closing said aperture, arranged to be operated from the exterior of the chamber, substantially as described.

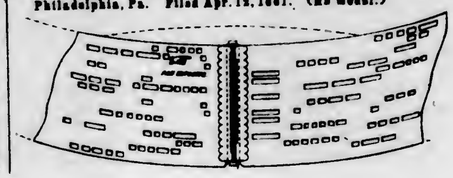
3. In the apparatus described, the combination, with the reservoir A, chamber C, and suspended pipe B', having the valved aperture *c*, of the support C⁶ for the pipe B', apertured to allow free passage to the air, substantially as and for the purposes stated.

4. In combination with the pipe B B', leading from near the bottom of the chamber A, and provided with a valved opening, *c*, above the liquid in said chamber, a valved passage, b^3, in the pipe B B', located above the opening *c*, and smaller than the general interior of said pipe, substantially as described, and for the purposes set forth.

5. In combination with the chamber A, contrived to hold both liquid and compressed air, and provided with means for permitting the discharge of either to the burner, the separate air-storing chamber A', provided with a pump, and the valved pipe E, connecting the chambers A and A', and leading to near the bottom of the latter, substantially as and for the purposes set forth.

255,245. HYDROCARBON-GAS STOVE. ADELBERT M. BRAINARD, Chicago, Ill. Filed Mar 11, 1881. (No model.)

Claim.—1. In combination with the depressed plate B and central shield, F, beneath said plate, the burner-tube C, having an annular generator, H, about its upper end, and a generator-heater beneath the generator and within the shield, said generator and initial heater being suitably connected with the source of hydrocarbon supply, and, together with the shield F, arranged and operating substantially as described.

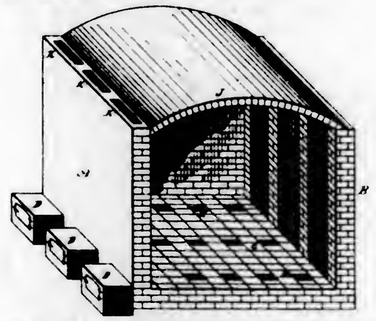


2. In the burner described, the annular generator H, composed of the base-plate H^2 and the dome-plate C^4, having the outer and inner flanges, c^2 and c^3, joined with the base-plate, and the upper flange, c^4, forming the mouth of the burner-tube, substantially as described.

3. In the burner described, the combination, with the burner-tube C and supply-stem G', of the initial heater-cup I, having the chamber I' and opening *i'* around the tube C, said cup being supported and supplied from the stem G', and surrounding the tube C by the rising flange c^5, substantially as described.

4. In a hydrocarbon-gas stove, the combination, with a main burner having a generator, of an additional burner, R, supported and supplied by a jointed tube leading from the main generator, and a support for an article to be heated from said additional burner, forming part of the unitary stove structure, substantially as described.

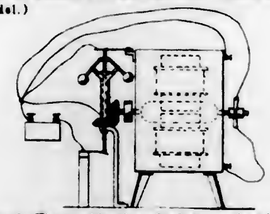
5. In combination with the burner described, comprising the central tube, C, the generator H, and the initial generator-heater I, arranged as shown, the dished plate B and the cup F, arranged to embrace the parts C, H, and I, as set forth.



255,246. MUSIC-SHEET FOR ORGUINETTES. LOUIS REARDS, Philadelphia, Pa. Filed Apr. 12, 1881. (No model.)

3

Claim.—As a new article of manufacture, a music-sheet having its ends provided with loops or pockets which are formed of separate pieces of fibrous or textile material folded on and pasted or gummed to the ends of the sheet on both sides thereof, all as set forth.



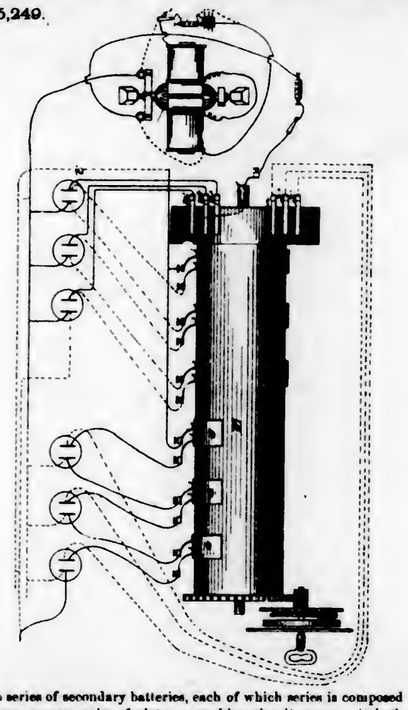
255,247. TILE-KILN. ROBERT A. BROWN and JOHN F. BROWN, Washington, Ind. Filed Feb. 3, 1882. (No model.)

Claim.—1. A brick-kiln the back wall of which is provided with vertical concave recesses communicating with the floor-flues, substantially as set forth.

2. The herein-described improved kiln, provided with furnaces D, floor-flues F, having openings H extending through the floor G, back wall, B, having vertical concave recesses I communicating with the flues F, arched roof J, flues K, and front wall, A, having openings L connecting the interior of the kiln with the lower ends of the exit-flues K, all constructed and arranged substantially as set forth.

255,248. MEANS FOR CHARGING SECONDARY BATTERIES. CHARLES E. BUELL, New Haven, Conn. Filed Jan. 13, 1882. (No model.)

Claim.—1. The combination of a dynamo-electric machine, a developing-circuit, on which the machine is worked temporarily, a main charging-circuit, including one or more secondary batteries, and means, substantially as described, for dividing the current through the developing-circuit and the main charging-circuit, and then breaking the developing-circuit while the main charging-circuit remains closed.



2. The combination, substantially as described, of a dynamo-electric machine, a developing-circuit, a main charging-circuit, including one or more secondary batteries, and automatic switching devices, substantially as described, normally completing the developing-circuit, and operating, when the machine is in motion, to make connection with the main charging-circuit without breaking the developing-circuit, and then to break the developing-circuit and keep the main charging-circuit closed, and when the machine slackens and stops to perform the said operations in reverse order, whereby the wasting of the charge of the secondary batteries is prevented when the machine is at rest.

3. The combination, substantially as described, of a dynamo-electric machine, a developing-circuit containing an adjustable resistance, a main charging-circuit, including one or more secondary batteries, and switching devices, substantially as described, for dividing the current through the developing-circuit and the main charging-circuit, and then breaking the developing-circuit while the main charging-circuit remains closed, all as set forth.

255,249. MEANS FOR CHARGING AND DISCHARGING SECONDARY BATTERIES. CHARLES E. BUELL, New Haven, Conn. Filed Dec. 28, 1881. (No model.)

Claim.—1. The combination, substantially as described, of a charging-circuit including a dynamo-electric machine or battery,

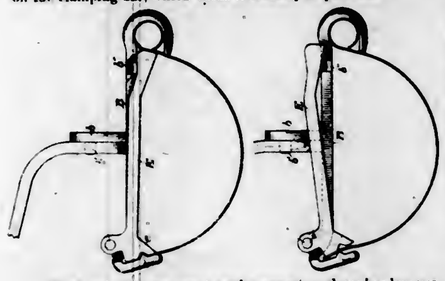
255,249.

two series of secondary batteries, each of which series is composed of two or more pairs of plates, a working-circuit common to both series, and a switching device for alternately connecting the pairs of one series successively to the charging-circuit, and at the same time discharging the pairs of the other series into the working-circuit in tension series.

2. The combination, substantially as described, with an electrical generating-machine, of a charging-circuit which includes the helices of the field-of-force magnets, a separate exterior charging-circuit which includes the helix of the armature, a working-circuit, two series of secondary batteries, and devices, substantially as described, for alternately placing the pairs of each series in the exterior circuit of the machine to be charged and in the working-circuit to be discharged.

3. The combination, with an electrical generating-machine, of a charging-circuit which includes the helices of the field-of-force magnets, a separate exterior charging-circuit which includes the helix of the armature, a working-circuit, two series of secondary batteries, and switching devices for alternately placing the pairs of each series successively in the exterior charging-circuit to be charged and in the working-circuit in tension series to be discharged, whereby the reversal of the magnetic condition of the machine by back flow from the batteries is avoided, and the loss of charge from the back flow of the batteries, if the generator slackens speed or stops, is confined to one pair of plates.

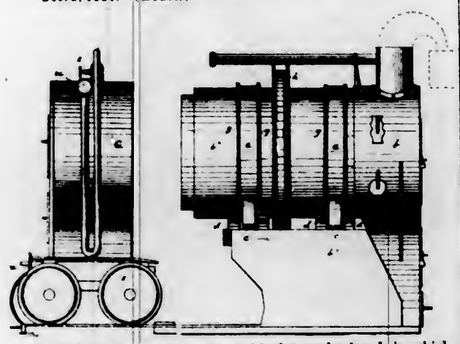
4. The combination, with an electrical generating-machine, of a charging-circuit which includes the helices of its field-of-force magnets, a separate exterior charging-circuit which includes the helix of the armature, a working-circuit, two series of secondary batteries, and devices for placing each series alternately in the exterior charging-circuit of the machine to be charged and in the working-circuit to be discharged, and independent means for separately regulating the circuits which include the armature-helix and the field-of-force magnets, substantially as described.



255,250. WHISTLING TOY. THOMAS E. BOLGER, Baltimore, Md. Filed Feb. 3, 1882. (No model.)

Claim.—The combination of a suitable whistling tube or pipe with a flexible tube containing water or other liquid, substantially as herein set forth.

255,251. EAVES-TROUGH HANGER. CHARLES BURRICK, Cleveland, Ohio. Filed Dec. 21, 1881. (No model.)



Brief.—A vertically-moving lever is pivoted to the clamping-bar, one end of which, with the end of the bar, clamps the edge of the trough, and the other end is sprung down under a projection on the clamping-bar, which holds it securely in position.

Claim.—1. As an eaves-trough support, a clamping-bar provided at one end with a hook to fit over the rolled bead of the trough, and with a lateral projection, and at its other end with a downward and inward bend having a corrugated inner surface, combined with a clamping-lever pivoted to the clamping-bar, and having its short arm toothed to engage with the toothed bend of the clamping-bar and its long arm adapted to fit under or engage the projection on said bar, substantially as specified.

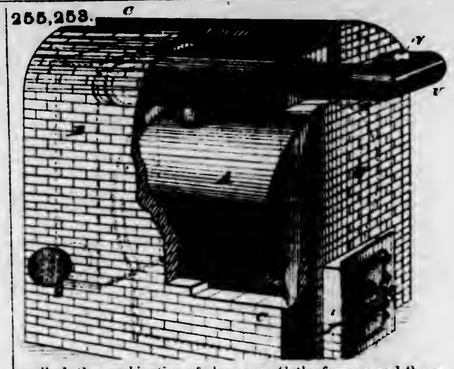
2. The horizontal clamp B, having the lateral projection *b''*, combined with the clamping-lever E, whose long arm engages or locks with the projection *b''*, substantially as and for the purpose specified.

255,252. APPARATUS FOR REMOVING TIN AND GALVANIZED COATING. THOMAS H. CAMPBELL, Allegheny, Pa. Filed Dec. 2, 1881. (Model.)

Claim.—1. In combination with the smoke-box *b*, in which the volatile oxides are condensed, the rotating drum *c*, in which the metal is heated, and the movable section G, containing the heating devices, the removable receptacles F Z, in which the oxides and melted metal are collected, substantially as specified.

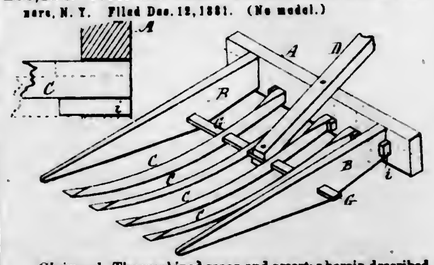
2. In combination with the movable section of the apparatus, the heating device consisting of a central tube having a sliding annulus and a spring, and the bent tubes extending into said tube and terminating in nozzles, as described.

3. In combination with the stationary section, the longitudinal tube extending centrally into the rotating drum and provided with perforations and gas-connecting pipes and with water-pipes, as set forth, substantially as and for the purposes specified.



4. In combination with the drum and rear section of the apparatus, the perforated cylinder located within the drum and provided with a series of longitudinal ledges, substantially as specified.

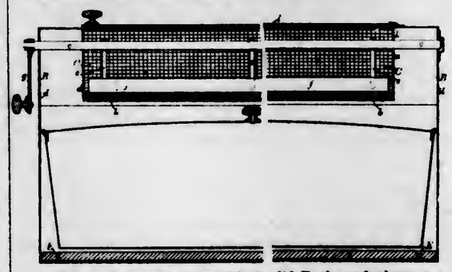
5. The heating device herein described, consisting of a main outer pipe or casing having jet-apertures, and a number of smaller tubes having a water-space between them for conducting the fuel and water inlet and eduction pipes, substantially as shown, and for the purpose specified.



255,253. FURNACE. ANDREW CLARADON and MICHAEL B. MCDOWELL, Altoona, Pa. Filed July 30, 1881. (Model.)

Claim.—In a hot-air furnace constructed substantially as described, the combination of the casing C, the furnace, and the radiators N J, the latter of which is connected by a pipe, U, having damper V, with the inside of the casing, as described, for the purpose shown and specified.

255,253.

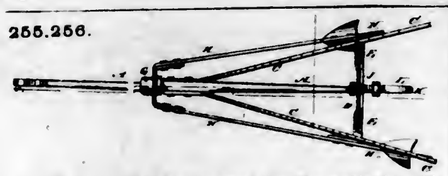


255,254. SCOOP AND FORK. GEORGE CLAFLIN, Miller's Corners, N. Y. Filed Dec. 12, 1881. (No model.)

Claim.—1. The combined scoop and assorter herein described, consisting of the head A, side guards, B B, tines or fingers C C, cross-piece G, and handle D, the guards and tines provided with tenons fitting in sockets in the head, adjustable to different positions therein, and secured by shifting keys *i i*, as shown and described, and for the purpose specified.

2. In combination with the guards B B and tines C C, provided with tenons resting in sockets of the head-piece, the keys *i i*, fitted in the sockets and capable of being shifted to either side of the tenons for the purpose of adjusting the guards and tines, as herein shown and described.

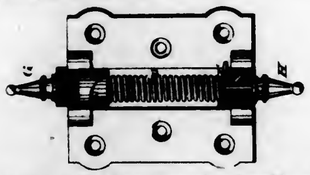
255,255. BREAD-MAKING UTENSIL. MARGARET J. COOK, Baltimore, Md. Filed Jan. 18, 1882. (No model.)



Claim.—In combination with the lid B, the end plates, *a a*, wire-cloth *b*, shaft *c*, pendent strips *e*, and handle *g*, substantially as specified.

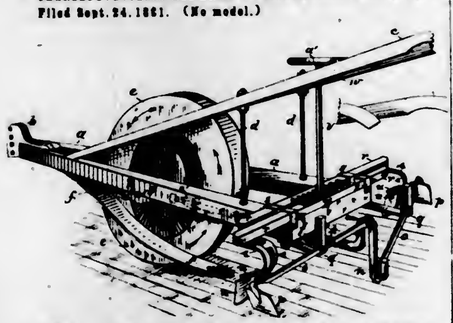
255,256. CULTIVATOR. WALTER B. CULLUM, Benwood, W. Va. Filed Dec. 22, 1881. (Model.)

Brief.—The handles are rigidly attached to the draft-beam and move with it. The shovel-beams are swiveled upon the draft-beam and are locked by a spring-latch engaging the sector upon the handle-braces. When unlocked the handles turn from side to side, turning the draft-beam upon its axis.



255,256.

Claim.—1. In a double-shovel plow, the combination, with the draw-bar A, of the loose collar G, the plow-beams H, the connecting-bar J, the lever K, and means for locking the same, substantially as and for the purpose set forth.



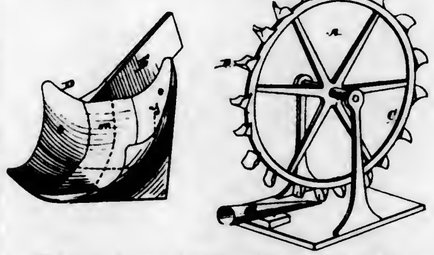
2. In a double-shovel plow, the combination, with the cross-bar J, attached to the plow-beams H, and the braces E, connecting the handles C and draw-bar A, of the lever K, the spring-catch lever L, and the cross-bar F, substantially as herein shown and described, whereby the plow-beams can be readily locked in place, unlocked, and adjusted, as set forth.

255,257. SPRING-HINGE. IRA S. DAVIS, Detroit, Mich., assignor to the Edwards Manufacturing Company, same place. Filed Dec. 5, 1881. (No model.)

Claim.—In a spring-hinge, the combination of the regulating-drum K, having ratchet-teeth thereon, with the pintle G H, made in two parts, adapted to screw together, the upper end of part H being made to fit into a hole in the center of drum K, whereby said pintle and drum cannot rotate independently of each other, substantially as shown and described.

255,258. IMPLEMENT FOR SIDING AND THINNING COTTON. CHARLES P. DICKERT and EMANUEL McD. HELLER, Walton, S. C. Filed Sept. 24, 1881. (No model.)

Claim.—1. The combination, with a rigid wheel-frame carrying two transverse laterally-adjustable bars, each provided with a pair of scrapers on its outer end, the pairs of scrapers lying on opposite sides of the frame, of mechanism, substantially as described, for laterally adjusting the bars, as set forth.



2. The combination, with a rigid wheel-frame carrying two transverse laterally-adjustable bars, each provided with a pair of scrapers arranged as set forth, and means, substantially as described, for laterally adjusting said bars, of mechanism, substantially as described, for operating two hoes on the same shaft for thinning out the plants, as set forth.

3. The combination, with the driving-wheel *e*, provided with the circular bevel-gear *i*, and the shaft *k*, provided with the bevel-pinion *e'* and double cranks *m n*, of the handles *o o'*, pivoted respectively to the double cranks, hoes *p p'*, and guides *q q*, substantially as described, and for the purpose set forth.

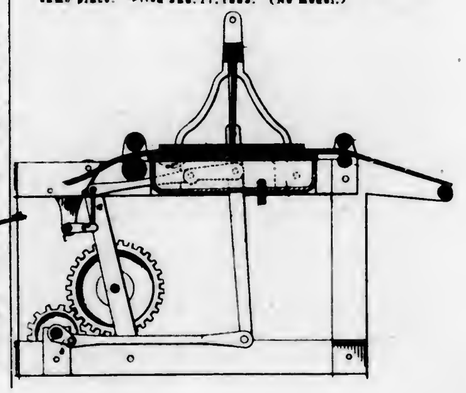
4. The combination of the frame *a*, laterally-adjustable rack-bars *r*, provided with scrapers *u*, shaft *v*, provided with hand-wheel *a'*, and cog-gear *b'*, driving-wheel *e*, having bevel-gear *i*, shaft *k*, provided with bevel-pinion *e'*, and double cranks *m n*, handles *o o'*, hoes *p p'*, and guides *q*, substantially as described, and for the purpose set forth.

255,259. WATER-WHEEL. DANIEL DONNELLY, Butter Creek, Cal. Filed Jan. 18, 1882. (No model.)

Brief.—The buckets D have concave sides O, and a central or bottom portion, *m*, concaved in the direction of its length and flat in the direction of its width, and rear portions fashioned like the prow of a ship in order to prevent the motion of the wheel from being impeded by the spray and waste water.

Claim.—1. A water-wheel, A, with its rim C, to which are secured the buckets D, said buckets having faces constructed with concaved sides *o*, and a central portion or bottom, *m*, concaved in the direction of its length and flat in the direction of its width, substantially as and for the purpose herein described.

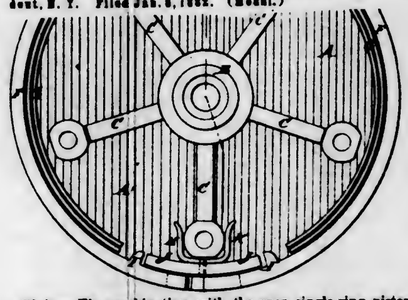
2. A water-wheel, A, having buckets D secured to its rim, said buckets having their rear faces or sides formed like the prow of a ship—that is, carved to the line *o*—substantially as and for the purpose herein described.



255,260. MANUFACTURING HATS AND OTHER FUR-FACED FABRICS. WILLIAM E. DOUBLEDAY, New York, N. Y., assignor to Ellen M. Doubleday, same place. Filed Jan. 19, 1882. (No model.)

Claim.—1. The herein-described improvement in the manufacture of fur-napped fabrics, which consists in applying a layer of fur to a fabric composed wholly or in part of feltable fiber, and which has been previously manufactured and has the density and thickness which it is desired it shall have after the fur has been stuck, and then subjecting the material to the combined pressing and rubbing action of a vibrating jigger.

2. The herein-described method of sticking fur to a previously-felted hat-body—that is to say, by applying a layer of fur to the felted hat-body and then subjecting the material to the combined pressing and rubbing action of a vibrating jigger, substantially as set forth.



255,261. SCALDING FUR-NAPPED FABRICS. WILLIAM E. DOUBLEDAY, New York, N. Y., assignor to Ellen M. Doubleday, same place. Filed Jan. 17, 1882. (No model.)

Claim.—1. The herein-described improvement in the art of manufacturing fur-faced fabrics, consisting in pressing and rubbing the material while wet with hot water between the flat parallel surfaces after the fur has been stuck to the fabric by any suitable means, substantially as set forth.

2. In a machine for scalding fur-faced fabrics, the combination of two flat parallel surfaces, adapted to press and rub the material, with means, substantially such as described, for keeping the material in a wet and heated condition during the pressing and rubbing operation.

255,262. PISTON. JOHN DYKEMAN and JASON G. CORBIN, Rondout, N. Y. Filed Jan. 3, 1882. (Model.)

Claim.—The combination, with the open single-ring piston-packing F, having rim I, and the end of a web, C, of the piston-head, of the curved plate J, and the U-shaped plate K, substantially as herein shown and described, whereby key-plates to center or line the piston can be received and held, as set forth.

255,263. MILK-PAN COVER. CHARLES C. FAIRLAMB, Chicago, Ill. Filed Aug. 25, 1881. (No model.)

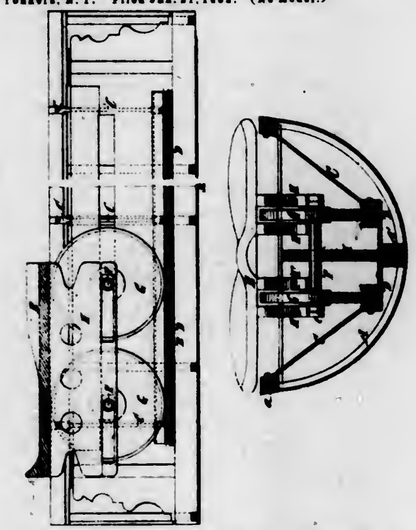
Claim.—1. The cover-body B, in combination with an elastic band, C, of cylindrical form normally, and clamping-rings D and E, applied to the upper and under sides of the cover, clamping both edges of the band to the cover, substantially as described.

2. The cover-body B, having its outer edge turned inward, in combination with the cylindrical rubber-cloth band C, the upper clamping-ring, D, having its edges bent substantially as described, and the lower clamping-ring, E, having its edges upset substantially as described, whereby the band is securely fastened to the cover and its edges covered and protected, substantially as and for the purposes set forth.

3. The cover-body B, in combination with the elastic band C, the upper clamping-ring, D, extending nearly or quite to the outer edge of the cover, and the lower clamping-ring, E, arranged nearly or quite inside the upper ring, whereby a wide surface of the band is left exposed on the under side of the cover, substantially as and for the purposes set forth.

255,264. BAKER'S OVEN. HENRY FALKE, Buffalo, N. Y. Filed Mar. 22, 1881. (No model.)

Claim.—1. The combination, with an oven, A, of the chamber B, provided with an opening, *b'*, a slide, C, and a shield, F, protecting the slide C, substantially as set forth.



2. The combination, with an oven, A, of a chamber, B, provided with an opening, *b'*, and a removable table, H, provided with a vertical plate, K, having an opening, *k*, coinciding with the opening *b'* and covered by a sheet of mica, *k'*, substantially as set forth.

3. The combination, with an oven, A, of a chamber, B, provided with an opening, *b'*, and adapted to receive an illuminating apparatus, and air-conduits M *m m'*, surrounding the chamber B, whereby the latter is cooled, substantially as set forth.

4. The combination, with an oven, A, of a chamber, B, provided with an opening, *b'*, and a lamp, I, having its oil-reservoir provided on its under side with longitudinal ribs *n*, whereby an air-space is formed between the bottom of the oil-reservoir and the bottom plate of the chamber B and the oil-reservoir is kept cool, substantially as set forth.

5. The combination, with an oven, A, of a chamber, B, provided with an opening, *b'*, and a lamp, I, having a chimney, O, composed of metallic side plates, *p p*, and mica plates *p'*, arranged in line with the opening *b'*, substantially as set forth.

255,265. SLIDING SEAT FOR ROW-BOATS. THOMAS PEARCE, Yonkers, N. Y. Filed Jan. 21, 1882. (No model.)

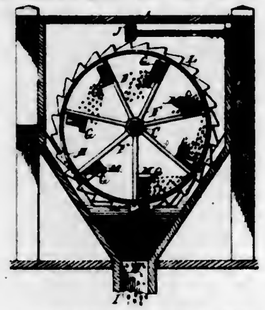
Claim.—1. The combination, with a boat-seat, of axles provided with supporting-wheels and having a rolling connection with said seat, substantially as herein described.

2. The combination, with a boat-seat, of axles provided with supporting-wheels and having a rolling connection with said seat, and stops for limiting the rolling movement of the axles upon the seat, substantially as herein described.

3. The combination, with a boat-seat, of axles provided with supporting-wheels and having a rolling connection with or bearing upon the seat on each side of each wheel, substantially as herein described.

4. The combination of the seat E, the axles F, and wheels G, the slotted bearings H, receiving the rolling axles, and the bearings H', resting upon the rolling axles, substantially as herein described.

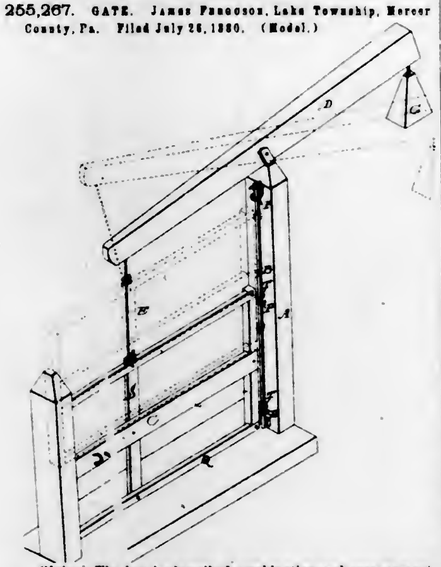
5. The combination, with a boat-seat, of axles and supporting-wheels, each axle being composed of an inner tube upon which the wheels are fitted, and outer tubes fitting on the inner tube, between and on the outside of the wheels, substantially as herein described.



6. The combination, with a boat, of a platform or floor arranged therein, ways or rails upon said platform or floor covered with leather or analogous material, axles supporting said seat, and wheels running upon said ways or rails, substantially as herein described.

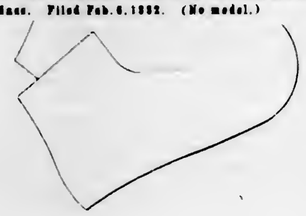
7. The combination, with a boat, of a platform or floor secured directly to the keel, ways or rails thereon, a seat, axles supporting said seat, and wheels running upon said ways or rails, substantially as herein described.

8. The combination, with the boat containing ways or rails,



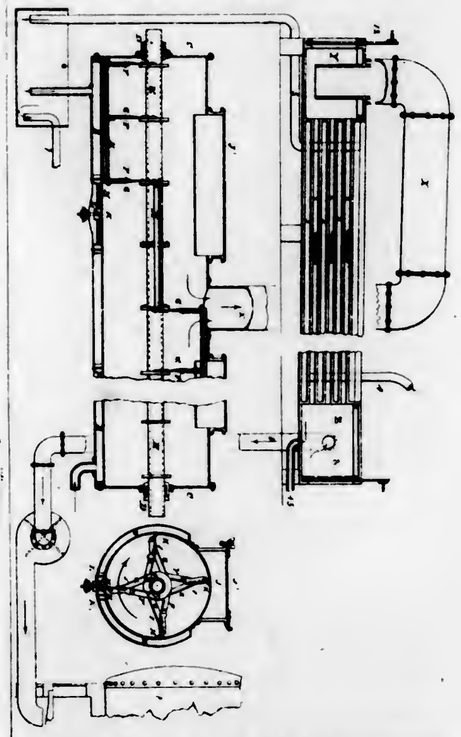
the seat and its supporting axles and wheels, of a slotted center piece or ledge secured in the boat and receiving the axles through it, substantially as herein described.

255,266. GRAIN SEPARATOR OR SIZER. JACOB FRIESNO, West Granville, assignor of one half to Jedocus Ehnert, Granville, Wis. Filed Aug. 30, 1881. (No model.)



Claim.—The combination of screen A, shaft C, arms F, and the longitudinally-arranged troughs consisting of bars G and M, provided with angular surfaces X and Y, substantially as set forth.

255,267. GATE. JAMES FERGUSON, Lake Township, Mercer County, Pa. Filed July 26, 1880. (Model.)



Claim.—The herein-described combination and arrangement of the gate-post A, having vertical rod B, the gate G, swinging and vertically adjustable upon said rod, and having central vertical brace, S, and the lever D, swiveled to the top of post A, and having its outer end weighted and its inner end extending over the center of the gate, and connected thereto by a link or rod, E, upon which said gate is evenly balanced, as set forth.

255,268. PLOW-SHOE. JOHN W. D. FIFIELD, North Brookfield, Mass. Filed Feb. 6, 1882. (No model.)

Claim.—The herein-described method of producing a crimped upper for a plow-shoe, which consists in first cutting the upper for a front opening to the point, substantially as shown and described, then crimping the same from such point to the toe, and then cutting the opening farther into the crimped portion, all substantially as set forth.

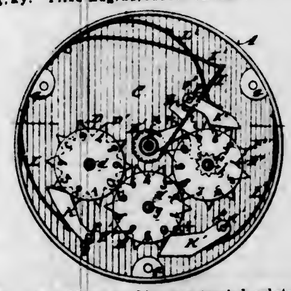
255,269. APPARATUS FOR REDUCING MATERIAL TO A PULVERULENT FERTILIZER. HENRY S. FIRMAN, New York, N. Y. Filed Nov. 8, 1881. (No model.)

Claim.—1. In a desiccator and mill for the purpose designated, the combination, with cylinder A, of disintegrating-arms F and knives H, both formed of thin plates of steel or mild steel set edgewise in direction of rotation and made sharp on their advancing edges, as shown and described.

2. In a desiccator and mill for the purpose designated, the long narrow angular discharging-holes K, with sink or depression formed by the walls of said hole and by the closing-plate L, and whose salient angle opposed to the advancing knife-edge is either sharply angular or toothed or serrated, as and for the purposes shown and set forth.

3. In a mill and drier for the purpose stated, the combination, with the cylinder A, of the revolving disintegrating-arms F and the knives H, pivoted thereto and adjustable thereon, as herein shown and described.

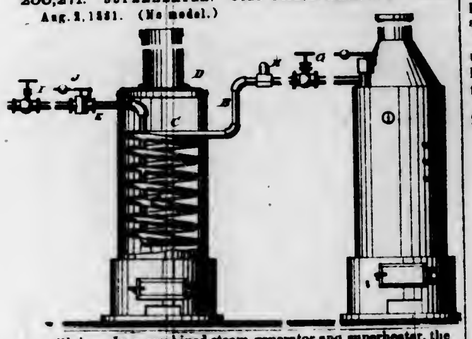
4. The provision at the discharge opening K of a desiccator and mill for the purpose described, and in combination with the bridge *k* and the bolt S at the mid-length of said opening, and with the nut T, of the depressible and swinging closing-plate L, substantially as set forth.



5. In a mill and desiccator for the purpose set forth, the combination, with the disintegrating-arms F, with their attached knives H, of the specially shaped and arranged discharge-apertures K, having the serrated salient edges M or M′ in opposition to the knife action, to secure grinding or granulating without balling, as set forth.

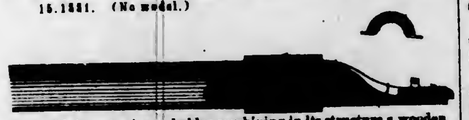
6. In a desiccator and mill for the purpose designated, the combination of the disintegrating-cylinder A and the condenser Y Z 2, connected therewith by vapor pipe or trunk X, all as herein shown and described.

7. In combination with a mill and desiccator for the purpose described, the condenser consisting of the cold-water tank 3, receiving and discharging chambers Y Z, tubes 2, and the sliding and removable ends or shutters 12 12′, substantially as set forth.



8. The combined mechanical organism consisting of a hermetical cylinder, within which the material is comminuted under a moderate heat, a condenser with exhaust attachment for withdrawing fetid vapors from the comminutor and expediting desiccation of its contents, a boiler-furnace which receives the thus exhausted vapor, and water-supply pipes, whereby the water, after performing refrigerating service in the condenser, is conveyed as heated water to the boiler-feed tank, substantially as and for the purpose set forth.

255,270. ADDING-MACHINE. JOHN GEORGE FISCHER, Flemingsburg, Ky. Filed Aug. 26, 1881. (Model.)



Claim.—An adding-machine constructed substantially as herein shown and described, consisting of pivoted disks and wheels D E F D′ E′ F′, respectively, case A, provided with numbered and perforated cover B, pivoted pointer and rack M H, respectively, pinion G, ratchet-wheel G′, and spring-actuated dogs, arranged as set forth.

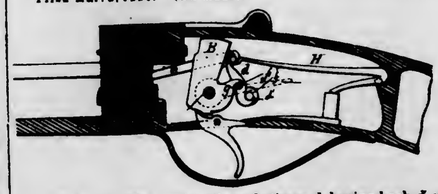
255,271. SUPERHEATER. JOHN FISH, Summit, N. J. Filed Aug. 2, 1881. (No model.)

Claim.—In a combined steam generator and superheater, the combination, with the superheater-pipe C and the pipes B E, provided with valves G I, of the check-valve H and the safety-valve J, located in the said pipes between the said valves and the superheating-pipe, substantially as and for the purpose set forth.

255,272. PEN-HOLDER. BRADLEY A. FISKE, Naperville, Ill., assignor to Eberhard Faber, Port Richmond, N. Y. Filed Dec. 15, 1881. (No model.)

Claim.—1. A pen-holder combining in its structure a wooden staff or handle, provided at one end, on its under side, with a segmental-shaped groove, terminating at its inner portion in a flat seat, and a longitudinally-bent spring having a segmental-shaped tip and a flat end, resting respectively in the segmental groove and on the flat seat of the staff or handle, substantially as and for the purpose described.

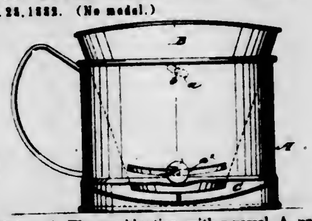
2. The combination, substantially as hereinbefore set forth, of the sheet-metal pen-holding spring having a flat shank, segmental tip, and thumb-ears projecting laterally from the tip, with the handle having a longitudinal groove extending upward from its lower end for the reception of the spring, and means for attaching the spring to the handle.



3. The combination, substantially as hereinbefore set forth, of the sheet-metal pen-holding spring, the handle having a longitudinal groove extending upward from its lower end for the reception of the spring, and the attaching-sleeve having the spring secured thereto, such sleeve being fitted loosely on the handle.

255,273. STUD AND BUTTON FASTENING. PARKE P. FLOURNOY, Bethesda, Md. Filed Feb. 8, 1882. (Model.)

Claim.—As an improved article of manufacture, an ornamental stud or button having the shank A permanently secured thereto and formed of a single piece of wire, bent at *a*, and having a return-bend at B, so that the parallel continuation C will be sprung against the bend *a* to prevent accidental unfastening, the whole constructed and arranged substantially as shown and described.



255,274. LOCK FOR FIRE-ARMS. GEORGE H. FOX, Boston, Mass., assignor to the American Arms Company, same place. Filed Mar. 5, 1881. (No model.)

Claim.—1. The combination of stirrup *d*, having hook *d′* on its lower end, with stop-pin *f′*, arranged to be engaged by said hook, mainspring H, operating to lift said stirrup, and hammer B, provided with a hook which catches against a stud on said stirrup substantially as set forth.

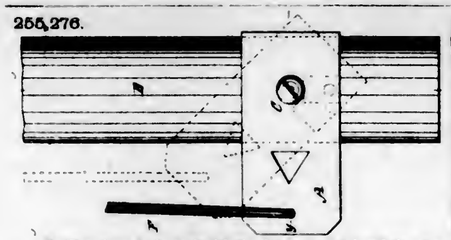
2. In combination with a firing-pin operating in axial alignment with the bore of the barrel or barrels, a vertical top-snap locking-shaft, said shaft being constructed with a passage for said firing-pin to play through.

255,275. SIFTER. AUGUSTUS J. FRANK, Warsaw, Ill. Filed Jan. 24, 1882. (No model.)

Claim.—1. The combination, with a vessel, A, provided with a sieve, C, of a tapering bottomless hopper, B, adapted to receive the material to be sifted, and arranged to oscillate inside of said outer vessel, substantially as and for the purpose herein described.

2. The combination of the outer vessel, A, provided with the sieve-bottom C and the slots *a* and *a²*, and the inner vessel, B, provided with the scraper E, and the stud *b*, and shaker-rod D, substantially as and for the purpose shown and described.

3. The combination of the curved sieve-bottom C of the vessel A and the scraper E, carried by the inner vessel or oscillating hopper, B, arranged and operating as herein shown and described.

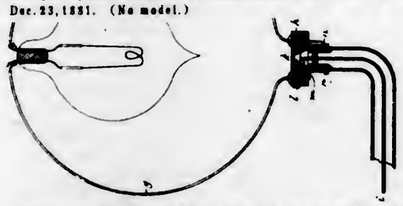


4. The combination of the curved slots or guides *a a²* with the stud *b* and the shaker-rod D, provided with the knob or handle *d*, as shown and described, for the purpose specified.

255,276. WASTE-VALVE FOR PUMPS. JEROME GILBS, South Bend, Ind. Filed Dec. 27, 1881. (No model.)

Brief.—When the plate A is at its extreme upper or lower position the water cannot escape from the pipe D through leak-hole *c* and space E, but only when it is horizontal.

Claim.—1. The herein-described waste-valve, consisting of the plate A, provided with the flanges *a b* and the stop *d*, and the packing B, provided with the passage E, substantially as specified.

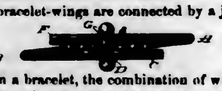


255,276.

2. The plate A, formed with the flanges *a* and *b* and the stop *d*, in combination with the packing B and the rod F, the packing being formed with the cut-away place or passage E, substantially as described.

3. The plate A, covering or inclosing the passage E in the packing B, and adapted to deflect the stream of waste water, substantially as and for the purposes described.

255,277. ELECTRIC LAMP. CHARLES H. GIMINGHAM, Newcastle-upon-Tyne, County of Northumberland, England. Filed Dec. 23, 1881. (No model.)



Claim.—1. The combination, with the carbon and tubular holder, of a paste formed of a salt of platinum and a carbonaceous compound, and a deposit of carbon at the junction of said carbon and its holder, as and for the purpose specified.

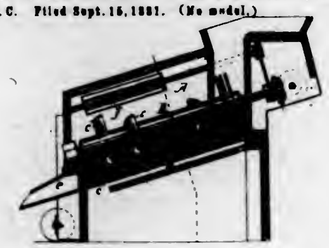
2. The method of attaching carbon threads to a tubular holder, which consists in first dipping the thread ends in a paste formed of a carbonaceous compound and a platinum salt, and then slipping them into the tube; and, secondly, holding them in a Bunsen gas-flame until the paste is carbonized and the platinum salt is reduced to metallic platinum, as described.

3. The combination, with a gas-pipe and fitting substantially as described, of the brass springs *g g'*, the insulator *h*, having the brass plug *k*, the insulated wire *i*, having spring *m*, the screw *l*, and the brass collar *n*, as and for the purpose specified.

255,278. BRACELET. GAMALIEL B. GOFF and GUSTAVUS LEBAU, Attleborough, Mass., assignors to S. E. Fisher & Co., same place. Filed Jan. 18, 1881. (No model.)

Brief.—The bracelet-wings are connected by a joint.

Claim.—1. In a bracelet, the combination of wings A B, the lateral tubes forming a joint, and a spring passing laterally through such tubes.

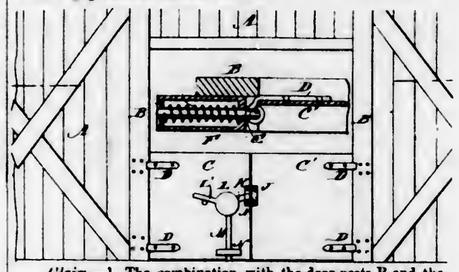


2. The combination of the wings A B, connected to lateral tubes D G, the spring, the notches 5 6 in the tubes, and the pins.

3. The combination, with the wings of a bracelet, of the arms C F and the lateral tubes D G.

4. The wings A B, arms C F, and tubes D G, in combination with the ferrule.

5. In combination, the wings A B, the arms C F, connected to the side of the said wings by the beads I, and the described joint, all substantially as set forth.



255,279. COTTON-WHIPPER. ROSS H. GOLDSMITH, Charleston, S. C. Filed Sept. 15, 1881. (No model.)

Claim.—The combination, with the shaft B, provided with the whipper-arms *c*, and the box A, of the longitudinally-bladed parallel and superposed roll *f*, and suitable mechanism for rotating the same, whereby the said roll is caused to press the cotton to the whipper-arms, as described.

255,280. GRAIN-CAR DOOR. MARTIN GRAFF, Terre Haute, Ind. Filed Jan. 30, 1882. (No model.)

Brief.—The double doors are hinged by means of eye-straps connected to hook-pintles sliding in sockets and governed by springs therein. An eccentric and handle on one of the doors carries two bolts, one of which fastens the doors together and the other engages a socket in the door-sill.

Claim.—1. The combination, with the door-posts B and the doors C C', of the eye-straps D, the hook-pintles E, the sockets F, and the springs H, substantially as herein shown and described, whereby the doors can be opened outward by the pressure of the grain and will close automatically when the outward pressure is removed.

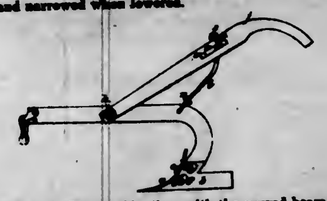
2. The combination, with the doors C C', of the bolts K M and the eccentric L, substantially as herein shown and described, whereby the doors can be readily fastened and unfastened, as set forth.

255,281. COMPOSITION FOR SEWER, DRAIN, AND WATER PIPES, &c. JEREMIAH D. GREER, Troy, N. Y. Filed Jan. 10, 1882. (Specimens.)

Claim.—A concrete composed of coal-tar, asphaltum, oxide of iron, sulphur, sand or gravel, hydraulic cement or calcined plaster, and either with or without oils or salt, prepared substantially as described and set forth.

255,282. SASH FASTENER AND HOLDER. HARRY GREENFIELD, Harrison, N. J. Filed Dec. 10, 1881. (Model.)

Brief.—A loosely-pivoted holding-catch engages with the cam-projection on the pivoted locking-catch, thus locking the sash. By raising the locking-catch the holding-catch will disengage itself and the sash be free to be opened by both hands.



Claim.—1. The loosely-pivoted holding-catch B, in combination with the pivoted locking-catch A, formed with the cam-projection *a*, substantially as and for the purposes set forth.

2. The plate *b*, formed with the recessed lug *c*, in combination with the pivoted locking-catch A and the loosely-pivoted holding-catch B, substantially as and for the purposes set forth.

255,283. PLOW. MILTON T. HANCOCK, Thomasville, Ga. Filed Feb. 25, 1882. (No model.)

Brief.—By loosening the double screw-nut the handles may be slid up or down the length of the slot upon the brace. The heads of the latter are such that the handles are spread when raised and narrowed when lowered.

Claim.—1. The combination, with the curved beam-standard and the adjustable mold-board *a*, of the open box-plate *c*, the adjustable land-bar *h*, the screw-bolts, and their confining-nuts, the said box-plate and land-bar being secured to opposite sides of the standard by the screw-bolts by which the land-bar is secured, substantially as herein set forth.

2. The combination, with the plow-beam, of the handles *j*, provided with slots *r r*, the bent screw-threaded rod *l*, bound and tied to the beam and passed through said handle-slots, the right-and-left-screw nut *s*, and the shouldered cross-brace *t*, arranged within the said handle-slots, whereby the handles are adapted for vertical adjustment and braced and supported vertically and laterally, substantially as herein set forth.

3. The combination, with the beam, of the handles having the slots *r r*, the screw-threaded rod *l*, the clasp or link *u*, and the right-and-left-screw nut *s*, the said rod being passed through the handle-slots and having the inner and outer bands, *t t'*, on opposite sides of said handles, and united above the latter by the said screw-nut, whereby the handles are adapted to be set high or low and to vary the distance between the handles to suit a high or low position thereof, substantially as described.

255,284. EMBROIDERING-MACHINE. ALBERT HARDEGEN, New York, N. Y. Filed Oct. 24, 1881. (No model.)

Claim.—1. The combination, in an embroidery-machine, of the vertically and horizontally movable frame carrying rollers for the fabric that is to be embroidered with the series of reciprocating needle-bars arranged at one side of the frame, the series of rotary thread-conductors arranged at the opposite side of said frame and adapted to form loops upon the needles after the latter have penetrated the fabric, mechanism timed for intermittently moving said frame the length of a stitch, and devices arranged to be under control of the operator for causing said frame in its movements to be guided in accordance with the lines of the pattern to be produced, substantially as described.

2. The combination, in an embroidery-machine, of the vertically and horizontally movable frame carrying the rollers upon which the fabric to be embroidered is wound with the reciprocating needle-bars and needles, and the rotary thread-conductors, adapted and arranged to form lines of chain-stitches upon the fabric, devices for automatically and intermittently moving the frame to the extent of a stitch at requisite intervals, mechanism arranged to be under the control of the operator and adapted to direct the movement of the frame, and the pattern-guide arms connected with the frame, and having a pointer arranged to move over the pattern-board, whereby the operator can direct the movements of the frame in accordance with the pattern-lines upon the pattern-board, substantially as described.

3. The combination, with the movable frame upon which the fabric to be embroidered is supported, of the series of reciprocating needle-bars, the rotary shaft provided with cams for actuating the needle-bars, the rotary thread-conductors A^3, adapted to form the threads into loops upon the needles after the latter have penetrated the fabric, and the reciprocating rack-bar adapted to revolve the thread-conductor alternately in reverse directions, said members being constructed and arranged for operation substantially as described.

4. The combination, with the front row of standards, A, of the T-shaped bar secured thereon, the standards G, supported upon said bar, the rotary shaft provided with a series of cams and having its bearings in said standards, and the reciprocating needle-bar *g*, actuated by said cams, substantially as described.

5. The combination, in an embroidery-machine, of the movable frame upon which the fabric to be embroidered is supported with the horizontal reciprocating needle-bars, the hinged plate g^3, with openings for the passage of the needles, and the rotary thread-conductors, substantially as described.

6. The combination, in an embroidery-machine, of the reciprocating needle-bars and the movable frame for supporting the fabric to be embroidered with the rotary thread-conductors A^3, provided with spring-rings B^3, and the weighted brake or tension plates H', substantially as described.

7. The combination, with the rotary thread-conductor B^3, of the reciprocatory rack-bar for actuating the said thread-conductors, the vibratory levers L, pivoted to the rack-bar and connected with each other and with a vibratory lever, L^3, and the cam-grooved wheel adapted to actuate said levers, substantially as described.

8. The combination, in an embroidery-machine, of the vertically and horizontally movable frame supporting rollers upon which the fabric to be embroidered is wound with the crossed supporting-levers E^3, provided with wheels supporting said frame, and having the intermeshing segment-racks B^3, whereby the movement of one lever will cause a corresponding movement on the part of the other lever, substantially as described.

9. The combination, in an embroidery-machine, of the vertically and horizontally movable frame carrying supports for the fabric to be embroidered with the vertical standards E, connected in pairs by cross-bars E^2, the double fork-shaped levers E^3, weighted at their upper ends, and having at their lower ends grooved wheels bearing upward against the said cross-bars, and the pair of intermeshing segment-racks connected with the levers, substantially as described.

10. The combination, in an embroidery-machine, of the movable frame supporting the rollers upon which the fabric is wound, and comprising the bars C, with the adjustable rods C^3, passing through said bars, and the stretching-plates D^4, connected with the adjustable rods, substantially as described.

11. In an embroidering-machine, the vertically and horizontally movable frame comprising the bars C, the stretching-bars D^4, the end plates, C' and C^3, the rollers, and the mechanism for rotating one of said rollers, the above members being constructed and arranged substantially as described.

12. The combination, in an embroidering-machine, of the vertically and horizontally movable frame carrying the rollers upon which the fabric to be embroidered is wound with the horizontal rods *f*, arranged in pairs and journaled in the frame F', and the vertical guide-rod F, passing between the said horizontal rods, substantially as described.

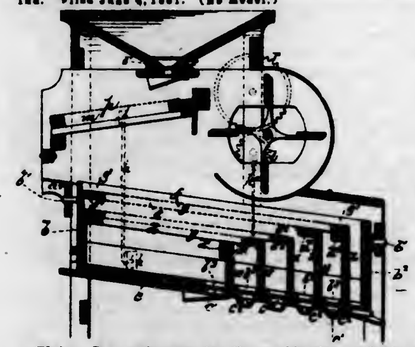
13. The combination, in an embroidery-machine, of the movable frame provided with plate C^3 at one end and carrying supports for the fabric to be embroidered with the vibratory lever E^3,

and the rod m^3, adapted to bear against said plate and connected with the vibratory lever by a universal joint, substantially as described.

14. The combination, with the vibratory lever M^3, of the rod m^3, connected with said lever by a universal joint and passing through the hollow shaft N, the hollow cone N', arranged to slide upon the said shaft, and the lever N', connected at one end with the rod within the hollow shaft and at its remaining end resting upon the slidable cone, substantially as described.

15. The combination, with the vibratory lever M^3, of the hollow cone N', arranged to slide upon a hollow shaft and connected with said lever, the lever N', connected at one end with a rod, m^3, arranged to swing laterally within the hollow shaft, and having its remaining end rested upon the slidable cone, substantially as described.

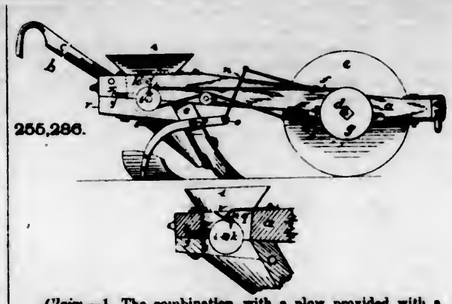
16. The combination of the rotary shaft M with the cams m m', secured thereon, the vibratory levers M^2 and M^3, actuated by said cams, the swinging and longitudinally-movable rod m^3, the slidable cone arranged upon a hollow shaft inclosing the swinging rod, and the lever N', connected with said rod at one end and at its other end rested upon the slidable cone, substantially as described.



17. The combination, with the hollow shaft N, of the rod m^3, connected with a vibratory lever by a universal joint, the bevel-gear N^2, secured upon the hollow shaft, the lever N', pivoted to said gear and connected with the rod m^3, and mechanism for rotating the bevel-gear and hollow shaft, substantially as described.

18. The combination, with the rotary shafts M and M^1, connected by an endless belt, of the cams m and m', the vibrating levers M^2 M^3, the rods m^3, the slidable cones N^1, the hollow shafts N, and the bent levers N' and springs n^3, said members being constructed and organized for operation substantially as described.

19. The combination, with the rotary shaft p', provided at one end with a crank, of the bevel-gear at the opposite end of said shaft, gearing with a bevel-gear upon shaft P', the bevel-gear P on the last-mentioned shaft engaging a bevel-gear upon hollow shaft N, the lever N', pivoted to the bevel-gear that is fixed upon the hollow shaft, and the rod m^3, connected by a universal joint with a vibratory lever, and also connected with the bent lever, and the cone N^1, adapted to slide upon the hollow shaft and actuate the lever that is pivoted to the bevel-gear and connected with the said rod, said members being constructed and adapted for operation substantially as described.

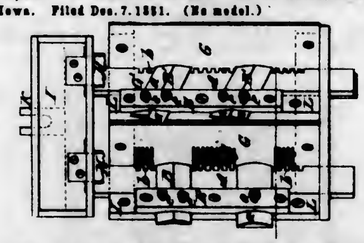


20. The combination, in an embroidering-machine, of the vertically and horizontally movable frame carrying rollers upon which the fabric to be embroidered is wound with devices for shifting said frame the length of a stitch after the needles have been drawn out from the fabric, the herein-described guide arranged over the pattern-board, and devices for varying the direction in which the frame is shifted, substantially as described.

255,285. GRAIN-SEPARATOR. JAMES F. HATFIELD, Dublin, Ind. Filed June 4, 1881. (No model.)

Claim.—In a grain-separator, the combination, with the oscillatory cradle *b*, having partitions *w x v y z* and discharge-openings b^2, of the inclined double-arched screens *d* and *f*, the single screen *e*, and the slide-board *c*, having apertures *c'* and inclined chutes c^2, substantially as specified.

255,286. SEED-PLANTER, COVERER, AND FERTILIZER-DISTRIBUTER. LEWIS S. HOOVER, Sparkling Catawba Springs, N. C., assignor to himself and E. O. Elliott, same place. Filed June 15, 1881. (No model.)



255,286.

Claim.—1. The combination, with a plow provided with a seed-dropper depositing seed in the furrow made by the plow, of the spring *m*, bail *n*, secured to the free end of the spring, coverer-standards *o o*, carrying right and left plows, and pivotally secured to the lower ends of the bail-arms and pivoted to the horizontal bolt *p*, having right and left screw-threads provided with nuts, whereby the spring-coverers may be adjusted laterally, substantially as described.

2. The dropping-wheel *k*, provided with a recess in its circumference, having one edge cut away, in combination with detachable and interchangeable plugs *u*, substantially as described, and for the purpose set forth.

3. The combination, with a plow provided with the supporting-wheel *o* and detachable and interchangeable hand-pulleys *g*, of the band *f*, axle *i*, carrying the pulley A, and recessed dropping-wheel *k*, having detachable and interchangeable plugs *u*, detachable box *r*, spring *v*, and piece *w*, having spring *y*, substantially as described, and for the purpose set forth.

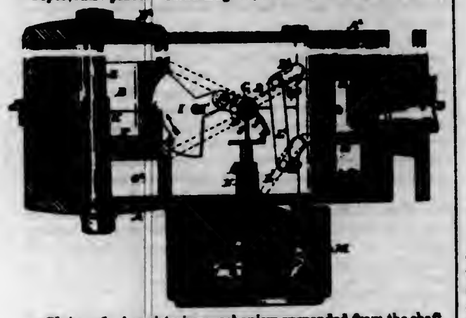
255,287. OATMEAL-MACHINE. ANTON HEISS, Muscatine, Iowa. Filed Dec. 7, 1881. (No model.)

Claim.—1. The combination, with two plates, G G', arranged at an angle to each other, thus forming a trough, one of them having recesses or openings for passage of the meal as it is cut, of the recessed plates A and one or more knives, which are placed substantially at right angles and contiguous to said recessed plates A, substantially as set forth, to operate as specified.

2. The sliding frame formed of the triangular cross-pieces F F and F'', inclined plates G and G', and the knives, in combination with the stationary recessed plates A, substantially as and for the purposes set forth.

3. The recessed plates A and the knives, in combination with means, substantially as described, for diminishing and increasing the size of the recesses, as and for the purposes set forth.

4. The recessed plates A and inclined plates G and G', in combination with the toothed adjustable plate P, substantially as and for the purposes described.



5. The hopper I, having the troughs H H, formed with the passages *h* and guides *i*, said hopper and troughs communicating and being adapted to reciprocate together, in combination with the inclined plates G and G', recessed plate A, and the knives, substantially as and for the purposes described.

255,288. HEAD-BLOCK FOR SIDE-BAR BUGGIES. ALONZO D. HICKOX, Columbus City, Iowa. Filed Nov. 14, 1881. (No model.)

Claim.—In a side-bar buggy, the combination of the axle having the plate B C secured to its top, the headed king-bolt F, secured in place by the plate, the metallic head-block D, having the fifth-wheel formed as a solid part thereof, and having the supports I secured to its ends, substantially as shown and described.

255,289. PISTON WATER METER AND REGISTER. SIDNEY W. HOAG, Sr., New York, N. Y., assignor of one-half to Henry B. Piper, same place. Filed Aug. 16, 1881. (No model.)

Claim.—1. A registering mechanism suspended from the shaft by which it is operated, in combination with a glass case mounted upon and revolving with said operating-shaft and inclosing the registering mechanism, and a stationary casing inclosing the revolving glass case and provided with a glass front, substantially as and for the purposes described.

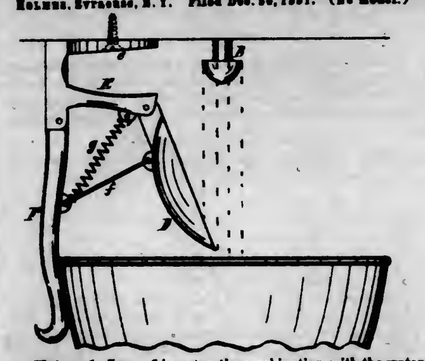
2. The combination, in a water-meter, of the shaft N, a registering mechanism pendent from and operated by said shaft, the glass case O', mounted upon and revolving with the shaft N and inclosing the registering mechanism, a reciprocating piston and mechanism connecting with the shaft N, and adapted to be acted upon by said piston to intermittently rotate the shaft N, substantially as and for the purposes described.

3. The combination of the shaft N, provided with the star-wheel N', a registering mechanism pendent from and operated by said shaft, the sleeve-shaft H, provided with the radial arms *j* and *j'*, the levers A^4 and I, and the piston F, all arranged and adapted to operate substantially as and for the purposes described.

4. The combination of the piston F, the segmental lever I, provided with shoulders *i* and *i'*, the lever A^4, sleeve-shaft H, and the valve or gate H', all arranged and adapted to operate substantially as and for the purposes described.

5. The combination of the pistons F and F', the notched segmental levers G' and I, shaft G, sleeve-shaft H, lever A^4, and the gates G^2 and H', all arranged and adapted to operate substantially as and for the purposes described.

6. The valves or gates G^2 and H', arranged as set forth, and operated respectively by the pistons F' and F to open and close the induction-passages, in combination with the valves or gates J J' and L L', connected together in pairs and operated by the force of the incoming current of water to open and close the eduction-passages, substantially as described.

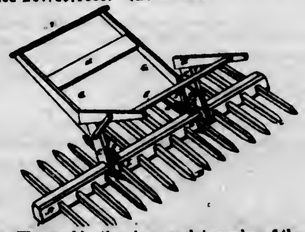


7. A water-meter case composed primarily of the three castings A, A', and A^1, packed at their joints by V-shaped tongues and grooves, in combination with the removable heads B^2 and B^3 and the clamping-bolts E and E', provided with the conical sections e^3, substantially as and for the purposes described.

8. The combination of the worm-shaft N, the metal disk O, the cylindrical chamber M, provided with the glass front M^2, the glass chamber O', attached to and adapted to revolve with the disk O and with the shaft N, and a registering mechanism contained within said glass chamber and pendent from and adapted to be operated by said worm-shaft, substantially as described.

9. The combination of the worm-shaft N, the frame *h*, pendent from said shaft and provided with the stationary or fixed index-fingers *a* and *a*, the graduated worm-wheel *p*, the worm-shaft *l*, the differential worm-wheels *q* and *r*, arranged to be operated by the worm-shaft *l* at different speeds, the index-finger *s*, arranged to move with the wheel *r*, and the circular graduated scale on the wheel *q*, all adapted to operate substantially as and for the purposes described.

10. The casting A^1, provided with the passages *a*, *b*, *c*, *d*, *e*, and *f*, and the induction-orifice D and eduction-orifice D', in combination with the castings A and A', having formed therein the cylinders B and B' and passages *a'*, *b'*, c^2, d^2, e^2, and f^2, arranged relative to each other and to passages in the casting A^1, substantially as described.

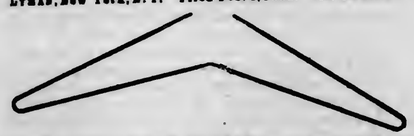


255,290. DRIP-PAN FOR REFRIGERATORS. GEORGE F. HOLBEN, Syracuse, N. Y. Filed Dec. 30, 1881. (No model.)

Claim.—1. In a refrigerator, the combination, with the water-discharge orifice, of a movable drip-pan, D, attached to the bottom of the refrigerator, a projection or arm whereby the pan is swung from under the discharge-orifice by the vessel which receives the waste water when said vessel is put in place and retained in this position while said vessel remains in place, and means whereby the pan is automatically returned under the discharge-orifice to receive the water when said vessel is removed, substantially as set forth.

2. The combination, with a refrigerator having a water-discharge orifice, B, of a bracket, E, a drip-pan, D, and arm F, pivoted to said bracket, spring *g*, connecting the arm with the bracket, and a rod, *f*, connecting the arm with the drip-pan, substantially as set forth.

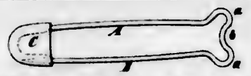
255,291. REVOLVING HAY-RAKE. EDWARD HUBER, Marion, Ohio. Filed Nov. 29, 1881. (No model.)



Claim.—1. The combination, in a revolving rake, of the rake-head A, revolving in the standards C, the plates K, notched at *c* and secured to the rake-head and tines, the handles G, pivoted to the standards C, the springs J, secured to said handles, and the two legs or projections *a a* on said springs, one projection serving to hold down the rake-teeth in working position and the other projection serving as a lifter, substantially as described.

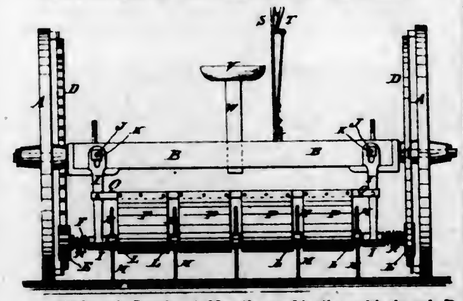
2. The combination of the rake-head adapted to revolve in bearings of standards C, the metal bands L, encircling the rake-head, the spring catch-plates J, and the plates K, bearing against said bands, substantially as specified.

3. For a horse hay-rake of the character described, a curved spring, J, provided near its curved end with two catches, *a a*, adapted for use in combination with the plate K, notched at *c*, for the purpose described.



255,292. HAIR-PIN. CHARLES A. HERSEY and WILLIAM H. LYMAN, New York, N. Y. Filed Feb. 4, 1882. (No model.)

Claim.—As a new article of manufacture, a magnetized hair-pin, substantially as and for the purposes specified.

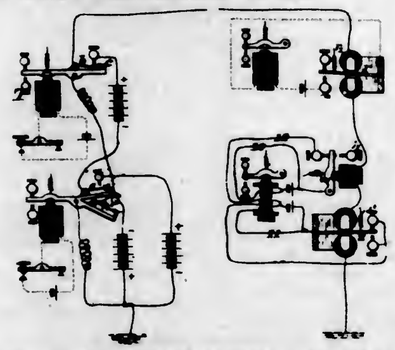


255,293. SAFETY-PIN. WILLIAM P. HYATT, Brooklyn, N. Y. Filed July 23, 1881. (No model.)

255,293.

Claim.—The safety-pin consisting of the limbs A B, the bends *a*, extending laterally outward beyond the limbs, and the bend *b* between or at the junction of the limbs, all said bends being in the same plane with the limbs, and the shield C, substantially as specified.

255,294. COMBINED HAY TEDDER AND RAKE. WILL R. JONES, Rockford, Ill. Filed Nov. 19, 1881. (No model.)



Claim.—1. In a hay-tedder, the combination, with the axle B and the shaft F, carrying the tedder-teeth, of the arms I, provided with bearings at their lower ends for the said shaft, and having their upper ends slotted, and the bolt and nut J K, substantially as and for the purpose set forth.

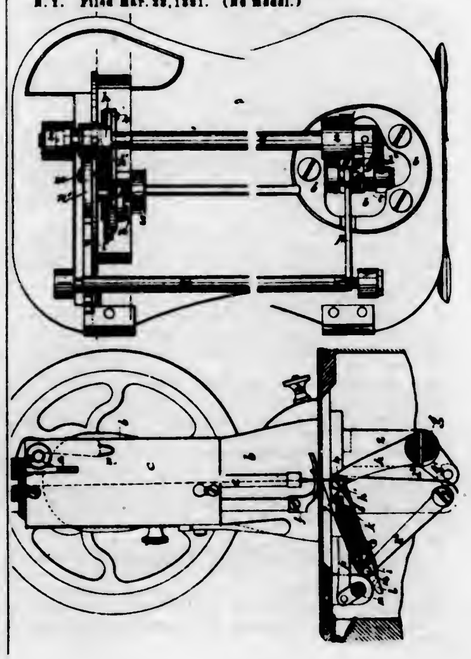
2. In a hay-tedder, the combination, with the drive-wheels A the cog-wheels D, and the axle B, of the shaft F, the gear-wheels E, the hubs L, provided with the teeth M, and the arms I, adjustably secured to the axle, substantially as and for the purpose set forth.

3. In a hay-tedder, the combination, with the rotary shaft F, the hubs and teeth L M, and the arms I, of the scroll-guards O P and the cross-bar Q, substantially as herein shown and described, whereby the tedder-teeth are kept from carrying hay over the shaft and becoming clogged, as set forth.

255,295. QUADRUPLEX TELEGRAPH. FRANCIS W. JONES, New York, N. Y. Filed Jan. 18, 1882. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of a key or transmitter, two insulated contact-springs mounted thereon, two insulated contact-stops with which said springs are simultaneously brought in contact when said key is depressed, two independent main batteries of like electro-motive force but unlike polarity inserted between the earth and said insulated contact-stops, respectively, and a second key or transmitter having an insulated contact-stop, said key and contact-stop being respectively connected with the two contact-springs of the first key, whereby said contact-springs are alternately placed in connection with the main line.

2. The combination, substantially as hereinbefore set forth, of a key or transmitter, two insulated contact-springs mounted thereon, two insulated contact-stops with which said springs are simultaneously brought in contact when said key is depressed, two independent main batteries of like electro-motive force but unlike polarity inserted between the earth and said insulated contact-stops, respectively, a second key or transmitter having an insulated contact-spring mounted thereupon, a line-wire extending from said spring to the distant station, a third main battery having one of its poles connected with that insulated contact-spring upon the first key, which, when said key is depressed, unites it with another battery of coincident polarity and its other pole with the working-contact of the second key, and a conductor uniting the remaining contact-spring of the first key with the resting-contact of the second.



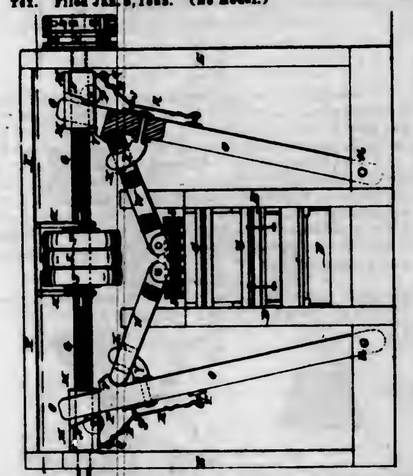
3. The combination, substantially as hereinbefore set forth, of a key or transmitter, two insulated contact-springs mounted thereon, two insulated contact-stops with which said springs are simultaneously brought in contact when said key is depressed, two independent main batteries of like electro-motive force but unlike polarity inserted between the earth and said insulated contact-stops, respectively, a second key or transmitter having an insulated contact-spring mounted thereupon, a line-wire extending from said spring to the distant station, a third main battery having one of its poles connected with that insulated contact-spring upon the first key, which, when said key is depressed, unites it with another battery of coincident polarity and its other pole with the working-contact of the second key, a conductor uniting the remaining contact-spring of the first key with the resting-contact of the second, and an artificial resistance inserted in said conductor equal to the resistance of the last-named battery.

4. The combination, substantially as hereinbefore set forth, of an electro-magnet provided with two pairs of differential or neutralising coils with two independent batteries and two independent relays, one having a polarized and the other a neutral armature.

5. The combination, substantially as hereinbefore set forth, of two independent relays included in the same main circuit, one having a polarized and the other a neutral armature, two independent local circuits controlled by the respective armatures of said relays, and an electro-magnet having two independent magnetizing-coils, one included in each of said local circuits.

6. The combination, substantially as hereinbefore set forth, of an electro-magnet provided with two pairs of differential or neutralising coils with two independent batteries and two independent relays, one having a polarized and the other a neutral armature, which, respectively, open and close local circuits traversing two coils, both having a like magnetic effect upon the core of the electro-magnet.

255,296. SEWING-MACHINE. JOHN THOMAS JONES, Utica, N. Y. Filed Mar. 28, 1881. (No model.)



Claim.—1. In a sewing-machine, of the stationary hollow arm *h*, having brackets *i*, that project down through the bed *a*, the links *g* and *g*, hinged together, the rock-shaft *m*, and feed-bar *n*, the block *r*, grooved hub *s*, arm *v*, and pivot *s'* in the bracket *i* for the hub *s*, substantially as set forth.

2. The combination, in a sewing-machine, of the shuttle-link *h'*, having supports for the shuttle, with the arm *h²*, pivoted at 3, the arm *h*, rock-shaft *g*, and mechanism for giving motion to the rock-shaft, substantially as set forth.

3. The combination, with the arm *h²*, rock-shaft *g*, and arm *h*, of a shuttle-link, *h'*, having fingers 5 and 7 to receive the nose of the shuttle, and the lever *l*, pivoted at 14, and recessed for receiving the heel of the shuttle, and a spring to retain the lever *l* in position, substantially as set forth.

4. The combination, with the needle-bar and needle in a sewing-machine, of a thread-tension, the take-up lever 12, having a positive movement, and the spring cushioning device *o*, the parts being arranged substantially as specified, so that the thread passes from the controller 12 over the cushioning device and then directly to the needle, for the purposes set forth.

255,297. BALING-PRESS. ISAAC VAN SANDT JONES, Salado Tex. Filed Jan. 3, 1882. (No model.)

Claim.—1. In a press, the combination, with the follower *b*, the right-and-left screw G, and nuts M, of the hinged levers O and the bars W, swiveled to the said levers, substantially as and for the purpose set forth.

2. In a press, the combination, with nuts M, having shoulders N, and the levers O, having forked upper ends, of the anti-friction wheels P, journaled in recesses in the rear of the shoulders of the nuts, with their faces projecting beyond the said shoulders, substantially as and for the purpose set forth.

3. In a press, the combination, with the follower *b*, the right-and-left screw G, the nuts M, and the hinged bars O, of the slotted bars W, the hinged socket *a*, and the swiveled arms Y, substantially as and for the purpose set forth.

4. In a press, the combination, with the hinged levers O and the follower-bars W, having slots X, of the curved and flattened swiveled arms Y, substantially as herein shown and described, whereby the lower ends of the said follower-bars can have a lateral movement, as set forth.

5. In a press, the combination, with the nuts M and the levers O, of the connecting rods or chains R, substantially as herein shown and described, whereby the said nuts in their outward movements are made to carry the said levers with them, as set forth.

255,298. JOINTED HARVESTER-REEL. FREDK. F. KASER, Waterville, Minn. Filed Jan. 12, 1882. (No model.)

Claim.—1. The combination, with the reel-shaft *b*, journaled in the reel-post *a*, and provided with the gudgeon *d* at its opposite end, and cam *h*, being loosely on the reel-shaft on the driver's side of the machine, of the metallic hook *d*, having an eye, *e*, cord *f*, having a weight, *i*, at its rear end, and inclined brace *h*, provided with a pulley, *g*, at its upper end, substantially as described, and for the purpose set forth.

2. The combination, with the reel-shaft *b*, journaled in the

Claim.—1. The combination, in a sewing-machine, of the stationary hollow arm *h*, having brackets *i*, that project down through the bed *a*, the links *g* and *g*, hinged together, the rock-shaft *m*, and feed-bar *n*, the block *r*, grooved hub *s*, arm *v*, and pivot *s'* in the bracket *i* for the hub *s*, substantially as set forth.

2. The combination, in a sewing-machine, of the shuttle-link *h'*, having supports for the shuttle, with the arm *h²*, pivoted at 3, the arm *h*, rock-shaft *g*, and mechanism for giving motion to the rock-shaft, substantially as set forth.

3. The combination, with the arm *h²*, rock-shaft *g*, and arm *h*, of a shuttle-link, *h'*, having fingers 5 and 7 to receive the nose of the shuttle, and the lever *l*, pivoted at 14, and recessed for receiving the heel of the shuttle, and a spring to retain the lever *l* in position, substantially as set forth.

4. The combination, with the needle-bar and needle in a sewing-machine, of a thread-tension, the take-up lever 12, having a positive movement, and the spring cushioning device *o*, the parts being arranged substantially as specified, so that the thread passes from the controller 12 over the cushioning device and then directly to the needle, for the purposes set forth.

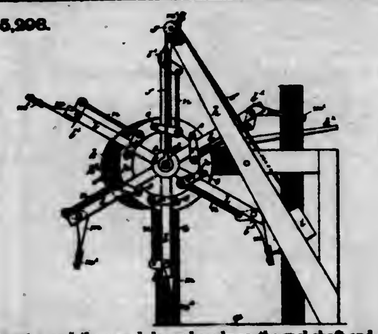
255,297. BALING-PRESS. ISAAC VAN SANDT JONES, Salado Tex. Filed Jan. 3, 1882. (No model.)

Claim.—1. In a press, the combination, with the follower *b*, the right-and-left screw G, and nuts M, of the hinged levers O and the bars W, swiveled to the said levers, substantially as and for the purpose set forth.

2. In a press, the combination, with nuts M, having shoulders N, and the levers O, having forked upper ends, of the anti-friction wheels P, journaled in recesses in the rear of the shoulders of the nuts, with their faces projecting beyond the said shoulders, substantially as and for the purpose set forth.

3. In a press, the combination, with the follower *b*, the right-and-left screw G, the nuts M, and the hinged bars O, of the slotted bars W, the hinged socket *a*, and the swiveled arms Y, substantially as and for the purpose set forth.

4. In a press, the combination, with the hinged levers O and the follower-bars W, having slots X, of the curved and flattened swiveled arms Y, substantially as herein shown and described, whereby the lower ends of the said follower-bars can have a lateral movement, as set forth.



5. In a press, the combination, with the nuts M and the levers O, of the connecting rods or chains R, substantially as herein shown and described, whereby the said nuts in their outward movements are made to carry the said levers with them, as set forth.

255,298. JOINTED HARVESTER-REEL. FREDK. F. KASER, Waterville, Minn. Filed Jan. 12, 1882. (No model.)

Claim.—1. The combination, with the reel-shaft *b*, journaled in the reel-post *a*, and provided with the gudgeon *d* at its opposite end, and cam *h*, being loosely on the reel-shaft on the driver's side of the machine, of the metallic hook *d*, having an eye, *e*, cord *f*, having a weight, *i*, at its rear end, and inclined brace *h*, provided with a pulley, *g*, at its upper end, substantially as described, and for the purpose set forth.

2. The combination, with the reel-shaft *b*, journaled in the

255,298.

reel-post *a*, and the cam *h*, hung loosely on the reel-shaft and provided with a cam-groove, *h'*, on the driver's side of the machine, of the slotted reel-arms *i*, rings *p*, bell-crank levers *m*, jointed beaters *m'*, hooks *n*, and rock-shafts *o*, having arms *o' o²*, the former provided with rollers *o³*, operating in the cam-groove *h'*, substantially as described, and for the purpose set forth.

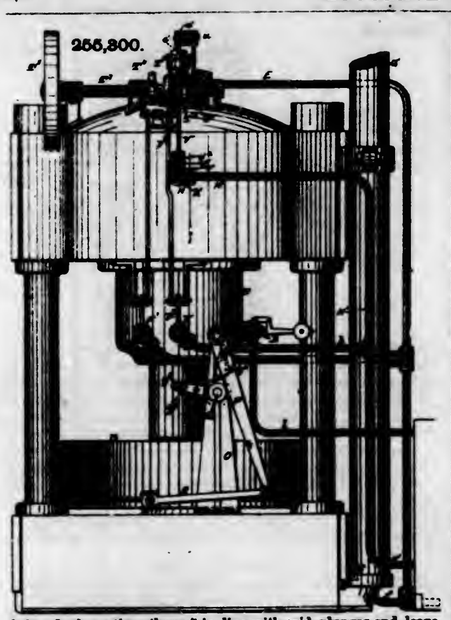
3. The combination, with the overhanging reel-shaft *b*, and cam *h*, hung loosely on said shaft and provided with the cam-groove *h'*, lever *h²*, and means for holding the cam when adjusted, arranged on the driver's side of the machine, of the slotted reel-arms *i*, rings *p*, bell-crank levers *m*, jointed beaters *m'*, hooks *n*, rock-shafts *o*, having arms *o' o²*, and rollers *o³*, substantially as described, and for the purpose set forth.

255,299. CANE, UMBRELLA-HANDLE, &c. THOMAS V. KEAN, Keam's Canyon, Ariz. Filed Feb. 20, 1882. (No model.)

Brief.—The cane has a reservoir for the reception of liquids. A suction-tube is secured to the neck by a stopper which is provided with vent-holes. The tube projects above the stopper, so that the liquid can be drawn without inverting the cane.

Claim.—1. A hollow cane or handle for the reception of liquids, provided with a suction-tube secured in the head of the cane or handle and provided with air-vents, substantially as set forth.

2. A hollow cane or handle provided with a suction-tube and air-vents, and a removable or spring cap having a rubber lining-piece, which closes and protects the suction-tube and vents when the cap is in its normal position.



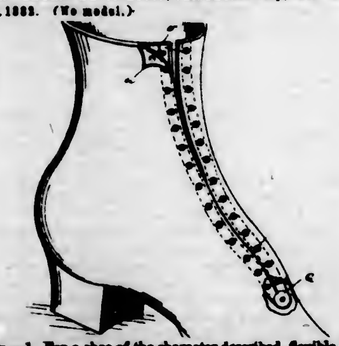
3. The combination, in a cane or reservoir, A, having the vents, a suction-tube, C, secured by the stopper D, and removable or spring cap B, having the rubber seat with opening *a*, whereby the suction-tube and vents are closed and protected and leakage of the liquid contents prevented when the cap B is in its normal position, substantially as set forth.

4. The combination of the hollow cane A, liquid-reservoir, suction-tube C, secured in the reservoir, and cap B, having the protecting-piece E seated therein, substantially as set forth.

255,300. AUTOMATIC HYDRAULIC PRESS. GEORGE A. LAWRENCE, New York, N. Y., and EDWARD J. FREEY, Philadelphia, Pa. Filed Oct. 15, 1881. (No model.)

Claim.—1. In a hydraulic press, the combination, with a suitably-arranged plunger and a platform having movement in a plane in the path of the plunger and at a right angle thereto, of automatically-operating valves for causing reciprocation of said plunger, and automatic devices for giving said platform an intermittent motion to bring fresh portions thereof successively directly in line with said plunger, substantially as described.

2. The combination, with the plunger of a hydraulic press arranged substantially as described, of a platform having movement in a plane in the path of the plunger and at right angles thereto, and automatic mechanism for shifting said platform to

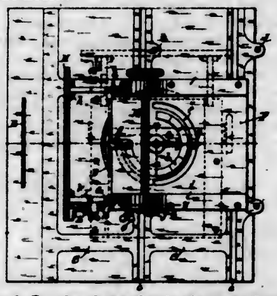


bring fresh portions thereof in line with said plunger and leave the same temporarily at rest while the plunger is performing its outward stroke.

3. In a hydraulic press, the combination, with the plunger and cylinder and the valves and water-pressure apparatus, constructed and arranged substantially as described, of the cams arranged to operate said valves, the platform provided with means for holding ore, and automatic mechanism for giving said platform an intermittent motion correlative with the action of said cams to bring and retain fresh portions of the ore successively into position to receive the plunger, substantially as described.

4. The hydraulic press composed of the cylinder provided with the shouldered plunger, the pipes leading into said cylinder above and below the shoulder of the plunger and controlled by suitable valves, the water-pressure apparatus connected with said pipes, the rotary platform carrying one or more mortars, the shaft T, carrying the series of cams for operating said valves through intermediate mechanism, and suitable devices connected with the plunger for communicating intermittent rotary motion to the platform, substantially as described.

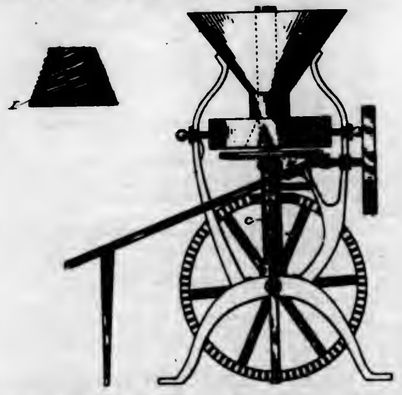
5. The combination, with the plunger and rotary platform, of the suitably connected and supported arms q and q', the lever P, pitman R, arm S', and pawl T, substantially as described.



255,801. SHOE. DAVID LUBIN, Sacramento City, Cal. Filed Feb. 3, 1882. (No model.)

Claim.—1. For a shoe of the character described, flexible and elastic metal strips united to the flaps of the upper by means of a series of eyelets adapted to receive the lacing, substantially as described.

2. The combination, in a shoe, of the elastic metal strips perforated to receive the lacing, and united by tubular rivets or eyelets between the inclining portions *F a* of the flaps and connected together at their lower ends by a single flat joint, G, substantially as described.



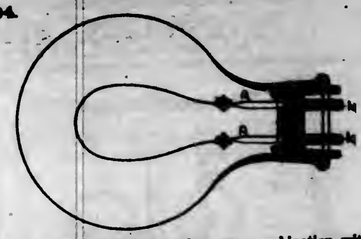
255,802. BEVEL SAW-TABLE GAGE. BENJAMIN S. LUTHER, Hebronville, Mass., assignor to Frank W. Sawyer, Providence, R. I., and Charles A. Sawyer, Malden, Mass. Filed Nov. 10, 1881. (No model.)

Claim.—1. In a bevel-gage for circular saws, the combination of the bed-piece C, provided with a groove, *c*, sliding plate D, pivoted plate F, gears J J, secured to the shaft K, racks G G, and pivoted guide-plate H, substantially as and for the purpose set forth.

2. In a bevel-gage for circular saws, the combination of the grooved bed-plate C, sliding plate D, and pivoted plate F with the clamp-pin N, provided with the hook *n*, and cam O, having unequal sides *r r'*, whereby the sliding plate D and pivoted plate F may be either immovably secured to the bed-plate C or secured to each other in sliding connection with the bed-plate C, substantially as described.

255,803. GRINDING-MILL. JOHANN MATZNER, Mount Pleasant, D. C. Filed Dec. 29, 1881. (No model.)

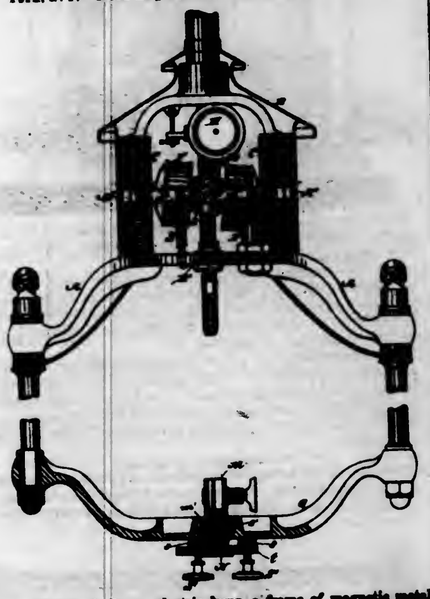
Claim.—1. The shell K, having the spiral ribs, each rib being provided with a series of notches, the notches in any two adjacent ribs being arranged alternately.



2. The cone I, having the spiral grooves, each of such grooves extending entirely around its circumference and decreasing both in diameter and pitch toward the base.

3. The combination of the stationary shell K, having the spiral ribs and notches, as described, with the spirally-grooved cone I, mounted on the shaft C, substantially as described.

255,804. ELECTRIC LAMP. HIRAM S. MAXIM, Brooklyn, assignor to the United States Electric Lighting Company, New York, N. Y. Filed Sept. 7, 1881. (No model.)



Claim.—1. In an incandescent electric lamp, the combination, with a plug or stopper, of metallic plugs B and conductors D, having conical enlargements or shoulders, as shown, and adapted to be screwed together in perforations having conical openings in the stopper for forming a tight joint between the metal and the glass, substantially as shown and described.

255,804.

2. In an incandescent electric lamp, the combination, with a perforated plug or stopper, of steel plugs B and copper conducting rods or wires D, having conical enlargements, as shown, and adapted to be screwed together in the perforations and clamped against the stopper on opposite sides, substantially as and for the purpose set forth.

255,805. ELECTRIC LAMP. HIRAM S. MAXIM, Brooklyn, assignor to the United States Electric Lighting Company, New York, N. Y. Filed Aug. 4, 1881. (No model.)

Claim.—1. In an electric lamp, a frame of magnetic metal supporting the feed-regulating mechanism, the sides of said frame being provided with pole-pieces and wound with an insulated conductor forming part of the lamp-circuit, substantially in the manner set forth, to form the feed-regulating magnets.

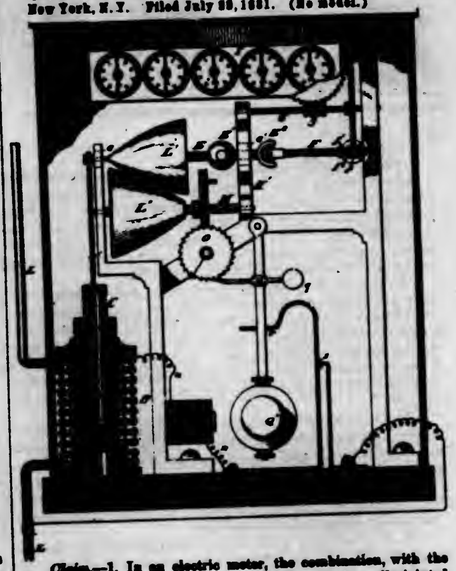
2. In an electric lamp, the combination, with the side rods and connecting-bar, of an upper supporting-frame of magnetic metal, cast in one piece, the sides of which are provided with pole-pieces, and wound with an insulated conductor forming a part of the lamp-circuit, substantially as and for the purpose set forth.

3. The combination of two electro-magnetic cores, having coils included in the main or arc circuit of an armature wound with coils forming part of a shunt-circuit of high resistance, and pivoted midway between the said cores, a gravitating carbon-holder, and mechanism connected with the pivoted armature and adapted to control the descent of the carbon-holder, substantially as set forth.

4. The combination, in an electric lamp, of parallel cores, having consequent poles A' A'' and coils C C' included in the main or arc circuit, armature B, pivoted between the said poles and having coils F, forming part of a shunt about the lamp-carbon-holding rod K, and mechanism connected with the pivoted armature and adapted to control the descent of the carbon-holder, as set forth.

5. The combination of pivoted armature B, link *a*, and frame G, having shafts carrying friction-wheels journaled therein, which are adapted to engage with the carbon-holder K, one of said shafts, *g''*, being provided with a friction-disk, H, whose rotation is controlled by a detent, *s*, carried by the armature B, substantially as set forth.

6. The combination of pivoted armature B, connecting-link *a*, and frame G of shafts journaled therein and carrying friction-disks which are adapted to engage with the carbon-carrier K when the frame G is tilted, friction-disk H, retarding mechanism I, and a spring-detent, *s*, carried by the armature B and arranged to bear on the periphery of said disk, substantially as set forth.



7. The combination, with carbon-holder and rotary feed mechanism connected therewith, of a disk fixed to a shaft engaging with the said carbon-holder, and two or more pivoted dash-pots, whose pistons are connected to the disk by the same crank-pin, as set forth.

8. The combination, in an electric lamp, with the carbon-holding rod K, of a cut-out or switch consisting of a pivoted contact-lever, V, insulated terminals T T', and a spiral spring, *v*, connected to the lever at a point directly above the fulcrum, as and for the purpose set forth.

9. The combination, with carbon-holding rod K, pivoted lever V, spring *v*, and insulated terminals T T', of a locking-lever, Y, adapted to be turned so as to prevent the tilting of lever V, as and for the purpose set forth.

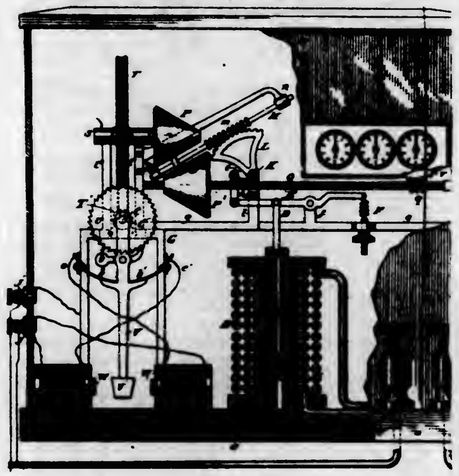
10. In an electric lamp, the combination of a carbon-holder consisting of a stem, N, having a socket for the reception of the carbon-flanges *n'*, and a plate, *t*, carrying adjusting-screws, with the cross-bar O, provided with a stocket containing a spiral spring, *s'*, as described.

255,806. ELECTRICAL METER. HIRAM S. MAXIM, Brooklyn, assignor to the United States Electric Lighting Company, New York, N. Y. Filed July 28, 1881. (No model.)

Claim.—1. In an electric meter, the combination, with the axially-movable core of the magnet B, of the universally-jointed shaft E, connected thereto by an intermediate link, and also connected by intermediate gears with a registering apparatus, and carrying the conoid L', arranged to rock longitudinally upon the conoid L'', mounted upon a shaft journaled in fixed bearings and rotated by armature mechanism, substantially as described.

2. In an electric meter, the combination, with a registering apparatus, of a conoid, L', mounted upon a universally-jointed shaft in gear with said registering apparatus, a conoid, L'', mounted upon a shaft rotating in fixed bearings and supporting the first-named conoid upon its surface, suitable devices for varying the point of contact between said conoids by the influence of an electric current over the main line, and automatic mechanism for rotating said conoid L'' under the influence of a current derived from said main line, substantially as described.

3. The combination, with the registering apparatus and the electro-magnet B, arranged for connection with a main line and



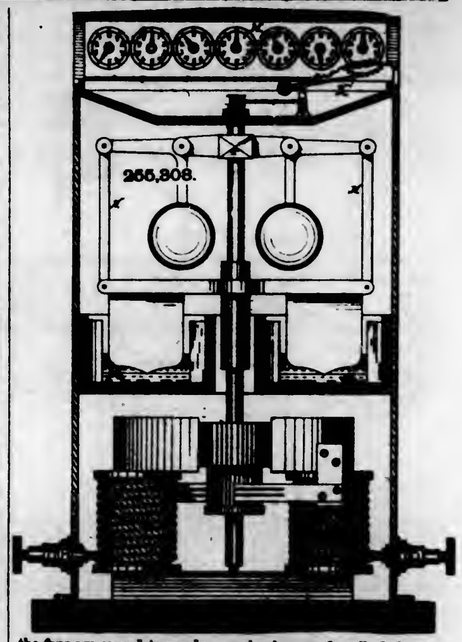
provided with an axially-movable armature, of the universally-

2. The strips for the manufacture of carbon conductors, com-

255,811. REGULATOR FOR DYNAMO-ELECTRIC MACHINES. HIRAM S. MAXIM, Brooklyn, assignor to the United States

provided with an axially-movable armature, of the universally-jointed oscillating shaft E, in connection with said apparatus and carrying the conoid I/, a link connecting said shaft with said armature, the conoid I/', mounted upon shaft M, carrying a worm-wheel, the ratchet-wheel O, fixed upon a shaft carrying a worm meshing with said wheel, an electro-magnet in a circuit derived from the main line, a pendulum adapted to be oscillated thereby and provided with a pawl, *e*, substantially as described.

255,807. ELECTRICAL METER. HIRAM S. MAXIM, Brooklyn, assignor to the United States Electric Lighting Company, New York, N. Y. Filed July 20, 1881. (No model.)



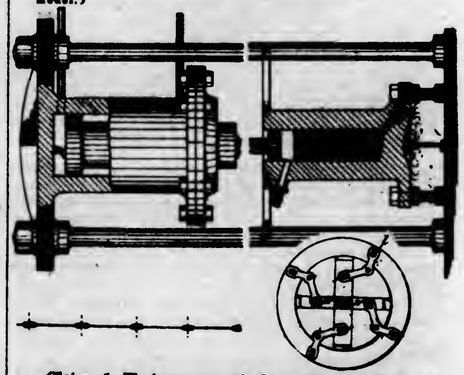
Claim.—1. The combination, with a single electric circuit, of a motor consisting of an electro-magnetic motive device having a constant rate of speed for different degrees of current strength, a registering apparatus impelled thereby, connecting-gear capable of varying the speed of movement transmitted, and an electro-magnet and armature, in conjunction with the said gearing and adapted to regulate its action, substantially as set forth.

2. In an electric motor, the combination, with an electro-magnet provided with axially-movable core, and a registering apparatus, of the cones P' and P, the former rotated by automatic mechanism, the friction-wheel O, arranged between said cones, suitable devices connected with the core of said magnet for shifting said wheel between said cores, and mechanism for transmitting motion from the cone P to the registering apparatus, substantially as described.

3. The combination, with the magnet E, arranged for connection with the main line and provided with the axially-movable core C, of the segmental gear L, connected with said core, the axially-movable shaft M, provided with the projections *m* and wheel O, the cone P, mounted upon the shaft Q, in gear with the registering apparatus, and the cone P, arranged for rotation by automatic mechanism, substantially as described.

4. In an electric meter, the combination, with the electro-magnets W W', the pendulum-bar V, arranged for vibration by the opposite attraction of said magnets and provided with pawl *e*, of the ratchet-wheel U, the worm mounted on the same shaft with the ratchet-wheel, the worm-wheel T, cone P', cone P, mounted on a shaft in gear with the registering apparatus, the friction-wheel O, arranged between said cones, and suitable devices arranged for operation to shift said wheel under the influence of an electrical current to be measured.

255,808. ELECTRICAL METER. HIRAM S. MAXIM, Brooklyn, assignor to the United States Electric Lighting Company, New York, N. Y. Filed Aug. 10, 1881. (No model.)



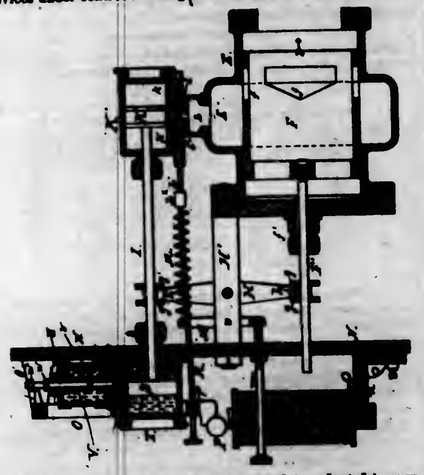
Claim.—1. The combination, with an electro-magnetic motor and registering mechanism, of retarding mechanism calibrated to cause the motor to revolve at a speed proportionate to the strength of the current energizing it, substantially as hereinbefore set forth.

2. The combination of an electro-magnetic motor, fans or blades driven thereby, a receptacle containing a liquid in which the fans are caused to revolve, mechanism, as described, for controlling the degree of immersion of the said fans or blades, and a registering apparatus, substantially as set forth.

3. The combination of an electro-magnetic motor, fans or blades driven thereby, a receptacle containing liquid, a centrifugal governor suitably connected with the said fans and adapted to control their degree of immersion in the liquid, and a registering apparatus, substantially as described.

4. The combination, with an electro-magnetic motor, of fans or blades L-shaped, as described, a system of levers, N, connecting the fans with a centrifugal governor, a tank or receptacle, M, containing liquid, and a registering apparatus, these parts being connected and arranged for operation substantially in the manner specified.

255,809. MANUFACTURE OF CARBON CONDUCTORS. HIRAM S. MAXIM, Brooklyn, assignor to the United States Electric Lighting Company, New York, N. Y. Filed Aug. 10, 1881. (No model.)



Claim.—1. The improvement in the art of manufacturing carbon conductors for incandescent lamps from plastic carbonizable substances, which consists in forming a continuous strip of alternately enlarged and slender sections, dividing the same into equal lengths, each having an enlargement at the ends, and carbonizing the lengths so formed, substantially as set forth.

2. The strips for the manufacture of carbon conductors, composed of a plastic carbonizable substance and formed with alternately enlarged and slender sections, as set forth.

255,810. SPEED-REGULATOR FOR DYNAMO-ELECTRIC MACHINES. HIRAM S. MAXIM, Brooklyn, assignor to the United States Electric Lighting Company, New York, N. Y. Filed July 26, 1881. (No model.)

Brief.—The main valve of the steam-engine is regulated by devices under control of a magnet in a branch of the main circuit.

Claim.—1. The combination, in a regulator adapted to regulate the speed of a steam-engine used for driving a dynamo-electric machine, of a steam-pipe, C, a valve for controlling the admission of steam, a stem for said valve, and mechanism, substantially as described, for shifting the same, an electro-magnet included in the circuit from the dynamo-electric machine driven or in a shunt branch thereof, and an armature connected with and controlling the shifting mechanism, whereby the flow of steam to the engine is regulated according to the varying attraction of the said magnet, as set forth.

2. The electric regulator consisting of the valve-chamber E, arranged for interposition in a steam-pipe and provided with the annular enlargement E', the hollow open valve F, arranged within said chamber and provided with the ports *f* and stem F', the cylinder K', connected with said annular enlargement by steam-passages controlled by suitable valves arranged to admit steam alternately to opposite end of said cylinder, the piston K, playing in said cylinder and provided with piston-rod I, the oscillating lever H, loosely connected with said piston-rod and the valve-stem F', and an electro-magnet and connections, as described, for controlling the positions of the valves governing the flow of steam from said annular enlargement E' to said cylinder K'.

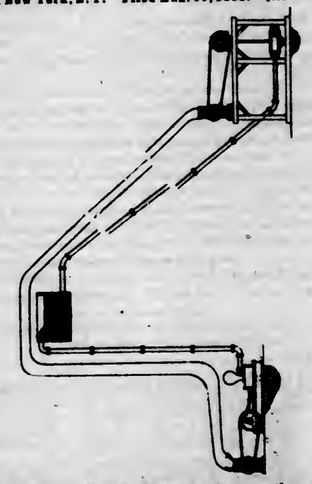
3. The combination, with the valve-chamber E, having the annular enlargement E', and the valve F, provided with the ports *f* and stem F', of the cylinder K', connected with said annular enlargement by steam-passages controlled by valves for admitting steam alternately to opposite end of said cylinder, the piston K, having the piston-rod I, the oscillating lever H, connected to said piston-rod and stem of valve F, the electro-magnet, the pivoted armature-frame carrying armature P, the valve-stem L', the rod R, arranged between said armature-frame and said valve-stem, and the spring M, arranged substantially as described.

4. The combination, with piston-rod I, arranged for operation substantially as described, of the piston S of the dash-pot T, in which said piston plays, and means, as described, for regulating the flow of a liquid in said dash-pot from one side of the piston to the other, substantially as described.

5. The combination, with piston-rod I, arranged for operation substantially as described, of the piston S, the dash-pot T, in which said piston plays, an adjustable rod, U, for regulating the flow of a liquid in said dash-pot from one side to the other, and an electro-magnet and armature connected with the said rod U, and having a projection adapted to raise the same and permit a free passage to the liquid in the dash-pot when the armature has been depressed to its lowest point, substantially as and for the purpose set forth.

255,811. REGULATOR FOR DYNAMO-ELECTRIC MACHINES. HIRAM S. MAXIM, Brooklyn, assignor to the United States Electric Lighting Company, New York, N. Y. Filed Aug. 5, 1881. (No model.)

Brief.—The regulation is effected by means of a switch, which first diverts the current from the coils of one pair of field-magnet cores and then reverses the current through the same coils.



Claim.—1. The combination, with the field-magnet coils of a dynamo-electric machine, of a combined resistance-switch and current-reverser, substantially as set forth.

2. The method of regulating dynamo-electric machines, substantially as described, which consists in first diverting the current from a portion of the coils around the field-magnets and then reversing its direction in the same, as described.

3. The combination, with a dynamo-electric machine, of a rotary regulating device adapted to be moved by the main shaft of the machine, a pivoted magnetic bar placed in proximity to the lower portion of the main magnets, mechanism, substantially such as described, connecting the same with the regulating mechanism, for the purpose of controlling the extent and direction of movement of the latter.

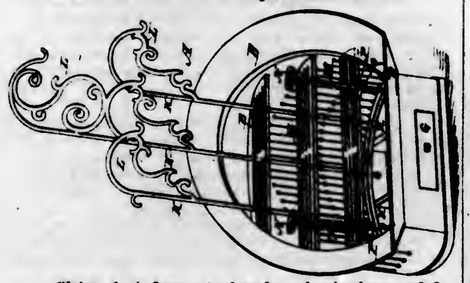
4. The combination of rotary shaft F, carrying resistance devices, as described, ratchet-wheel H, oscillating pawl K, connected to a shaft, L, that is continuously revolved by the main shaft of the machine, and lever-connections M from the pawl to a pivoted magnetic bar, P, or its equivalent, substantially as described.

255,812. ELECTRICAL ENGINEERING. HIRAM S. MAXIM, Brooklyn, assignor to the United States Electric Lighting Company, New York, N. Y. Filed Aug. 10, 1881. (No model.)

Claim.—1. The method of draining mines or other excavations, which consists in converting the force of the water pumped up into an electric current when the same shall have fallen a distance greater than twice the vertical distance through which it was forced up, then reconverting the current into power and utilizing said power to work the pumps, substantially as described.

2. In a system of drainage substantially as hereinbefore described, the combination of an electro-magnetic motor, a force-pump, a turbine or other wheel located at a proper distance below the said force-pump, connected by suitable pipes therewith, a dynamo-electric generator, and wires connecting the same with the motor, these devices being arranged and combined for mutual operation substantially as set forth and described.

3. In a system of drainage substantially as hereinbefore described, the combination of an electro-magnetic motor, a force-pump, and a pipe for the water raised thereby, a reservoir or tank



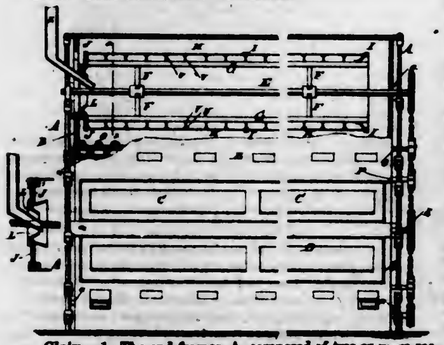
for receiving the water, an eduction-pipe from the reservoir, a water-wheel located at a proper distance below the same, a dynamo-electric machine, and line-wires connecting the said machine with the motor, these devices being arranged and combined for mutual operation substantially as shown and described.

255,313. BOX-FASTENER. HENRIC HAYER, Columbus, Ohio. Filed Jan. 27, 1882. (No model.)

Claim.—In a box-fastener, the plate A, having countersunk screw-holes *a* and threaded central aperture, B, secured to the front wall, C, of the box, as shown, and the headed and threaded bolt D, constructed and combined to serve with the hinged cover E, having countersunk aperture *d* and ring *d'*, adapted to receive sealing material, as and for the purposes set forth.

255,314. FLOWER-STAND. WILLIAM D. MCCALLUM, Truro, Nova Scotia, Canada. Filed Aug. 24, 1881. (Model.)

Claim.—1. A flower-stand made, as herein shown and described, with an outwardly-projecting beveled flange along its edges and with a series of shelves, hangers, and pedestals, as set forth.



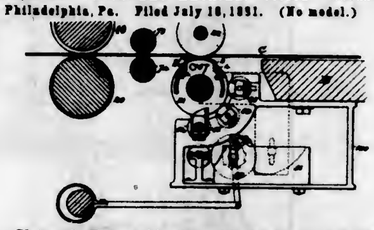
2. The combination, with the flower-stand A, of the outwardly-projecting flange D along the upper edges, substantially as shown and described, and for the purpose set forth.

3. In a flower-stand, the combination, with the shelves E, flange D, and pans G H, of the upright pivoted rods K, provided with hooks, and the ornamental braces L, substantially as shown and described.

4. In a flower-stand, the removable rods O and bearing-plates N, in combination with shelves E, substantially as described.

5. The combination, with the flower-stand A, of the pans or vessels H, and the pan or vessel G, provided with flanges J, overlapping the upper edges of the sides of the vessels H, substantially as herein shown and described, and for the purpose set forth.

255,315. FLOUR-BOLT. JOSIAH N. MCCONNELL, Lawrence, Kans. Filed Nov. 4, 1881. (No model.)



Claim.—1. The end frames, A, composed of two or more sections detachably connected together, in combination with the connecting boards or rods *a*, detachably secured to the said end frames, substantially as and for the purpose set forth.

2. In a flour-bolt, the combination, with the reel-shaft E, the radial arms F, the reel-ribs G, the bolting-cloth H, and the metal bands U, of the short studs V, having their ends bent at right angles and perforated, substantially as and for the purpose set forth.

3. In a flour-bolt, the combination, with the reel-shaft E, the radial arms F, the reel-ribs G, and the reel-head J, of the short studs V, having their ends bent at right angles and perforated, the metal bands U, secured to the outer ends of the said studs, the bolting-cloth H, secured at one end to the said head, and the wooden hoops I, placed upon the reel at the center and tail, substantially as and for the purpose set forth.

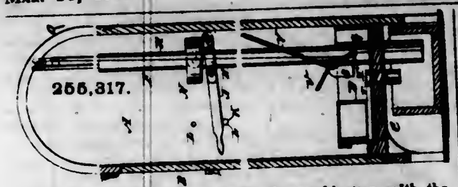
255,316. PAPER-BAG MACHINE. JOSEPH MCCULLOUGH, Philadelphia, Pa. Filed July 16, 1881. (No model.)

Claim.—1. The combination, with the former and rolls for advancing the paper, of an impression-roll, a type or form carrier, and eccentric toothed wheels geared to and driven from the feed-roll shaft, substantially as described.

2. The combination, in a bag-machine, of a former, rolls for advancing the paper or tube, a rotating striker for severing the tube into lengths, an impression-roll, and co-operating type or form carrier or roll, eccentric toothed wheels for actuating the latter, and gearing driving said eccentric toothed wheels and the striker, substantially as described.

3. The combination, in a bag-machine, with a slotted former, over which the paper is drawn, feeding-rolls for advancing the paper, and a striker or cutting apparatus for severing the paper into lengths, of an impression-roll and co-operating type or form carrier, eccentric toothed wheels for actuating the said carrier, the driven eccentric toothed wheel having means for adjusting it with relation to the type or form, and an interchangeable gear for concertedly driving the striker and type or form carrier, all substantially as described.

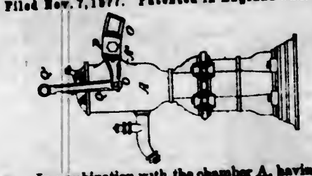
4. The combination, with the slotted former C, of rolls 10 20, roll 22, type-carrier 21, adjustable eccentric toothed wheels 27 28, wheel 30, swinging frame 63, striker 71, wheels 72 and 76, and interchangeable wheels 31, substantially as described.



5. The combination, with the former and rolls for advancing the paper, of a type or form carrier and eccentric toothed wheels for driving said carrier, substantially as described.

255,317. WARDROBE SHOWER-BATH. EDGAR N. MCKINN, Lathrop, Mo., assignor to himself, James D. L. Parks, Cornelius E. Kelsey, and James T. Parshel, all of same place. Filed Nov. 26, 1881. (No model.)

Brief.—The base of this structure has two perforations. One serves to drain the interior, and is provided with a plug, I, when not in use. The other permits the pump-tube F to be lowered into a box, B, which is both a supply to the pump and a drain to the tub. The pump-tube, in its vertical movement, is operated by a lever, J, whose fulcrum is in the wall of the structure, whose operating end encircles the pump-tube and engages with a collar, N, thereon, and whose power end, when not operated, is held by a pin, K, in perforation L. The piston-rod is pivoted to a beam, P, centrally pivoted to the exterior upper end of the wall Q, the other end of the beam being pivoted to a rod, R, which is reciprocated by a crank, *s*, on the spindle T, which is operated axially by oscillating the rod V by hand or by alternately depressing one end of the piece *v* by the foot. The water is discharged from the pump into the rose N through pipe M and falls upon the person bathing and then into the box D. When the bather is an invalid the pump may be operated from the exterior by imparting motion to the beam P.

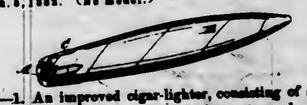


Claim.—1. The combination, with the wardrobe A B C, of the metallic tank D, having the sleeve G, the reservoir-vessel E, arranged under the casing, the pump-tube F, the hand H, the lever J, and the adjustable stud K, as shown and described.

2. In a wardrobe shower-bath, the combination, with the pump-tube F, provided with the rods O and R and the beam P, of the tank D, provided with a sleeve, G, for the pump-tube, substantially as herein shown and described, and for the purpose set forth.

3. In a wardrobe shower-bath, the combination, with the pump-tube F, of the collar H, surrounding and supporting it, the pivoted lever J, to which the collar H is attached, and the pin K, fitting in apertures L in the sides of the casing A, for the purpose of supporting the end of the lever J, substantially as herein shown and described, and for the purpose set forth.

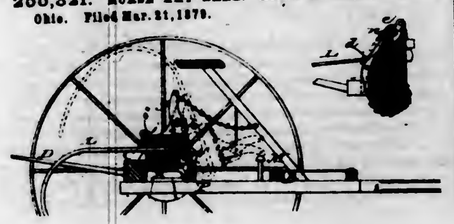
255,318. PUMP. JOHN A. MCMARTIN, Montreal, Quebec, Canada. Filed Nov. 7, 1877. Patented in England Jan. 26, 1877.



Claim.—In combination with the chamber A, having the lug A^4 cast integral therewith, the handle P, pivoted to the lug A^4, and having the arms O', adapted to partially encircle the casing, the pump-rod C, and the connecting-links Q, pivoted out of a vertical line to the pump-rod and to the arms O', substantially as described.

255,319. CHURN-DASHER. THOMAS A. HILLER, Grenola, Kans. Filed Oct. 20, 1881. (No model.)

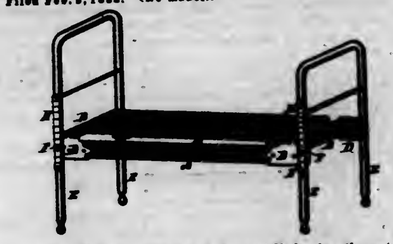
Claim.—In a churn-dasher, the water-vessel A, having perforated depending rim B, divided off into air-chambers by wings *f*, in combination with the removable inverted pan C, having perforated bottom h, substantially as and for the purpose set forth.



255,320. CIGAR-LIGHTER. ALFRED C. MOSS, Allentown, Pa. Filed Jan. 5, 1882. (No model.)

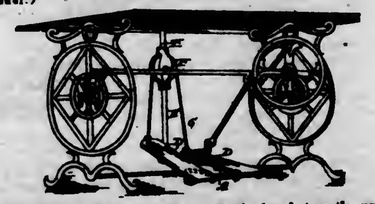
Claim.—1. An improved cigar-lighter, consisting of a cross having an inflammable wafer attached to its center and adapted to be secured to a cigar by having its wings bent over on the sides of cigar and connected thereto, substantially as and for the purpose set forth.

2. A cigar-lighter consisting of the central inflammable wafer, A, and radial wings C, provided with adhesive matter at their outer ends, the said wings being centered to the wafer while in a molten state, substantially as and for the purpose set forth.



255,321. HORSE HAY-RAKE. HIRAM MYERS, Springfield, Ohio. Filed Mar. 21, 1870.

Claim.—1. The combination, with the rake-head or axle F, of the teeth L, formed with loops E, and the strip *e*, passing through said loops and bolted to the rake-head, substantially as shown and described.



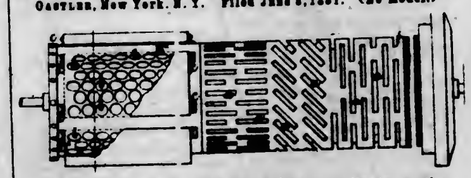
2. The combination of the rake-head or axle F with the pawls *d*, pivoted on the flanges *c*, the spiral springs *n n*, the oscillating rod H, having on its ends the pawls or levers *c c*, the lever *g*, and the spring pressing-plate *f*, substantially as shown and described.

255,322. BEDSTEAD. WILLIAM J. MYERS, Hartford, Conn. Filed Feb. 9, 1882. (No model.)

Claim.—The combination of the post E, having the notched bar H, the corner-plate D of a bed-frame, having the flange G, and the clamping-bolt F, substantially as described.

255,323. SEWING-MACHINE TREADLE. ISRAEL B. MYRICK, Cleveland, Ohio, assignor of two-thirds to Julius W. Brett and Edmund R. Whiting, same place. Filed Feb. 14, 1882. (No model.)

Claim.—1. The combination, with the bracket on the under side of the table, carrying the band-wheel or pulley, of the connecting rod or brace and base-plate, substantially as herein set forth.



2. The combination, with the bracket E, carrying the band-wheel or pulley F, and having the perpendicular strengthening brace or rod H, the lower end of which is secured to the base-plate brace or rod H, the lower end of which is secured to the base-plate A, which straddles the cross-bar of the machine, of the treadles D and band or cord G, substantially as and for the purpose specified.

255,324. BELT-FASTENER. ALFRED E. NOBLE, New Milford, Conn. Filed Dec. 27, 1881. (No model.)

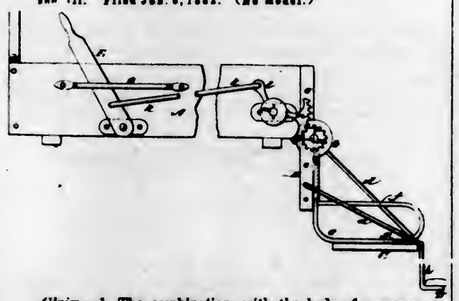
Claim.—The metallic belt-fastener composed of the open head or eye *b*, the tongue or shank *c*, and the lip *d* on the opposite side of the head or eye from said tongue or shank, and made less in width than said head or eye, so as to form angular notches at its juncture therewith, substantially as and for the purpose specified.

255,325. ROTARY SCREEN FOR STONE, &c. WILLIAM C. OASTLER, New York, N. Y. Filed June 8, 1881. (No model.)

Claim.—1. A rotary screen comprising a section or portion having in its periphery elongated holes or slots *a*, some of which extend transversely of the screen, others of which extend diagonally or obliquely of the screen, and still others of which extend longitudinally of the screen, substantially as specified.

2. A rotary screen comprising a portion or section having

elongated holes or slots which are so disposed that their lengths extend in various or different directions, and comprising a second portion surrounded or inclosed by an outer shield or casing which is imperforate opposite the holes or perforations in said second portion of the screen, substantially as specified.



255,326. PROCESS OF TREATING HIDES OR ANIMAL MEMBRANES AND TISSUES. JOHN H. ORDWAY and GEORGE F. ORDWAY, Boston, assignors of one-fourth to Joseph A. Ordway, Worcester, Mass. Filed Aug. 8, 1881. (Specimens.)

Brief.—The object is to produce from hides, animal membranes, and tissues a material which, while it preserves the fibrous character, will be tough, flexible, and elastic and adapted to many uses in the arts and as a substitute for whalebone and hard rubber.

Claims.—1. The herein-described process for treating hides, animal membranes, and tissues, consisting essentially in impregnating them with a cold nearly-saturated solution containing chromic acid, and then exposing them to sunlight, substantially as and for the purpose set forth.

2. As a new article of manufacture, hides and membranes free from gelatine, having the contained collagen and fibrine chemically combined with chromic acid, substantially as set forth.

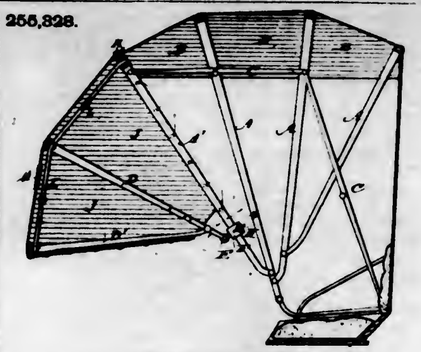
255,327. STEP FOR VEHICLES. ASA KENYON OWEN, Tennessee Ill. Filed Jan. 6, 1882. (No model.)

Claim.—1. The combination, with the body of a wagon or other vehicle and the end-gate B, hinged thereto, of the seat C and the frames *e f*, substantially as shown and described, whereby the seat is connected to the end-gate and adapted to be moved with the end-gate to form a seat or step, as set forth.

2. The combination, with the swinging seat C, connected with the lower rear end portion of the body of the vehicle to admit of its being inverted and turned down and back to form a step, of the supplementary step D, hinged or pivoted to said seat, essentially as herein set forth.

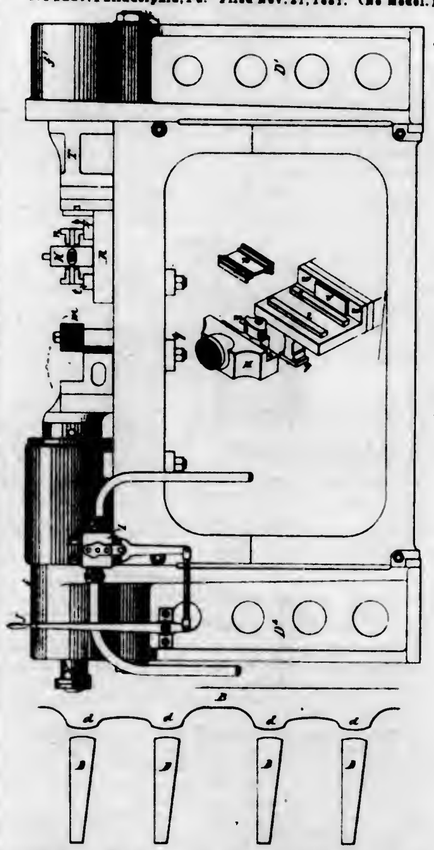
3. The rods or frames *e f*, in combination with the swinging seat C, made convertible into a step, as described, the cleats or projections *f' f'*, for supporting the ends of the seat, and the supplementary step D, hinged or pivoted to the seat and serving as an intermediate support to it, substantially as described.

4. The combination, with the body A of the vehicle, of the end-gate B, pivoted below to said body, the seat C, arranged at right angles in transverse relation to said gate, but parallel with it longitudinally, and connected with the gate so as to work from the same centers of motion, *a a*, and the supplementary step D, hinged or pivoted by a bent arm or leg, *h h*, to the seat for operation in relation with each other and with the body of the wagon, substantially as specified.



5. The combination of lever E, rod *k*, arm *l*, toothed sector *s*, and the pinion *r*, fixed to gate B, substantially as herein shown and described, whereby the step C and end-gate are operated by the driver from his seat, as set forth.

255,328. CARRIAGE-TOP. RICHARD J. PARRETT, Portland, Ind. Filed Jan. 17, 1882. (Model.)



Claim.—1. In a carriage, the combination, with the bow A', having knobs K, of an auxiliary top consisting of the bows D D', hinged together near the bottom and there clamped detachably to the bow A', the cover J, extending rearwardly and buttoning on said knobs, and the jointed bar L, connecting detachably with carriage-bow A', whereby the auxiliary top will hang over in front of the ordinary top, and can be readily attached to or detached from the carriage-top, as described.

2. The combination, with bows D A', of the rubber-lined clamp E F, the bolt H, and the tube I, as and for the purpose specified.

255,328.

255,329. MANUFACTURE OF LOCOMOTIVE-FRAMES. CHAS. T. PARRY, Philadelphia, Pa. Filed Nov. 21, 1881. (No model.)

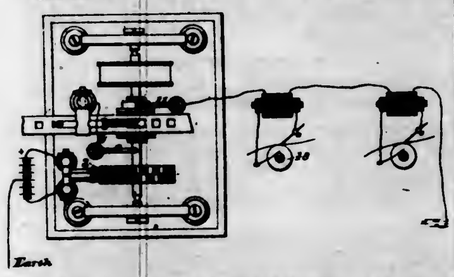
Claim.—1. The mode herein described of making the wrought-iron frames of locomotives, the said mode consisting in, first, forging projections *d d* on a bar, B, and preparing forgings D D; and, second, applying the bar to the forgings or the forgings to the bar under pressure while both are at a welding-heat at the points where the union has to be effected, all substantially as set forth.

2. The mode herein described of effecting a clean welding of the projections *d d* of the bar to the forgings D D, the said mode consisting in rounding the said projections and forgings and heating them to a welding-heat and applying the rounded ends of the projections while at a welding-heat to the welding-hot rounded ends of the forgings or the forgings to the projections under direct pressure, all substantially as set forth.

3. The within-described holder for the forgings D D, the same consisting of the yoke N, distance-piece *n*, and key *n'*, all being combined substantially as set forth.

4. The combination of the plate E, its flange *w*, and the abutment *f* of the frame with the recessed cross-head and its block *u* and mechanism for operating either the plate or the cross-head, substantially as set forth.

255,330. BREECH-LOADING FIRE-ARM. ROBERSON PEIRCE, New Bedford, Mass. Filed Sept. 24, 1881. (No model.)

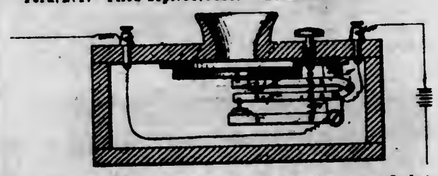


Claim.—A breech-loading shoulder-gun for killing whales, combining in its structure the tilting barrel having projecting lugs, the metal stock, the lock-chamber, and enlargements in advance of the breech-piece, having recesses formed in the enlargements for receiving the lugs upon the barrel, the mechanism for locking and releasing the barrel, embracing the slide for engaging the rear end of the barrel, and located to work below the cap-plate of the locking-chamber, the spring for throwing the locking-plate forward, the retractor for drawing the locking-plate back, and the spring-hammer for firing the gun, the locking and firing mechanism being boxed together within the locking-chamber of the stock, said parts being all constructed and arranged substantially as shown and described.

255,331. REMOVABLE BOOK-COVER. THOMAS D. PRICE, Carrollton, Ill. Filed Dec. 17, 1881. (No model.)

Claim.—The combination of the cover, the back of which is provided at its ends with interned hooks, the pad having a blotter attached by means of a flexible strip secured to the under side of the pad, as described, and the holding-strip I, substantially as and for the purpose herein set forth.

255,332. AUTOMATIC TELEGRAPH. CHARLES A. RANDALL, New York, N. Y. Filed Sept. 7, 1881. (No model.)



Claim.—1. The combination, substantially as hereinbefore set forth, of an inductorium, mechanism for producing a regular succession of alternate positive and negative electric impulses of equal duration in the primary circuit of said inductorium, and one or more telegraphic recording-instruments actuated by induced electrical impulses in the secondary circuit of said inductorium.

2. The combination, substantially as hereinbefore set forth, of an inductorium, mechanism for producing a regular succession of alternate positive and negative impulses in the primary circuit of said inductorium, an automatic circuit-controller for transmitting predetermined signals, and one or more telegraphic recording-instruments actuated by induced electrical impulses in the secondary circuit of said inductorium.

3. The combination, substantially as hereinbefore set forth, of two or more inductoriums having a common primary circuit and independent secondary circuits, mechanism for producing a regular succession of alternate positive and negative impulses in said primary circuit, an automatic circuit-controller for transmitting predetermined signals, and a telegraphic receiving-instrument included in each of said secondary circuits.

255,333. TELEPHONE-RELAY. CHARLES A. RANDALL, New York, N. Y. Filed Sept. 19, 1881. (No model.)

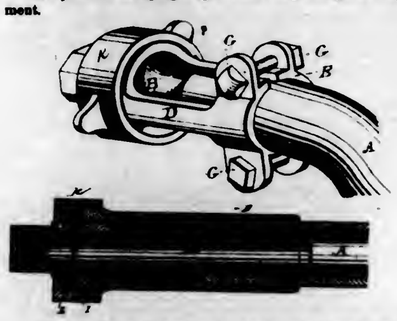
Claim.—1. The combination, in a telephonic system, of a battery main-line circuit, including a transmitter, with a magnet in said circuit, a tension-regulator operated by said magnet and included in a battery local circuit, which also includes the primary of an induction-coil, the secondary circuit of said coil including a receiver, whereby the main-battery currents are caused to traverse the main line, and the full electro-motive force of the local current is utilized for actuating the diaphragm of the receiver, substantially as and for the purpose specified.

2. The telephonic relay consisting of a compound lever composed of two arms pivoted together and fulcrumed, as more fully hereinbefore described, an electro-magnet in the main circuit for actuating the lever to transmit the vibrations produced by electric currents, waves, or pulsations over the main line, a contact-maker or tension-changer, to which said waves or vibrations are transmitted, the local-battery circuit, including the primary of an induction-coil, in which said contact-maker is placed, the secondary circuit of said induction-coil, and the receiving-telephone therein.

3. The combination of the electro-magnet F', the compound lever, the long arm of one member of which carries an armature arranged in front of the core of said magnet, while the short arm of the other member is connected with one member of a contact-maker, including a local circuit, in which is embraced the primary circuit of an induction-coil, the secondary circuit of which includes a telephonic receiver, substantially as described.

4. In a system of telephonic telegraphy, the combination of an electrically-closed main-line circuit, over which currents of varying electro-motive force are caused to flow in transmission, a telephonic receiver in a local circuit operated by intermittent, alternating currents, and a telephonic relay interposed between the said receiver in the local circuit and the transmitter, as set forth.

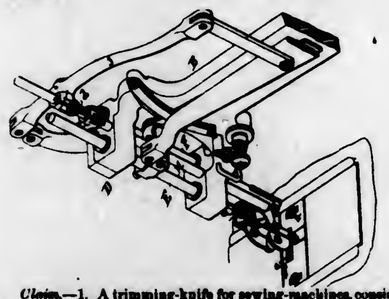
255,334. SIDE-SADDLE. LEWIS A. ENISTER, Chico, Cal. Filed Oct. 19, 1881. (No model.)



Claim.—1. A riding-saddle consisting of the steel fork A, leather body B, provided with the hand-hold C, and suitable attaching and foot-holding devices, all substantially as set forth.

2. In a saddle, the adjustable stirrup-strap E, arranged with the loosely-hung stirrup G, ring F, and crown-strap H, and the cur-cingle, substantially as and for the purpose herein described.

3. The metal tree A, consisting of three rigid points or prongs, as described, two of said prongs being made to rigidly fit the curve of the animal's back and the third prong to form the horn of the saddle, substantially as and for the purpose set forth.



255,335. HOSE-COUPLING. EDWARD A. RIX, San Francisco, Cal. Filed Oct. 28, 1881. (No model.)

Brief.—The clamping-ring D holds the parts against displacement.

Claim.—The hose-coupling herein described, consisting of the tube B, fitting within section A of hose, and provided with a flange, against which abuts the flange L, in combination with the ring K, the clamp D, provided at one end with a male screw and at the other end with sectional ring E, having fastening-lugs F, and bolts G, all constructed and arranged as set forth.

255,336. TRIMMING ATTACHMENT FOR SEWING-MACHINES. THOMAS C. ROBINSON, Cambridge, Mass., assignor to himself and E. Baker Welch, same place. Filed Nov. 11, 1881. (No model.)

Claim.—1. A trimming-knife for sewing-machines, consisting of a flat blade having a horizontal cutting-edge, *x*, a finger, *i*, projecting downward at one edge thereof, and with a lateral shoulder arranged at the side opposite the cutting-edge and above the latter at a height sufficient to permit the work to be turned up against the rear edge of the knife, substantially as set forth.

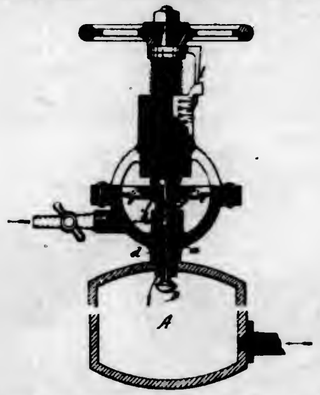
2. The trimming-knife consisting of a blade sharpened to form a horizontal cutting-edge, *x*, provided with a finger, *i*, and an edge, *u*, constituting a prolongation of the side of the finger, and extended laterally from said edge *u* to form a shoulder, *m*, arranged substantially as set forth.

3. The combination, in a sewing-machine, with the needle and presser-bars, of a cutter-bar, H, appliances for reciprocating the same, and a knife having a horizontal cutting-edge and a finger, *i*, at the side opposite that toward which the fabric is fed, and connected to the cutter-bar and extending laterally to a position parallel and behind and adjacent to the needle, substantially as set forth.

4. The combination of the bar H, lever J, pivoted block *a*, and set-screw securing the bar adjustably in said block, substantially as set forth.

5. The combination, with the base-plate of a sewing-machine, and with a reciprocating flat knife arranged in close proximity to the needle, and having a horizontal cutting-edge, *x*, and a finger, *i*, at the side of said knife opposite that toward which the fabric is fed, of an adjustable cutter-plate, *h*, substantially as set forth.

6. The combination, in a sewing-machine, of the needle-bar, cutter-bar H, levers S and J, link W, pivoted to the lever J and to the arm B, and link *c*, as set forth.



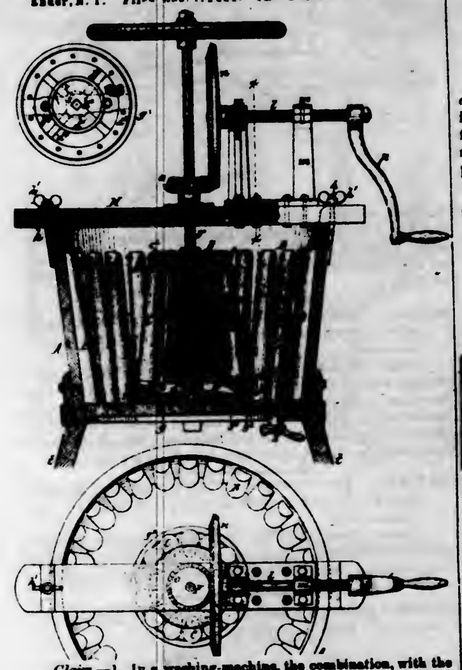
255,337. WIRE-STRETCHER. JOSEPH REED, Swede Point, Iowa. Filed Jan. 26, 1882. (No model.)

Claim.—1. In a machine for stretching wire, the combination of the lever C, provided with the slanting shoulder G, the lever D, pivoted to the side of the lever C and provided with a beveled end, and the supporting-frame B, substantially as described.

2. The combination of the supporting-bars, the frame A, the levers C D, and the brace, the brace being made adjustable back and forth at its lower end for the purpose of raising and lowering the levers, substantially as set forth.

255,338. PRESSURE-REGULATOR. ETIENNE SALOMON, Montreal, Quebec, Canada. Filed Apr. 26, 1881. (No model.)

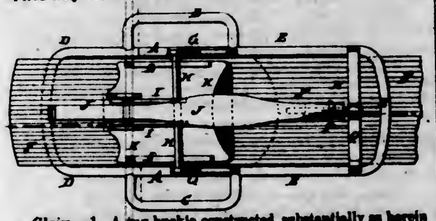
Claim.—In a pressure-regulator, the combination of the vessel A, regulating-chamber C, securely attached thereto, said regulating-chamber being provided with diaphragm *e*, capable of yielding to an upward-and-downward pressure, the valve-stem *c*, one end of which is secured to the diaphragm and the other to a valve, D, within the vessel A, said stem having a groove or port, *d*, in its side, through which the fluids pass, and ports *a* and *b*, with the regulating mechanism, all arranged for operation in the manner set forth and described.



255,339. STOVE-PIPE SHELF. THEODORE SCHAPER, Harvard, Ill. Filed Jan. 30, 1882. (Model.)

Claim.—1. A ring or band to be applied to stove-pipes, composed of sections which are slotted, in combination with sliding supporting-pieces which are provided with suitable sockets to receive the ends of the supporting rods or arms, substantially as shown.

2. A ring or band to be applied to stove-pipes, which is formed in sections which are bolted together, which sections are slotted, in combination with the sliding supporting-pieces provided with tubular sockets and suitable means for fastening the ends together, so as to adjust the ring or band to different-sized pipes, substantially as set forth.



255,340. WASHING-MACHINE. CHARLES T. SHADDOLT, Alexander, N. Y. Filed Dec. 1, 1881. (No model.)

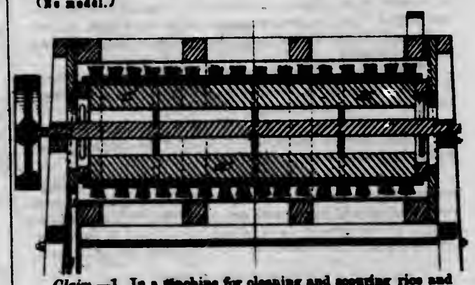
Claim.—1. In a washing-machine, the combination, with the tub A, provided with upright ribs B, of a series of upright rollers, C, horizontal disks D D', provided with sockets in which the roller-journals turn, a vertical shaft, F, to which both disks are secured, and a step-bearing, G, secured to the bottom of the tub and provided with a marginal guard-flange, *g*, substantially as set forth.

2. The combination, with the series of rollers C, of the vertical shaft F, the upper head, D, provided with a recess, *d*, and sockets in which the roller-journals turn, and a lower head, D', provided with a recess, *d'*, and sockets for the roller-journals, and a block, E, surrounding the shaft F and seated in the recesses *d d'* of the heads D D', substantially as set forth.

255,341. TUG-BUCKLE. HARRISON T. SHADDUCK, Shunk, Pa. Filed Aug. 26, 1881. (No model.)

Claim.—1. A tug-buckle constructed, substantially as herein shown and described, of the frame A, having loops B C D E and flanges G, the cross-rod H, the links I, the lever J, the plate K, having inclined flanges L and tongue M, and the spring-bolt O N and eye-bar Q, as set forth.

2. In a tug-buckle, the combination, with the frame A, provided with flanges G, connecting-rod H, and eye-bar Q, of the links I, the tongue-plate K, and the lever J, provided with the spring-bolt N, substantially as and for the purpose set forth.



3. In a tug-buckle, the combination, with the frame A, provided with the flanges G and connecting-rod H, the links I, and the lever J, of the tongue-plate K, provided with the inclined flanges L, substantially as and for the purpose set forth.

255,342. FENCE. CLARENCE C. SHELDON, Urbana, Ill. Filed Nov. 14, 1881. (No model.)

Claim.—The combination, in a fence, of the hollow cylindrical tile posts A, having slots *a* and openings *b*, boards B, supported in the slots *a*, wires D, and angular fastenings *c*, the arms of said fastenings being passed through the openings *b* on different planes and their free ends twisted around the barbed wires, as and for the purpose specified.

255,343. MACHINE FOR CLEANING AND SCOURING RICE, &c. DAVID L. SHOEMAKER, Washington, D. C., assignor to John Hughes, New Berne, N. C., H. Maurice Talbott, Baltimore, Md., and Marie F. Sylvester, Boston, Mass. Filed Mar. 16, 1881. (No model.)

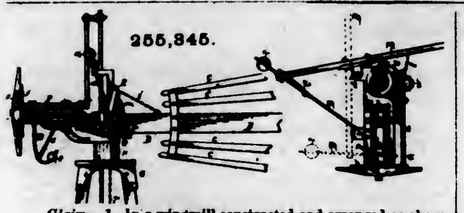
Claim.—1. In a machine for cleaning and scouring rice and other grain, the combination, substantially as described, of a horizontal outer cylindrical screen, a horizontal revolving cylinder armed with longitudinal brushes which project in close proximity to the outer cylindrical screen, and means for forcing currents or blasts of air from the inner revolving cylinder out through the outer screen.

2. In a machine for cleaning and scouring rice, the combination, substantially as described, of a horizontal outer cylindrical screen, an inner revolving cylinder between which and the outer screen the rice is fed, longitudinal brushes on the inner cylinder projecting in close proximity to the outer screen and operating to press the rice against said outer screen to scour it, and a fan arranged within the inner cylinder for forcing a blast or blasts of air outward through the rice and through the outer screen to remove the scoured-off particles, substantially as described.

3. In a machine for cleaning and scouring rice, the combination of a horizontal outer cylindrical screen, an inner cylinder provided with longitudinal brushes projecting in close proximity to the outer screen, and an air-forcing fan for supporting and rotating the inner cylinder and forcing air currents or blasts out through it laterally and through the outer screen, substantially as described.

4. In a machine for cleaning and scouring rice, the combination of an outer cylindrical screen, an inner cylinder consisting of alternate perforated and imperforate sections and open at one or both ends, brushes on the outside of the inner cylinder, and a fan within said cylinder, whereby the air is directed from the fan through the perforated section of the inner cylinder in the form of sharp blasts, substantially as described.

255,344. WIRE-SOLDER COATED WITH FLUX. EDWARD SMALL, Baltimore, Md. Filed Feb. 14, 1882. (No specimens.)



Claim.—1. The method herein described for providing wire-solder on its exterior with flux, consisting of first oiling the surface of the wire, then causing powdered resin to adhere to the oiled surface, then subjecting the wire to heat, which melts the resin, as set forth.

2. A new article of manufacture, flexible solder wire exteriorly provided with a non-friable flux, as set forth.

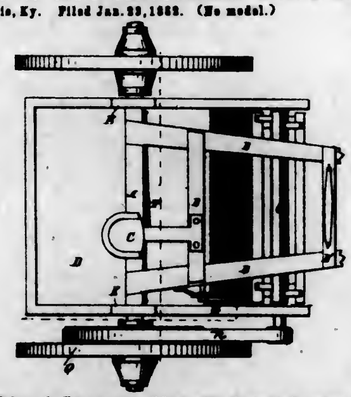
255,345. WINDMILL. EDWARD B. SMITH, Richland, assignor, by mesne assignments, to the Iosia Manufacturing Company, Iosia, Mich. Filed July 30, 1881. (No model.)

Brief.—The rudder B is eccentrically arranged, and has an elongated stem, with regulating-weight D *t*, employed in connection with rope *r*, curved lever E *s*, chain *i*, pulley *m*, brake *a*, and circular metallic brake-band *f*, for the purpose of throwing the edge of the wheel to the wind and stopping the rotary motion of the wheel when not desired to be used.

255,845.

Claim.—1. In a windmill constructed and arranged as above described, the combination of elongated rudder-stem B, pendulum-weight D *t*, connecting-rod C, bumper *y*, connecting-chain *t*, lever E *e*, brake *a*, circular brake-band *f*, rope or chain *r*, and pulley *m*, substantially as described, and for the purposes set forth.

2. The combination of the rudder-stem B, pivoted about its middle and projecting forward and to one side of the vertical axis of the wind-wheel, pendulous weight D *t*, constructed as described, and applied to the forward end of the stem, as set forth, and connecting-rod C, with the main supporting frame or casting, substantially as set forth.



3. The combination of the rudder-stem B, pendulous weight D *t*, connecting-rod C, and bumper *y* with the main supporting frame or casting, substantially as set forth.

4. The combination of lever E *e*, pulley *m*, brake *a*, chain *r*, and metallic circular brake-band *f*, substantially as described, and for the purposes set forth.

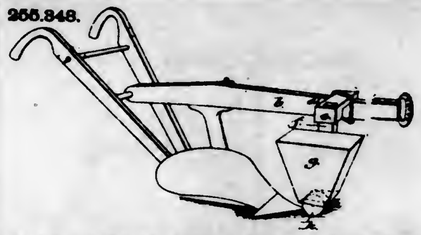
5. The combination of the cap G, collar H, main casting I, rudder-stem B, pivoted about its middle and projecting forward and to one side of the vertical axis of the wind wheel, pendulous weight D *t*, constructed as described, and applied to the forward end of the stem and connecting-rod C, substantially as set forth.

255,846. WITHDRAWN

255,847. GRASS-SEED HARVESTER. HENRY H. SPEARS Paris, Ky. Filed Jan. 23, 1882. (No model.)

Claim.—1. In a grass-seed harvester, the tooth I, as described, having legs J' J', combined with the bar H and yoke J, substantially as set forth.

2. In a grass-seed harvester, the body D, suspended, as described, below the axle, combined with cross-levers F F, links F' F', and side lever, G, substantially as set forth.



3. In a grass-seed harvester, the bar H, journaled in the arms M, and provided with the crank K, having the stop N, in combination with the lifting-lever and connecting-link, whereby the bar may be partially rotated and afterward raised by the motion of the same lever, substantially as set forth.

4. In a grass-seed harvester, the combination of the body D, having guides or arches E, the reel O', the transverse toothed bar H, journaled to the arms M, and having the crank K, the lever L, link L', the levers F F and G, the drive-wheels provided with the pulley Q, and the belt R, substantially as and for the purposes set forth.

255,848. SEEDING ATTACHMENT FOR PLOWS. HENRY H. SPENCER, Mound City, Ill. Filed July 30, 1881. (No model.)

Claim.—The combination of the following parts, to wit: a beam, *b*, having the arm *c* extending at right angles thereto past

255,848.

the share, and provided at its end with the vertical socket *a*, the seed-box *g*, having the stem *f*, fitting said socket, and the feed-wheel *h*, located in the seed-opening *h* in the bottom of the box, all constructed and arranged substantially as and for the purpose set forth.

255,849. DYEING BLUE COLORS UPON TEXTILE FABRICS. JAMES H. STEBBINS, Jr., New York, N. Y. Filed Feb. 1, 1882. (Specimens.)

Claim.—As a new article of manufacture, textile fiber, yarn, or cloth, whether knit or woven, having the herein-described color developed within or upon the same by the reaction in or upon the fiber of nitroso-diethylaniline chloride and the soda salt of alpha-napthol in the presence of an oxidizing agent, substantially as set forth, or by any other means which will produce a like result.

255,850. MANUFACTURE OF BLUE COLORING-MATTER. JAMES H. STEBBINS, Jr., New York, N. Y. Filed Feb. 1, 1882. (Specimens.)

Claim.—The blue dye-stuff produced by the action of diethyl-paraphenylendiamine chloride upon an alkaline solution of phenol in the presence of an oxidizing agent, substantially as set forth.

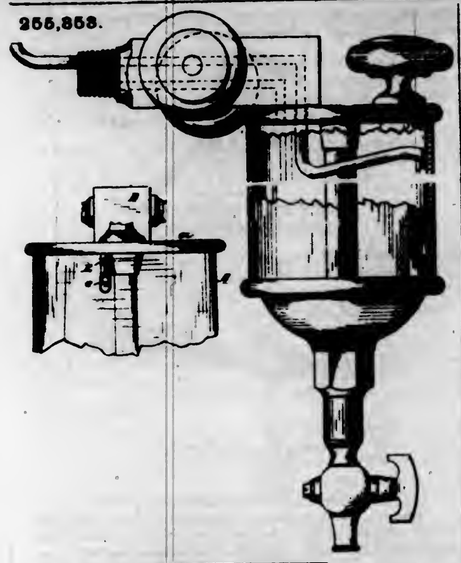
255,851. HOISTING APPARATUS. EDGAR L. STOCKING, Buffalo, N. Y. Filed Sept. 19, 1881. (No model.)

Claim.—1. The hoisting-standard A, provided with legs *a a*, terminating in rearwardly-projecting feet *a'*, arranged in the same horizontal plane, and adapted to enter between the boards of a pile of lumber, and a forwardly-projecting hook, *b*, to which the rope-pulley is attached, substantially as set forth.

2. The combination, with the hoisting-standard A, provided with feet *a'*, of the detachable shoe C, whereby the thickness of the base can be increased, substantially as set forth.

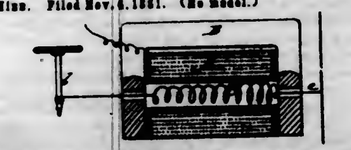
3. The hoisting-grapple F, composed of parallel jaws *f f*, a fulcrum-bar, *g*, levers *h h' i i'*, and bars *h h'*, having their upper ends connected with the hoisting-rope, substantially as set forth.

255,852. MANUFACTURE OF INK. ALBERT P. STODHART, Stoyd Park, Bristol, County of Bristol, England. Filed July 26, 1881. (No specimens.) Patented in England Feb. 21, 1881.



Claim.—The process described of manufacturing ink in the preparation of which gallic acid and thickening substances are obtained from spent tanning-liquor, said process consisting in reducing the liquor by boiling, drawing it off, adding green copperas, and boiling until the copperas is dissolved, and then drawing off and exposing to the atmosphere, substantially as set forth.

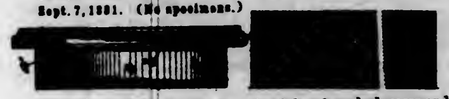
255,853. LUBRICATOR. ALLEN W. SWIFT, Elmira, N. Y. Filed Jan. 20, 1882. (Model.)



Claim.—1. A drip-tube of a lubricator, having its end highly polished to present a bright surface, and extended in close proximity to the transparent portion of the oil-cylinder, substantially as and for the purpose set forth.

2. A drip-tube of a lubricator having a plate with a polished surface at its end, and extending in close proximity to the transparent portion of the oil-cylinder, substantially as and for the purpose specified.

255,853.



255,854. TELEPHONE. HARRY S. THORNBERRY, Winona, Miss. Filed Nov. 6, 1881. (No model.)

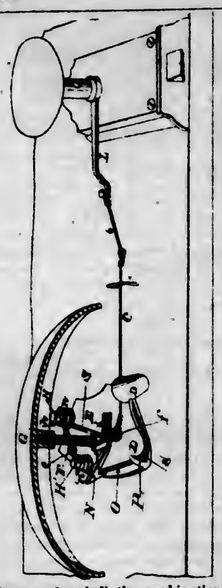
Claim.—The combination, with the permanent magnet B, of a magnet-coil in the line-circuit between the legs of magnet and parallel to its yoke, and a spiral core, C, of magnetic material, within said coil, said core being connected at one end by a cord or wire with the adjusting-screw *b* and rigidly connected at the other end with the diaphragm, substantially as and for the purpose specified.

255,855. PROCESS OF MANUFACTURING CELLULOID CLOCK-CASES. REUBEN T. TRIPLETT, New York, N. Y. Filed Sept. 7, 1881. (No specimens.)

Claim.—1. The described mode of forming clock-cases and their dials in one structure by first forming the dial separately from a plate of celluloid, then placing this dial in a mold with a space in said mold beyond or around the edges of said dial, and corresponding to the walls of the clock-case, and finally filling said molding-space with celluloid, so as to form the sides or walls of the case and unite with the said dial-plate at the same time, substantially as herein shown and described.

2. As a new article of manufacture, a clock-case formed of celluloid, as herein set forth.

3. A clock-case formed of an internal core or skeleton of suitable material and an external sheath or layer of celluloid, substantially as herein set forth.



4. A clock-case formed of celluloid, with a dial-plate made separately therefrom, but united with the case in the act of molding the same, substantially as herein set forth.

5. A clock-case formed of an internal metallic core or skeleton and an external layer or sheath of celluloid, substantially as herein specified.

255,856. ALARM AND DOOR-BELL. MICHAEL TRUBY, Elkhart, Ind. Filed Dec. 8, 1881. (No model.)

Claim.—1. The combination of a striker, D, snap-catch N, and slide O, substantially as described and shown, and for the purpose set forth.

255,856.

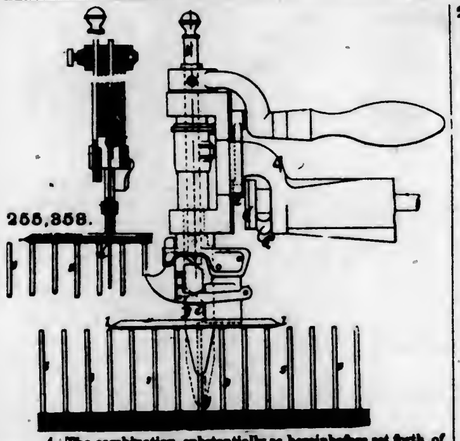
2. In an alarm or door-bell, the combination of a continuous spring, S, having striker D, coils *u* and *u'*, snap-catch N, and slide O, with a plate, E, having studs H H', substantially as shown and described.

3. The combination of a plate, E, studs H H', screw-post F, gong G, and stop P with a continuous spring, S, having striker D, coils *u* and *u'*, loop *f*, snap-catch N, and slide O, substantially as shown and set forth.

255,857. FLEXIBLE HOSE OR PIPE. MAURICE J. WALSH, New York, N. Y. Filed Jan. 19, 1881. Renewed Feb. 3, 1882. (No model.)

Claim.—Flexible hose or pipe composed of a layer of india-rubber, leather, or like material, spirally-wound layers of a stout woven fabric—such as duck—surrounding said layer of india-rubber, leather, or like material, a second layer of india-rubber, leather, or like material inclosing the said spirally-wound layers, superposed layers of the stout woven fabric or other suitable material, and an external wrapping of flexible wire, preferably copper wire serving to strengthen and protect the hose or pipe, substantially as and for the purpose specified.

255,858. CUTTING-MACHINE. ALBIE WARTH, Stapleton, N. Y. Filed Feb. 10, 1882. (No model.)



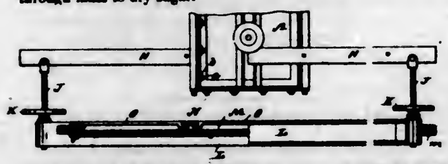
Brief.—The cloth-plate rests upon upright pins and forms a base for the knife and its connections. This plate passes beneath and forms a support for the material while being cut

Claim.—1. The combination, substantially as before set forth, of the base of the machine, the cutter-standard, the cutter having an inclined cutting-edge arranged to cut in an upward direction, and the knife-receiving socket arranged above said base, with a space between the two for the passage of cloth.

2. The combination, substantially as before set forth, of the base of the machine, the cutter-standard, the cutter having an inclined cutting-edge arranged to cut in an upward direction, the knife-receiving socket arranged with its mouth downward above said base, and the means of adjusting the relative position of said base and said knife-receiving socket.

3. The combination, substantially as hereinbefore set forth, of the base, the vertically-reciprocating knife, the knife-receiving socket arranged with its mouth downward and above the cloth plate to co-operate with the cutting-edge of the knife, and a bed for supporting the cloth-plate, having an opening to allow the movement of the knife.

255,858.



4. The combination, substantially as hereinbefore set forth, of the bed composed of upright elastic projections, the base movable on such bed beneath the material to be cut, the standard rising from the base and following the cut produced in the material, the vertically-reciprocating knife having an inclined edge arranged to cut on its upward stroke, and the knife-receiving socket arranged mouth downward above the base to co-operate with the cutting-edge of the knife.

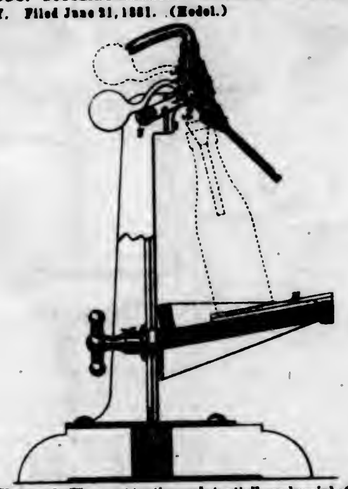
5. The combination, substantially as hereinbefore set forth, of the base or cloth plate, the cutter-standard, the knife having an inclined cutting-edge adapted to cut in an upward direction, the knife-receiving socket arranged above the base with its mouth downward, and the swivel-arm.

6. The combination, substantially as before set forth, of the base, the cutter-standard, the knife having an inclined cutting-edge adapted to cut in an upward direction, the knife-receiving socket arranged above the base with its mouth downward, the swivel-arm, the secondary arm jointed to the swivel-arm, the track supporting the secondary arm, and the driving mechanism of the cutter.

255,859. METHOD OF AND APPARATUS FOR THE PRODUCTION OF REFINED SUGAR IN PLATES, STICKS, AND OTHER LIKE FORMS. HENRY WEINRICH, Vienna, Austria. Filed Jan. 21, 1882. (No model.)

Brief.—The pan M is connected with a suction-pump and is provided with transverse bars for supporting the sugar-receiving boxes A. The sugar is poured into the boxes, which are divided by partitions, and when it has hardened sufficiently the green sirup is pumped out. Hot air (112° to 144½° Fahrenheit) is pumped through mass to dry sugar.

Claim.—1. In a sugar-clarifying apparatus, the pan or sirup-receiver M, constructed, substantially as herein shown and described, with a series of transverse bars, N, and longitudinal bars O, as set forth.



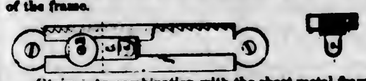
2. In a sugar-clarifying apparatus, the pan or sirup-receiver M, combined with a series of sugar-receiving boxes, A, fitting on the same, substantially as herein shown and described, and for the purpose set forth.

3. The combination, with the pan or sirup-receiver M, of the side bars, I, the transverse bars N, the longitudinal bars O, and one or more sugar-receiving boxes, A, fitting on the pan, substantially as herein shown and described, and for the purpose set forth.

4. The combination, with the pan or sirup-receiver M, of the side bars, I, the transverse bars N, the longitudinal bars O, the rails H, the screws J, and the hand wheels K, substantially as herein shown and described, and for the purpose set forth.

5. The combination, with the box A, of the partitions C, provided with studs or projections *d*, substantially as herein shown and described, and for the purpose set forth.

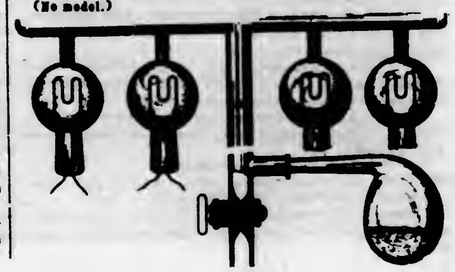
255,860. BOTTLING-MACHINE. ALBERT R. WEISS, Brooklyn, N.Y. Filed June 21, 1881. (Model.)



Claim.—1. The combination, substantially as hereinbefore set forth, of the supply tube or cock adapted to connect with the vessel containing the liquid to be bottled, and constructed with a series of lateral outlet-orifices, the filling-tubes constructed with valvular heads fitted on the supply-tube opposite to its outlet-orifices and adapted to rotate thereon for opening the outlet-orifices to the filling-tubes, or closing such orifices, and the weights or equivalent acting on the valvular heads of the filling-tubes for closing the outlet-orifices automatically, as set forth.

2. The combination, substantially as hereinbefore set forth, with the supply tube or cock, the filling-tubes, and their valvular heads, of the elastic bottle-stopping vent-rings fixed to the filling-tubes, and the valve-chambers communicating with the vents of the vent-rings and containing a float-valve closing in an outward direction, for the purpose specified.

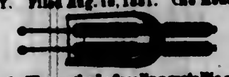
3. The combination, substantially as hereinbefore set forth, of the tray or bottle-rest with the filling-tubes, the elastic bottle-stopping vent-rings fixed to the filling-tubes, and the valve-chambers communicating with the vents of the vent-rings and containing the float-valves closing in an outer direction, for the purpose specified.



255,861. CURTAIN-CORD TIGHTENER. FRANCIS J. WEBSTER, Baltimore, Md. Filed July 22, 1881. (No model.)

Brief.—The frame is open at top and bottom and the sliding block which bears against the ratchet is grooved to fit the edges of the frame.

Claim.—In combination with the sheet-metal frame, open at top and bottom for the insertion of the slide, and having internal lateral ratchet, the block C, grooved to fit the edges of the frame and having the knob or pulley for the cord, as set forth.

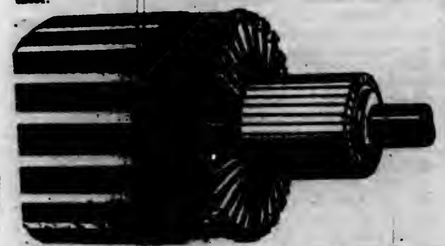


255,862. ABSORBENT FOR ELECTRIC LAMPS. EDWARD WESTON, Newark, N. J., assignor to the United States Electric Lighting Company, New York, N. Y. Filed Oct. 17, 1881. (No model.)

Claim.—1. The improvement in the manufacture of incandescent electric lamps which consists in first exhausting mechanically the globes as perfectly as possible and then withdrawing the residual air by means of therion.

2. The combination, with an air-pump, of an exhaust-tube connected with one or more incandescent electric lamp-globes and a retort or suitable receptacle containing therion and connected with the exhaust-tube, as and for the purpose set forth.

255,863. ELECTRIC LAMP. EDWARD WESTON, Newark, N.J., assignor to the United States Electric Lighting Company, New York, N. Y. Filed Aug. 16, 1881. (No model.)



Claim.—1. The method of sealing metallic conductors in glass, which consists in forming between the said conductors and the glass a film or coating of conducting metal, fusing the same into the surface of the glass, and then forming a coating of metal thereon by electro-deposition, substantially as set forth.

2. The combination, in an electric lamp, of tubes or projections welded to the glass forming the globe with metallic conductors passing through and sealed to the said tubes by impervious films or coatings of metal incorporated with the glass, substantially such as described.

3. The combination, in an electric lamp, of tubes or projections welded to the glass forming the globe with metallic conductors passing through and sealed into the said tubes by connecting films of conducting material covered and strengthened by a coating of metal electro-deposited thereon, substantially as set forth.

255,864. DYNAMO-ELECTRIC MACHINE. EDWARD WESTON, Newark, N.J., assignor to the United States Electric Lighting Company, New York, N.Y. Filed Oct. 17, 1881. (No model.)

Brief.—The armature is wound with two or more independent endless wires, which are connected by loops to alternate segments of the commutator, to avoid short-circuiting at the commutator.

Claim.—1. In a magneto or dynamo electric machine, an armature containing two or more systems of independent conductors wound in sections thereon, so as to pass through the magnetic field at right angles to the lines of force, as described, in combination with a commutator to alternate segments of which adjacent sections of the armature-conductors are connected, substantially in the manner set forth.

2. In a magneto or dynamo electric machine, a cylindrical or annular armature wound with two or more systems of independent continuous conductors the adjacent sections of which are connected to alternate segments of the commutator, substantially as set forth.

3. In a magneto or dynamo electric machine, the combination of a cylindrical or annular armature having grooves or recesses for the reception of the coils or bobbins, two or more independent continuous conductors wound thereon, substantially in the manner described, and a commutator to the segments of which the said coils or bobbins are alternately connected, substantially as and for the purpose set forth.

255,865. ELECTRO-MAGNET. EDWARD WESTON, Newark, N. J., assignor to the United States Electric Lighting Company, New York, N. Y. Filed Aug. 16, 1881. (No model.)

Claim.—1. The combination, with a hollow helix of insulated wire, of a movable armature composed of a central core extending entirely through the helix, and an inclosing-shell, of iron, of equal length therewith, substantially as set forth.

2. The combination, in an electric lamp, with the swinging lever or frame supporting the feed-regulating mechanism, of a hollow stationary helix composed of one or more coils of insulated wire, as described, and a movable armature consisting of a central core capable of extending entirely through the helix, and an inclosing-shell, of iron, of equal length therewith, substantially as shown and described.

255,866.

255,866. DYNAMO-ELECTRIC MACHINE. EDWARD WESTON, Newark, N.J., assignor to the United States Electric Lighting Company, New York, N.Y. Filed July 13, 1881. (No model.)

Brief.—The connections of the armature-coils with the commutator-plates are made by means of tips attached to the wires and fitted to eyes in radial extensions from the plates, the tips being held by clamping or binding screws.

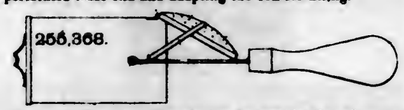
Claim.—1. The combination, with the armature-coils of a dynamo-electric machine, of commutator-segments D, radial arms A, and metallic connecting-tips attached to the free ends of the wires composing the said coils, and fitted to eyes in the radial arms, and adapted for connection therewith by means of clamping or binding screws, substantially as described.

2. The combination of segments D, radial arms A, having eyes B at or near their ends, with connecting-pins C, attached to the free ends of the armature-coils, and fitted to and fastened in the eyes B by means of screws E, as and for the purpose set forth.

255,867. TREADLING TOY HORSE. ELIJAH J. B. WHITAKER, Belair, Md. Filed July 7, 1881. (No model.)

Claim.—1. A toy consisting of a device representing an animal provided with a push-tongue rigidly attached to the animal, an axle of a pair of wheels swiveled below and independent of the animal, and lines to turn the axle independent of the animal, as set forth.

2. The combination of the axle provided with an upright steering-post, a device representing an animal loosely swiveled on the steering-post, a cross-bar rigidly attached to the steering-post, above the back of the animal, and guide-lines connected to the cross-bar, as set forth.

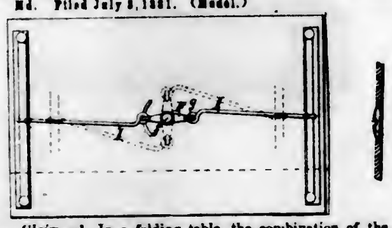


3. In a treadling toy, the combination of a pair of wheels, an axle connecting the wheels, provided with an upright steering-post, a device representing an animal loosely swiveled on the steering-post and having a hole through its mouth, a cross-bar rigidly attached to the steering-post, and guide-lines connected to the cross-bar and extending from one end thereof to and freely through the hole in the animal's mouth, and thence back to the other end of the cross-bar, as set forth

255,868. CLOTHES-SPRINKLER. ELIJAH J. B. WHITAKER, Belair, Md. Filed Sept. 13, 1881. (No model.)

Brief.—The cylindrical box has on diametrically-opposite sides trunnions, whereby the handle is capable of being transferred to the loose end of the cylinder, thereby throwing the rods hold-

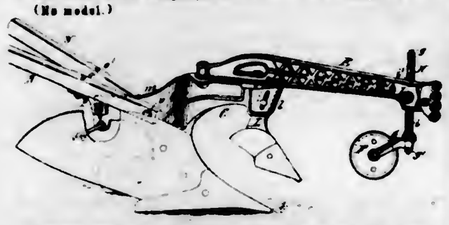
ing it in position out of direct line with the bails, thus releasing the perforated loose end and adapting the box for filling.



255,368.

Claim.—1. In a sprinkling device, the combination of a water-vessel provided on diametrically-opposite sides with a trunnion, a bail attached to the trunnions, whereby the vessel may be turned upside down within the bail, and a catch by which one end of the water-vessel is held by the bail, as set forth.

2. In a sprinkling device, the combination of a water-vessel having one end permanently closed and the other end provided with a perforated hinged cover, trunnions attached to the vessel on diametrically-opposite sides, a bail attached to the trunnions, and the hinged cover and bail connected on each side by a rod, substantially as set forth.



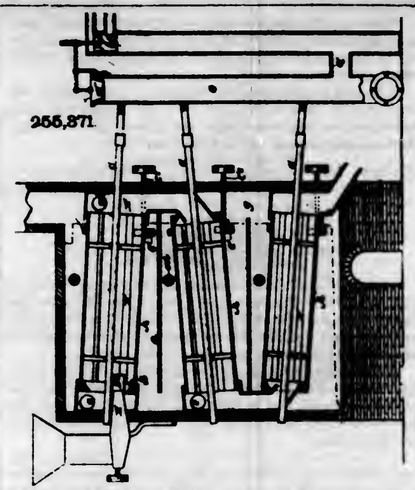
255,369. FOLDING TABLE. ELIJAH J. B. WHITAKER, Belair, Md. Filed July 8, 1881. (Model.)

Claim.—1. In a folding table, the combination of the legs hinged to the table-top, a bar pivoted to the table-top, and two rods, one end of each of which connects with and upon diametrically-opposite sides of the pivoted bar, while the other end of each rod connects with the hinged legs at either end of the table, whereby, upon a half-turn being given to the pivoted bar, the hinged legs may be extended to support the table or folded against the table-top, as set forth.

2. In a folding table, the combination, substantially as set forth, of the folding legs, a pivoted bar, a rod to connect the folding legs at either end with the pivoted bar, and a locking device.

255,370. PLOW. GARNER WILARD, Batavia, N. Y., assignor to the Wilard Plow Company, same place. Filed Aug. 24, 1881. (No model.)

Claim.—1. The combination, with a plow-beam, of a caster-wheel journaled in a bearing, G, provided with one or more stops, h, a pivot-bolt, g, a sleeve, H, surrounding the bolt g and secured to the beam, and one or more recesses, h', formed in the sleeve H, substantially as set forth.



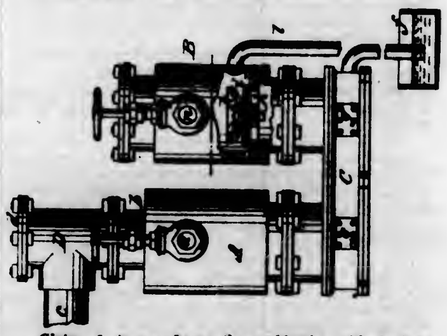
2. The combination, with a standard, C, constructed with a lateral bend or offset, m, whereby the rear portion of the standard is located nearer the mold-board than its front portion, of a beam, E, secured to the standard in front of the bend m, and handles N, secured to the standard in rear of the bend m, substantially as set forth.

255,371. APPARATUS FOR DRYING GRAIN. FREDERICK W WIEDENBOCK, New York, N. Y. Filed Jan. 24, 1882. (No model.)

Claim.—4. The combination, with the rotary inclined drying-cylinders A, arranged to deliver the grain from one to the other, of the stationary air-tubes C, supporting said cylinders, and provided along their under sides only with perforations, so as to discharge the air-currents for drying the grain into the lower portion of the cylinder, substantially as described.

2. The combination, with the rotary drying-cylinder, of the spiral conveyer located within the feed-spout to discharge the grain

255,371.



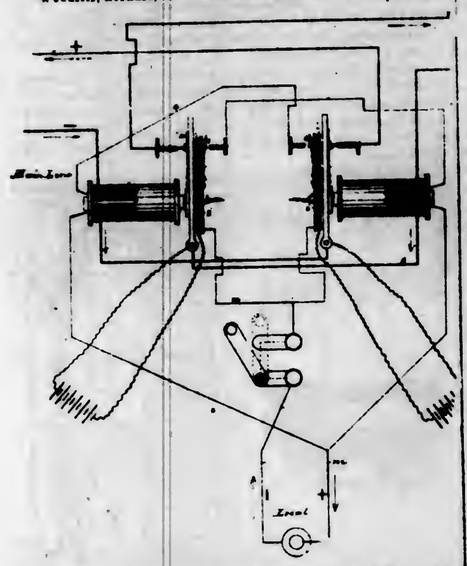
into the said cylinder, and the spring-valve detachably connected with the feed-spout and adapted to act, in conjunction with the spiral conveyer, to express the moisture from the grain before the latter has entered the drying-cylinder, substantially as described.

3. The combination, with the rotary drying-cylinder, of the hopper, the spiral conveyer located within a perforated feed-tube leading from the hopper and entering the rotary drying-cylinder, the spring-valve detachably applied to the shaft of the conveyer in position to normally close the discharge end of the perforated feed-spout, and the jacket surrounding the feed-spout, and provided with a drip-pipe, substantially as described.

4. The combination, with the rotary drying-cylinders mounted upon hollow perforated shafts, of the hot-blast pipe connected with the said hollow shafts, the regulator located in said pipe, and adapted to expand by the action of heat, and the valve connected with said regulator, and so located as to automatically open communication between a cold-air pipe and the hot-air pipe, or to close the same, substantially as described.

5. The combination, with the rotary drying-cylinders mounted upon hollow perforated shafts, of the hot-blast pipe connected with said hollow shafts, the cold-air pipe connected with the hot-blast pipe, the valve for automatically opening communication between these two pipes, and the regulator connected with the hot-blast pipe, and consisting of a metal casing having a flexible diaphragm connected with a pivoted lever that acts to open or close the aforesaid valve, substantially as described.

255,372. CONDENSER FOR STEAM-ENGINES. RICHARD E. WILLIAMS, Grass Valley, Cal. Filed Dec. 23, 1881. (No model.)



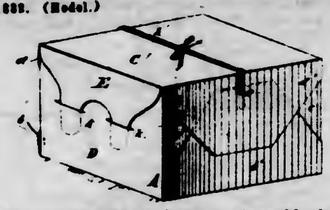
Claim.—1. In a condenser, the combination, with air-chamber B, provided with the valve i, of the pipe l, entering the chamber a little above the said valve, substantially as and for the purpose set forth.

2. The air-chamber B, provided with valve i and pipe l, in combination with base C and condensing-cylinder A, substantially as shown and described.

3. The condensing apparatus consisting of cylinder A, water supply pipe s, hollow base C, air-chamber B, provided with valve i, and discharge-pipe l, substantially as shown and described, combined for operation as set forth.

255,373. TELEGRAPH RELAY AND REPEATING-INSTRUMENT. JAMES M. WOODHILL, Aurora, assignor to John I. Woodfill, Nichols, Mo. Filed Oct. 27, 1881. (No model.)

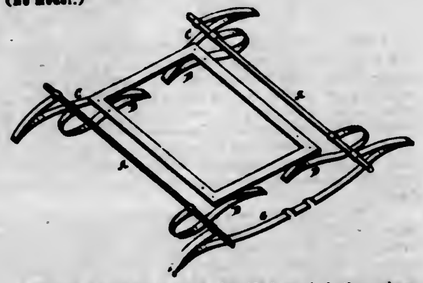
Claim.—1. A repeating-instrument consisting of the combination of a magnet having separate inner and outer helices wound in the same direction throughout the length of the core, and an armature having front and back contacts, both of which are closed at one point in the movement of the armature, the inner helix of each instrument being connected to a local battery and its circuit broken through one of the contacts of the armature of the other instrument, and the outer helix of each instrument being connected with their separate main lines and their circuits broken by the other armature-contact on the opposite instrument, substantially as described, and for the purpose of repeating with a weak or single-cell battery.



2. The combination, with two or more instruments having compound magnets B, formed of two separate helices wound in the same direction throughout the length of the core, and armature-lever contacts for making and breaking the circuits, as described, of a single local battery connected with the inner helix of each instrument and arranged to be thrown alternately through the said inner coils of the instruments in an automatic manner, as described, to avoid difference in tension, as set forth.

3. The combination, with the compound magnet B, having separate inner and outer coils, and its armature with contacts for repeating, as described, of a local battery connected with the inner coil of the magnet, and a switch arranged in the local-battery circuit, arranged to break the circuit of the inner coil, to avoid inductive effects when the instruments are worked separately as relays.

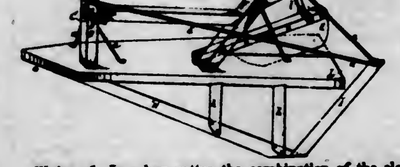
4. The combination, with two repeating-instruments having magnets with separate inner and outer helices for the main and local circuits, respectively, and a stationary front and back contact for each instrument, arranged respectively in one of the main-line circuits and the local circuit, of an armature vibrating between the two stationary contacts and having itself spring-contacts, arranged, as described, to temporarily hold both front and back stationary contacts closed, and finally to be backed up by the armature-lever for a solid bearing and positive unbroken closure of the contact, toward which the armature moves, as described.



5. The combination, with an armature-lever having a hole through it, a tongue-spring contact on one side and an insulated plate, A, with pin A' on the other, the said pin A' being arranged to close a sounder-circuit through the tongue-spring by the pressure of the tongue-spring against a stop when the armature is drawn by a magnet controlled by a main circuit, as described.

255,374. PAPER BOX. CHARLES P. WOOLDRIDGE, New York, assignor to William H. H. Rogers, Brooklyn, N. Y. Filed Jan. 30, 1882. (Model.)

Claim.—A folding box formed in one piece, with a bottom, C, cover C', two fixed sides, D D', body-flaps a a', b b', c c', and perforated cover-flaps d d' E, the flap E locking in slots k of side D, the body being held in form and the cover being secured to body when in folded position by cords ', substantially as shown and described.

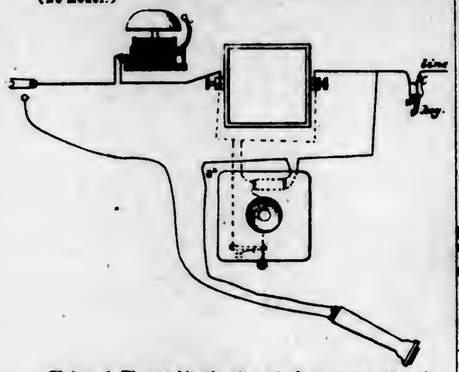


255,375. CARRIAGE-SPRING. JOHN E. BELL, Akron, assignor of one-half to William J. Bell, Toledo, Ohio. Filed Aug. 1, 1881. (No model.)

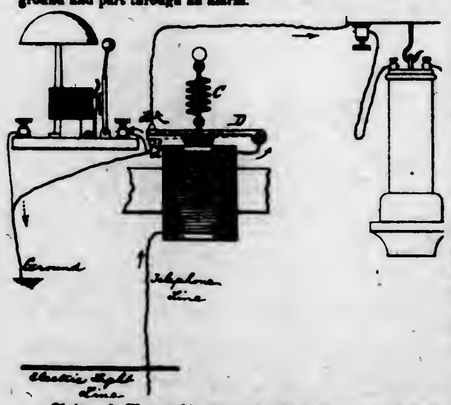
Claim.—In combination with the side bars, A A, the springs C C and D D, each having partial return-leaves, and constructed and arranged as shown, for the purpose specified.

255,376. BOG-CUTTER. SAMUEL W. BREWSTER and LYMAN BREWSTER, Southeast, N. Y.; said Sherwood assignor to Sarah Elizabeth Sherwood. Filed Nov. 23, 1881. (No model.)

Brief.—A bog-cutter formed of a base plate or bottom having an inclined horizontal cutting-blade attached to the side of its front beveled end, a vertical blade secured to the outer end of said inclined blade, and an adjustable guiding-blade working in a slot in the rear portion of said bottom. Elastic arms or braces connect the inclined blade with the base, and the vertical blade is braced by diagonal rods.



Claim.—1. In a bog-cutter, the combination of the slotted base or bottom A, the adjustable guiding-blade K, and the rearwardly-inclined cutting-blade H, substantially as shown and described.

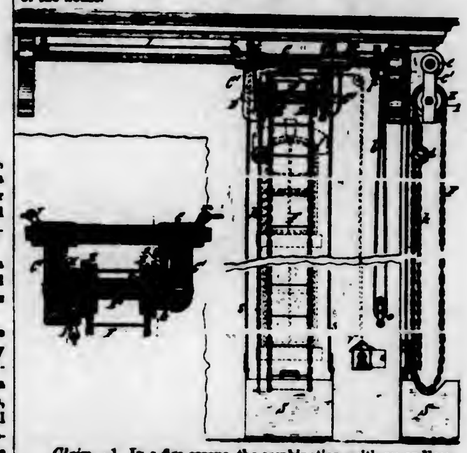


2. In a bog-cutter, the horizontal and upright cutting-blades mounted upon one side of the bottom piece, the draft-post, the guiding-blade, and the handles, all combined and arranged substantially as shown and described.

3. The herein-described improved bog-cutter, consisting of the bottom piece, the two cutting-blades, the draft-post, the adjustable clevis attachment, the handles, and the adjustable guiding-blade provided with lifting-lever and securing pin or bolt, all arranged to operate substantially as and for the purpose set forth.

265,877. MEANS FOR UTILIZING SECONDARY BATTERIES ON TELEPHONE-CIRCUITS. CHARLES E. BUELL, New Haven, Conn., assignor of two-thirds to James G. Smith, Hackensack, N. J., and George W. Coy, Milford, Conn. Filed Dec. 5, 1881. (No model.)

Brief.—An abnormal current causes magnet B to attract its armature when the current is divided, part passing directly to ground and part through an alarm.



Claim.—1. The combination, with a device for protecting telephonic, telegraphic, and signaling instruments from injury by abnormal powerful currents of electricity, such device comprising means for changing normal line-circuit to ground, of an electric bell in the ground circuit or branch thereof, substantially as and for the purpose set forth.

2. The combination, with the electric magnet B and armature D, having front and back stops, d d', and spring C, of insulated attachment or tail-piece D', with front and back stops, d^2 d^3, and spring F, the latter being in normally-open circuit with front stop d^3, whereby when armature D is attracted a division of the working current is effected, part going through the magnet to maintain the energization of the latter and part going direct to ground, as set forth.

265,879. FIRE-ESCAPE. THOMAS DARBY, Buffalo, N. Y., assignor of one-half to Charles A. Gerlach, same place. Filed Aug. 1, 1881. (No model.)

Brief.—The endless ladder is prevented from moving, except in one direction, by a ratchet and spring-pawl on the shaft on which it turns, and a brake controls its speed. A basket gathers the ladder as it is being raised and is supported in an elevated position by a lever, which is operated by a rope passing down and outside of the house.

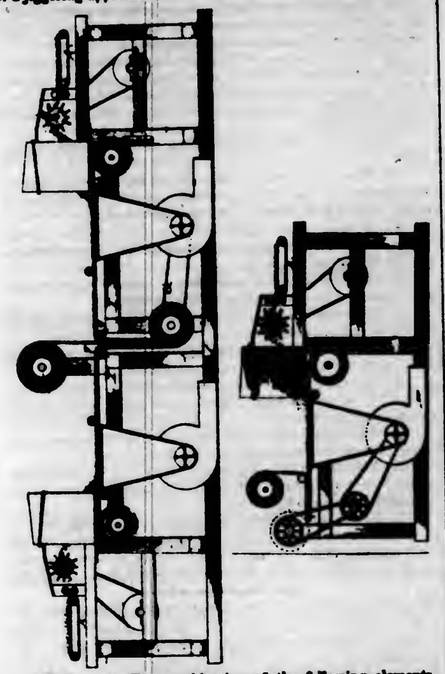
Claim.—1. In a fire-escape, the combination, with an endless ladder, F, of supporting wheels or pulleys E and a ratchet mechanism, G g, whereby the ladder is prevented from moving except in the proper direction, substantially as set forth.

2. In a fire-escape, the combination, with the endless ladder F, of the supporting-wheels E, brake mechanism H I, and ratchet mechanism G, all mounted in a traveling carriage, C, substantially as set forth.

3. The combination, with the endless ladder F, of the basket S and mechanism whereby the basket is elevated, the basket being adapted to gather the endless ladder as it is elevated, substantially as set forth.

4. The combination, with the endless ladder F and basket S, of the lever U, whereby the basket is supported in an elevated position, and mechanism whereby the lever U is released at desire and the basket and ladder permitted to drop, substantially as set forth.

265,880. BROILER. WILSON P. DOBSON, Philadelphia, Pa., assignor to F. Howard Eldridge, same place. Filed Feb. 14, 1881. (No model.)



Claim.—1. A broiler consisting of two corrugated plates, in which are perforations in the upper part of the corrugations, substantially as and for the purpose set forth.

2. The corrugated plates A A, in which are perforations in the upper part of the corrugations, substantially as described, and for the purpose set forth.

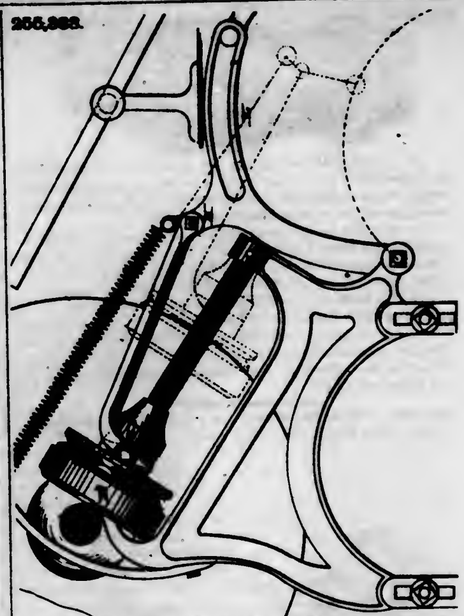
265,881. MAKING FUR-FACED FABRICS. WILLIAM E. DOUBLEDAY, New York, N. Y., assignor to Ellen H. Doubleday, same place. Filed Jan. 26, 1882. (No model.)

Brief.—The fur fiber is blown upon a perforated plane former, over which travels some perforated material, as mosquito-netting or millinet, and is drawn upon this non-felting material by an air suction. It is then transferred automatically to a felting material unwound from a roll and subsequently stuck thereon by means of a of a jiggering apparatus.

Claim.—1. The combination of the following elements, namely: means adapted to move a continuous non-felting fabric over a perforated surface, means adapted to deposit fur upon said fabric, means for causing the fur to adhere to said fabric, and means for supplying a felting fabric to the layer of fur thus produced, substantially as set forth.

2. The combination of the following elements, namely: means adapted for moving a sheet of cloth, composed wholly or in part of felting fiber, in combination with mechanisms, substantially as described, adapted to apply to each side of the cloth a fur batt, substantially as described.

265,882. TRACE-CARRIER. GEORGE F. EBERHARD, Cleveland, Ohio, assignor to the Eberhard Manufacturing Company, same place. Filed July 20, 1881. (Model.)



Claim.—In a trace-carrier, the combination, with the carrier-frame A, of the pivoted double hook B, provided immediately in front of its base-bar, and rising from the arms of the hook with the rounded vertical studs D D, whereby the double hook may be turned up to receive the cockeyes, substantially as specified.

265,883. POWER-TRANSMITTER FOR SEWING-MACHINES. CHARLES W. FOSTER, New Haven, Conn. Filed Jan. 6, 1882. (No model.)

Claim.—1. The combination of the main shaft having a fixed friction drive wheel or disk, the counter-shaft secured rigidly in its bearings, the friction-pulley mounted loosely upon said counter-shaft, mechanism for adjusting it upon said counter-shaft, and a suitably-arranged retracting-spring, substantially as set forth.

2. The combination of the loose pulley having an annularly-grooved hub, an adjusting-lever operated by a treadle, and a pivoted forked connecting-rod having pivoted bearing-lugs for the loose pulley, substantially as set forth.

265,883.

2. The combination, with the loose and adjustable friction-pulley, of a driving-disk provided near its center with a shallow annular recess, substantially as and for the purpose set forth.

4. The combination of the counter-shaft secured rigidly in suitable rests or brackets, the loose pulley adjustable upon said counter-shaft and having a recess to receive the bracket at one end of said counter-shaft, and a brake-block or cushion secured in the recess of said pulley, substantially as set forth.

5. The combination of the driving-disk having an annular recess, the counter-shaft secured in rests or brackets, and the loose adjustable friction-pulley having a recess provided with a brake-block or cushion adapted for contact with the rest at one end of the counter-shaft, substantially as set forth.

6. A friction driving wheel or disk provided, near its center with an annular recess to relieve it from contact at that point with the friction pulley or pulleys driven by said disk, substantially as set forth.

7. A friction-pulley having a central annular recess to receive a brake-block or cushion, as set forth.

8. A bracket or hanger supporting one end of a shaft and adapted to engage a brake-block or cushion placed in a central annular recess of a loose pulley moving upon said shaft, substantially as set forth.

9. A bracket or hanger supporting one end of a shaft and adapted to engage a brake-block or cushion placed in a central annular recess of a loose pulley moving upon said shaft, in combination with a retracting-spring adapted to hold said pulley automatically in contact with said bracket, substantially as set forth.

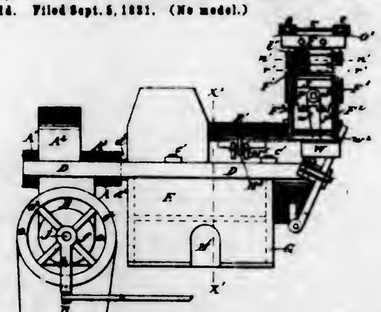
10. As an improvement in power-transmitters for sewing-machines, the combination of the main shaft carrying a driving-disk having a central annular recess, the counter-shaft mounted rigidly in brackets or rests, the loose friction-pulley having a recess provided with a brake-block or cushion adapted to engage one of the brackets supporting the counter-shaft, mechanism for adjusting the said pulley while in motion upon the counter-shaft, and a retracting-spring, arranged substantially as herein described, as and for the purpose set forth.

11. In a power-transmitter constructed substantially as herein described, the herein-described main frame, supporting the main and the counter shafts, and having vertically-adjustable legs or supports, as and for the purpose set forth.

265,884. CHUCK FOR HOLDING BOTTLES. WILLIAM FOX, Steubenville, Ohio, assignor to himself and Robert J. Beatty, same place. Filed Jan. 25, 1882. (No model.)

Claim.—1. A chuck for holding glass bottles, having on its inner wall one or more bands of felt, cloth, or equivalent soft elastic material, substantially as and for the purpose set forth.

255,384.



2. A chuck for holding glass bottles, having in its inner face or chamber wall one or more grooves, *c*, with a soft, elastic band seated therein, such band or bands having thickness in excess of the depth of groove, substantially as set forth.

3. A chuck, A, for holding glass bottles, having a comparatively narrow band, *c*, of soft elastic material, secured to its inner chamber wall near its inner end, substantially as described, whereby the bottle is held by uniform pressure applied near its base.

4. The chuck A, for holding glass bottles, having chamber *a* therein equal in length to the desired length of finished article, with a rest or stop, *a'*, at the inner end of such chamber and one or more comparatively narrow bands, *c c'*, of soft elastic material, secured to the side wall of such chamber, substantially as and for the purposes set forth.

255,385. BRICK-MACHINE. WALTER E. GARD, Baltimore, Md. Filed Sept. 5, 1881. (No model.)

Claim.—1. The combination of the oil-case B, horizontal shaft J', worm-pinion K, worm-gear R, and pug-mill shaft I or I', constructed and operated substantially as and for the purpose described.

2. A pug-mill shaft with a friction-surface, *i*, firmly attached, friction-rollers *h*, operating between it and friction-plate *w*, all combined, substantially as and for the purpose herein specified.

3. The combination of oil-case B, worm-gear R, friction-plates *w i*, and rollers *h*, as set forth.

4. The oil-case covering A^2, with caps A' and A^3 attached, substantially as specified.

5. The combination of cross-head J, flange D, and pug-mill E, when constructed and cast in one single piece, as herein specified.

6. The cross-head J, oil-case B, flange D, pug-mill E, and supports G, constructed and arranged substantially as shown and described.

7. The bearing A, case B, opening *d*, opening *d'*, and space d^2, as arranged and constructed as to prevent clay from working into the bearing A, as set forth.

8. A shoulder, *w'*, on pug-mill shaft I or I', adapted to fit against a master-wheel, R, for the purpose of keeping the shaft from being forced through the wheel by the back-pressure of the clay, as specified.

9. A tempering-blade, M, without a hub or shank, in combination with a bolt, d^2, or its equivalent, used to attach the blade M to a projection, L or M', on mud-shaft I or I', substantially as specified.

10. A pug-mill shaft with spiral thread L, in combination with a detachable tempering-blade M, substantially as described.

11. An expressing-screw wing, N, without a hub, made in one piece with it, in combination with bolts d^2 and projection L or M' of mud-shaft I or I', as specified.

12. A pug-mill shaft with a continuous spiral thread, L, in combination with a detachable expressing-screw wing, N, constructed as described.

13. A tempering-blade, M, without a hub or shank, in combination with an expressing-screw wing, N, without a hub, as specified.

14. The projection M' of a pug-mill shaft, I', so made that it performs the office of a hub or shank for a tempering-blade, M, which is attached to it by a bolt, d^2, or its equivalent, as specified.

15. The safety-plate R', with hinge H^2, arranged as and operating in the manner herein set forth.

16. The die U, constructed and arranged to guide a bar of clay so that it will take an upward or ascending direction as it issues from said die, substantially as described.

17. The die U, to guide a bar of clay so that it will take an ascending or upward direction, in combination with a receptacle, S, filled with sand and placed on top of said die U, which causes the sand to adhere to the ascending bar of clay without the use of rollers, as specified.

18. The die U, in combination with swinging bolts *s'*, as set forth.

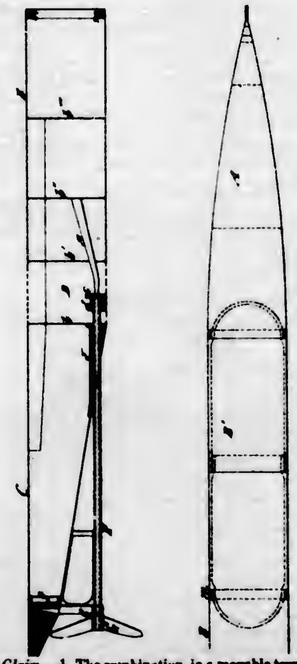
19. The sand-receptacle S, so arranged that the material to be sanded enters at the bottom or under side of the receptacle and passes upward to be sanded, in the manner described.

20. A sand-receptacle, S, with hollow sides S^2, in which steam or hot fluids can circulate to keep the sand dry, substantially as and for the purpose set forth.

21. The application of heated sand to a bar of clay in its passage through a sand-receptacle, as herein specified.

22. The slots *s'* in form V, through which a severing device may be passed, as specified.

23. The links V V', in combination with eccentric-shaft *m* *m'* m^2, or its equivalent, for the purpose described.



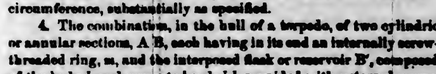
24. The rods *r*, bell-crank *e*, eccentric-shaft *m* *m'* m^2, and links V V V' V', all arranged and operated substantially as and for the purpose herein stated.

25. The counterweighted carriage F F' F^2 F^3 W, substantially as herein described, for the purpose set forth.

26. The die U, sand-receptacle S, press V V V' V', and guide-rollers X, when combined and operated as herein shown and described, for the purpose set forth.

27. The sand-receptacle S, so constructed and arranged that it will sand a bar of clay while it is passing through it in an upward and ascending direction without the use of rollers or other means to cause the sand to adhere to the bar of clay, as specified.

255,386. SUBMARINE TORPEDO. MARTIN HEDER, Bayonne, N. J., and MARCUS A. HANDY, Newport, R. I., assignors to Frederic H. Snyder, Jersey City, N. J. Filed July 21, 1881. (No model.)



Claim.—1. The combination, in a movable torpedo, of a water-compartment for an engine, having openings for the admission of water to it, a screw-shaft extending therefrom, and a tube leading aft from said compartment to the exterior of the hull and loosely surrounding said screw-shaft, substantially as specified.

2. The combination of the middle section, B, comprising a water-compartment, D, for an engine, the conical after or stern section C, arranged with its upper side in line with the upper side of the section B, the screw-shaft F, and the tube J, affording provision for the circulation of water from said compartment D around the screw-shaft, substantially as specified.

3. The combination, in the hull of a movable torpedo, of two cylindric or annular sections and an interposed flask or reservoir having bands made separate from its body and inserted into its body, the said bands being also inserted into the sections between which the flask or reservoir is placed and secured therein at the circumference, substantially as specified.

4. The combination, in the hull of a torpedo, of two cylindric or annular sections, A B, each having in its end an internally screw-threaded ring, *m*, and the interposed flask or reservoir E', composed of the body *h* and separate bands *l l*, provided with external screw-threads for engaging with the internally screw-threaded rings *m*, substantially as specified.

255,387. CUTTER-BAR FOR MOWERS AND REAPERS. ANDREW H. LACKEY, Brownsburg, Va., assignor to James A. Porter and James H. Chambers, Mace, Ind. Filed May 17, 1881. (No model.)

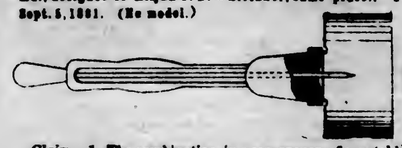
Claim.—The combination of the sickle-sections having notched dovetail shanks, the notches E being beveled at *e*, the bar G, having beveled blocks F, adapted to ride up on bevels *e*, and the adjusting-nut H, substantially as described.

255,388. HANDLE FOR GLASS COVERS. DANIEL E. LADD, Baltimore, assignor of one-half to Elijah J. B. Whittaker, Belair, Md. Filed Jan. 30, 1882. (No model.)

Claim.—1. A blown-glass shade or cover provided with a detachable handle secured by means substantially as described, as set forth.

2. A glass shade or cover provided with a detachable handle secured by means of a circular metal plate, D, upon the top of the glass cover, and a circular plate, E, within the glass cover, so arranged that the rims or edges of the two plates coincide or are directly opposite, and a bolt one end of which is attached to the handle to secure the two plates firmly in said position, as set forth.

3. A glass shade or cover provided with a detachable handle secured by means of a circular concavo-convex metal plate, D, upon the top of the glass cover, and a circular saucer-shaped plate, E, within the glass cover, a rubber washer against the glass, a filling in each plate of plaster-of-paris, the latter covering the rubber washer, and a bolt one end of which is attached to the handle to secure the two plates firmly in position, as set forth.



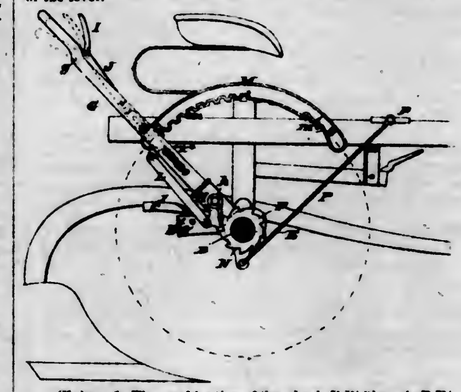
255,389. FRICTION RATCHET-MOTOR. ALFRED LEE, Paulding, Ohio, assignor of one-half to Francis B. De Witt, same place. Filed Jan. 24, 1882. (No model.)

Claim.—1. The combination of section C and straps E and G with means for operating the same in opposite directions with section B, and means contained within the limits of said sections and yieldingly held away from the shaft A by an intermediately-arranged spring, for operating said shaft, all substantially as shown and described.

2. The combination of shaft A, sections B and C, ratchet-bar D, spring *d'*, straps E and G, spring H, and treadle F, substantially as shown and described.

255,390. CAN-OPENER. WILLIAM B. MONTGOMERY, Belair, Md., assignor to Elijah J. B. Whittaker, same place. Filed Sept. 5, 1881. (No model.)

Claim.—1. The combination, in a can-opener, of a metal block to fuse the solder about the can-cap and a piercer-rod to penetrate the cap and remove it, as set forth.



2. The combination, in a can-opener, of a metal block to fuse the solder and a rod passing freely vertically through the block, having its extremity pointed to penetrate the can-cap, as set forth.

3. The combination, in a can-opener, of a metal block to fuse the solder, a pointed rod to penetrate the can-cap, and a handle attached to the metal block, as set forth.

4. The combination, in a can-opener, of a metal block to fuse the solder about the can-cap, means to remove the cap, and a detachable handle, as set forth.

255,391. SULKY-PLOW. GILPIN MOORE, Molino, Ill., assignor to Deere & Co., same place. Filed Nov. 4, 1881. (No model.)

Brief.—Devices for locking the wheel to lift the plow by the draft and for automatically unlocking it. The finger-latch is divided from the pawl-engaging devices, the latter being thrown out of contact by a spring. The rack-holding teeth is released by the same movement that engages the pawl to the wheel-ratchet. A slighter movement of the finger-lever will only release the lever from the rack for hand-lifting. For these two uses a double finger-latch may be used, one arranged to throw farther when grasped than the other. An unlocking-cam arranged upon a hollow stud of the lever.

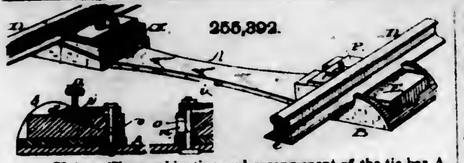
Claim.—1. The combination of the wheels B B', the axle D D', the plow-beam *c'*, and ratchet F with the lever G, pawl H, lever I, rod J, part K, rod L, and spring O, substantially as set forth.

2. The combination of the wheels B B', axle D D', and ratchet F with the lever G, the part K, tooth k^4, the segment M, and spring O, substantially as set forth.

3. In a wheel-plow, as described, the combination of the axle D D', levers G and I, and rod J with part K, tooth k^4, rod L, spring O, and segment M, substantially as described.

4. The combination of the axle D, the lever G, having the boss g^3, the cam N, and the pawl H, substantially as described.

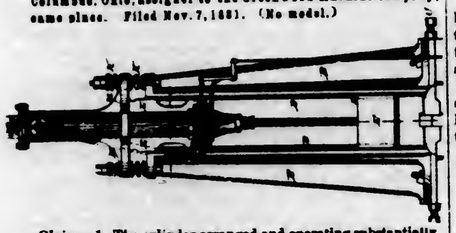
5. The combination of the axle D, the lever G, the wheel B, the ratchet F, the pawl H, the cam N, the segment M, the part K, and tooth k^4, substantially as described.



6. The combination of the axle D, the wheel B, the ratchet F, the lever G, the boss g^3, the cam N, and means for keeping the cam from turning on the boss.

7. The combination of the loose cam N and the rod P, substantially as and for the purpose described.

255,392. RAILROAD-TIE. PHILIP PENDLETON, Bath, W. Va., assignor of one-half to James W. Denver, Wilmington, Ohio. Filed July 14, 1881. (No model.)



Brief.—A tie-bar connects removable boxes, in which are inserted blocks, on which rest the rails, which are secured by means of binding-plates and bolts.

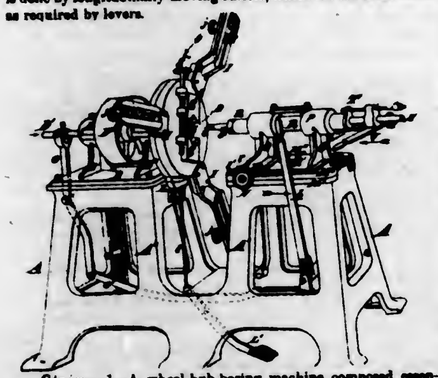
255,392.

Claim.—The combination and arrangement of the tie-bar A, removable boxes B B, blocks E, binding-plates P P, bolts *o*, and rails D, substantially as and for the purpose set forth.

255,393. STEAM DROP-HAMMER. JULIUS C. RICHARDSON, Columbus, Ohio, assignor to the Greenwood Machine Company, same place. Filed Nov. 7, 1881. (No model.)

Claim.—1. The cylinder arranged and operating substantially as described, and provided with grooved flanges parallel to its bore, by means of which it is fitted between vertical uprights, so as to be capable of moving longitudinally when the hammer is operated, as set forth.

2. In a steam drop-hammer, the cylinder fitted between and supported upon vertical guides, cushion-springs being interposed, as described, for the purpose set forth.



3. In a steam drop-hammer, the cylinder fitted between and supported upon vertical guides, cushion-springs being interposed and superimposed, as described, for the purpose set forth.

4. In a steam drop-hammer, the cylinder having the interior cushion-spring, K, vertically adjustable above the piston, said cylinder being supported upon the vertical guides B between two sets of cushion-springs, K K, substantially as and for the purpose set forth.

5. In a steam drop-hammer, the combination of the cylinder, the steam-chest, the port W, the slide-valve S, the pipe Z, and the exhaust-pipe A', having valve B', with mechanism for operating the valves S and B' simultaneously, substantially as herein described, for the purpose shown and specified.

255,394. WHEEL-HUB-BORING MACHINE. JOHN T. RICHMOND and HENRY J. CORNEGMAN, Jr., Cincinnati, Ohio, assignors to Cordesman, Egan & Co., same place. Filed Apr. 8, 1881. (No model.)

Brief.—The wheel is held in a revolving chuck having adjustable clamping-pieces for the hub part and rim. The cutting is done by longitudinally-moving cutters, which are fed to the work as required by levers.

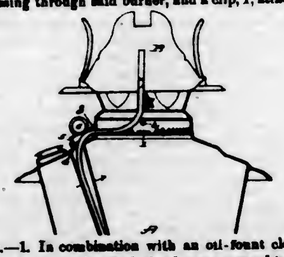
Claim.—1. A wheel-hub-boring machine composed essentially of a duplex bed or table, A' A'', a revolving wheel-chuck mounted on a hollow revolving shaft supported in bearings on one of the said tables and revolving in an open space between the tables, a longitudinally-moving non-revolving shaft supported within said revolving shaft and armed with a cutter, and a second longitudinally-moving non-revolving shaft and cutter mounted upon the opposite table, both of said cutter-shafts being operated endwise by suitable actuating-levers at one end of the machine, whereby the revolving hub is adapted to be bored from its opposite sides by the longitudinally-moving knives, substantially as described.

2. The combination, with the cutting-knife, of the rotary wheel-chuck consisting of the wheel carrying the hub-clamps adjusted by a right-and-left screw, and the bent radial arms I with the adjustable clamps, substantially as described.

3. The combination, in a wheel-hub-boring machine, of the wheel-chuck mounted upon a hollow rotary shaft, the cutter-shaft IV, arranged to be moved through the said hollow shaft, and the levers *e e'* and hand-lever A, all arranged to effect such movement of the knife-shaft, substantially as described.

4. The combination of the shaft S and the knife *s* with the hollow shaft R, the lever V, connected with a block secured upon the said shaft carrying the knife, and an adjustable connection between said block and the tubular shaft, the lever being pivoted to a bar secured to one of the bearings, *p*, substantially as described.

5. The combination of the hollow shaft R and its contained shaft S, carrying cutters *s s'*, with the adjusting devices T and lever V, for the simultaneous operation of the cutters *s s'*, substantially as herein set forth.



255,395. HALTER. HENRY HORNBECK, Parma, N. Y., assignor of two-thirds to Charles S. Upton and Charles H. Coates, both of Spencerport, N. Y. Filed Feb. 10, 1882. (No model.)

Claim.—In a halter, the combination, with the leather head-piece A and nose-piece B, of the rope or strap C, provided with the two bights or branches C' C', said bights being permanently attached to the ends of the nose-piece, thence extending upward and passing loosely through the loops on the ends of the head-piece, thence extending downward, joining together, and having a loop at the bottom, through which the main end of the rope passes, thus forming a noose, as shown and described, and for the purpose specified.

255,396. LAMP. ANDREW ROSENBUSCH, Quincy, Ill., assignor to himself and Adolph F. Roth, same place. Filed Jan. 6, 1882. (No model.)

Brief.—The burner is attached to the lamp-body by means of a pin, 2, passing through said burner, and a clip, 1, attached to the lamp-body.

Claim.—1. In combination with an oil-fount closed at the point where the burner is attached, a burner secured to such fount by a clip, substantially as described.

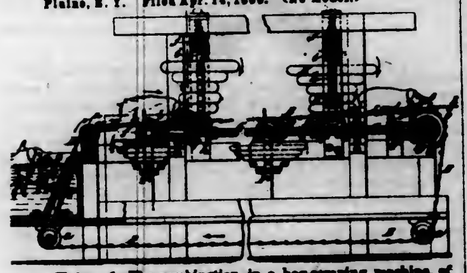
2. In combination with the oil-fount A and burner B, a wick-tube extending partly to the bottom of said fount and entering the burner from the outside both of the burner and fount.

3. The combination of the burner having central wick-tube, a raising and lowering device, and a slot, 3, and an oil-fount having an opening, 4, beyond the circumference of the burner, substantially for the purpose set forth.

4. In combination, the oil-reservoir, the burner, the exterior wick-passage, 5, connecting said reservoir and burner, and the removable cover 6.

255,397. SELF-LEVELING BERTH. GERARD SICKELS, Boston, Mass., assignor to Harry B. Wood, same place. Filed Jan. 9, 1882. (No model.)

Claim.—1. The combination, with the berth and its supporting-platform pivoted to tilt in any vertical plane, as described, of the rod *m*, pivoted to the berth at the upper end, to the deck at the lower end, and having midway a bearing in the tilting platform, below the pivots thereof, substantially as and for the purpose specified.



255,397.

2. The combination of a platform or support pivoted so as to tilt in any vertical plane, a berth or other structure adapted to slide laterally and longitudinally on said support, and a bar or rod pivoted at one end to a fixed part of the vessel below the berth, and having at its upper end a bearing in the berth and at its central portion an intermediate bearing in the tilting frame, below the pivots thereof, said parts co-operating to keep the berth or structure in a level position, as set forth.

3. The combination, with a berth or other structure for use on navigable vessels, of a frame or support on which the berth is adapted to slide longitudinally, and adapted to slide laterally with the berth, a platform supporting said frame and berth and adapted to tilt or oscillate in any direction, and a rod pivoted at one end to the deck or other fixed part of the vessel below the berth, and having a bearing at its other end in the center of the berth, and an intermediate bearing in the tilting platform, as set forth.

255,398. HOG-SCRAPING MACHINE. REINELANDER C. TOMPKINS, New York, assignor of one-half to Amasa Spring, White Plains, N. Y. Filed Apr. 14, 1880. (No model.)

Claim.—1. The combination, in a hog-scraping machine, of scraping devices, an endless chain or carrier for drawing the carcasses through, over, or in contact with said scraping devices, a scalding-tub arranged in proximity to an ascending portion of said chain or carrier, and means for attaching the carcasses while in the tub to said portion of said chain or carrier, whereby they may be taken directly from the tub, drawn upward therefrom, and carried to the scraping devices, substantially as specified.

2. The combination, with a tub or vessel and a trunk or tube, A', of a series of scraping devices and an endless chain or carrier passing up through said trunk or tube for the purpose of taking the carcasses from the tub or vessel and presenting them to the scraping devices, substantially as specified.

3. The combination, with the scalding tub or vessel and an endless chain or carrier passing through or arranged in close proximity to said tub or vessel, so as to draw the carcass directly therefrom, of a scraper or scraping device, which is arranged within said tub or vessel, and over which the carcass passes as it is drawn from said tub or vessel, substantially as specified.

4. The combination, with a scalding tub or vessel, an endless chain or carrier passing through or arranged in close proximity to said tub or vessel, so as to draw the carcass directly therefrom, and scraping devices past which the carcass is drawn by said chain or carrier after leaving said tub or vessel, of a scraper or scraping device, which is arranged within said tub or vessel, and over which the carcass passes as it is drawn from said tub or vessel, substantially as specified.

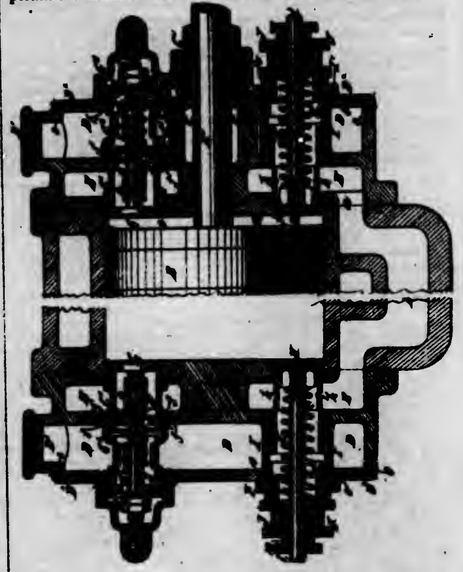
5. The combination of the tub or vessel A, the chain or carrier B, and the rotary scraping device I, arranged in, said tub or vessel, substantially as specified.

6. In a hog-scraping machine, the combination, with a rotary shaft or shafts, of a series of scrapers or scraping devices made of elastic material or having an elastic connection with said shaft or shafts and having salient rounded edges or faces, substantially as specified.

7. The combination, with an endless chain or carrier, of the hooks D, provided with downwardly-projecting prongs or arms *c*, for engaging with the links of said chain or carrier, substantially as specified.

8. The combination of the endless chain or carrier, the delivery-table, under which the chain or carrier passes, provided with an incline over which the chain or carrier passes, and the hook provided with the prong or arm *c*, which rides upon said incline and disengages said hook from said chain or carrier, substantially as specified.

9. The combination of the chain or carrier B, the delivery-table K, provided with inclines *n* and *o*, and the hook D, provided with the prong or arm *c*, and side wings or arms, *p*, all substantially as specified.



255,399. BARBED FENCE. ANDREW J. UPHAM, Sterling, Ill., assignor to the Washburn & Moen Manufacturing Company, Worcester, Mass. Filed Sept. 16, 1881. (No model.)

Claim.—The process of manufacturing barbed-fence material which consists in taking a metallic strip, A, about seven-sixteenths of an inch in width and of any suitable thickness, and passing the same flatwise between a stamp and a die having conformed faces, so as to produce the punctures *x x* in and conformation of the strip A shown in Fig. 2, then passing the barb B transversely any desired distance through the punctures *x x* and covering each barb diagonally the desired length, and finally passing each strip A, thus furnished with the barb B, between two horizontal rollers having flat faces, by means whereof the strip A and barb B are pressed into nearly the same plane, thus slightly bending the barb B at the punctures *x x* aforesaid and firmly seating each barb, substantially as herein described.

255,400. AIR-COMPRESSOR. JOHN B. WARING, New York, N. Y., assignor of one-half to Milan C. Bullock, Chicago, Ill. Filed Sept. 14, 1880. Renewed Jan. 26, 1882. (No model.)

Brief.—The valves in the ends of the cylinder are adapted to permit the entrance and exit of air at each stroke of the piston.

Claim.—1. The combination, with the cylinder and piston of an air-compressor, of a discharge-valve provided with means for balancing it when working under a pressure not materially in excess of that desired, but which will have an excess of pressure upon its face and remain open when the desired pressure is exceeded, substantially as and for the purpose specified.

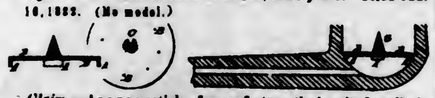
2. The combination, with an air-compressor cylinder and a

discharge-chest, of a discharge-valve which is subjected to the action of compressed air upon both sides, a valve-stem therefor, the end of which is exposed to the atmosphere, a spring for acting upon the back of said valve, and means for adjusting the tension of said spring to suit different pressures, substantially as and for the purpose specified.

3. The combination, with the hollow cylindrical valve H, provided with openings *h*, for admitting air to the back of the valve, of the stem, *l*, the end of which is exposed to the atmosphere, and the spring K, contained within the valve, substantially as and for the purpose specified.

4. The combination of the socket I, the packing-nut I', the packing *o*, the valve H, having in its cylindrical portion holes *h*, the stem *l*, the plug or nut J, and the spring K, all substantially as specified.

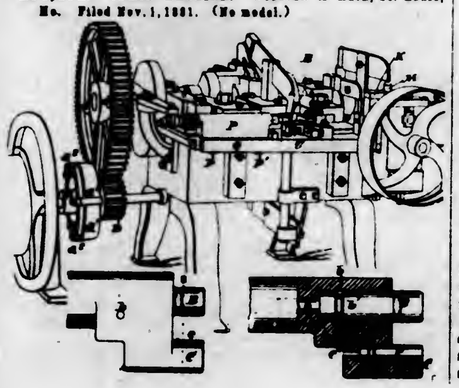
5. The combination, with an air-compressor cylinder and a hollow head therefor, of a removable cover for said hollow head, a valve-casing secured in said hollow head and projecting through said cover, and a screw-threaded nut applied to said casing outside said cover and serving as the means whereby the latter is held in place, substantially as specified.



6. The combination, with an air-compressor cylinder and a hollow head therefor, of a removable cover for said hollow head, a valve-casing secured in said hollow head and projecting through said cover, and a closed screw-threaded cap secured to said casing outside said cover and serving as the means whereby the latter is secured in place, substantially as specified.

7. The combination, with the hollow head of an air-compressor cylinder the outer wall of which is provided with a cylindrical hole, of a valve-casing comprising a cylindrical portion fitting said hole, a packing-ring placed upon the joint between the hole and the casing, and a cap for clamping said packing-ring upon said joint, the said packing forming a joint between said head and said casing, and also between said head and casing and said cap, substantially as specified.

8. The combination of the hollow head D, the removable cover D^2 therefor, the valve-casing composed of the detachable parts G' G^2, comprising a bearing or bearings for the stem of the valve, and screwed together, and the detachable cap G^3, screwed upon the part G^2 and serving to secure the removable cover in place, substantially as specified.



9. The combination, with the head of an air-compressor cylinder constructed with the two chambers or chests D E and the hole or aperture *f*, leading from one to the other, of the valve-casing composed of the parts G' G^2, connected by a screw-thread, and the packing *f'*, interposed between them and serving to prevent leakage through the hole or aperture *f*, substantially as specified.

265,401. TOBACCO-PIPE. JOHN J. WEBER, St. Clair, Pa., assignor of one-half to John B. Evans, same place. Filed Jan. 16, 1882. (No model.)

Claim.—As a new article of manufacture, the herein-described pipe-strainer, having the legs A A A A, the perforations B B B B, and the projection C, all constructed and arranged as and for the object set forth.

265,402. CHAIN-MACHINE. WILLIAM A. RUIN, St. Louis, Mo. Filed Nov. 1, 1881. (No model.)

Claim.—1. In a chain-machine, the bifurcated finger one fork of which consists of a cylindrical pin, B, secured in a bore of the finger by means of groove *b'* and pin *b*, and the other fork of which consists of a projection, C, nearly inclosing the roller *c*, which is held in place by means of groove c^2 and pin *c'*, so as to turn freely, all substantially as set forth.

2. In a chain-machine, the clutch-driving device consisting of a tight collar, H, with flange *h'*, loose pinion D, with flange *d*, dogs d^2, jam-bolts d^3, and ring d^4, all made substantially as and for the purpose set forth.

3. The combination, in a chain-machine, of the shaft G, loose pinion D, with flanges *d d'*, dogs d^2, jam-bolts d^3, ring d^4, and tight collar H, with flanges *h' h²*, all substantially as and for the purpose set forth.

4. In a chain-machine, the combination of frame K, adjustable boxes *k*, adjusting-screw *k'*, adjustable bolt N, with head N', having ribs *n* of different heights, and loose plug M, having grooves *m* of different depths, as and for the purpose set forth.

5. In a chain-machine, the combination of bracket P and support Q, the bracket being hinged to its support at one end and adjustable at its other end, and having suitable means for locking it to its adjustment, as set forth.

REISSUES.

10,064. OIL-HOLE COVER FOR JOURNALS. SMITH A. STINNER, Hoosick Falls, N. Y. Filed Feb. 1, 1882. Original No. 134,082, dated Feb. 27, 1873.

Claim.—The hereinbefore-described improvement in the apparatus for facilitating the lubrication of journals running in boxes, and the means connected therewith for excluding foreign substances from the oil-duct leading to the journal in such apparatus, consisting of the following arrangement of parts, viz: a chamber for the inclosure of the duct-closing devices constructed in the substance of the journal-box itself, having communication from its bottom part by an opening with the journal itself, the walls of which chamber constitute a guide for the movement of the plug and spring which operates the same to close the external port of such chamber, and provided at its upper part with provisions, substantially as shown, for retaining in position over the top of the plug a centrally-perforated plate, in combination with a plug having a conical head fitted to co-operate with and close the perforation of said plate on its under side, actuated by a spring beneath said head, both spring and plug being confined within said chamber substantially as described, and for the purposes set forth.

10,065. FOLDING SEAT AND TABLE. WILLIAM TUTLEY, Pana, Ill., assignor, by mesne assignments, to Edward F. Underhill, New York, N. Y. Filed Jan. 31, 1882. Original No. 155,901, dated Oct. 19, 1874.

Claim.—1. A recessed floor, in combination with a folding seat or table secured to said floor and adapted to be folded into a recess therein.

2. A recessed floor, in combination with a folding seat hinged thereto, and provided with folding legs or supports and a folding back, adapted to be folded with the seat into a recess in said floor.

3. The combination, with a recessed floor and a folding seat hinged thereto and adapted to be folded into a recess in said floor, of a cover folding into the recess and covering said seat and recess, and forming a part of the floor when thus folded.

4. The combination, with a seat adapted to fold into a recess in the floor, of a cover to said recess, forming a part of the floor when folded into said recess and a part of the seat when the latter is raised into position for use.

5. The combination, with the recessed floor, of the hinged cover B, hinged back E, and seat C, said cover being adapted to support the back when the latter is elevated for use, substantially as described.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—Northern District of New York.

LOERCHER *et al v.* CRANDAL.

Decided December 13, 1881.

1. REISSUE NO. 7,129—REISSUE VALID AGAINST DEFENDANT.

Reissue Letters Patent No. 7,129 to Charles Schuessler, for an improvement in buckle-fastenings, held not to be open to objection as to their validity so far as any question affecting the defendant's structures is concerned.

2. RELEASE IN PRESENTI—SUBSEQUENT INFRINGEMENT.

When an infringer, by agreement with the owners of a patent agrees not to make any articles infringing a certain reissued patent, and that engagement, in conjunction with his contract to pay royalty for certain infringing articles before made, formed the consideration for his release from liability for the making and selling of those articles, it appearing that the release was an absolute release *in presenti*, *Held* that such release, until set aside, relieves from all accountability for subsequent infringement by the making and selling of articles like those specified in the release.

3. BUCKLE-FASTENERS—INFRINGEMENT—COLORABLE CHANGES—MECHANICAL SKILL.

Attaching the buckle to a separate plate which is itself attached to the bottom plate of the case, instead of attaching the buckle directly to the bottom plate, does not change the nature of the invention. The plate which carries the buckle, being an additional separate plate, must be fastened in some way to the bottom plate of the case. The severance makes the reunion necessary and promotes no useful result. It is a mere mechanical change within the scope of the invention.

4. SAME—SAME.

The fact that the fastening-pins are integral with a longitudinal piece of metal on the other side of the fabric, instead of with the bottom plate of the case, does not alter the invention, the operation being substantially the same.

5. LIABILITY OF MERE IMPROVERS.

Features of construction may well be and are often equivalents of prior patented features because involving their construction and mode of operation, though going further and containing their own patentable features; and for that very reason, when the question of the novelty and patentability of such further features comes up, the prior existence of such prior patented features does not make them the equivalents of the further features so subsequently patented in such sense as to anticipate the latter, but such subsequent patentee will be held liable for infringement so far as he uses the prior invention.

Mr. A. v. Briesen for the plaintiffs.

Mr. Neri Pise and *Mr. C. M. Stone* for the defendant.

BLATCHFORD, *J.*:

This suit is brought on Reissued Letters Patent No. 7,129, granted to Charles Schuessler, May 23, 1876, for an improvement in buckle-fastenings, the original Patent No. 61,038 having been granted to Robert Meyer, as inventor, January 29, 1867, for seventeen years from January 29, 1867. The specifications of the reissue and of the original are so variant from each other in language that it is impossible to follow the one in the other. They are as follows:

Reissue.

Figure 1 is a plan view of my improved fastening, showing it applied to the back curtain and back stay of a carriage. Fig. 2 is a longitudinal central section thereof. Fig. 3 is an inverted plan view of the shell or case to which the strap is secured; Fig. 4, an inverted plan view of the shell or case to which the buckle is secured.

Similar letters of reference indicate corresponding parts in all the figures.

This invention consists in the employment, in connection with a strap and buckle, of two hollow cases or shells, to which said strap and buckle are respectively secured. That one of the two cases to which the buckle is secured has a bottom plate, to which the buckle is attached by a joint.

In the drawings, the letters A and B represent two pieces of fabric or pieces of the back stay and back curtain of a carriage, to which my invention is applied. C is the strap, and D is the buckle, by which strap and buckle the pieces A and B are to be held together. E is a case or shell, made of sheet metal or other suitable material, in form of an elongated inverted cup open at one end and at the bottom. This case or shell is provided with downwardly-projecting pins *a b*, which, when they are passed through the fabric or piece A, serve to fasten the case or shell in place on said fabric. One end of the strap C is inserted in the shell E, and secured thereto by means of the pins *a b* in the manner clearly shown in the drawings. F is another case or shell, also made of sheet metal or other suitable material, but provided at the bottom with a plate, *d*, which forms part of said case or shell F. At the open end of the case or shell F the buckle D is attached by a joint to the plate D, as shown. By means of downwardly-projecting pins *c c*, with which the case or shell F is provided, the same is fastened to the fabric or piece B in line with the case or shell E, as shown, so that the strap C can be readily buckled, and its loose end then confined in the case F, as clearly shown in Fig. 2.

If desired, the outer end of the case F may also be left open, so that the strap may be passed through when buckled.

The cases or shells E and F may be made of suitable sizes and stamped in dies of any ornamental shape or form desired, and can be used on all kinds of straps and buckles.

In place of the pins hereinabove specified, equivalent fastening means may be provided.

I claim as my invention—

1. The case or shell E, made with an open bottom and provided with the pins *a b*, adapted to pass through the strap and

Original.

The nature of my invention consists in the employment of two metallic cases, one of which acts as a covering for the end of the strap, which passes into the buckle, and is provided with pins, which pass through the leather or straps to which it is fastened, and through two perforated plates, to one of which the buckle is attached by a joint, the other being used as a plate to hold the several parts together when the ends of the pins are riveted to it, the other case being provided with pins, which pass through the leather and strap to which it is fastened, and through one metallic plate, upon which the ends of the pins are riveted.

* * *

I construct my buckle-fastening of the usual description, such as iron, copper, or brass; but sheet-iron or tin-plate, I think, would be the cheapest and best.

In said drawings, Figure 1 represents a plan view of the fastening with the strap and buckle in place. It is represented in the position it would occupy if attached to the back curtain and back stay of a carriage. Fig. 2 is a back view of the case to which the buckle is attached. Fig. 4 is a vertical section through the center of Fig. 1.

The same letters in the several drawings represent similar parts in each.

A and B represent either two straps or a piece of the back stay and back curtain of a carriage. C is the case, which fastens and holds the straps E firmly to the piece A by means of the pins F G and plate M, as shown in the section, Fig. 4. D represents the case to which the buckle is attached, and into which the end of the strap E is slipped after being buckled. K is the buckle. H H, I, and J in Fig. 3 are the pins which fasten it to the piece B by means of plate N, as shown in section in Fig. 4, to which the ends of said pins are riveted when it is desired to fasten them in place. R is a plate to which the buckle is jointed. The case C is also riveted in the same way to the plate M, which holds them more firmly in place than by the old and tedious way of sewing, and at the same time it is a plain and more pleasing ornament to the carriage.

If desired, the end of the case D may be left open, so that the strap may be passed through when buckled.

They may be made of various sizes, from the half-inch size up to two inches, and stamped in dies of any ornamental shape or form desired. They may also be used on straps of any kind, as

firmly hold it in place, substantially as and for the purpose herein shown and described.

2. The case or shell F, made with the bottom plate, *d*, and combined with the buckle D, which is attached to said plate, substantially as specified.

3. The case or shell F, made with the bottom plate, *d*, and with the projecting pins *e e*, substantially as herein shown and described.

4. The combination of the case E and strap C with the case F and buckle D, substantially as herein shown and described.

well as for harness or carriage trimmings.

I do not claim the case D alone, but

What I do claim is—

1. The combination therewith of the pins H H, I, J, or the equivalent thereof, and the plates R and N, as herein substantially described.

2. The case C, the pins F G, and plate M, for fastening the end of the strap in place, as described.

The plaintiffs claim that the defendant has infringed claims 2, 3, and 4 of the reissue. Prior to June 17, 1878, the defendant made and sold articles like Exhibit No. 1. Since that date he has not made or sold any of them. By and under the agreement of that date he settled and paid for all those articles. Although by that agreement he agreed not to make any buckle-loops infringing upon said reissue, and although that engagement, in conjunction with his contract to pay royalty for the articles before made, formed the "consideration" for his release from liability for the making and selling of those articles, yet the release was an absolute release *in præsenti*; and even though he may subsequently have infringed, the release must stand till formally set aside, and operates to exclude from this suit all further accountability for articles like Exhibit No. 1, such release being set up in the answer.

The defendant admits the making and selling after August 1, 1878, of articles like Exhibit No. 2. The sale of articles like Exhibit No. 3 since the release is not proved. No. 2 and No. 4 being the only structures involved, the only claims of the reissue which need be considered are claims 2 and 3.

Claim 2 requires that there shall be a case or shell like the case or shell F; that it shall have a bottom plate like the bottom plate *d*; that such case or shell having such bottom plate shall be combined with a buckle like the buckle D, and that such buckle shall be attached to such plate. The projecting pins for attaching the case or shell to a fabric do not appear to be an element in claim 2. The specification describes the case or shell F as hollow, as made of sheet metal or other suitable material, and as provided at the bottom with a plate, *d*, which forms a part of the case or shell. One end of the case or shell is open, and the buckle D is attached to the bottom plate at that end by a joint, so as to project outwardly. The other end of the case or shell is either open or closed. The case or shell is provided with downwardly-projecting pins, which start from the bottom plate and pass through the fabric to which the shell or case is to be attached, and serve to attach the shell or case to the fabric. Equivalent fastening means may be used in place of the downwardly-projecting pins. Claim 3 combines the case or shell F, the bottom plate, and the pins, omitting the buckle.

No. 2 has a hollow case or shell like F, made of sheet metal, and provided at the bottom with a plate which forms a part of the case or shell. One end of the case is open and the other is closed. There is a buckle at the open end, but it is not attached to the bottom plate by a joint. It is attached by a joint to a short piece of flat sheet metal, so as to project outwardly. This short piece carrying the buckle is of two thicknesses, the metal being bent to form the joint for the buckle, and is beneath and close up against the lower surface of the bottom plate. In order to secure it to the bottom plate there is a third flat piece of metal lying longitudinally underneath, which has at its extreme end farthest from the buckle an integral upwardly-projecting pin or fin, which enters a hole in the bottom plate and is intended to be bent over and down and clinched inside the shell against the upper surface of the bottom plate. The other end of such third longitudinal piece has at its extreme end nearest the buckle two integral upwardly-projecting pins or fins lying in line, side by side, one each side of the center of its width, and extending each from near such center to the outer edge, each of which enters and passes through a separate hole for it through each of the two thicknesses of the short piece which carries the buckle, (the two holes for each pin or fin being coincident,) and then enters a separate hole for it in the bottom plate, and is intended to be bent over and down and clinched inside the shell against the upper surface of the bottom plate. Thus, when the pins or fins are in place and clinched, the buckle is held firmly and the structure becomes a unit.

No. 4 has a hollow case or shell made of sheet metal, and provided at the bottom with a plate, which forms a part of the case or shell. Both ends of the case are open. There is a buckle at each end not attached to the bottom plate by a joint. A buckle is attached by a joint to each end of a separate longitudinal plate, which is longer than the bottom plate. Each buckle projects outwardly. Such separate plate is for a distance at each end of it two thicknesses, the metal being bent to form the joint for the buckle, and is beneath and close up against the lower surface of the bottom plate. In order to secure it to the bottom plate there is a third flat piece of metal lying longitudinally underneath, and somewhat shorter in length than either such separate plate or the bottom plate, which has at each extreme end of it two integral upwardly-projecting pins or fins lying in line, side by side, one on each side of the center of its width and extending each to the outer edge, each of which enters and passes through a separate hole for it through each of the two thicknesses of such separate plate which carries the two buckles, (the two holes for each pin or fin being coincident,) and then enters a separate hole for it in the bottom plate, and is intended to be bent over and down and clinched inside the shell against the upper surface of the bottom plate, there thus being four of such pins or fins. So, when the pins or fins are in place and clinched, the buckles are held firmly and the structure becomes a unit.

It is manifest that there is involved in claims 2 and 3 of the reissued patent the idea of a hollow case with a top, two longitudinal side plates, and a bottom plate, all forming a unit and a case, the case having such bottom plate being in claim 2 combined with a buckle attached to the bottom plate and having in claim 3 the downwardly-projecting pins. The buckle is secured to the case, and it is so secured by being attached to the bottom plate. The strength of the structure as a whole, composed of top sides and bottom plate united in one is availed of to hold firmly the buckle through the attachment of the buckle to the bottom plate.

The combination in claim 2 of the case, of which the bottom plate forms a part with the buckle, is effected by attaching or jointing the buckle directly to the end of the bottom plate. A pull on the buckle cannot result in displacing anything, if the buckle does not break, without displacing the structure as a whole.

In claim 3 the case, of which the bottom plate forms a part, has the downwardly-projecting pins, and when, by means of them, the structure is fastened to a fabric, no pull on the pins against the structure can displace any part of it without displacing the whole of it. In both claims the fact that the bottom plate forms an integral part of the case is a leading feature.

In the light of the foregoing suggestions, an examination of No. 2 and No. 4 shows a hollow case with a top, two longitudinal side plates, and a bottom plate, all forming a unit and a case. The case having such bottom plate is combined with a buckle. The buckle has for all practical purposes the same relation to the bottom plate as if it were attached to it. The combination of the case with the buckle is effected by means of the plate carrying the buckle and of the lower flat piece of metal and the pins or fins on the latter. The plate which carries the buckle, being an additional separate plate, must be fastened in some way to the bottom plate of the case. The severance makes the reunion necessary and promotes no useful result. It is a mere mechanical change, within the scope of the principle of the Meyer structure. When the parts are put together and the pins or fins are clinched the case or shell made with the bottom plate is combined with the buckle, and the buckle is as much attached to the plate for all the practical purposes of the structure as is the buckle in the Meyer structure. The strength of the case as a whole, composed of top, sides, and bottom plate united in one, is availed of to hold firmly the buckle through such combination of the case with the buckle. A pull on the buckle cannot result in displacing anything, if the buckle does not break, without displacing the structure as a whole. When the pins or fins are clinched the case, of which the bottom plate forms a part, is provided with downwardly-projecting pins, which start from the bottom plate, and after passing through the buckle-plate pass through the fabric to which the shell or case is to be attached, and serve to attach the shell or case to the fabric. The fact that the pins are integral with a longitudinal piece of metal on the other side of the fabric makes no difference. They are the projecting pins of Meyer in that when clinched they project from the bottom plates toward and through the fabric and fasten the combined case and buckle to the fabric. When the structure is fastened to a fabric no pull on the pins against the structure can displace any part of it without displacing the whole of it. The same results follow as in the Meyer structure, from the fact that the bottom plate forms an integral part of the case.

The defendant has a patent, granted to him July 23, 1878, No. 206,298, under which he claims the right to make No. 2 and No. 4. They are described in that patent. That patent claims (1) the third flat piece of metal, with its integral pins or fins, in combination with the separate buckle-plate having holes in it corresponding with the pins or fins, for the purpose of securing the buckle in proper relation to the case; (2) the combination, with the third flat piece of metal having its integral pins or fins, of the separate buckle-plate and the case with its bottom plate, both of the latter having holes in them coincident with said pins or fins when secured to a curtain by means of such interior clinching of the pins or fins.

It may be that these claims may be sustainable for their specialties, notwithstanding prior structures; but still No. 2 and No. 4 embrace points of construction which are the equivalent of the points of construction claimed in claims 2 and 3 of Reissue No. 7,129. Beyond that what is patented by No. 206,298 is only an improvement still involving the principle of what is claimed in said claims 2 and 3.

On the question of infringement, features of construction may well be and are often equivalents of prior patented features, because involving their construction and mode of operation, though going further and containing their own patentable features; and for that very reason, when the question of the novelty and patentability of such further features comes up, the prior existence of such prior patented features does not make them the equivalents of the further features so subsequently patented in such sense as to anticipate the latter. An illustration of this is found in the case of *Crandal* v. *Walters*, a suit brought on the Davis patent, decided herewith.

The validity of the reissued patent is attacked. The drawings of the original and the reissue are structurally the same, although the lettering is changed and figures 2, 3, and 4 are differently numbered in the two. Criticism is made on the facts that the original speaks of "metallic" cases and the reissue of "hollow" cases; that the original speaks only of "metallic materials" while the reissue speaks of "sheet metal or other suitable material"; that in the original the pins are said to be riveted to the lower plate, N, after they have passed through the curtain and through the plate N, so as to fasten the buckle-plate R to the curtain, and claim 1 of the original is for the combination of the case and the pins, or their equivalents, and the plates R and N, while in the reissue the plate N is not lettered in the drawings and is not mentioned in the text or in claims, and the statement in the reissue is that the case is provided with downwardly-projecting pins which, when they are passed through the fabric, serve to fasten the case in place on the fabric.

Assuming that Meyer was the first to make a case with a bottom plate forming part of it combined with a buckle attached and jointed to said plate and furnished with pins capable of attaching the structure as a whole to a curtain, it is immaterial whether the plate N is used or not, or whether the pins are clinched on that plate or on the curtain, or whether the pins are of such large dimensions that they have to be clinched by hammering their ends, or of such small dimensions that they can be clinched by bending them over, even with the fingers, so long as the pins project downward from the bottom plate of the case and go through the fabric and are clinched on the other side of it. This Reissue No. 7,129, was before Judge Wallace in this court in the case of *Schussler* v. *Davis*, (13 O. G., 1011.) He there says:

> The description as well as the drawings and model accompanying the original patent clearly point out the invention claimed in the reissue. The improvement consists in a compact device embodying a loop bottom plate and buckle to be attached to a strap by rivets or an equivalent fastening. In my view the valuable feature of the improvement does not consists in the method by which the case is fastened to the strap, but in the case itself, as forming a loop and buckle combined, and its adaptability to being fastened by various methods to the strap. In the original patent the claim did not cover the combination of the buckle with the case, or, speaking more accurately, with the bottom plate of the

shell of the case, but was limited to a combination of the pins or rivets with the case. It was the object and the proper office of the reissue to correct this omission, so as to protect the patentee to the full extent of his invention.

The defendant's structure in that case was not the same as the defendant's structure in this case, but consisted of a metallic case with fins or lugs integral with it and projecting down from it, and of a plate underneath with a buckle jointed to each end of it and projecting beyond the end of the case, the fins passing through slits in the plate and then through the curtain, and being clinched by bending them over on the other face of the curtain. Such a structure was held to infringe claim 2 of the reissue.

I do no not think the reissue is open to objection so far as any question affecting the defendant's structures No. 2 and No. 4 is concerned.

On the question of novelty several prior patents are set up in the answer. Only one of them is introduced—No. 49,309, to Cyrus W. Saladee, August 8, 1865. In that there are two modifications. In one the buckle is not connected to the plate. In the other the connection between the buckle and the plate is rigid and without a joint. In the Meyer structure the buckle is attached to the plate by a joint.

Five other prior patents were introduced by the defendant. None of them are set up in the answer. They are as follows: No. 26,013, to Lucius C. Chase, November 8, 1859; No. 39,217, to Frank Douglas, July 14, 1863; No. 44,554, to George Purple, October 4, 1864; No. 47,574, to Cyrus W. Saladee, May 2, 1865, and No. 47,765, to Ebenezer Brown, May 16, 1865. In Chase the buckle-frame is rigidly secured and not jointed. In Douglas the buckle-frame is not connected with the loop by the bottom plate. In Purple the buckle-frame carrying the tongue is not jointed, but the tongue has a rigid fastening. In Saladee of May, 1865, the Meyer structure is not found, nor is it found in Brown. Besides the features above mentioned as to Chase, Douglas, and Purple, the structures in them would not suggest the structure of Meyer.

As to the parol testimony in regard to prior structures by Moore and Davis and the defendant, it must be held that, in view of the construction given to claims 2 and 3 of Reissue No. 7,129 and of what the invention of Meyer has been defined to be, nothing is shown making out a satisfactory anticipation of said claims.

I think the suit is properly maintainable in the names of the plaintiffs as surviving members of the firm composed of themselves and Schuessler, and that a decree should be entered for the plaintiffs as to claims 2 and 3 for an account and a perpetual injunction, with costs.

U.S. Circuit Court—Southern District of New York.

PRATT *et al. v.* ROSENFELD *et al.*

Decided June 14, 1880.

1. DESIGN PATENT NO. 7,914—PEARL BUTTONS ARRANGED BY DOZENS, ON CARDS, IN THREE ROWS OF FOUR—REVISED STATUTES, SECTION 4929.

   A design for a card of buttons divided into spaces covered with foil by narrow bands, with a dozen of pearl buttons in rows of three by four to each space, is not a "new, useful, and original shape or configuration of an article of manufacture" within the meaning of section 4929 of the Revised Statutes, relating to the granting of patents.

2. SAME—SAME—INVENTION.

   Cards for buttons, faced with foil and divided into spaces by bands, were well known and in common use prior to such design, and there was therefore nothing in this arrangement rising to the level of inventive skill.

53

Mr. George C. Lay, Jr., for the plaintiffs.
Mr. Edmund Wetmore for the defendants.

WHEELER, *J.*:

This suit is brought upon Design Patent No. 7,914 for a design for a card of buttons divided into spaces covered with foil by narrow bands, with a dozen of pearl buttons in rows of three by four to each space. The statute (Rev. Stats., sec. 4929) authorizes the grant of a patent to any person who, by his own industry, genius, efforts, and expense, has invented and produced any new and original design for a manufacture, bust, statue, alto-relievo, or bas-relief; any new design for the printing of woolen, silk, cotton, or other fabrics; any new and original impression, ornament, print, or picture to be printed, painted, cast, or otherwise placed on or worked into any article of manufacture; or any new, useful, and original shape or configuration of any article of manufacture, the same not having been known or used by others before his invention or production thereof.

The subject of this patent is not covered by this statute, unless it is included in the term "manufacture." The buttons are however the principal thing, and they are not changed at all, either in form or appearance, by the patented invention. It affects nothing but the card, and that is not a card for buttons to be used for successive sets, but a card of buttons, which constitutes a mere method of putting them up for sale to attract customers, not on account of anything at all about the thing sold, but wholly on account of the manner of arranging it for sale.

In *Langdon* v. *De Groat* (1 Paine, C. C. Reps., 203) the invention was for folding thread and floss cotton in a manner different from the ordinary mode, whereby it would sell quicker and higher. The court said:

> The article itself undergoes no change, and the whole of the improvement—for it is a patent for an improvement—consists in putting up skeins of it, perhaps of the same size in which they are imported, decorated with a label and wrapper, thus rendering their appearance somewhat more attractive and inducing the unwary not only to give it a preference to other cotton of the same fabric, quality, and texture, but to pay an extravagant premium for it.
>
> Now that such contrivance—for with what propriety can it be termed a "useful art" under the Constitution—may be beneficial to a patentee if he can exclude from the market all other retailers of the very same article will not be denied, and if to protect the interest of the patentee, however frivolous, useless, or deceptive his invention may be, were the sole object of the law, it must be admitted that the plaintiff has made out a satisfactory title to his patent; but if the utility of an invention is to be tested by the advantages which the public are to derive from it, it will not be perceived how this part of his title is in any way whatever established. It is said that many ornamental things are bought of no intrinsic value to gratify the whim, taste or extravagance of a purchaser, and that for many of these articles patents are obtained. This may be so, but in such cases there is no deception, no false appearance, and the article is bought to be used with all its decorations and ornaments, which may have been the principal inducements to the purchase, and which will last as long as the article itself.

In this case the buttons are to be used by the purchaser, but the card is not, either with them or by itself. The design does not apply to the manufacture proper, but only to the arrangement of it for sale. Putting an article into a more convenient form for sale, without changing its qualities or properties, is not patentable as an improvement in the article. (*Glue Company* v. *Upton*, 97 U. S., 3.) So, merely changing the mode of keeping and presenting an article for sale, without changing its form or appearance, will not support a patent for a design. There should be something affecting the article itself. Further, cards for buttons, faced with foil and divided into spaces by bands, were well known and in common use. Those for pearl buttons may not have been divided into dozens, in rows of three by four, but they were divided so that dozens could be readily cut from the card, in two rows of six and one of twelve; and there were cards divided into spaces for several dozens by such bands as the patent described, and cards of cloth buttons spaced for dozens in rows of three by four. With these things known, there was nothing rising to the level of inventive skill in arranging pearl buttons by dozens, on cards, in three rows of four.

Let a decree be entered, dismissing the bill of complaint, with costs.

DESIGNS.

12,834.—BRACKET.—*George S. Barkentin*, Oceanus, N. Y., assignor to *P. & F. Corbin*, New Britain, Conn. Application filed July 1, 1881. Term of patent 14 years.

12,835 and 12,836.—STOVE.—*George O. Bergstrom*, Neenah, Wis., assignor to *Bergstrom Brothers & Co.*, same place. Applications filed October 15, 1881. Term of patents 14 years.

12,837.—CORSET.—*Morris P. Bray*, Worcester, assignor to *Theodore C. Bates*, North Brookfield, Mass. Application filed January 23, 1882. Term of patent 7 years.

12,838.—CARPET.—*Henry Horan*, East Orange, N. J., assignor to *The Hartford Carpet Company*, Hartford, Conn. Application filed February 11, 1882. Term of patent 3½ years.

12,839.—UPRIGHT DRILLING MACHINE.—*Vernon F. Prentice*, Worcester, Mass. Application filed January 23, 1882. Term of patent 14 years.

12,840.—SPOON OR FORK HANDLE.—*Frederick Waterhouse*, Wallingford, Conn., assignor to *The Racine Silver Plate Company*, Racine, Wis. Application filed February 13, 1882. Term of patent 3½ years.

12,841.—SPOON OR FORK HANDLE.—*Frederick Waterhouse*, Wallingford, Conn., assignor to *Hall, Elton & Co.*, same place. Application filed February 13, 1882. Term of patent 3½ years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

9,234.—ALPACA BRAID.—*Edward W. Bedell*, New York, N. Y. Application filed February 25, 1882.
"The arbitrarily-selected word 'WINDSOR.'"

9,235.—WRITING-INKS.—*Brentano's Literary Emporium*, New York, N. Y. Application filed February 13, 1882.
"The word 'EXCHEQUER.'"

9,236.—MEDICINAL PREPARATION.—*Ambrose L. Clum*, Red Wing, Minn. Application filed March 2, 1882.
"The letters 'A L C' arranged within the three exposed sides of a cube."

9,237.—CORSETS.—*Crotty & Lindauer*, New York, N. Y. Application filed December 29, 1881.
"The words 'THE VERY.'"

9,238.—WRITING-INKS.—*Fountain Ink Company*, New York, N. Y. Application filed November 30, 1881.
"The word 'FOUNTAIN.'"

9,239.—CARBONATE OF SODA.—*Gaskell, Deacon & Co.*, Widnes, county of Lancaster, England. Application filed February 17, 1882.
"The arbitrarily-selected word 'CRYSTAL.'"

9,240.—CHAMPAGNE-WINE.—*Louise H. L. R. Olry*, Rheims, France. Application filed January 25, 1882.
"The title 'L. RODERER' printed in a circle."

9,241.—WHISKIES.—*Henry Rosenheim*, Baltimore, Md. Application filed February 21, 1882.
"The word-symbol 'SPRING DALE.'"

9,242.—WHISKY.—*Adams, Taylor & Co.*, Boston, Mass. Application filed February 20, 1882.
"Two barrels placed as shown—viz., one lying on its side and the other tipped on an edge of its end and supported at an angle by the reclining barrel."

9,243.—LEATHER-DRESSING.—*Joseph H. Dwyer*, Lynn, Mass. Application filed February 17, 1882.
"The words 'SUN SHINE.'"

9,244.—MEATS, BACON, AND LARD.—*J. C. Ferguson & Co.*, Chicago, Ill. Application filed February 14, 1882.
"The words 'UNITY BRAND' and the symbols described—namely, the four shamrock-leaves, the rose with buds and leaves, and the thistle-blossom with leaves."

9,245.—PLUMBAGO CRUCIBLES AND OTHER PLUMBAGO CHEMICAL WARE.—*Patent Plumbago Crucible Company*, Battersea, county of Surrey, England. Application filed November 7, 1881.
"The arbitrary word 'SALAMANDER.'"

9,246.—MEDICINE FOR THE CURE OF NEURALGIA.—*G. R. Traver*, Perry, N. Y. Application filed December 5, 1881.
"The fanciful term 'NEURALGIA KING' and pictorial representation of a shield with the American flag on one side and the British flag on the other, over which is a crown."

9,247.—WHISKY.—*Alonzo W. Balch*, New York, N. Y. Application filed March 7, 1882.
"The arbitrarily-selected words 'RIP VAN WINKLE.'"

9,248.—CANNED CORN.—*James P. Baxter*, Portland, Me. Application filed March 7, 1882.
"The word 'YARMOUTH.'"

9,249.—LINIMENT.—*Richard English*, New York, N. Y. Application filed March 7, 1882.
"The word-symbol 'KNOCK.'"

9,250.—RUBBER BANDS.—*Parker, Jones & Co.*, New York, N. Y. Application filed March 6, 1882.
"The word 'JET.'"

9,251.—CANNED PROVISIONS.—*Portland Packing Company*, Portland, Me. Application filed March 7, 1882.
"The figure of a star."

9,252.—LEAF-TOBACCO.—*Sartorius & Co.*, New York, N. Y. Application filed March 7, 1882.
"The representation of the three-leaved clover."

LABELS.

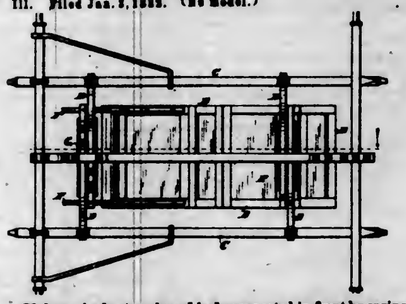
2,653.—Title: "BANCROFT'S LINIMENT."—*Atha B. Crooks*, Newark, N. J. Application filed March 9, 1881.

2,654.—Title: "BANCROFT'S OINTMENT."—*Atha B. Crooks*, Newark, N. J. Application filed March 9, 1881.

2,655.—Title: MAULICK'S DYES."—*William F. Maulick*, Columbia, Pa. Application filed February 24, 1882.

2,656.—Title: "SUGAR VALLEY WHISKEY."—*Sulzberger & Co.*, Philadelphia, Pa. Application filed January 25, 1882.

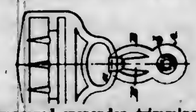
DISCLAIMERS.



9,572, (Reissue.)—*Clark P. Tillinghast*, Providence, R. I., dated February 15, 1881. IMPROVEMENT IN RAILROAD-CAR VENTILATORS. Disclaimer filed March 23, 1882.

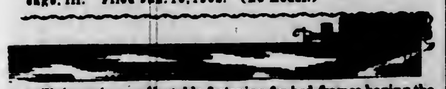
Enters his disclaimer "to that part of the specification which is in the following words, to wit: 'It is evident that a close round hinge attached to the inner edge of the deflector would in a measure serve a similar purpose and yet be within the scope of my invention, which consists in providing the deflectors with such a means of close connection with the car as will direct the current of air past the joint of junction with the car when the leaf is extended outward and in use;'" further, "to any broad claim to a freely-swinging pivoted shield having a flange at its inner or pivoted edge that rests against the side of a car when the shield stands at right angles to the same. And your petitioner desires to explain that his claims are intended to cover hinged deflectors or dust-guards having their hinged edges shielded by a strip on the car or by a projecting part of the car-frame in such manner as to form a 'break-joint,' so that the entrance of dust, cinders, &c., at the pivoted edges of the deflectors or guards is effectually prevented."

PATENTS



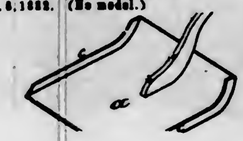
GRANTED MARCH 28, 1882.

255,403. VEHICLE-SPRING. ARTHUR A. ABBOTT, Chicago, Ill. Filed Jan. 3, 1882. (No model.)



Claim.—A phaeton-shaped body supported in front by springs D D, steadied by the independent transverse bar E, and at the rear by the brackets F, transverse bar G, and springs D D, attached to said bar G and to the side bars, C C, all constructed and arranged as described and shown.

255,404. SUSPENDER-TRIMMING. MORITZ ALTMANN, Camden, N. J. Filed Jan. 25, 1882. (No model.)



Claim.—The improved suspender-trimming formed of the plate A, provided with the hook B, the pivot and fastening b, and the spring-tongue E, and the tabs D D, said pivot and fastening b being common to both tabs, the parts being constructed, combined, and operating substantially as and for the purpose set forth.

255,405. ADJUSTABLE CONNECTION FOR WOVEN-WIRE BED-FRAMES. CHARLES L. ARMS and ABEL E. FROST, Chicago, Ill. Filed Jan. 16, 1882. (No model.)

Claim.—As an adjustable fastening for bed-frames having the fabric stretched from end to end, the dovetailed plates C and D, having countersunk bolt-holes in their meeting faces, and the recessed plate C, having the end lug, C', and screw C², threaded through said lug, and arranged to bear against the end of the plate D, substantially as described.

255,406. SNOW-SHOVEL. CHESTER ARMS, Oswego, N. Y. Filed Feb. 6, 1882. (No model.)

Claim.—The improved snow-shovel blade consisting of the rectangular blade a, formed with right-angled side flanges, c c, and devoid of cross bands or ribs at its rear end, substantially as described and shown.

255,407. MESHED OR NETTED FABRIC. AUGUSTUS BEALS, North Weymouth, Mass. Filed Jan. 3, 1882. (No model.)

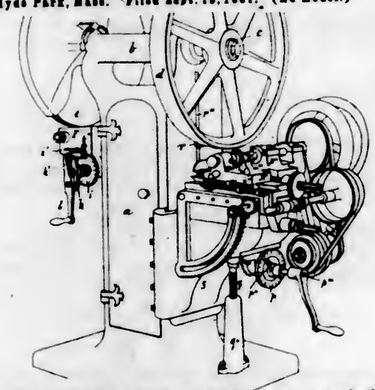
Brief.—The fabric is chiefly intended to be used in forming the middle portion or main part of the body of a hammock.

Claim.—The meshed or open fabric, substantially as described, consisting of a series of pairs of strands, *a b*, arranged and interlooped, as set forth, the two strands of each pair being zigzagged in opposite directions and interlooped with each other at regular intervals, and at medium distances between their own interloopings interlooped with the next adjacent strands of the two second pairs of planking strands, all being essentially as shown and explained.

255,408. FRICTION-CLUTCH. JAMES E. ELDRIDGE, Albany, and RALPH E. OSGOOD, Troy, N. Y. Filed Jan. 12, 1882. (No model.)

Claim.—1. In a friction-clutch, a pressure-cylinder mounted upon and turning with the driving-shaft, said cylinder carrying a piston driven by fluid-pressure and connected with the friction-band, substantially as and for the purposes set forth

2. The conduit for the fluid under pressure, the same entering the axis of the shaft, passing out at an angle with the same, and leading to the bottom of the pressure-cylinder, said cylinder being made to turn with the shaft, substantially as and for the purposes set forth.



3. The pressure-cylinder, made to turn with the shaft, the piston thereof, connected with the arm which regulates tension on the friction-band, and the fluid-pipe containing a constant supply of fluid and connecting the pump and cylinder, the several parts combined substantially as shown and described.

4. The combination of the pressure-cylinder, the piston therein, connected with the arm which moves the clutch-band, and the retracting-spring applied to said arm, these several parts being mounted and arranged to turn with the shaft, substantially as shown and described.

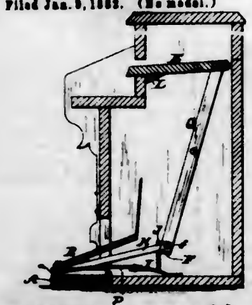
5. In combination with the fluid-conduit connecting the pressure-pump and the pressure-cylinder, mounted upon and turning with the axle, the air-cocks, arranged, substantially as shown, so as to relieve the pipe or conduit, in the manner and for the purposes set forth.

6. The combination of the arm or lever connected with the friction-band, the pressure-cylinder and its piston, the coupling-rod, the retracting-spring, the supply pipe or conduit leading through the shaft of the drum to the bottom of the pressure-cylinder, and the pressure-pump, all combined and arranged to operate substantially as herein shown and described.

255,409. GEAR-CUTTING MACHINE. Amos H. Brainard, Hyde Park, Mass. Filed Sept. 19, 1881. (No model.)

Claim.—1. In a gear-cutting machine, the worm-wheel *e*, in combination with the vertically-adjustable worm-carrying bracket F, adapted to be adjusted on the standard a by means of set-screw *a'*, and having fastening-screws *g g*, as and for the purpose set forth.

2. In a gear-cutting machine, the dividing-shaft *f''*, its toothed wheel *i*, recessed plate *m''*, crank-lever *k k'*, pawl *m m'*, hinged crank *l*, latch *i'*, and button *i''*, all combined and arranged to operate as and for the purpose described.



3. In a gear-cutting machine, the cutter-arbor *n* and cutter *n'*, in combination with the extensible collar *n'' n'''* and fastening-nut *n''*, as and for the purpose set forth.

4. The herein-described centering device for centering the cutter *n'* with the arbor *e*, consisting of the rod *o*, set-screw *o'*, adjustable pointed strip *o''*, collar *o'''*, and shank *o''*, adapted to be inserted in a hole or slot in the bearing N' for the cutter-arbor, as set forth.

5. In a gear-cutting machine, the combination, with the crank-shaft *p'''* and intermediate mechanism for raising or lowering the carriage S, of the stationary and graduated dial *p* and adjustable index or pointer *p''*, as and for the purpose set forth.

6. In a gear-cutting machine, the vertically and laterally adjustable rim-rest *r r' r''*, adapted to be secured to the front of the standard *a*, and having its set-screw *r'* arranged to support the rim of the wheel *d* that is to be cut, as set forth.

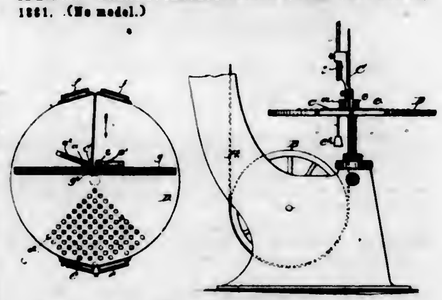
255,410. ORGAN CASE AND PEDAL. Silas B. J. Bryant, Atlantic, Iowa. Filed Jan. 9, 1882. (No model.)

Claim.—1. The combination, in an organ or melodeon case, of the compound lever consisting of the cross-bar F and upright arms G, attached to the sides of the case, with the bar I, provided with the pin J, the rod P, and the lever H, as shown and described.

2. In an organ or melodeon, the combination of the lid or cover E and the lever consisting of the cross-bar F and the upright arms G with the bar I, pedals B, and door A, as shown and described.

3. The adjustable pedals B, having the projections C, in combination with the hinged door A of an organ or melodeon having slots or guides, as set forth.

4. The combination of the cover or lid E, having the stop L, with the stop-board to prevent the lid closing when the pedals are used in pumping.



5. The combination of the pedals B, provided with the projections C, working in the grooves or guides *a* in the door A, with the levers H and P, bar I, and lever F G, all as described, and for the purpose specified.

255,411. BREAD-MAKING MACHINE. Peter F. Beyer, Indianapolis, Ind. Filed Mar. 8, 1881. (No model.)

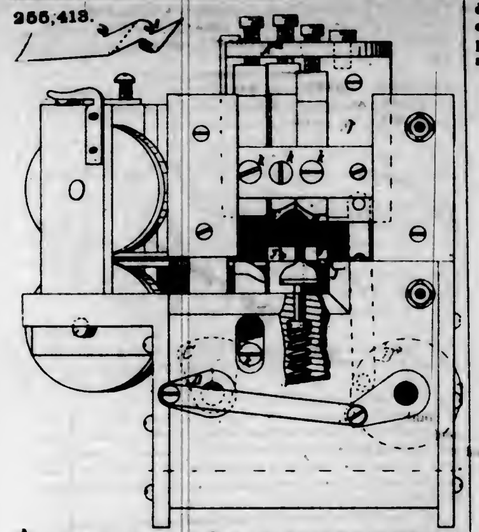
Claim.—In a machine for forming loaves of bread, the combination of a vertically-reciprocating head carrying loaf-separating knives, the lower ends of which are rounded for the purpose of separating the loaves, a bed for the dough to rest upon, guides for the reciprocating head to move upon, and a series of clearers for removing the loaves from the head, all substantially as described.

255,412. MECHANISM FOR AND METHOD OF FORMING HOOP-SPLINTS. Henry F. Campbell, Concord, N. H. Filed Dec. 12, 1881. (No model.)

Claim.—1. The table or bed to support the hoop-pole and a band-saw to cut the hoops, combined with an elastic-surfaced roller in which to embed the knots, warts, and short crooks of the hoop-pole, and with a suitable presser to keep the hoop-pole pressed against the said elastic-surfaced roller, substantially as described.

2. The table D, the anti-friction balls *d*, arranged therein, the edge-rollers *e f*, and the roller *g g'*, combined and arranged substantially as shown and described.

3. The herein-described method or process of producing hoop-splints which are to retain the natural bark, which consists in embedding the knots, warts, and short crooks of that part of the hoop-pole to be contained in the splint then being produced into the substance of an elastic roller, against which the hoop-pole is pressed, and sawing the said splint from the pole parallel with the center of the pole whatever may be its curvature, substantially as described.



255,413. MACHINE FOR MAKING PRONG-BARBS. Edwin Childers and Arthur S. Childers, East Dubuque, Ill. Filed Oct. 26, 1881. (Model.)

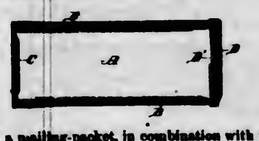
Claim.—1. In a machine for cutting and forming sheet-metal barbs from an intermittently-fed strip of metal, the combination of two sets of slitting and forming knives operating upon a bar of material, a set of severing and forming knives, and a forming device for forming the prong, substantially as specified.

2. In a machine for cutting and forming sheet-metal barbs from an intermittently-fed strip of metal, the combination, with the barb cutting and forming knives, of the yielding support for assisting in the forming operation and returning the completed barb to the level of the feed, substantially as specified.

3. The combination of two pairs of slitting and forming knives, and a pair of severing-knives, which also form one of the prongs, substantially as specified.

255,413.

4. The combination, with the slitting and forming knives, of the forming devices *e'* and *f'*, accompanying the moving halves thereof, substantially as and for the purpose set forth.



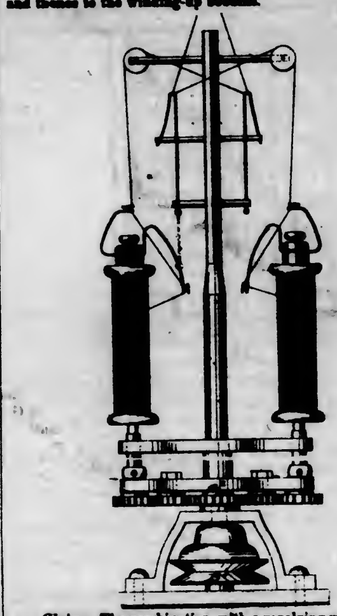
5. The combination, with the devices for severing and completing the barb, of the spring-guide J', substantially as set forth.

255,414. MAILING-PACKET. Arthur Christy, Buffalo, N. Y. Filed Apr. 28, 1881. (No model.)

Claim.—In a mailing-packet, the band *d*, secured to the body A on each side, and flap E, secured to the body at one side and folded over the band *d'* at the other, adapted to receive the folded-down end of the envelope, substantially as set forth.

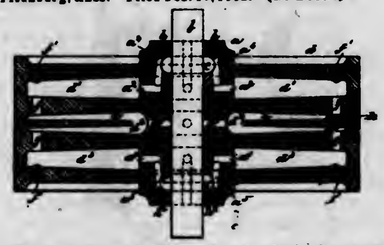
255,415. MAILING-PACKAGE. Arthur Christy, Buffalo, N. Y. Filed Dec. 21, 1881. (Model.)

Claim.—In a mailing-packet, in combination with the box A and envelope B B', the extra cover D, made larger, so as to fit over the paper envelope and box at the opening end, all substantially as specified.



255,416. HARNESS-FASTENER. Myron Clark, Rockford, N. Y. Filed Jan. 30, 1882. (No model.)

Claim.—The strap-fastener A, consisting of a narrow piece of metal bent at the top to form the hook *a*, and provided with a longitudinal base, *b*, the straight downwardly-bent portion *b'*, and the supplemental longitudinal base *c*, in combination with the loop C, and adapted for use with the strap, substantially as specified.

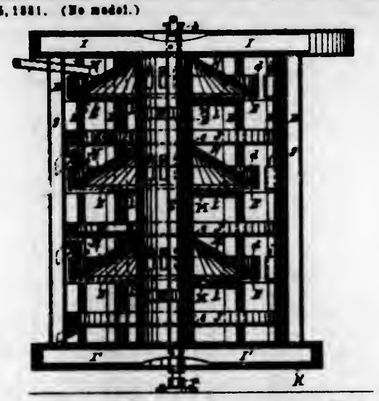


255,417. SPINNING, DOUBLING, AND TWISTING MACHINE. William J. Conlon and Henry B. King, Paterson, N. J. Filed July 18, 1881. (No model.)

Brief.—The revolving main spindle carries fixed arms for the bearings of the auxiliary spindles, which are rotated by transmitting-gearing from a central gear-wheel fixed on the bolster as they are revolved with the main spindle. A flier is used with each bobbin, and is stopped by means of a weighted drop-tension device that is guided in fixed arms at the upper part of the main spindle, which causes the breakage of the remaining threads when one is broken. The thread from each bobbin passes over guide-pulleys at the upper part of the main spindle to the drop-tension, and thence to the winding-up bobbins.

Claim.—The combination, with a revolving main spindle and frame carrying two or more axially-revolving auxiliary bobbin-spindles, of thread-guiding devices and vertically-guided and weighted drop-tensions arranged at the upper part of the main spindle, substantially as specified.

255,418. SELF-OILING PULLEY. Charles H. Cowdrey, Fitchburg, Mass. Filed Feb. 17, 1882. (No model.)



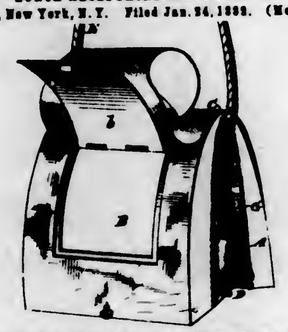
Claim.—1. In a self-oiling pulley, the rim having communicating annular chambers d' d^2 d^3, combined with the hub provided with oil-passages a', leading from the chamber d^3 to the shaft on which the pulley runs, and with other passages, substantially as described, to convey the oil from the ends of the hub into the chambers d' d^3, as and for the purpose set forth.

2. The hub provided with oil-passages a' and e d', the latter being located nearer the end of the hub than the chambers d' d^3 of the rim, and with passages a^2 a^3 a^4 a^5, combined with the rim *d*, having communicating chambers d' d^2 d^3, substantially as and for the purpose described.

3. In a self-oiling pulley, the cast-metal rim provided with the chamber d^3, and the prongs and fingers *e*, located therein, as set forth, combined with the hub *a*, provided with oil-passages *a'*, substantially as shown, and for the purpose described.

4. As an improved article of manufacture, a cast-metal pulley composed of a chambered rim and a hub provided with oil-passages to permit the circulation of oil introduced into a chamber of the rim through the hub to the shaft, along the shaft, and back into the chambers of the rim, as set forth, the said chambered rim being driven or shrunk upon the said hub, substantially as described, to form an oil-tight joint between them.

255,419 MACHINE FOR BOLTING AND PURIFYING FLOUR AND MIDDLINGS. JAMES CRAIK, Rawley, Minn. Filed Dec. 5, 1881. (No model.)



Claim.—1. The combination of the central tube, D, sieves E, mounted thereon, shaft C, arranged within said tube, and eccentrics upon the shaft, substantially in the manner and for the purpose set forth.

2. The combination of the tube D and sieves E with the driving-shaft C, eccentrics or cams N N, and the track formed of stops i at suitable distances apart, substantially in the manner and for the purpose set forth.

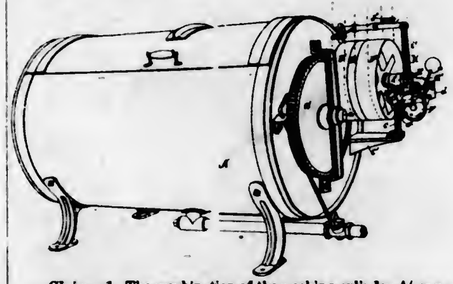
3. The combination, with the columns B, formed with bores g, fans I and I', and sieves E, of the air-tubes M, for injecting currents of air upon the lower surfaces of the sieves, substantially in the manner and for the purpose set forth.

4. The combination of the stationary brushes L, air-tubes M, bores g, and fan I' with the sieves E, substantially as and for the purpose set forth.

255,420. LUNCH-RECEPTACLE AND MUFF. SARAH A. CUSHINGHAM, New York, N. Y. Filed Jan. 24, 1882. (Model.)

Claim.—1. A lunch-receptacle consisting of two covered receptacles joined at their upper and lower extremities, leaving an intermediate space, thus adapting the device for use as a lunch-box and muff, substantially as specified.

2. A combined lunch-receptacle and muff consisting of a lunch-receptacle in one portion and a water-tight vessel in the other portion, connected at their upper and lower extremities, and provided with an intermediate space for the hands, the whole adapted to serve as and for the purpose set forth.



3. The vessel A a and receptacle B b, combined with the muff C G, portion D, and cord E, as set forth.

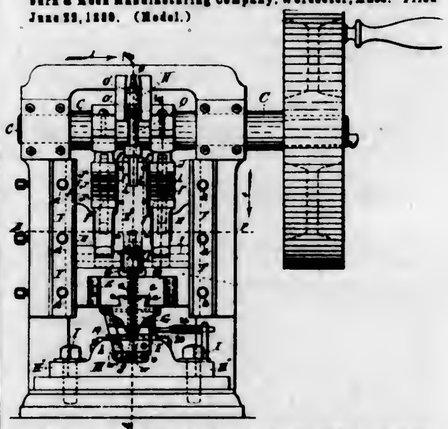
255,421. GILDING METALS. PAUL A. DODÉ, Rheims, assignor to the Société Française D'Inoxydation et de Platinage, Paris, France. Filed Apr. 6, 1880. (Specimens.) Patented in France May 21, 1879.

Claim.—1. The process of bright or mat gilding wrought and cast iron and other metals by first covering the said metals with a preparatory enamel, and then with a mixture of gold, muriatic acid, nitric acid, tin, arsenious acid turpentine, balsam of sulphur turpentine, and essential oil, substantially as specified.

2. The composition herein described for surface-coating metals preparatory to gilding them, consisting of a mixture of glass, boracic acid, and red lead combined with a calcined mixture of alum, ammonia, nitric acid, and carbonate of cobalt, substantially as specified.

255,422. REVERSING MECHANISM FOR WASHING-MACHINES. ALEXANDER M. DELPH, Cincinnati, Ohio. Filed Nov. 17, 1881. (No model.)

Claim.—1. The combination of the washing-cylinder A', provided with gear-wheel a, pinion B, shaft B', pulley D, pinions b b', shaft E, provided with worm d, gear-wheel F, provided with stud d^2, rock-shaft G, provided with arms e e', lever H, and sliding bar H', substantially as described.



2. The combination of the shaft E and operating mechanism, said shaft being provided with worm d, gear-wheel F, provided with stud d^2, rock-shaft G, provided with collar h and arms e e', said arms having lugs f f', lever H, pivoted at h', and the sliding bar H', said bar being provided with looped rods J J', substantially as described.

3. The gear-wheel F, provided with means to cause it to revolve, and having on its face the stud d^2, in combination with the rock-shaft G, provided with arms e e', weighted lever G', and collar h, and the pivoted lever H and sliding bar H', provided with the looped rods J J', substantially as and for the purpose specified.

4. The rock-shaft G, constructed substantially as described, and adapted to be moved laterally by appropriate mechanism, in combination with the pivoted lever H, sliding bar H', provided with looped rods J J', and the pulleys D D' D^2, substantially as and for the purposes specified.

5. The rock-shaft G, provided with collar h, weighted lever G', and arms e e', said arms being provided with the lugs f g and f' g', in combination with the bracket E' and upright C, and the pivoted lever H and sliding bar H', substantially as described.

255,423. MACHINE FOR MAKING METAL FENCE-BARBS. THOMAS B. DOOLITTLE, Bridgeport, Conn., assignor to the Washburn & Moen Manufacturing Company, Worcester, Mass. Filed June 23, 1880. (Model.)

Claim.—1. The combination, with sliding frame E and eccentric-shaft C, of the adjustable composite eccentric-rods and nuts J, K, J', and J'', said nuts having their top and bottom surfaces parallel, substantially as and for the purposes set forth.

2. The combination, with sliding frame E and adjustable block G, of the two sets of dies or cutters d d thereon, and block H, having cutters d' d', the sets arranged to cut at different angles, substantially as and for the purposes set forth.

3. The combination, with sliding frame E, provided with block G and dies or cutters d, of plunger M and punches i, h, and h', with block H, having cutters and openings relatively arranged, substantially as and for the purposes set forth.

4. The combination, with plunger M and punches i, h, and h', of the hollow piece Q, screw P, and lock nut or wheel R, substantially as and for the purposes set forth.

5. The combination of the block H, provided with cutters and openings, as described, with the slotted block G, having openings for the passage of punches i, h, and h', and the plates m and n, substantially as and for the purposes set forth.

6. The combination of the block G and piece Q, provided with punches i, h, and h', with the slotted or grooved block H, the blocks o, q, r, and s, and plates s' and p, substantially as and for the purposes set forth.

7. The combination of the cutters d, arranged as described, with the cutters d', the bars u, and angular pieces v, substantially as and for the purposes set forth.

8. The combination of a series of cutters, d', arranged in two sets and inclined to each other at an acute angle, with blocks u and the cam-rod w, substantially as and for the purposes set forth.

9. The combination, with cam-rod w and block G, of the joint-lever w', substantially as and for the purposes set forth.

10. The combination, with blocks or holding-surfaces 4 4 and 5 5, of punch i, substantially as and for the purposes set forth.

11. The combination of punches h h' with the blocks r r', having flanges r' and slots 7, substantially as and for the purposes set forth.

12. The combination of blocks r r, having flanges r' and slots 7, with the hinged barb guard or tongue 11, substantially as and for the purposes set forth.

13. The combination, with blocks G and H, of the barb-guard 11, spring 16, and tongue-depressing part 15, for the purposes stated.

14. The combination, with block H, guides 19 and 20, and cutters d' between these, of the adjusting-spring and its rod 22, substantially as and for the purposes set forth.

255,424. DEVICE FOR CHECKING THE DRAFT IN FIRES. J. H. DRAKE, Warren, Ohio. Filed Jan. 18, 1882. (No model.)

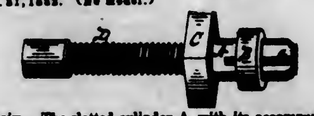
Claim.—A fire-check adapted for use with grates or other open heaters, consisting of a plate provided with a hook to engage with the grate or heater, a damper, and vertical slots, the latter being adapted to fit over the sides of the ash-pan of the heater, substantially as set forth.

255,425. SEWING-MACHINE TAKE-UP. J. V. D. ELDRIDGE, Detroit, Mich. Filed July 8, 1881. (No model.)

Claim.—The take-up lever D, pivoted to the interior of the face-plate A, as described, in combination with the link E, pivoted to said lever, the needle-bar B, provided with holes for receiving the inner pivotal screw of the link E, and the face-plate A, having a slot, b, to allow the passage and movement of the lower end of the take-up lever, as and for the purpose specified.

255,426. ANTI-FRICTIONAL BEARING. THOMAS E. FRENALL, Boston, Mass. Filed Feb. 6, 1882. (No model.)

Claim.—In an anti-frictional bearing, the combination of central sleeve-bearing, a, its lubricator-channel a'' a''', flanges a^{iv} a^{iv}, rollers b b b, the regulators d d, with their radial projections d' d', and the ring-casing c, or its equivalent, and the annular plates e e, or their described equivalents, as set forth.



255,427. PIPE-JOINT. WILLIAM FORMAN, Bradford, Pa. Filed June 23, 1881. (No model.)

Brief.—The sections A and B are adapted to turn in any direction, so that connections may be made with pipes coming from any point.

Claim.—The combination, with the branched section A, having an annular flanged rim, E, of the branched section B, fitting within said rim, and the screw-bolt G, having an enlargement fitting a socket in a lug on the section A and bearing on a packing, H, in said socket, as set forth.

255,428. NUT-LOCK. JAMES GRAHAM, Detroit, Mich. Filed Jan. 21, 1882. (No model.)

Claim.—The slotted cylinder A, with its accompanying ring B, in combination with the nut C and bolt D, substantially as described, and for the purposes set forth.

255,429. FEED-CUTTER. WILLIAM H. HALLOCK and ALONZO H. SMITH, Racine, Wis. Filed Dec. 7, 1881. (No model.)

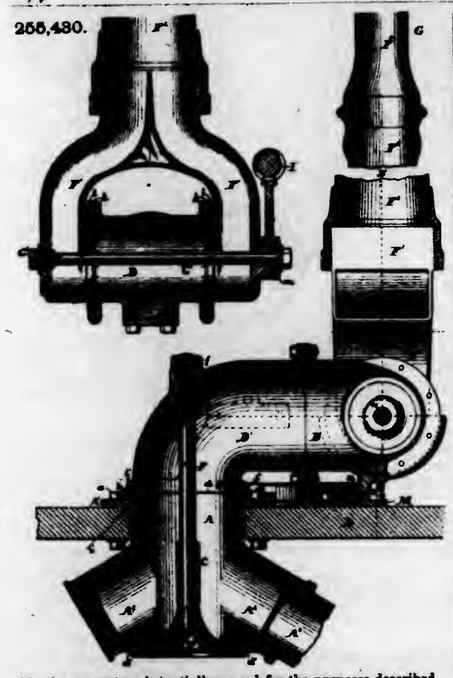
Claim.—1. In a feed-cutter, the combination of the guiding and cutting bars B B' B with the knife C, having the blades C' C' sharpened to a bevel on opposite sides to form shear-edges in conjunction with the center bar, B', as shown and described.

2. In a feed-cutter, the combination of the box or body A A', guiding and cutting bars B B' B, and knife C C' C' with the hinged gage-board D, having incline D', and the spring i, as shown and described, and for the purpose set forth.

255,430. STAND HOSE-PIPE. BENJAMIN HOLLAND, Jr., Newport, R. I., assignor to Thomas S. Howell, Trustee, Boston, Mass. Filed Feb. 6, 1882. (No model.)

Brief.—The nozzle is adapted to have two or more lines of hose connected to its lower part or base, a division-plate, c, directing the stream upwardly. The stream may be turned in the desired direction by turning the pipe on the segmental guide M or by manipulating worm-wheel H.

Claim.—1. The combination of the bifurcated hose-pipe G, the three-way section D D', the stationary base A, provided with two inlet-passages, and means of coupling thereto two or more lines of hose, and means of securing the base and three-way sections together and permitting the latter to be revolved upon the former, substantially as and for the purposes described.



2. The base A, provided with two inlet-passages, A', and the two annular shoulders d and d', in combination with a three-way section connected to said base by virtue of bearings upon said shoulders d and d', and adapted to be revolved thereon, substantially as and for the purposes described.

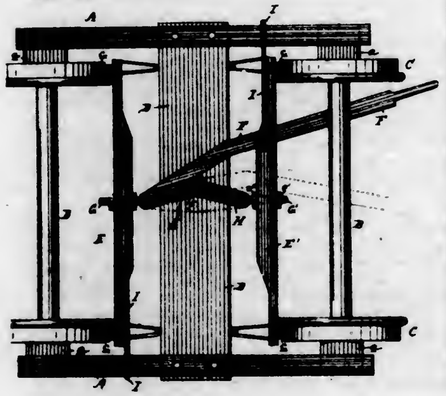
3. The combination of the base A, provided with the annular shoulders d and d', and two inlet-passages communicating with two or more lines of hose, the three-way section D D', the curved disk or head E, the packing-rings g and h', and the bolt F and nuts f and f', all arranged and adapted to operate substantially as and for the purposes described.

4. The stationary base A, provided with the annular groove h, the packing-ring h', secured in said groove, the three-way section D D', fitted to and having a bearing upon the upper portion of said base, and provided with the annular groove d', to receive the upper edge of said packing, all constructed, arranged, and com-

provisions being also available to adjust or regulate its level and screws F^2 F^2 beneath the boards leading to the same discharge, the

255,480.

bined to operate substantially as and for the purposes described.



5. The combination of the base A, three-way section D D', the bifurcated pipe G, the worm-wheel segment H, and the worm I, all arranged and adapted to operate substantially as and for the purposes described.

6. The base A, provided with two inlet-passages communicating with two or more lines of hose, and the partition *c*, in combination with the three-way pipe-section D D', the curved disk or head E, the bolt F, and the nuts *f* and *f'*, all constructed, arranged, and adapted to operate substantially as described.

7. The combination of the stationary base A, the three-way section D D', provided with a quarter turn or bend, as set forth, and the bifurcated discharge-pipe G, all arranged and adapted to operate substantially as described.

8. The combination of the platform B, the base A, and segmental guide M, secured thereon, the three-way section D D', provided with a quarter turn or bend, the bifurcated pipe G, and the supporting and guiding lip *o*, all arranged and adapted to operate substantially as described.

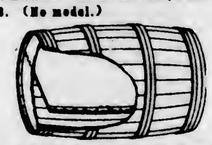
255,481. CAR-BRAKE. ALPHEUS J. KELLY, Soto, Mich. Filed Jan. 31, 1879.

Claim.—1. In combination with the brake-bars E E', the lever F, the projection *f* of said lever, the link H, pivoted to the projection *f*, and suitable connections between the lever and link and the brake-bars, substantially as and for the purpose specified.

2. The lever F and the projection *f* of said lever, in combination with the link H, the eyebolts G G', and the nuts *d d'*, substantially as and for the purpose specified.

3. In combination with the side frames, A, the brake-bars E E', and the toggle-joint F H, the stays I I, connecting with the brake-bars and the side frames at opposite sides of the car, substantially as and for the purpose specified.

255,482. WIND-WHEEL. BENJAMIN H. KLEIN, Delaware, Ohio. Filed Feb. 16, 1881. (Model.)



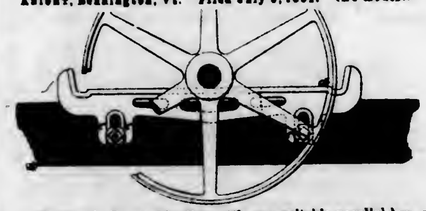
Claim.—1. In a wind-wheel, the combination, with pivoted sails and with the ordinary wheel-rims, of an auxiliary inner and outer rim supported by said sails, as and for the purpose set forth.

2. In a wind-wheel, the combination, with the ordinary wheel-rims and with the pivoted sails, of the auxiliary outer rim and inner rim, with the springs for operating said auxiliary rims to automatically swing the sails into the wind.

3. The combination, with the stationary inner rim and outer rim, and with the movable inner rim and outer rim, of a series of sails provided with angular flanges and pivoted to said stationary and movable rims.

4. In a wind-wheel, the combination, with the hub, the spokes, the stationary inner rim, and outer rim secured to said spokes, of the movable rims *i* and *i'*, the sails F, pivoted as shown, and a spring connecting the spokes with the pivot *h* or with the rim *i*.

255,483. BARREL. HALE KNIGHT, Newbury, Mass. Filed Jan. 14, 1882. (No model.)

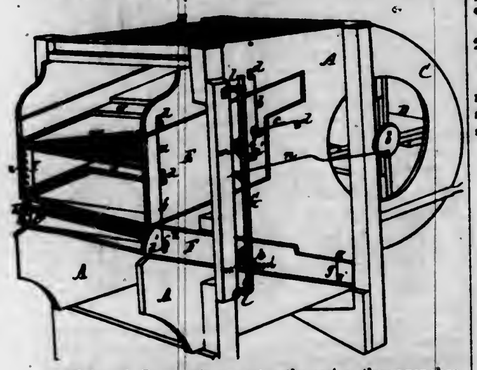


Claim.—1. A barrel having a longitudinal partition of thin flexible material fitting the interior bilge of the barrel, substantially as specified.

2. In combination with a bilged barrel, a longitudinal collapsible partition conformed to the interior bilge of the barrel, and adapted to be inserted in and withdrawn from the barrel, as and for the purpose specified.

3. In combination with a barrel, a longitudinal partition formed to conform to the interior bilge of the barrel, and having strips *a* of thinner material along its edges, substantially as described.

255,484. APPARATUS FOR BALANCING PULLEYS. LUTHER KNIGHT, Bennington, Vt. Filed July 8, 1881. (No model.)



Claim.—1. In combination with any suitable parallel bar, a bar having a straight upper edge on which the mandrel can roll, and an upwardly-projecting or other suitable end stop at each end of said straight upper edge, provided with means for attachment to a horse or bench and for horizontal or level adjustment, substantially as described, and for the purpose set forth.

2. A parallel bar for balancing pulleys, provided with an upper straight edge having an end stop at each terminus thereof, a central perforation through its body for purposes of handling, and provisions for its attachment to a bench or horse, said last-named

provisions being also available to adjust or regulate its level and parallelism with its companion bar, substantially as described and set forth.

255,485. GRAIN-SEPARATOR. JOHN A. KRAUS, Buffalo, N. Y., assignor to WM. P. MILLER, same place. Filed June 18, 1881. (No model.)

Claim.—1. In a grain-separator, the casing, the upper shoe, vertical hangers therefor, and a rock-shaft connected with such shoe, whereby vertical and lateral vibrations are imparted to it, combined with links *b*, arranged longitudinally of said shoe to cause a longitudinal motion thereof, substantially as shown and described.

2. In a grain-separator, the combination, substantially as shown and described, of the lower shoe, F, its suspension-rods *f g*, the rock-shaft, and connecting and operating mechanisms with the horizontal links *h h* and their pivotal points *i i'*, whereby said shoe receives transverse vertical and longitudinal movements.

3. In a grain-separator, the combination, substantially as shown and described, of the lower shoe, the suspension-links *f*, the slotted bearings *d'* for said links, the links *g*, a jolter, *j*, and operating mechanism, as specified.

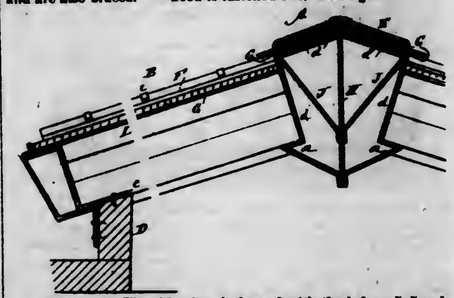
4. The combination, substantially as shown and described, of the casing A, the upper shoe, E, and the hangers *a* and *b*, to suspend said shoe in said casing, the lower shoe, F, the hanger *f*, for connecting the two shoes independently of the freedom of motion of the hanger *a*, and the hanger *g*, connecting the lower shoe to the casing, the said hangers *a b* and *f g* permitting independent motions to be imparted to the shoes, substantially as specified.

5. In a grain-separator, the combination, with the casing, of the two shoes E F and hangers *a b f g*, the rear of the lower shoe being suspended from the rear of the upper shoe, the upper shoe being connected with the sides of the mill by pivoted side links, *e e*, and the lower shoe being connected with the sides of the mill by pivoted links *h h*, as shown and described, and for the purpose specified.

6. In a grain-separator, the combination, with the suspended shoes E F, of right-angled crank-arms *m m'*, the rock-shaft G, and the hanging-blocks H H, attached to the sides of the shoes, and having lugs *r r'* for connecting links opposite the respective crank-arms, whereby motion may be communicated to the shoes by either crank-arm when its link is connected, as herein shown and described.

7. In a grain-separator, the combination, with the shoes, of a rock-shaft, G, the crank-arms *m m'*, attached to the rock-shaft, one arm standing at right angles to and the other parallel with the sides of the shoes, and blocks H H, attached to the shoes, provided with lugs, one at right angles to and the other parallel with the sides of the shoes corresponding with the crank-arms, the crank-arms and lugs being provided with holes or sockets for the attachment of connecting-links, as herein shown and described.

8. In a grain-separator, the combination, with the screen *w* and toothed straps I I, of the deflector K, provided with pins *c' c'*, resting in the teeth of the straps and adjustable to different angles by raising or lowering in the teeth, as herein shown and described.



9. In a grain-separator, the combination of the stationary discharge-board f^3, the adjustable dividing-board f^4, and the dividing-bar h^3, set in an angular position across the dividing-board, the dividing-board moving freely under the bar, and the bar serving to divide and run off the heavy grain, as shown and described.

10. In a grain-separator, the combination of the discharge-board f^3, the dividing-board f^4, the dividing-bar h^3, and the two screens h^4 f^5 beneath the boards leading to the same discharge, the abutting ends of the screens being held in close contact, as herein shown and described.

11. In a grain-separator, the combination, in the lower shoe, of the two abutting screens h^4 f^5, the rear one set at an upward angle, side pins therefor, and hooked side straps, L, to receive said pins, whereby the two abutting ends of the screens are kept in close contact, as herein shown and described.

255,486. SKYLIGHT. FREDERICK H. LEADLEY, St. Louis, Mo. Filed July 11, 1881. (No model.)

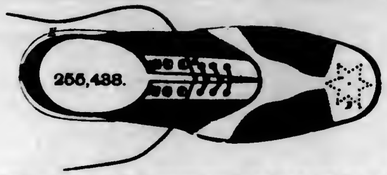
Brief.—The ridge-bar is formed of side plates bent to form ridges to hold the glass and offsets to hold the rafter-bars. These side plates are secured at top and bottom to a center vertical plate, and are also braced. A hood is fastened over the ridge.

Claim.—1. The ridge-bar A, formed with the ledges *d' d'* and the offsets *a a*, in combination with the rafter-bars B and the curb C, substantially as and for the purposes set forth.

2. The ridge-bar A for skylights, formed of the plates *d d*, secured upon the center plate, H, with or without the braces J J, the plates *d d* being bent to form the ledges *d' d'* and the offsets *a a*, substantially as and for the purposes set forth.

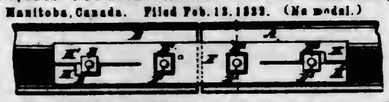
3. The ridge-bar A, formed of the side pieces, *d d*, secured upon the center plate, H, the plates being bent to form the ledges *d' d'* and the offsets *a a*, in combination with the hood E and the braces J J, substantially as described.

4. The ridge-bar A and the rafter-bars B B and curb C, in combination with the plates of glass L and the plates L', placed over the glass L, substantially as and for the purposes set forth.



255,487. PAPER-HANGING OR WALL-PAPER. EDGARD LEIGNIER, New York, N. Y. Filed Feb. 16, 1882. (No model.)

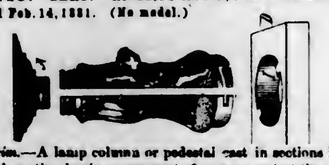
Claim.—1. The embossed wall-paper A, combined with the filling C of cement, which is in the cavities of the back, and with the outermost lining, D, substantially as described.



2. The embossed wall-paper A, lined at its back with the embossed sheet B, and combined with the filling of cement C and outer lining, D, substantially as herein shown and described.

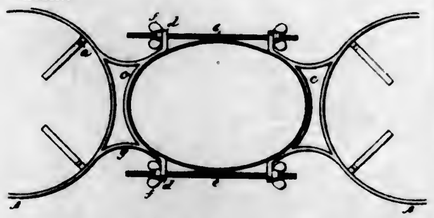
255,488. SHOE. WILLARD LISCOTT, West Auburn, Me. Filed Jan. 16, 1882. (No model.)

Claim.—The described improvement in the manufacture of shoes having cloth uppers, such improvement consisting in the combination, with the cloth upper provided with the toe and heel re-enforces, as set forth, of the furcated or branched re-enforce or stay I, arranged to extend across the upper from the lower part of the instep or instep-opening to opposite parts of the sole, and also from said lower part of the instep or instep-opening to the toe re-enforce, all as set forth.



255,439. NUT-LOCK. ALEXANDER F. MACDONALD, Winnipeg, Manitoba, Canada. Filed Feb. 13, 1882. (No model.)

Claim.—1. The locking-plate F, having nut-apertures G G, bolt-holes H H', and tongues K K' cut longitudinally, commencing from the middle of the plate at the ends, thence half-way around the space to be occupied by the nuts of the bolts which pass through the holes H H', and thence in a longitudinal direction toward apertures G G, whereby spring-tongues K K' are formed, each tongue having a recess in which one corner of the nut impinges, said tongue offering an endwise resistance to the nut, and by depression permits the nut to be removed without injury to the plate, after the tongue has locked the nut, by being slightly sprung up, as set forth.

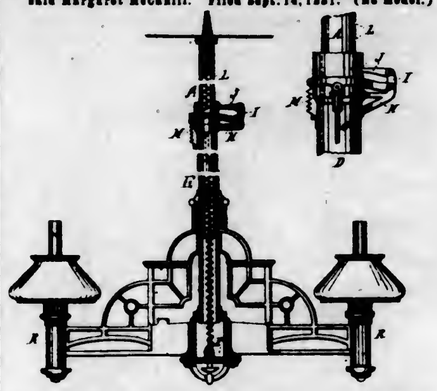


2. In combination with rails A B, fish-plate C, bolts D D' D² D³, and nuts E E' E² E³, the locking-plate F, having apertures G G, receiving the nuts E' E², holes H H', and longitudinally-cut tongues K K', with a recess encompassing a portion of nuts E' E², whereby the tongues offer an endwise resistance to said nuts when slightly sprung outward, and capable of depression for the removal of the nuts, as set forth and described.

255,440. LAMP. RIVERIUS MAASS, New Brunswick, N. J. Filed Feb. 14, 1881. (No model.)

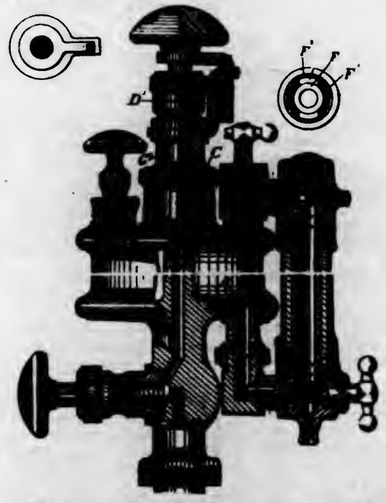
Claim.—A lamp column or pedestal cast in sections lengthwise, each section having a segment of a screw cast at the ends, in combination with the base D and lamp-rest A, substantially as shown and described.

255,441. STOVE-PIPE SHELF AND STOVE-LID HOLDER. GEORGE MCADAMS, Winchester, Ind. Filed Nov. 5, 1881. (No model.)



Claim.—1. The combination, in a stove-pipe shelf and lid-holder, of the hoop A with supports *b b b b*, having recesses *a a a a*, substantially as described.

2. In a stove-pipe shelf and stove-lid holder, the combination of the hoop A, having supports *b b b b* and recesses *a a a a*, with segmental parts *c c*, provided with lugs *d d d d*, threaded rods *e e*, and thumb-nuts *f f f f*, for the purpose specified.



3. The combination of the hoop A, having supports *b b b b* with braces *g g* and adjustable collar, as set forth.

255,442. ADJUSTABLE CHANDELIER-HANGER. MARGARET MCCAHILL and JOHN K. MCCAHILL, Detroit, Mich., assignors to said Margaret McCahill. Filed Sept. 14, 1881. (No model.)

Claim.—In a chandelier, the stationary pipe A, provided with notches L, having downwardly-inclined lower sides, the pipe D, sliding on said pipe and provided at one end with the bracket H and at the other end with the burner-branches, and the spring E, contained within the two tubes and connected to their opposite ends, in combination with the lever I, connected to the bracket H at one side of the tube and with a spring, M, on the other side, the dog J, pivoted to the upper end of the lever and engaging with notches L, inclined, as described, in the stationary tube, and the rod O, pivoted to the lever near the center of the same and extending downward close to the side of the pipe D, as and for the purpose specified.

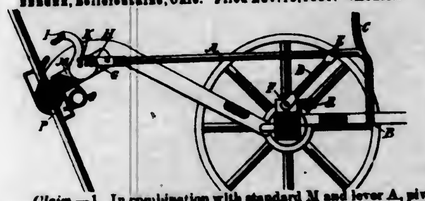
255,443. LUBRICATOR. ELIJAH MCCOY, Detroit, Mich., assignor to Henry C. Hodges and Charles C. Hodges, same place. Filed Oct. 21, 1881. (No model.)

Claim.—1. In a lubricator, the combination, with the main oil-chamber and a discharge-tube projecting therein, of the plunger separating an upper extension of said oil-chamber above the discharge-pipe from the lower portion of said chamber and means for adjusting said plunger from the exterior of the lubricator, substantially as described.

2. In a lubricator, the combination, with the oil-chamber, the central discharge-tube, and the adjustable plunger arranged above said tube, of an adjustable exterior indicator connected with said adjustable plunger, substantially as and for the purpose set forth.

3. In a lubricator, the combination, with the glass indicator-tube and a slotted stationary metallic casing surrounding said tube, of a similarly slotted movable metallic casing surrounding said stationary casing and arranged to partially rotate thereon, substantially as described.

4. The combination, with the glass indicator-tube F, properly seated and packed at its lower end, of the packing-ring at its upper end, the follower resting upon said packing-ring, the spring having its lower end bearing upon said follower, the casing inclosing said spring, and screw-plug screwed into said casing and bearing upon the upper end of said spring, substantially as described.

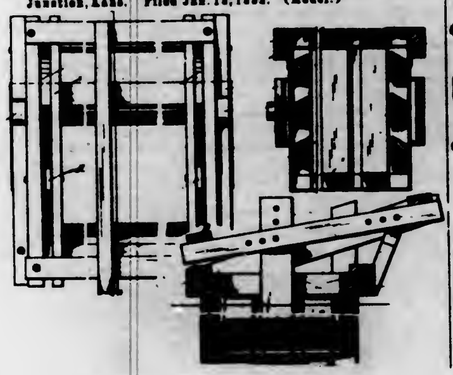


5. The combination, with a main oil-chamber, A, and tee discharge and steam tube B extending therein, of the condensing-chamber C, the plunger D, fitting closely and sliding in said chamber C, and the adjustable stem D', attached to said plunger and projecting outside the casing, substantially as described.

255,444. VEHICLE-WHEEL SCRAPER. FREDK. C. HERCHE, Winnipeg, Manitoba, Canada. Filed Jan. 13, 1882. (Model.)

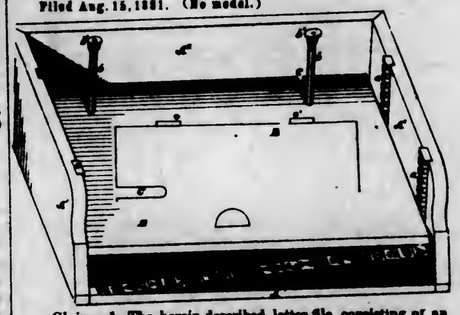
Claim.—A mud or clay scraper for vehicle-wheels, composed of the segmental and rectangular-shaped channel A, having the opening *a*, the shank B, having formed in it the slot *b*, the set-screw *c*, and the sustaining-bar C, substantially as shown and described, and for the purpose set forth.

255,445. REVOLVING SULKY HAY-RAKE. THOMAS HILTENBRAND, Bellefontaine, Ohio. Filed Nov. 15, 1881. (Model.)



Claim.—1. In combination with standard M and lever A, pivoted thereto, trip-lever I, having a curved slot, H, in the upper portion of its disk, through which plays a pin, G, in the rear end of lever A, and pivoted near its center to oscillating standard M, substantially as set forth.

2. In combination with the lever A and standard M, pivoted thereto, carrying spring-trips O, the trip-lever I, pivoted near its center to oscillating standard M, and having a curved slot, H, in the upper portion of its disk, through which plays a pin, G, in the rear end of lever A, substantially as described.



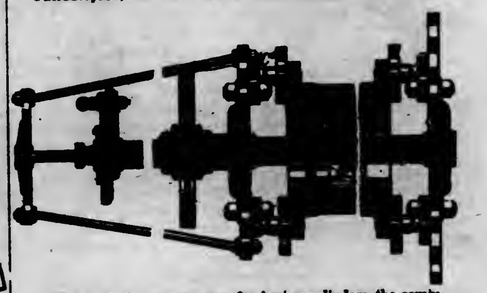
3. In combination with the revolving axle of the rake, provided with lugs P Q, the lever A and standard M, pivoted thereto, carrying spring-trip O, the trip-lever I, pivoted near its center to oscillating standard M, and having a curved slot, H, in the upper portion of its disk, through which plays a pin, G, in the rear end of lever A, substantially as set forth.

255,446. WASHING-MACHINE. NUTTER W. MURPHY, Cedar Junction, Kans. Filed Jan. 18, 1882. (Model.)

Claim.—In a washing-machine, the lining composed of spaced bottom slats and spaced vertical end and side slats detachably secured to a surrounding upper frame, all adapted to fit into and conform to the inside of the tub, in combination with the plunger adapted to operate therein, its operating devices, and the tub or vessel adapted to be used either on or off of the stove, as and for the purpose set forth.

255,447. LETTER-FILE. GEORGE V. MAUBETH, Dayton, Ohio. Filed Aug. 15, 1881. (No model.)

Claim.—1. The herein-described letter-file, consisting of an outer case, provided with the racks *a* and the pins *b*, and the cover B, provided with the lugs *c c'* and notches C, substantially as and for the purposes specified.

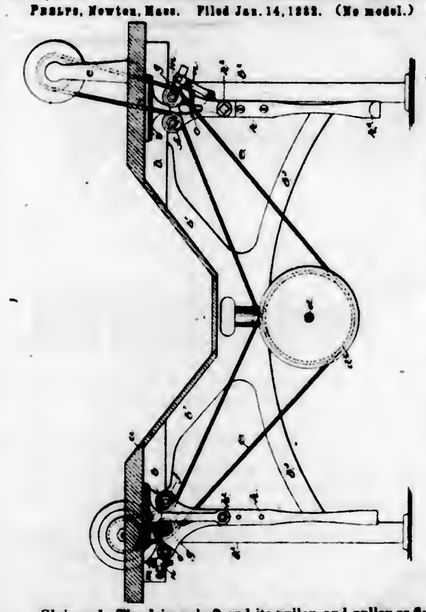


2. A letter-file consisting of an outer case, provided with racks *a*, and the cover B, provided with lugs *c c'*, fixedly attached to the cover and arranged in such a manner that the cover and lugs are attached to and detached from the racks by sliding the cover horizontally, substantially as and for the purposes specified.

255,448. COMBINED MOP HOLDER AND WRINGER. JOSEPH M. OHO, Bloomfield, Mich. Filed Sept. 10, 1881. (No model.)

Claim.—In a combined mop holder and wringer, the combination of the handle A, having hinged loop C D, with the sliding sleeve F, having bail P, the end of which is flattened at G, and provided with a ring, H, adapted to encircle the end of the handle, as described, for the purpose set forth.

255,449. METAL-BORING MACHINE. DANIEL W. PRESCOTT, Philadelphia, Pa. Filed Dec. 30, 1881. (No model.)

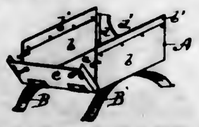


Claim.—1. In an apparatus for boring cylinders, the combination, substantially as set forth, of a boring-plate having a central opening for the passage of a boring-bar, a bearing or thrust plate having a central socket for the reception of a feed-screw, and coupling-rods by which said plates are connected one with the other.

2. In an apparatus for boring cylinders, the combination, substantially as set forth, of a boring-bar, a feed-screw concentric therewith, a gear journaled upon a casing which is fitted to move with

the boring-bar longitudinally on the feed-screw without rotating with the boring-bar, a sectional or divided nut pivoted to said gear, and a clamp by which said nut may be made to either engage with or be removed from contact with the feed-screw.

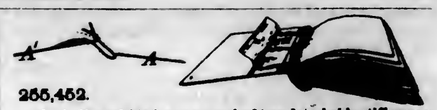
255,450. BELT-CONTROLLING MECHANISM. GEORGE H PHELPS, Newton, Mass. Filed Jan. 14, 1882. (No model.)



Claim.—1. The driver-shaft and its pulley, and pulley or fly-wheel W, and belt *e*, extended over them, combined with a lever, A, having two sheaves adapted to be pressed against and tighten the said belt when it is desired to drive the pulley or fly-wheel, substantially as described.

2. The pulley or fly-wheel, the continuously-driven pulley *d*, the belt *e*, extended over them, and the lever having the two sheaves to press against the said belt to tighten it only when the fly-wheel is to be driven by the belt, combined with a brake, *m*, actuated by the said lever to assist in stopping the fly-wheel quickly when the pressure of the sheaves against the belt *e* is released, substantially as described.

3. In a bench for sewing and other machines, the metallic cross beams or girders *b b'*, shaped as shown and described, combined with the legs *b²*, to support them, as set forth.

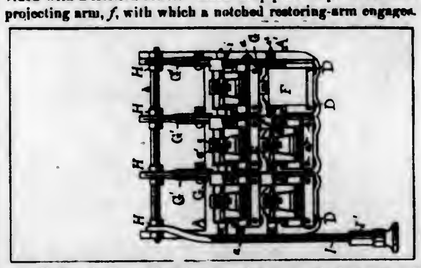


255,451. CAR-AXLE BOX. THOS. S. PHILLIPS, Buffalo, N. Y., assignor of one-half to George D. Briggs, same place. Filed Jan. 20, 1882. (No model.)

Claim.—In combination with an inclosed journal, E, and a railroad journal-box, D *f*, the rectangular follower A, for holding the lubricant C in contact with the journal, consisting of the flat bottom *a*, vertical metal sides *b b*, extension leather sides *b' b'*, leather end *d d'*, hinged front *c*, and springs B B, all constructed and operating substantially as specified.

255,452. TEMPORARY BINDER. JOHN B. PITT, Brooklyn, N. Y. Filed June 1, 1881. (Model.)

Claim.—1. A file and binder composed of two detachable stiff covers, one of said covers being provided at its inner edge with a hinged binding-strip which unites with and forms a part of said cover, the other of said covers being provided with a clamping-plate hinged thereto, and means for detachably uniting said covers and holding the papers or pamphlets between them, substantially as described.



255,452.

2. A file and binder composed of two detachable stiff covers, one of said covers being provided at its inner edge with a hinged binding-strip which unites with and forms a part of said cover, and with binding-wires attached to said hinged strip, the other of said covers being provided with a perforated clamping-plate hinged to and projecting from the inner edge thereof, forming a slot between the cover and clamping-plate, a flexible back piece united to the cover having the hinged strip, and adapted to pass through the slot of the cover having the clamping-plate, and fastening devices whereby said flexible back piece is detachably and adjustably connected to the latter cover, substantially as described.

3. A file and binder composed of two detachable stiff covers, one of said covers being provided at its inner edge with a hinged binding-strip which unites with and forms a part of said cover, and with binding-wires attached to said hinged strip, the other of said covers being provided with a perforated clamping-plate hinged to and projecting from the inner edge thereof, forming a slot between the cover and clamping-plate, said clamping-plate being provided with grooved lugs for retaining the ends of the binding-wires, and a flexible back piece rigidly connected to one of said covers and detachably connected to the other, substantially as described.

255,453. ELECTRIC ANNUNCIATOR. HENRY B. PENFIELD, Chicago, Ill. Filed Oct. 6, 1881. (Model.)

Brief.—An improvement on Letters Patent No. 214,261. The supporting-frame is cast in one piece with sockets for the magnet. The arm on the armature that supports the drop-plate is provided with a friction-roller. Each drop-plate is provided with a projecting arm, *f*, with which a notched restoring-arm engages.

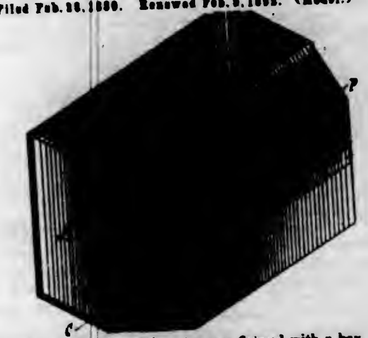
Claim.—1. In an electric annunciator, a vertical armature, E, having its central arm nearly twice the length of its outer arms, and provided with a pulley, *e*, at the tip, in combination with a helix with both ends of its core exposed at points opposite to the ends of the outer arms of the armature, substantially as shown.

2. In an electric annunciator, curtains F, hinged at the top edge to wires *c'*, so as to turn thereon, and provided with lips *f*, projecting radially from the hinge and transversely from and outside of the path of the curtain, as shown.

3. In an electric annunciator, vertical notched bar G, pivotal bar G', pivotal arm H, and push-rod I, in combination with hinged curtains F, having lips *f* projecting radially from the hinge and transversely out of the path of the curtain, all operating as shown.

4. In an electric annunciator, an armature, E, whose central arm is considerably longer than the outer arm, and provided at its tip with a pulley, *e*, such armature being loosely secured at the bottom in a vertical position, in combination with a curtain, F, operating together, as shown.

5. In an electric annunciator, a helix, B, recessed in the frame and secured by a helix-holder, C, having an opening in the center for the central arm of the armature to play back and forth in.



6. In an electric annunciator, a metal frame provided with numerous concave recesses, *b*, openings D, and slotted arms *d'*, cast in one piece, as shown.

255,454. EXTENSION-TABLE. JOHN A. PRUYT, Stringtown, Mo. Filed Sept. 24, 1881. (Model.)

Claim.—The combination, with a table-frame having the brace H, provided with slots K' and rollers G, arranged as herein shown, of the main leaf I, having studs K projecting downward through the slots K', and the extension-leaves L, having arms M, provided with wedges O, extending under and adapted to bear against the studs K of the main leaf, as herein shown and specified.

255,455. REFRIGERATOR. ALVIN D. PUFFER, Boston, Mass. Filed Feb. 16, 1880. Renewed Feb. 9, 1882. (Model.)

Claim.—1. The refrigerator-case formed with a bay, as described, in combination with the main door or doors closing the bottom of the bay and the adjoining face of the refrigerator-case, and the vessel or bottle guides or supports attached to and carried by said door or doors, substantially as herein before set forth.

2. The refrigerator-case formed with a bay, as described, in combination with one or more main doors closing the bottom of the bay and the adjoining face of the case, vessel or bottle supports or guides carried by said doors, and auxiliary doors, one in each main door, substantially as herein before set forth.

3. In combination with the bayed refrigerator-case, and the door or doors closing the bay and adjoining face of the same, the bottle or vessel guide-tubes or supports carried by the doors and provided with removable bottoms, substantially as hereinbefore set forth.

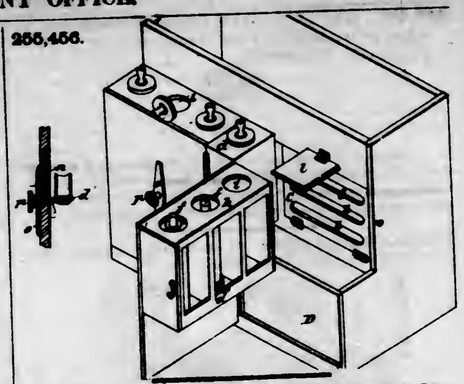
4. In combination with the guides *l*, the removable cups or supports adapted to be reversed in position, and in so doing vary the height of their bottom with respect to the ice chamber or tank below, substantially as described.

5. The double door H J, in combination with the case A and its bay D, partition F, and apertures *g g*, substantially as and for the purposes set forth.

6. The combination, with the double door and the bayed refrigerator-case having communicating openings in the wall or partition between its ice-chamber and the space inclosed by the double door, of means, substantially as described, adapted to be controlled by the auxiliary door for automatically opening and closing said openings, substantially as hereinbefore set forth.

7. The waste-water valve composed of the tube *a*, opening communication with the ice-water tank, and the plug *a'*, provided with its apertures *g'*, the tube *c'* screwing into the tube *a*, and the holes serving to open communication between the tube *a* and ice-water tank, while the screwing of the tube *c'* down to its seat shuts off such communication, essentially as explained.

255,456. REFRIGERATOR. ALVIN D. PUFFER, Boston, Mass. Filed Mar. 13, 1880. Renewed Feb. 9, 1882. (No model.)



Claim.—1. The combination, with the refrigerating-box A, provided with bay D, of one or more doors containing coils provided with removable covers, as described, said coils, when the door is closed, fitting over the top of the bay D and up against the body of the refrigerator, substantially as hereinbefore set forth.

2. In combination with the refrigerator-box and the door provided with coils, the cover or covers *l*, hinged to the box in position to drop over and cover the coil-openings when the door is closed, substantially as hereinbefore set forth.

3. In combination with the refrigerator and door for closing the same, one or more coils upon the interior of the door, provided with a vertically-movable interior bottom or support, and means, substantially as described, for adjusting and holding said bottom or support, substantially as hereinbefore set forth.

4. The combination of the bottom *d'* and springs *a a*, united by the button *p*, for the purpose of raising and sustaining the bottom in any position, substantially as stated.

255,456.

255,457. COOLER FOR AERATED WATERS. ALVIN D. PUFFER, Boston, Mass. Filed Apr. 14, 1880. Renewed Feb. 8, 1882. (No model.)

Brief.—The object of the device is to reduce the temperature of aerated waters. The water, after passing through the ice-chamber, flows into a close vessel, which is adapted to contain above the aerated water the free gas. The escape from the device is thus rendered smooth.

Claim.—1. In receivers or vessels for dispensing liquids under pressure, a supply-pipe considerably enlarged from its original area as it enters the vessel, substantially as herein set forth.

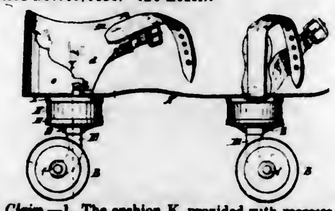
2. In receivers or vessels for dispensing liquids under pressure, a supply-pipe enlarged at its discharge end from its original area and discharging the liquid into the upper part of the vessel, and a second and smaller pipe open at bottom for escape of the liquid, and to prevent escape of gas until it accumulates sufficiently to displace a greater part of the liquid in the chamber, substantially as described.

3. The pipe D, provided with the opening or slit *b*, of attenuated tapering form and vanishing at top in the substance of the pipe and at bottom merging in the larger opening or mouth of such pipe, substantially as and for the purposes described.

4. In combination, the vessel A and pipe B', discharging at top of said vessel, and the pipe D, receiving liquid at the lower part of the vessel, and having the attenuated gradually-diminishing aperture *b*, substantially as and for the purposes set forth.

255,458. KNOCKDOWN-PACKING-BOX. FRED C. ROCKWELL, Hartford, Conn. Filed Sept. 19, 1881. (Model.)

Claim.—1. In a knockdown box, the sections forming the sides and ends thereof, having respectively suitable openings containing wedges and slitted pins adapted to enter the openings, substantially as and for the purpose set forth.



2. A knockdown box consisting of the sections A, having perpendicular grooves *b*, and the openings *c*, with wedges *f*, in combination with the sections B, having perpendicular tongues *a* and slitted pins *g*, substantially as and for the purpose set forth.

255,459. SCREW. CHARLES D. ROGERS, Providence, R. I., assignor to the American Screw Company, same place. Filed Oct. 12, 1881. (No model.)

Claim.—As an improved article of manufacture, a screw or similar article having a countersunk head, a continuous rim surrounding said countersunk portion, and one or more bars crossing said portion and joining the rim, substantially as set forth.

255,460. ROLLER-SKATE. JAMES K. ROSS, Springfield, Ohio. Filed Nov. 10, 1881. (No model.)

Claim.—1. The cushion K, provided with recesses, in combination with plate H, provided with projections S, flange *m*, and foot-plate, the cushion supporting the latter, substantially as and for the purposes specified.

2. The cushion K, provided with recesses, in combination with plate H, provided with projections S, and spider L, provided with projections *n* and the foot-plate, substantially as and for the purpose specified.

3. The cushion K, provided with recesses, in combination with plate H, provided with projections S and flange *m*, and spider L, provided with projections *n* and the foot-plate, substantially as and for the purposes specified.

4. The cushion K, provided with recesses, in combination with plate H, provided with projections S, and spider L, provided with projections *n* and flange *t*, substantially as and for the purposes specified.

5. The cushion K, provided with recesses, in combination with plate H, projections S, and flange *m*, and spider L, provided with projections *n* and flange *t*, substantially as and for the purposes specified.

6. The combination of the cushion K and roller-gear, plate H, cushion K, and foot-plate, and central connecting-rod W, the orifices in the cushion and plate H being made of greater diameter than that of the rod, substantially as and for the purposes specified.

7. The combination of the cushion K and roller-gear, plate H, cushion K, and spider L and foot-plate, and central connecting-rod W, the orifices in plates L and H and in cushion K being of greater diameter than that of the central connecting-rod, substantially as and for the purposes specified.

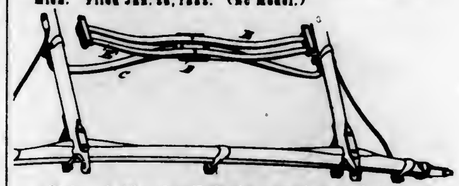
8. In combination with the rollers B, axle C, yoke E, adapted to receive a roller, and provided with a supporting-plate, the cushion K and foot-plate, and connecting devices, and devices for preventing undue rotation of the roller-gear, substantially as and for the purposes specified.

9. In combination, with the rollers B, axle C, yoke E, adapted to receive a roller, and provided with a supporting-plate, H, the cushion K, provided with recesses and the foot-plate, and projections entering said recesses, substantially as and for the purposes specified.

10. In combination, roller or rollers B, axle C, yoke E, plate H, having projections S and flange *m*, cushion K, formed with recesses *o*, foot-plate A, and central connecting-rod, W, the orifices of plate H and cushion K being of greater diameter than that of rod W, substantially as and for the purposes specified.

11. In combination, the roller or rollers B, axle C, yoke E, plate H, having projections S and flange *m*, cushion K, formed with recesses *o*, plate H, provided with recesses *o*, foot-plate A, and central connecting-rod, W, the orifices of plate H and cushion K being of greater diameter than that of rod W, substantially as and for the purposes specified.

12. The combination of the disk 2, rod 3, shouldered at 4, and angular plate 7, and the elastic resilient disk 6, substantially as and for the purposes specified.



13. The combination of the disk 2, rod 3, shouldered at 4, extension 5, and annular plate 7, having its orifice enlarged outwardly, and the elastic resilient disk 6, substantially as and for the purposes specified.

14. The combination of disk 2, washer 9, shank 3, and disk 6, and washer 9 and plate 7, secured together, substantially as and for the purposes specified.

15. The combination of the disk 2, washer 9, shank 3, and disk 6, and washer 9 and plate 7, screwed onto shank 3, substantially as and for the purposes specified.

16. The combination of the shank and disk 6, compressed between compressing plates or disks or washers having peripheral rounded and curved edges, substantially as and for the purposes specified.

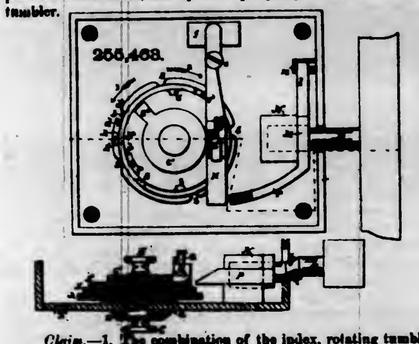
255,461. VEHICLE-SPRING. WILLIAM D. RUMSEY, Detroit, Mich. Filed Jan. 26, 1882. (No model.)

Claim.—1. The plate D, having central recess, *b*, formed by the flanges *a* upon its lower surface, and the side wings, *c*, having recesses formed by the outer flanges and raised central portion, adapted to serve with a single lower spring and duplex upper springs, as and for the purpose specified.

2. The plate D, having recess *b* and recessed wings *c*, flanges *a*, side flanges, and raised center, combined with the upper spring, E and E', the lower springs, C, and securing means, substantially as set forth.

255,462. COMBINED PORTABLE FURNACE AND BOILER. BENJAMIN L. BYRON, Chambersburg, Pa. Filed Dec. 17, 1880. (No model.)

Claim.—1. In a combined portable furnace and boiler having the same sheet of metal forming the top of the furnace and bottom of the boiler, the removable supporting-bars O, secured to the sides or box of the boiler by means of wood-screws, for the purpose of holding in place the bottom of the boiler or top of the furnace, and also holding the wings or sheet metal forming the sides of the furnace, substantially as and for the purposes set forth.



2. In a combined portable furnace and boiler having the same sheet of metal forming the top of the furnace and bottom of the boiler, and the removable supporting-bars O, secured to the sides or box of the boiler by means of wood-screws, for the purpose of holding in place the bottom of the boiler or top of the furnace, and also for holding the wings or sheet metal forming the sides of the furnace, the said sides of the furnace made internally convex and expanding outwardly, whereby the products of combustion are made to pass in a thin sheet under the sides of the boiler, substantially as set forth.

3. In a combined portable furnace and boiler having the same sheet of metal forming the top of the furnace and bottom of the boiler, and the removable supporting-bars O, secured to the sides or box of the boiler by means of wood-screws, for the purpose of holding in place the bottom of the boiler or top of the furnace, and also for holding the wings or sheet metal forming the sides of the furnace, a removable crib having a slat bottom and woven-wire sides, the same being fitted to each end of the two-compartment boiler, substantially in the manner and for the purposes set forth.

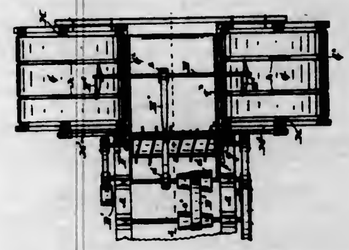
255,463. PERMUTATION-LOCK. CHARLES SEYBOLD, Cincinnati, Ohio. Filed May 6, 1881. (Model.)

Brief.—The tumblers rest directly on the arbor and are rigidly secured thereto after the combination is set. The diameters

of the tumblers diminish inward and each is provided with a notch having an inclined face, which allows the pin to mount the incline, pass out of the notch, and upon the periphery of the next smaller tumbler.

Claim.—1. The combination of the index, rotating tumblers provided with notches *b*, each having a side, *d*, beveled obliquely to the plane of the tumbler, and a locking-pin, G, pressed forward by mechanism, substantially as and for the purposes specified.

2. The combination of the index, rotating tumblers provided with notches *b*, each notch having a side, *d*, inclined obliquely to the plane of the tumbler, and swinging piece H, having movable pin G, pressed forward by a suitable device, substantially as and for the purposes specified.



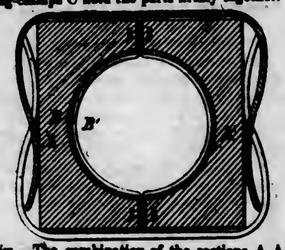
3. The combination of the index, rotating tumblers provided with notches *b*, each having a side, *d*, inclined obliquely to the plane of the tumbler, piece C', and the swinging piece H, having movable pin G, pressed forward by a suitable device, substantially as and for the purposes specified.

4. The combination of the index, arbor B, thumb-knob C, disk *a*, tumblers provided with notches, each having a side, *d*, inclined obliquely to the plane of the tumbler, piece C', swinging piece H, and pin G, actuated by weight G', substantially as and for the purposes set forth.

5. The combination of piece L, swinging lever M, provided with tail-piece *p*, and the swinging piece H, and operating mechanism, substantially as and for the purposes specified.

6. The combination of the tumblers and driving-arbor, the said tumblers resting directly on said arbor and fixed rigidly thereon, substantially as and for the purposes set forth.

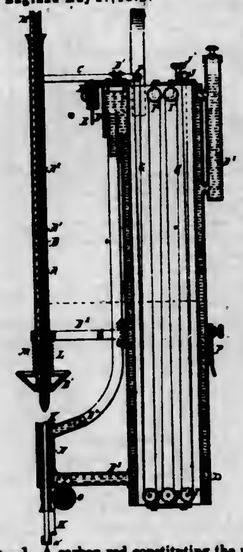
255,464. BAND-CUTTING AND FEEDING ATTACHMENT FOR THRASHING-MACHINES. GEORGE W. SHARP, Crawfordsville, Ind. Filed Sept. 27, 1881. (No model.)



Claim.—1. In a band-cutting attachment for thrashing-machines, the combination, with the table or carrier over which the sheaves pass, of a rotary cutter the head or knife of which runs transversely to the course of the carrier and is spiral in form, whereby its edge is caused to advance to correspond with the advance of the sheave, and mechanism for operating the same, substantially as shown and described, and for the purpose set forth.

2. In a band-cutting attachment for thrashing-machines, a cutter head or knife, E', the cutting-edge of which extends entirely around its shaft and is of gradually-increasing radius, substantially as shown and described, and for the purposes specified.

3. The combination of the grain-carriers G, mechanism for operating the same, the shafts H, which run at a greater speed than said carriers, and fingers *h* on said shafts, which act as crowders and force the sheaves forward on said carrier, substantially as shown and described, and for the purposes specified.



255,465. HOSE-CLAMP. JOHN SHEPHERD and JULIUS V. HELLER, Mason City, Ills. Filed Dec. 13, 1881. (No model.)

Brief.—Two sections, A A', form interiorly a cylindrical orifice adapted to encircle the hose, and exteriorly a rectangle. A gutta-percha or other water-proof lining is fastened to the inner sides of the sections. The rings E, at each end, are intended to form a closer joint there than at the middle or adjacent portions. The spring-clamps C hold the parts firmly together.

Claim.—The combination of the sections A A', linings B', having longitudinal ends *b b* and annular projections E E, and spring-clamps C, substantially as shown, and for the purpose described.

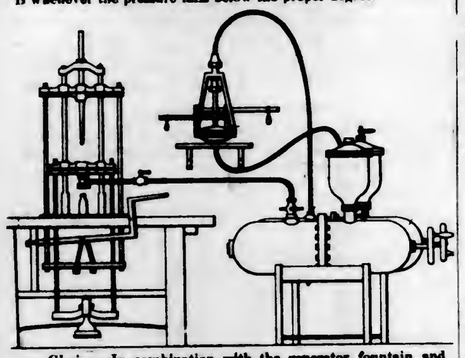
255,466. ELECTRIC LAMP. CHARLES W. SIEMENS, Queen Anne's Gate, Westminster, England. Filed Sept. 16, 1879. Patented in England May 27, 1879.

Claim.—1. A carbon rod constituting the pole of an electric lamp provided at its rear end with a bead of gum or saccharine matter, which becomes carbonized by the heat of the electric arc, so as to form a carbonaceous joint between the end of the rod and the contiguous end of the next one.

2. An iron or steel rod constituting the negative pole of an electric lamp, in combination with a holder containing a cooling-liquid and a spring, combined, as described, with said rod for the purpose of feeding it forward, as and for the purpose described.

3. In an electric lamp, the combination of the carbon pole A, holder B, lever C, thin metal strip or wire G, stretched over insulating-rollers F I, one end of the said wire or metal strip being in electrical connection with the one circuit-terminal, E, and the other end in connection with the other circuit-terminal, P, of the lamp, substantially as herein described with reference to the accompanying drawings.

4. In an electric lamp, the combination of the iron or steel negative pole K, tubular holder N, containing a cooling-liquid, tubular arms D^2 D^4, and lamp-casing D, constituting a water-reservoir, with extended heat-radiating surfaces, operating substantially as herein described.

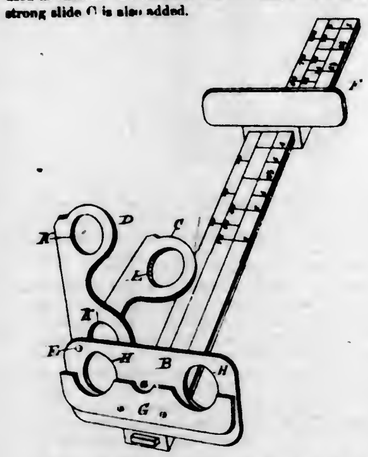


5. In an electric lamp, the combination of the tubular water-

reservoir containing within it the stretched thin metal strip or wire G, constituting a by-pass for the electric current, so that such metal strip or wire is protected from sudden changes of temperature of the surrounding atmosphere.

6. A reciprocating carbon-holder open at the upper end to permit the insertion of additional carbons to follow up the preceding one, in combination with a carbon rod provided at its rear end with matter which becomes carbonized by the heat of the electric arc, whereby the carbon is rendered continuous without interrupting the light.

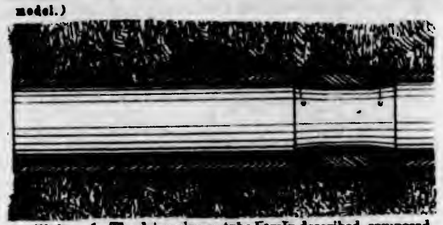
255,467. PRESSURE-REGULATOR FOR SODA-WATER. GEORGE S. SLOCUM, Newport, R. I., assignor to Alvin D. Puffer & Sons, Boston, Mass. Filed Nov. 6, 1880. Renewed Feb. 9, 1882. (No model.)



Brief.—B is a closed vessel which contains the water aerated by the gas from the generator A. Between B and A is located the pressure-regulator valve C, automatic in its operation, which opens for the influx of more gas into the closed vessel or fountain B whenever the pressure falls below the proper degree.

Claim.—In combination with the generator, fountain, and connecting-pipe of an aerated-water apparatus, a valve arranged in said pipe and operated by the pressure in said fountain to open and admit a fresh supply of gas when the pressure in said fountain falls below the proper point.

255,468. FOCI-METER. ANDREW L. SMITH, Geneva, N. Y. Filed Aug. 8, 1881. (No model.)



Brief.—To measure the focus of convex lens, the instrument is used as shown. To measure concave lens, slide D is used, and if strong slide C is also added.

Claim.—1. In an instrument for measuring lenses, the combination of the head B, having convex lenses H H, gage A, target F, and holder G, substantially as shown and described.

2. The combination of the head B, gage A, target F, and holder G with the slide-plates C and D, having lenses K L, substantially as shown and described.

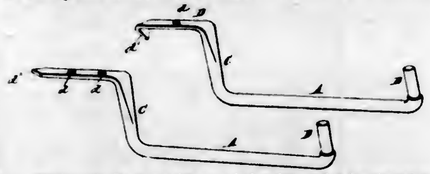
255,469. DRIVE-PIPE AND COUPLING FOR OIL AND OTHER WELLS. LEVI SMITH, Titusville, Pa. Filed June 14, 1881. (No model.)

Claim.—1. The drive pipe or tube herein described, composed of screw-threaded sections a a, said sections being strengthened at their ends by bands or rings set into said sections, over the screw-threads cut thereon, as shown and described, so as to be flush or of about the same external diameter as the sections.

2. The drive pipe or tube herein described for sinking oil and other wells, the same consisting of the tube-sections provided with tapering or reduced ends having square screw-threads cut thereon, and the coupling-sections provided with like screw-threads, as set forth.

3. A drive-pipe for sinking oil and other wells, the sections of which are connected by couplings having square screw-threads cut therein, as set forth.

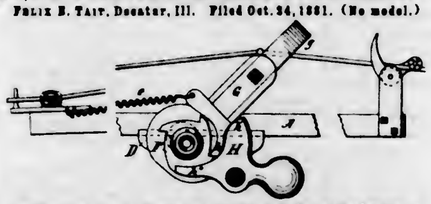
255,470. WATCH-MAKER'S CHUCK. JOHN SPICKERMAN, Jefferson, N. Y. Filed Jan. 13, 1882. (No model.)



Claim.—1. A chuck for jewelers' lathes, composed of the holder A and clamp B C, arranged and operating substantially as and for the purpose herein specified.

2. The watch-wheel clamp composed of the parts B C, constructed and operating substantially as and for the purpose herein specified.

255,471. CORNICE HOOK OR BRACKET. CHARLES D. STOSS, Brooklyn, N. Y. Filed Jan. 16, 1882. (No model.)



Brief.—The cornice hook or bracket is formed at the upper end into a barb or sharpened hook, and is adapted to be fastened on the top level of the window-frame.

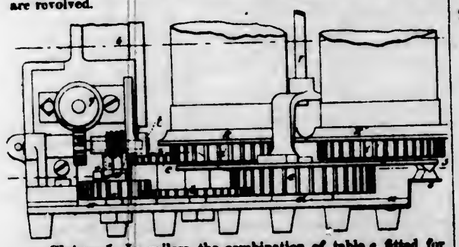
Claim.—1. In a cornice or pole bracket, a flat bearing-plate having a sharpened lug or hook and perforated to receive suitable securing means, adapted to rest upon and be secured to the upper level surface of a window or door frame, as set forth.

2. The cornice-bracket herein described, consisting of the single piece of metal bent to form the body A, hook B, bearing portion C, and the securing-plate D, having hole *d* and pointed lug *d'*, as and for the purposes specified.

255,472. CHECK-ROW ATTACHMENT FOR CORN-PLANTERS. FELIX B. TAIT, Decatur, Ill. Filed Oct. 24, 1881. (No model.)

Claim.—1. In a check-row attachment for corn-planters, a transverse shaft, a four-tooth ratchet-wheel, and weighted locking-pawl in combination with the oscillating arm G, having a tooth

or spur, h, cast onto one of its sides to engage with the teeth of the ratchet-wheel, and the oblong hole i, adapted to pass onto the transverse shaft C, as shown, and for the purpose specified.



2. The combination, with the transverse shaft C, having the four-tooth ratchet F and oscillating arm G, the weighted locking-pawl H, and bevel-gear I, of the lateral shaft J, supported by and adapted to revolve within the journals *f' f'* of the clip-journal E, and provided with bevel-gear K and crank-disk L, which actuates the seed-slide, substantially as set forth.

3. In a check-row attachment, the combination, with a transverse shaft and mechanism for imparting an intermittent rotary motion thereto, of a clip-journal centrally located on the transverse beam B, having a laterally-projecting arm, E', for the purpose of affording a central bearing and support to the shaft C, and provided with a cap, *g''*, which forms a part of the journal and extends along the top of said arm to the clip, to which it is secured in the manner and for the purpose specified.

4. In a check-row attachment, the combination, with the transverse beam and shaft, of the clip-journal E, having lower projections, *f f*, which pass down on either side of the beam B, and provided with holes or journals *g' g'*, which support the lateral shaft J, substantially in the manner shown, and for the purpose described.

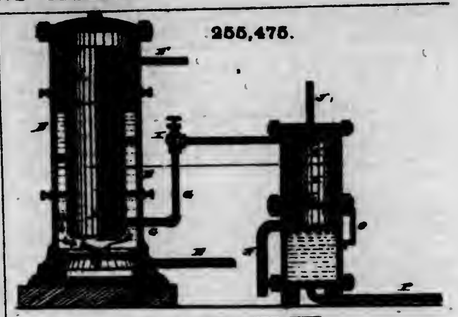
255,473. COILER FOR RAILWAY-HEADS, CARDING-MACHINES, &c. ROGER TATHAM, Rochdale, County of Lancaster, England. Filed Nov. 5, 1880. (No model.) Patented in England Apr. 12, 1879.

Brief.—Two cans are alternately and automatically presented to the machine to receive the sliver as it is delivered therefrom. When brought into proper position to receive such sliver the cans are revolved.

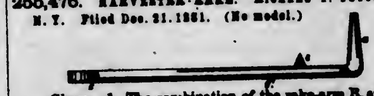
Claim.—1. In coilers, the combination of table c, fitted for rotation on a center, disks *k k'*, provided with gear-wheels *i i'* and driving gear-wheel *h*, and mechanism fitted for giving periodical rotation to table c, whereby the gears of the disks are brought alternately in mesh with the driving-gear, substantially as shown and described, for the purposes specified.

2. In coilers, the combination, with table c, of the mutilated gear u, provided with stud v, continuously-driven gear-wheel t, provided with pin u, driving-wheel o, placed for connection with the mutilated wheel, and gearing connecting the axis of table c with the axis of the mutilated wheel, substantially as shown and described, for operation as specified.

255,474. WELTING BOOTS AND SHOES. ROLLIN D. TUCKER and JOSEPH H. ANTHOINE, Boston, assignors to Sylvester C. Fay, Southborough, Mass. Filed Jan. 23, 1882. (No model.)



Claim.—The welt C, arranged and combined with the pieces A B substantially in the manner as set forth, such welt being folded and placed between the said pieces and connected thereto by a row of stitches, a, extending through them, the said pieces, and the two laps of the welt, and such laps being subsequently folded over the next adjacent ends of and against the said pieces, and further connected to such pieces by rows of stitches *b b*, arranged with and going through them and the laps, as represented.



255,475. FEED-WATER HEATER. JOHN H. TURNER, Fort Wayne, Ind. Filed Dec. 22, 1881. (No model.)

Claim.—As an improvement in feed-water heaters and condensers, the combination of the cylindrical tank A, surrounding shell B, tee pipe C E F G, the condensing-tank H, having spray-plate K, and diaphragm L, provided with V-shaped perforations, the overflow-pipe N, and pipe P, all constructed and arranged substantially as set forth.

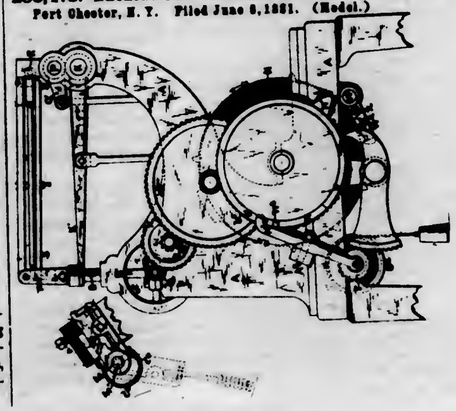
255,476.

255,476. HARVESTER-RAKE. RICHARD T. TUTTLE, Perry, N. Y. Filed Dec. 21, 1881. (No model.)

Claim.—1. The combination of the rake-arm B, sweep-board A, teeth A, and malleable fastening C, provided with arms *a a*, adapted to be bent around the teeth, substantially as and for the purposes set forth.

2. The combination of the rake-arm B, sweep-board A, teeth A, and malleable fastening C, provided with arms *a a* and spur *c*, substantially as and for the purposes set forth.

255,477. APPARATUS FOR COOLING ROASTED COFFEE. L. A. VERRIER, Chicago, Ill. Filed Feb. 6, 1882. (No model.)



Claim.—1. The combination, in a coffee-cooler, of the rotary wire-gauze cylinder H, removable perforated tube K, provided with hopper K', and having a pin, *e*, and head A, provided with an opening, *d*, substantially as shown and described.

2. The combination, in a coffee-cooler, of the rotary wire-gauze cylinder H, the pan L, inclosing a portion of the said cylinder, and an exhaust-fan having an air-induction tube entering the said pan, substantially as and for the purposes specified.

3. The combination, in a coffee-cooler, of the rotary wire-gauze cylinder H, the pan L, inclosing the lower part of the said cylinder, the perforated feed-tube K, entering the said cylinder, and an exhaust-fan having an induction-pipe entering the pan, substantially as and for the purposes specified.

255,478. MACHINE FOR TAPPING NUTS. WILLIAM B. WARD, Port Chester, N. Y. Filed June 6, 1881. (Model.)

Claim.—1. The combination, as before set forth, of a receiver adapted to hold nut-blanks, one by one in succession, a tap secured to a revolving holder by clamping-jaws while it is threading a series of blanks, one after the other, mechanism for releasing the tap from its revolving holder while the last blank in the series is being threaded, mechanism for clamping such last-named blank with the tap engaged therewith to the receiver, and mechanism for partially rotating the receiver and tap held therein, to enable the fully-threaded nuts to be discharged from the shank end of the tap by gravity.

2. The combination, as before set forth, of the nut-blank receiver, mechanism for partially rotating the same to permit the finished nuts to be discharged from the shank end of the tap while the screw end of the tap is held in said receiver, and mechanism, substantially as described, for returning the receiver and the tap to their normal positions.

3. The combination, as before set forth, of the rotating and longitudinally-reciprocating tap-holder, the nut-blank receiver, and mechanism, substantially as described, for partially rotating said receiver in opposite directions, or vibrating the same at stated periods relatively to the movement of the tap-holder.

4. The combination, as before set forth, of the revolving tap-holder, the partially-rotating nut-blank receiver, and centering-fingers for putting the tap into alignment with said tap-holder when the tap is to be restored to the control of its holding-jaws.

5. The combination, with the nut-blank receiver provided with the jaw L′, of the rod M′, having a cam, *n*, the spring *m*′, for moving said rod in one direction, and the cam N and lever N′, for moving it in the opposite direction, substantially as set forth.

6. The combination, with the sleeve C′, and the tap-spindle D, splined thereto and provided with clamping-jaws to hold a tap, of the axial rod G, having a cam, *g*, the spring *g*′, and the bars Q R S, substantially as and for the purposes specified.

255,479. FIRE-GRATE. FREDERICK W. WEAVER and DANIEL HORTON, Troy, N. Y. Filed Aug. 3, 1881. (No model.)

Claim.—1. In a grate of the character herein specified for use in any form of stove or heater, the section C, having bars *h* located between those of section B and on substantially the same level, the said section C being made movable in the direction of the axis of the grate to vary the width of the openings through the grate, and capable of being rocked either independently of said section B or together therewith, substantially as and for the purposes set forth.

2. In a grate composed of the two movable or operating sections, as specified, the combination, with the shaft of the shaking-section, of the locking-stud *h*, for engagement with the walls of the lower opening in the hollow axle G for the purpose of keying the two sections together, substantially as and for the purpose specified.

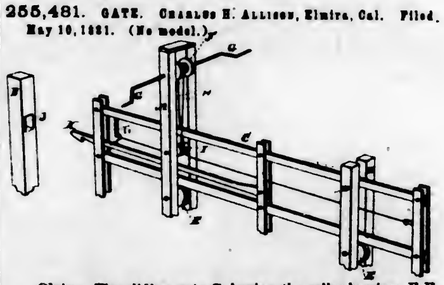
3. The combination, with the shaft of the shaking section C, of the lug *b* at one end thereof, for bearing against the walls of a corresponding groove or race formed in the bed-plate, whereby the section C is maintained in its proper place, substantially as shown and described.

4. In a grate composed of two movable sections, having grate-bars located as explained, the combination, with the shaft of the grate, of two lugs, *l l*, forming bearings for the shaking implement, by the use of which the shaking-section can be forced in the direction of the greatest length of the grate for the purpose of varying the width of the openings between the bars of the two parts of the grate, substantially as shown and described.

5. The herein-described shaking and dumping grate, composed of the two principal sections B and C, the bars *g* and *h* of which form the fire-bed, section C being adjustable longitudinally with respect to section B, both sections being capable of being revolved together, and the axle being provided with locking and guiding studs *b* and *h*, substantially as shown and described, and for the purposes set forth.

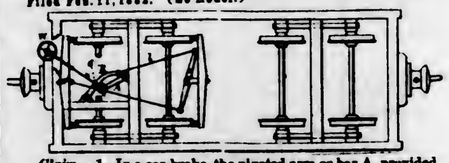
6. In a fire-grate composed of the two sections, as set forth, the combination, with the shaking-section, of a lug or stop applied thereon for the purpose of limiting the movement of the said shaking-section in one direction, substantially as explained, so that its bars will close up against the bars of the other section on one side only, as set forth.

7. The projection or half-ring applied on the bed-plate and overlapping the axle of the double grate at one end, the parts being arranged and combined substantially as shown.



8. The projecting end of the bed-plate, recessed, substantially as shown, to receive the projecting jaws of the shaking implement and to accommodate the side of said implement when turned down for dumping the grate, all substantially as shown and described.

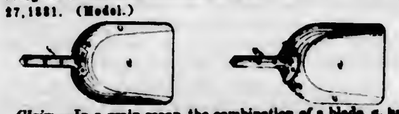
255,480. DEVICE FOR CONNECTING BOOTS OR SHOES. WILLIAM E. WEBB, North Bridgeton, Me. Filed Jan. 16, 1882. (No model.)



Claim.—A device for connecting a pair of shoes, consisting of a cord or string provided at each end with a bar, *a*, which is tubular a portion of its length and semi-tubular the remainder, and having the cord or string secured to said bars, and adapted to be used substantially as set forth.

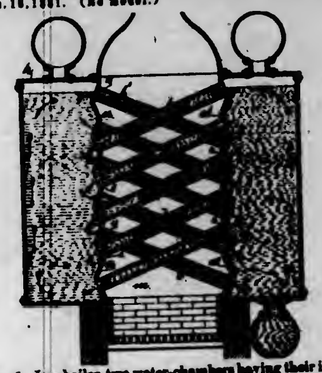
255,481. GATE. CHARLES H. ALLISON, Elmira, Cal. Filed May 10, 1881. (No model.)

Claim.—The sliding gate C, having the roller-bearings E E and a latch, K, operating substantially as described, the crank-shaft G, carrying the winding-drum F, and arranged above the gate, the pulleys I I, and the cords H H, passing over the drum F and pulleys I, the one rope connecting with the rear of the gate, and the other with the latch K through an eye or equivalent on the projection L, the whole constructed so as to act in combination, whereby upon opening the gate the latch may first be lifted by the cord before a direct pull is exerted upon the gate.



255,482. CAR-BRAKE. ALANSON BAILEY, Toledo, Ohio. Filed Feb. 11, 1882. (No model.)

Claim.—1. In a car-brake, the pivoted arm or bar A, provided with sheave *s* and guide *g*, substantially as shown, for the purposes specified.

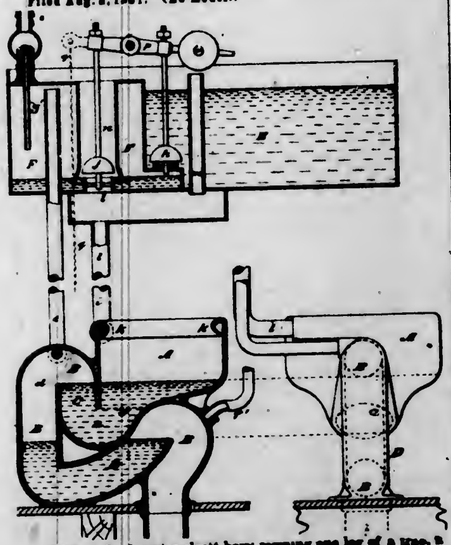


2. In a car-brake, the lever B, in combination with the bar A, sheave *s*, windlass W, and rod and chain *w*, substantially as shown and described, for the purposes specified.

255,483. GRAIN-SCOOP. THOMAS J. BLAKE, Pittsburg, Pa., assignor of one-half to John Rath, same place. Filed Sept. 27, 1881. (Model.)

Claim.—In a grain-scoop, the combination of a blade, *a*, having the high curved back *b*, front strap, *f*, corrugated at *e* and extended laterally to fit the curvature of back *b*, back strap, *g*, corrugated at *i*, fitting the back *b* laterally, and extending only to a point on the back *b* above its junction with blade *a*, said straps *f* and *g* being secured to the scoop by rivets passing through them and the back *b*, and a handle, A, attached to the said straps, substantially as described.

255,484. STEAM-BOILER. JOHN L. ROGERS, Flushing, N. Y. Filed Dec. 16, 1881. (No model.)



Claim.—1. In a boiler, two water-chambers having their inner plates corrugated, in combination with ranges of tubes inclined in opposite directions, the ends of such tubes passing through the plates at right angles to the surfaces, substantially as set forth.

2. In a boiler, the combination, with two semicircular shells, of the corrugated tube-sheets and the ranges of tubes inclined in opposite directions, with their ends passing through the tube-sheets and being at right angles to the surfaces where such tubes pass through, so as to connect the water-chambers, substantially as set forth.

3. In a boiler, the semi-cylindrical shells and corrugated plates, in combination with the ranges of tubes inclined in opposite directions, and the connecting-plates *f*, substantially as specified.

255,485. WATER-CLOSET. JAMES E. BOYLE, Brooklyn, N. Y. Filed Aug. 8, 1881. (No model.)

Claim.—1. A water-closet bowl forming one leg of a trap, a second trap below the first, an exhaust-pipe leading from the air-space between the two traps and terminating near the top of a flushing-chamber, the said chamber provided with inlet and outlet valves, and a flushing-pipe leading from the outlet-valve thereof to the bowl, all in combination, with suitable means, substantially as hereinbefore set forth, for preventing further retardation of the flow of flushing-water after the bowl has been siphoned by the partial vacuum formed by the descent of water in the flushing-chamber, thereby augmenting the after-wash and insuring the final filling of the bowl.

2. A water-closet bowl formed as one leg of a trap, a second trap below the first, an exhaust-pipe leading from the air-space between the two traps to the upper part of a flushing-chamber, the said chamber provided with inlet and outlet valves, and a flushing-pipe leading from the outlet-valve thereof to the bowl, all in combination with an air-pipe entering said flushing-chamber and opening therein in the lower portion thereof, substantially as and for the purposes set forth.

3. A water-closet bowl formed as one leg of a trap, a second trap below the first, an exhaust-pipe leading from the air-space between the two traps to the upper part of a flushing-chamber, the said chamber provided with inlet and outlet valves, and a flushing-pipe leading from the outlet-valve thereof to the bowl, all in combination with a check-valve opening outwardly from the top of the flushing-chamber, and an air-tube extending into the latter and opening therein about midway of its height, substantially as set forth.

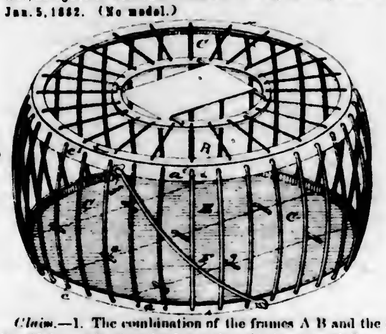
4. A water-closet bowl formed as one leg of a trap, a second trap below the first, an exhaust-pipe leading from the air-space between the two traps to the upper part of a flushing-chamber, the said chamber provided with inlet and outlet valves, and a flushing-pipe leading from the outlet-valve thereof to the bowl, all in combination with a check-valve opening outwardly from the top of the flushing-chamber, and an air-tube extending into the latter and opening therein about midway of its height, substantially as set forth.

5. The combination of bowl A, traps C and D, air-space *d*, pipe *e*, chamber F, pipe *n*, depending into said chamber, valve-seat *i*, projecting up inside the pipe *n*, valve *j*, normally unseated, pipe *l*, leading from said seat *i* to the bowl A, a normally-closed inlet-valve for the chamber F, and means for opening said inlet-valve and closing the valve *j* upon the depression of the water-closet seat, substantially as and for the purposes set forth.

6. The combination of bowl A, traps C and D, air-space *d*, pipe *e*, chamber F, inlet and outlet valves therefor, service-box G, into which said outlet-valve opens, air-pipe *m*, and flushing-pipe *l*, substantially as set forth.

7. The combination of bowl A and traps C and D, molded in one piece, with the belly of the trap C arranged to depend between the two legs of the trap D, and the crown of the latter arranged to one side of the belly of the trap C and close underneath the bowl A, substantially as set forth.

255,486. SEED-COTTON CLEANER. GEORGE E. BRADLEY, Atlanta, Ga., assignor of five-sixths to J. W. Goldsmith, R. J. Lowry, J. H. Goldsmith, T. D. Meador, and C. D. Meador, same place. Filed Jan. 26, 1882. (Model.)



Claim.—In a seed-cotton cleaner, the combination of a beating-chamber having a smooth inner surface and whipping means, a fan-chamber having a suction-fan, and the connecting-flues, substantially as described, and for the purposes set forth.

255,487. MEANS FOR ATTACHING CAPS TO BOTTLES. HENRY BROOKS, New York, N. Y. Filed June 6, 1881. (No model.)

Claim.—The bottle A, provided with recesses below its neck for receiving the ends of the bar B, in combination with said bar, the chain C, and the perforated cap B, substantially as and for the purpose described.

255,488. POLDING COOP. WILLIAM S. BURROUGHS, St. Louis, Mo., assignor of one-half to Amos E. Colby, same place. Filed Jan. 5, 1882. (No model.)

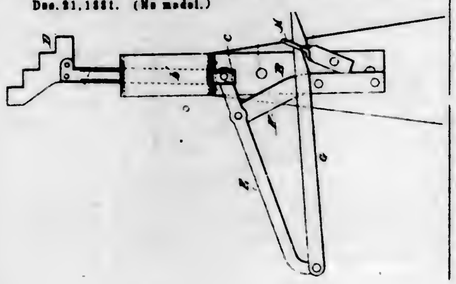
Claim.—1. The combination of the frames A B and the rods C C, said frames having the depressions *a' a'*, substantially as and for the purpose described.

2. The combination of the frames A B, the rods C C, and the brace F, substantially as described.

3. The combination of the frames A B, the rods C C, and the brace F, said frames having the depressions *a a'*, substantially as described.

4. A folding coop, box, cage, or other receptacle consisting of a top and a bottom frame united by a series of rods or bars which, when the receptacle is opened, form the side wall thereof, but which are jointed to the top and bottom frames for the purpose of enabling the receptacle to be closed into a compact form by moving in a spiral direction one frame toward the other until the two frames are closed together.

255,489. ICE-FLOOR FOR COLD STORAGE-HOUSES. HOMER C. CAIN, Cleveland, Ohio. Filed Dec. 22, 1881. (No model.)

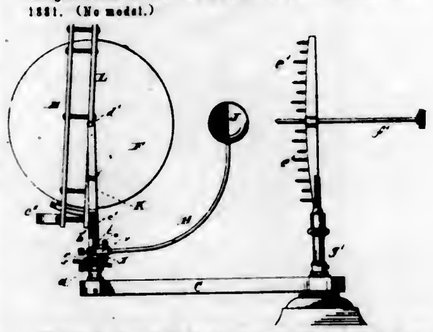


Claim.—1. An ice-floor for cold storage-houses, consisting of plates of metal secured at one edge at or near the lower edge of one joint, and extending diagonally across to the top of the next joist, to which its opposite edge is secured, substantially as set forth.

2. An ice-floor for cold storage-houses, consisting of plates of metal secured at one edge at or near the lower edge of one joist, and then extending diagonally up and over the top of the next one, and then downwardly, and secured at or near the lower edge of the latter, substantially as set forth.

3. An ice-floor for cold storage-houses, consisting of plates of metal secured at or near the lower edge of one joist, and then extending diagonally up and over the next one, and down again till at or near the lower edge of this joist, where they are turned up to form a trough, substantially as and for the purpose shown and described.

4. In an ice-floor for cold storage-houses, the combination of the joist provided with metal bars on the upper edge and the metal plate, substantially as and for the purpose shown and described.



255,490. WAGON-JACK. JAMES CLARK, Cleburne, Tex. Filed Dec. 21, 1881. (No model.)

Claim.—1. In a wagon-jack, the combination, with a standard, of a metallic strip bent to form horizontal guides, the latter being perforated, as described, a stepped plate and shank passing through said guides, and a lever pivoted to the lower end of said shank and provided with a suitable catch device for locking it in position, substantially as described.

2. In a wagon-jack, the combination, with a standard, of a strip, B, bent to form guides *b b'*, the plate D, and shank C, the lever E, fulcrumed on the arm F, and catch H, substantially as described.

255,491. TELLURIAN. THOMAS H. COSTELLO, Chicago, Ill., assignor to A. H. Andrews & Co., same place. Filed Mar. 14, 1881. (No model.)

Claim.—1. A curved wire or rod, *s*, carrying a ball, J, to represent the moon, and provided with a bevel-wheel, I, in combination with a bevel-gear, *r*, supported beneath the globe, for the purpose of keeping the illuminated side of the moon constantly toward the sun, substantially as specified.

2. A curved wire or rod, *s*, carrying a ball to represent the moon, and provided with a cog-wheel, I, a yoke, *r*, and collar *t*, in combination with a bevel-gear, *r*, and sleeve *o*, substantially as and for the purpose specified.

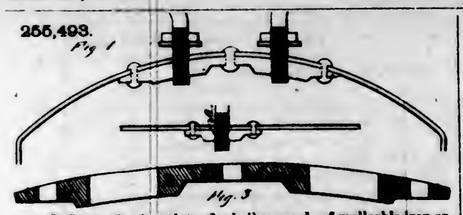
3. The yoke or support K, having its ends slotted and provided with a socket, by which it can be mounted on a fixed standard, within which the shaft which supports the earth rotates, in combination with a horizon-circle, L, provided with pins *d'*, to enter the slots in the ends of the yoke K, substantially as and for the purposes specified.

4. The yoke or support K, provided with slots at its ends, a socket, *b'*, for connecting the same to its standard, and pins *c'*, for the purpose of receiving and holding in position the horizon-circle L, substantially as specified.

5. The sleeve *k*, provided with a plate having a flange, *m*, to receive a screw or pin for the purpose of holding such sleeve in a fixed position, in combination with an arm, C, and shaft D, to receive the globe F, substantially as specified.

6. The reciprocating bar B, supported by a screw or bolt, *f*, passing through a slot, *e*, in the bar, in combination with a wheel provided with a slot, *h*, to receive a pin on such bar B, substantially as and for the purpose specified.

255,492. BARGE-PUMP. JACKSON D. COWAN and ROBERT E. LEE, McKeesport, Pa. Filed May 23, 1881. (No model.)



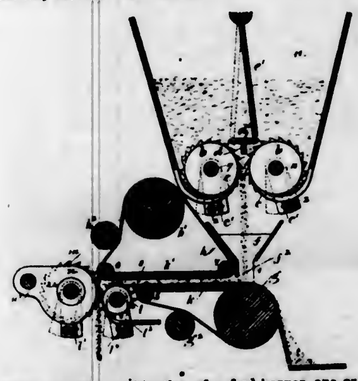
Claim.—1. In a barge-pump, a cylindrical barrel consisting of seamless wrought-iron tubing, in combination with a detachable cast-iron head and wooden spout, substantially as described.

2. The combination specifically of the cylindrical barrel A of iron tubing, the casting B, wooden jaws *b b*, back *c*, and apron *d*, substantially as described.

255,493. BOILER. ALLEN P. CHEQUE, New York, N. Y. Filed Feb. 3, 1882. (No model.)

Claim.—1. A boiler provided at its aperture or apertures with strengthening-plates made of malleable iron or other equivalent ductile material riveted to the boiler-shell, substantially as shown and described.

255,493.



2. Strengthening-plates for boilers, made of malleable iron or other equivalent ductile material, and consisting of a flange surrounding the aperture, and ears or projections provided with riveting-holes, substantially as described.

3. A strengthening-plate for the apertures of boilers, of malleable iron or other equivalent ductile material, having flanges surrounding the apertures, and ears or projections provided with rivet-holes, said ears or projections being of less thickness than the strengthening-flanges.

4. A strengthening-plate for the apertures of boilers, formed of malleable iron or other equivalent ductile material, and provided with ears or projections for rivet-holes, said ears or projections having a horizontal surface on one of their sides, the other side of the plate being curved to conform to the boiler.

5. A boiler-head having the holes for pipe-connections pierced at equal distances from the center thereof and strengthened by a plate of malleable iron or other equivalent ductile material riveted thereto, substantially as described.

255,494. MACHINE FOR OPENING AND FEEDING TOBACCO. CHARLES L. CURTIS and BENJAMIN ADRIANCE, Brooklyn, N. Y. Filed May 18, 1881. (No model.)

Claim.—1. The combination of a feed-hopper, one or more toothed feed-cylinders, stripper-fingers, and vibrators, substantially as set forth.

2. The combination, with the hopper and toothed feed-rollers, of the stationary cutter-fingers and reciprocating cutter-bar, substantially as set forth.

3. The combination, with the hopper, feeding-cylinders, and stationary and vibrating cutters, of the swinging plate *e'*, substantially as set forth.

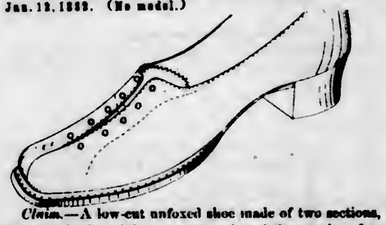
4. The combination, with the hopper and toothed feeding-cylinder, of the fingers *d* and swinging plate *e'*, substantially as set forth.

5. The combination, in a tobacco-feeding machine, of the hopper, toothed feed-rollers, separating-hopper *f*, with a mouth at one side, and the roller or belt *g*, substantially as set forth.

6. An endless belt, *g*, in combination with the graduating-roller *l*, having pins upon its periphery, substantially as set forth.

7. The endless belts *g* and *h* and their respective rollers and belt-tables, in combination with the graduating-roller *l*, having pins or teeth on its surface, substantially as set forth.

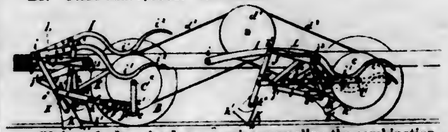
8. The endless belts *g* and *h* and their respective rollers and belt-tables, in combination with the graduating-roller *l*, having pins or teeth on its surface, and the guide-fingers between the belts, substantially as set forth.



9. The combination, with the belts *g* and *h*, of the graduating-roller *l*, having pins or teeth in its surface, and the notched bridge 8 between the belt *g* and the graduating-roller *l*, substantially as set forth.

10. The combination, with the belts *g* and *h* and baffle-plate *f'*, of the graduating-roller having pins or teeth in its surface, substantially as set forth.

11. The combination, with the belts *g* and *h* and graduating-roller, of the strippers *f'* and vibrator *f'*, substantially as set forth.



12. The combination, with the graduating-roller, of the serrated or toothed cylinder *m* and eccentric strippers and vibrator, substantially as set forth.

255,495. SHOE. CHAS. B. DANIELS, Haverhill, Mass. Filed Jan. 13, 1882. (No model.)

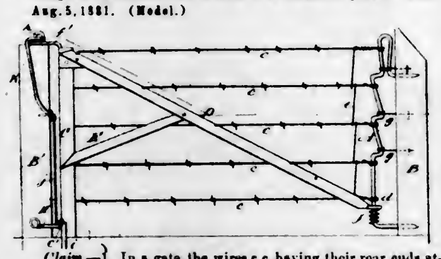
Claim.—A low-cut unfoxed shoe made of two sections, A B, having the back and front seams, *c c'*, and the opening *c²* over the ball and waist portion of the sole between the toe and the lower part of the instep, all substantially as described.

255,496. CAR-PROPELLER. HENRIAH E. DEPP, Sedalia, Mo. Filed Jan. 7, 1882. (No model.)

Claim.—1. In a land or a marine propeller, the combination of the axles C, having a crank, *c'*, connecting-rod E, knee-joint lever J, lifting-lever I, and link *h*, substantially as and for the purpose set forth.

2. The combination of the connecting-rod E, knee-joint lever J, and a clasp, F, substantially as and for the purpose set forth.

3. The combination, with a wheeled vehicle provided with power-transmitting mechanism, of the axles C, having cranks *c'*, connecting-rods E, knee-joint levers J, and lifting-levers I, links *h*, and feet K, substantially as and for the purpose set forth.

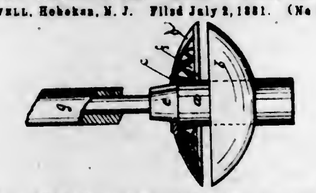


255,497. INCANDESCENT ELECTRIC LAMP. PHILIP DIEHL, Elizabeth, N. J. Filed Jan. 10, 1882. (No model.)

Claim.—1. An electric lamp consisting of a hermetically-closed glass globe, a light-giving part inside of the globe, a secondary coil supported within the globe and placed in circuit with the light-giving part, and a primary coil arranged exterior to said globe and in inductive relation to the secondary coil, substantially as set forth.

2. The combination of a glass globe containing the light-giving part, an extension made integral therewith, and secondary coil supported at the interior of the extension and placed in circuit with the light-giving part, and of a primary coil arranged exterior to the globe and in inductive relation to the secondary coil, substantially as specified.

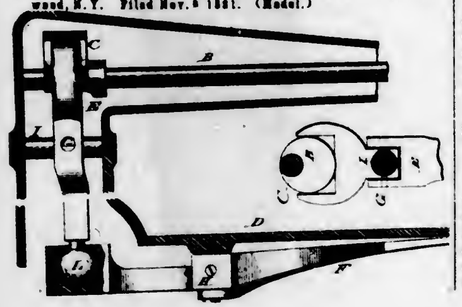
255,498. GATE. SAMUEL S. DUNNON, Junction City, Kans., assignor to himself and Walter A. Piers, same place. Filed Aug. 5, 1881. (Model.)



Claim.—1. In a gate, the wires c c, having their rear ends attached to the bent rod A, which is secured to the post B, whereby the wires are self-tightening, substantially as described.

2. The gate herein shown and described, consisting of the wires c c, the bent rod A, the upright C, and the braces D and E, the brace D being supported upon the spring *f*, substantially as and for the purposes set forth.

3. The upright C, provided with the loop *f*, and the projection c', in combination with the yoke H and levers J and K, the short arms of the levers being connected together and to the yoke, substantially as and for the purposes set forth.



4. The lever K, pivoted to the face of the post B', and having its upper end bent into a hook and adapted to enter the loop *h*, for locking the gate, in combination with hand-lever J, secured to the side of the post, the short arms of the said levers being connected together for opening and locking the gate from either side, substantially as set forth.

255,499. INSECT-GUARD. HARRY W. FLOOD and HENRY KRENWELL, Hoboken, N. J. Filed July 2, 1881. (No model.)

Claim.—An insect guard or protector consisting of the standard *a*, provided with the eccentric portion c and shoulder c, in combination with the vessel *b* and perforated cover *d*, all arranged and operating substantially as shown and described.

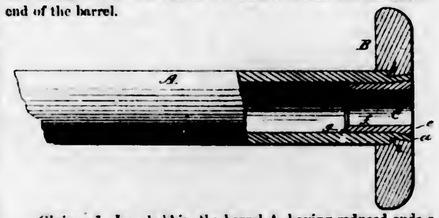
255,500. SEWING-MACHINE. CHARLES H. GIFFORD, Norwood, N. Y. Filed Nov. 9 1881. (Model.)

Claim.—1. In a sewing-machine, the vibratory shuttle-lever driver E, having a hinge, G, substantially as herein set forth.

2. In a sewing-machine, the shuttle-lever F, having a hinge, H, substantially as herein set forth.

3. In combination with th shaft B and the cam C in a sewing-machine, the combination of the hinged lever E and hinged lever F with the ball-joint L, substantially as herein set forth.

255,501. CHENILLE FRINGE. JOHN C. GRAHAM, Philadelphia, Pa. Filed Mar. 19, 1881. (Model.)



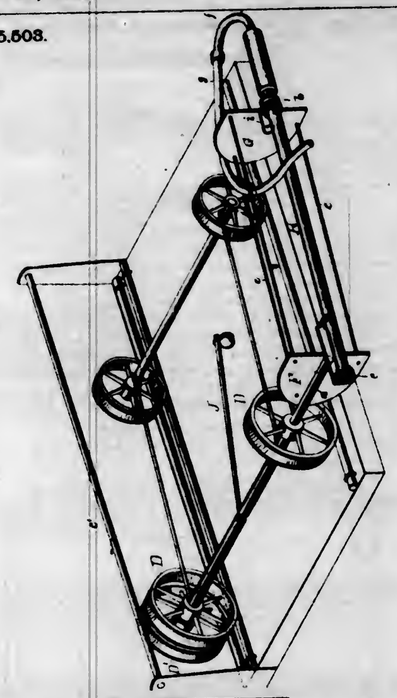
Brief.—A tuft or ball is formed directly upon the free end of each pendant. The fringe-web is woven with a series of warp-threads along one edge which are more tightly or closely woven than the body of the web, and when the web is cut the protrusion of these threads beyond the others forms a tuft, swell, or enlargement upon the end of each pendant.

Claim.—As a new article of manufacture, a fringe composed of a heading and a series of pendants, each pendant having loosely-woven body-threads, and a tuft, swell, or enlargement formed of closely-woven end threads, the body and end threads being woven upon a group of the filling-threads of the heading, substantially as set forth.

255,502. BOBBIN. DAVID HAMBLETON, Nashua, N. H. Filed Jan. 20, 1881. (No model.)

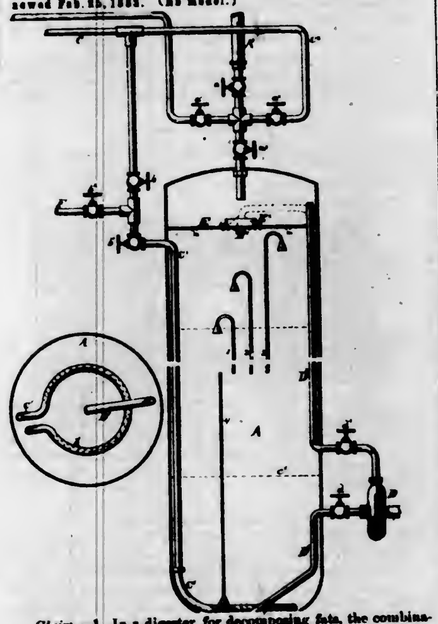
Brief.—An annular shoulder is formed near the end of the barrel of the bobbin and an annular seat in the head thereof. From this seat to the outer face of said head a flaring opening is formed. To adjust the parts the barrel is inserted through the opening in the head, and a bushing having a flaring head of the same contour as the flare of the hole in the head is driven into the hollow end of the barrel.

Claim.—1. In a bobbin, the barrel A, having reduced ends *a* and annular shoulders *b*, in combination with the heads B, formed with annular seats *c* and flaring openings *d*, the greater diameter of the barrel entering the head, so that the shoulders will abut against the seat between the sides of the head, and the bushing C, driven into the ends of the barrel to expand and force the ends thereof against the sides of the flaring openings, substantially as and for the purpose set forth.



2. The barrel A, having reduced ends *a* and shoulders *b*, in combination with the heads B, formed with seats c and flaring openings *d*, and the bushings C, having flaring head *e*, shank *f*, and bevel *g*, substantially as and for the purpose specified.

3. The combination, with the barrel A, having reduced ends *a* and shoulders *b*, and the bushings C, formed with flaring heads *e*, of the heads B, formed with annular seats c and flaring openings *d*, said openings increasing in diameter from the seats to the outer face or side of the head, substantially as shown, and for the purpose set forth.

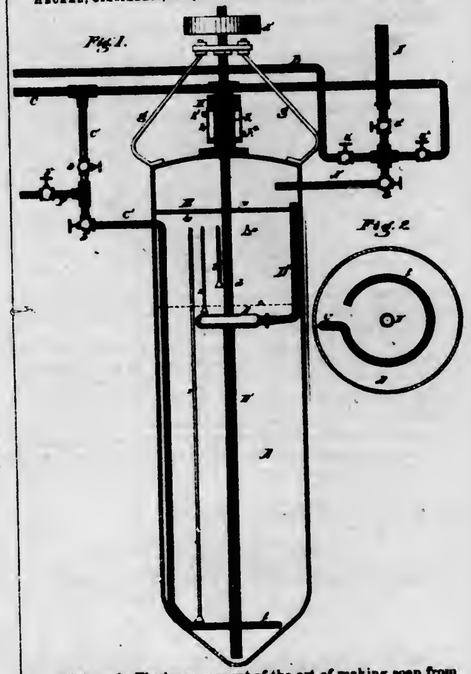


255,503. MACHINE FOR BLOWING WINDOW-GLASS. HENRY HARDS, JOHN PHILLIPS, and EDWARD PHILLIPS, Ottawa, Ill. Filed July 5, 1881. (Model.)

Claim.—In an apparatus for blowing glass, the combination, with a truck having a hollow axle and adapted to move on a track, of an auxiliary wheel, D', and rod *e'*, a rod, *a*, passing through the hollow axle, a weighted lever, J, secured to the rod *a*, plates F G, connected by rods *e* and secured to the rod *a*, blow-pipe having the collars *b* and secured to the plates by clasp c, and hook *i*, substantially as and for the purpose set forth.

255,503.

255,504. APPARATUS FOR DECOMPOSING FATS AND OILS. HENRY HECKEL, Cincinnati, Ohio. Filed May 15, 1880. Reissued Feb. 28, 1882. (No model.)

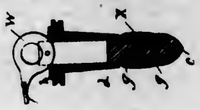


Claim.—1. In a digester for decomposing fats, the combination of a broad flat perforated diaphragm located and operated in the steam-space and above the fat and water line, and the pipes D' D', pump D, perforated steam-pipe C', by which the steam is directed in jets into and caused to flow up through the mass, substantially as before set forth.

2. In combination with a digester for decomposing fats, the pipes A' B C C', valves *a a' a² a²*, pipes C' F, valves *b b' b²*, pump D, and pipes D' D', provided with suitable valves, *d d'*, substantially as and for the purposes set forth.

3. In combination with a digester for decomposing fats, the pipes A' B C C', valves *a a' a² a²*, pipes C' F, valves *b b' b²*, pump D, pipes D' D', provided with suitable valves, and a perforated diaphragm, the latter being located and operating in the steam-space and above the fat and water line, substantially as and for the purposes set forth.

255,505. ART OF MAKING SOAP FROM FATS. HENRY HECKEL, Cincinnati, Ohio. Filed Nov. 17, 1881. (No model.)



Claim.—1. The improvement of the art of making soap from fats, which consists of first extracting the glycerine from such fats in their neutral condition by the direct action of steam and water under a pressure of about one hundred and fifty pounds, (so that the use of any chemicals is not necessary,) and then saponifying the resultant stock, substantially as before set forth.

2. The improvement of the art of separating glycerine from fats, which consists in heating the fat in admixture with water by the direct action of steam under a pressure of about one hundred and fifty pounds, and showering the heated admixture through a confined volume of steam under pressure, substantially as before set forth.

3. In a digester for decomposing fats, the combination of a perforated diaphragm located and operated in the steam-space and above the fat and water line of the digester, the circulating-pump D, with its suction-pipe D' and discharge-pipe D², all within the digester, and perforated steam-pipe C', by which the steam is directed in jets into and caused to flow up through the mass, substantially as before set forth.

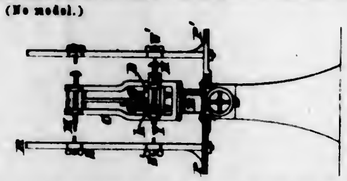
255,506. BOTTLE-STOPPER FASTENER. GEORGE F. HOUPER, Chicago, Ill. Filed Jan. 19, 1882. (No model.)

Claim.—1. The shouldered tapering concaved spool, with central perforation, *a b*, and constructed of one piece, substantially as shown, and for the purpose set forth.

2. The piston composed of shank *e e*, double-shouldered stem *g g*, and button *c*, the shank having a horizontal pin or axis passage, *f f*, and a vertical slot, *d d*, substantially as shown and described.

3. The barrel-shaped hollow centrally-perforated elastic stopper X, substantially as shown and described.

4. The combination of the shouldered tapering perforated spool with the piston provided with the vertical slot *d d* and horizontal pin or axis passage *f f*, stem with concaved button *c*, the one-armed perforated circular lever W, the circular concaved perforated metal plate, and the barrel-shaped hollow perforated rubber stopper X, substantially as and for the purpose stated.

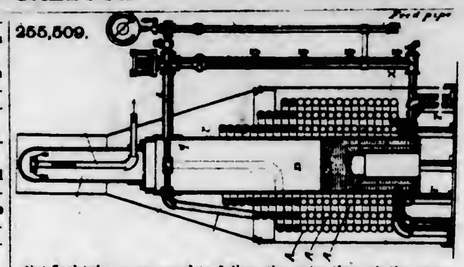


255,507. GRAIN-BIN. EBENEZER HOLMES, Chicago, Ill., assignor of one-half to Edward Baumann and William H. Lotz same place. Filed Jan. 31, 1882. (No model.)

Claim.—1. In grain-bins, and in combination therewith, the ring-shaped step-frames built into the partitions between four adjacent bins, substantially in the manner set forth.

2. In grain-bins, and in combination therewith, the ring-shaped frames *d*, placed in notches between the planks that form the partitions for four adjacent bins in such a manner that each ring forms steps in the corners of the four bins, substantially as set forth.

255,508. MACHINE FOR COPYING SCULPTURE, STATUARY, &c. AUGUSTUS B. HOLSTEIN, Cincinnati, Ohio. Filed Jan. 16, 1882. (No model.)

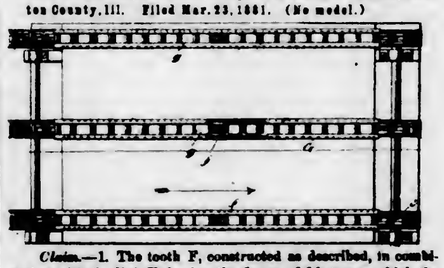


Claim.—1. The combination, in a machine for copying sculpture, of a swivel-frame carrying a pair of coupled vibrating beams armed with a tracer and three cutting-drills, and a pair of standards capable of being simultaneously advanced and retracted, and provided with devices for holding the pattern and copy-blocks, said coupled vibrating beams being disposed one above the other, substantially as herein described.

2. The combination of swivel-frame C *c*, primary swinging beam, D *d*, secondary swinging beam, E *e*, three-part pulley F G G', bands *g g'* J, drill-shafts H H' K, pulleys *h h' h'' h*, tracer M, and coupling-links N N', substantially as herein described.

3. The slide P, carrying a standard, R, slotted vertically at *r* and horizontally at *r'*, and provided with screws S S', for retaining the blocks to said standard, substantially as herein described.

255,509. STEAM-GENERATOR. WILLIAM D. HOSKINS, Oakland, Cal. Filed June 16, 1881. (No model.)



Claim.—1. The upright boiler or cylinder D, surrounded by one or more coils of pipe, A, and having the introverted heat and flame chamber E formed in its lower end and extending up into the body of water, said boiler being supported on water-legs F F, which extend down into the fire, substantially as described.

2. The upright boiler or cylinder D, with its superposed dome or extension J, said boiler having an annular water-space formed in its lower end around an introverted flame and heat chamber, and having one or more coils, A A, surrounding it, said coils being connected at their lower ends with the annular water-space at the lower end of the boilers and at their upper ends with the top of the boiler, in combination with the feed-water pipe *p*, with its radial feed-tubes *r*, arranged to deliver the water through the upper ends of the coils, substantially as described.

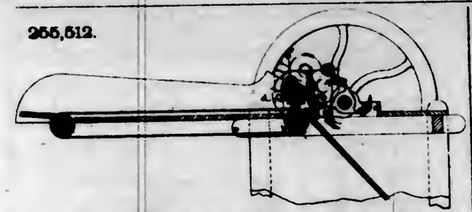
3. The method of feeding water to circulating coil-boilers, consisting in conducting the feed-water in a solid stream into the coils through internal imperforate pipes or tubes coiled around the exterior of the boiler, and delivering it at or near the water-level, whereby a circulation is established up through the boiler, while the incoming solid stream forms a counter-current downward in the lower part of the coil, substantially as above described.

255,510. RAKING MECHANISM FOR HARVESTERS. HARMON M. HOOVER, Centralia, assignor to SUSAN A. HOOVER, Clinton County, Ill. Filed Mar. 23, 1881. (No model.)

Claim.—1. The tooth F, constructed as described, in combination with the link E, having the flanges *f f*, between which the tooth is pivoted, said flanges extending both above and below the body of the link and serving to strengthen the same and also to support the tooth laterally, substantially as described.

2. The combination, with the link E, of the tooth F, pivoted to said link, as described, and having its shorter arm curved, so as to fit the bar of the adjoining link when the tooth is in raised position, substantially as described.

255,511. ILLUMINATING-GRATING. THADDEUS HYATT, Brooklyn, N. Y., assignor to Elizabeth A. L. Hyatt, Hyattsville, Md. Filed Mar. 1, 1862. (No model.) Patented in England Aug. 30, 1878.



Claim.—1. Concreted illuminating-gratings made by combining soft metal with the concrete and glasses as a foot-surface, substantially as and for the purposes herein set forth and illustrated.

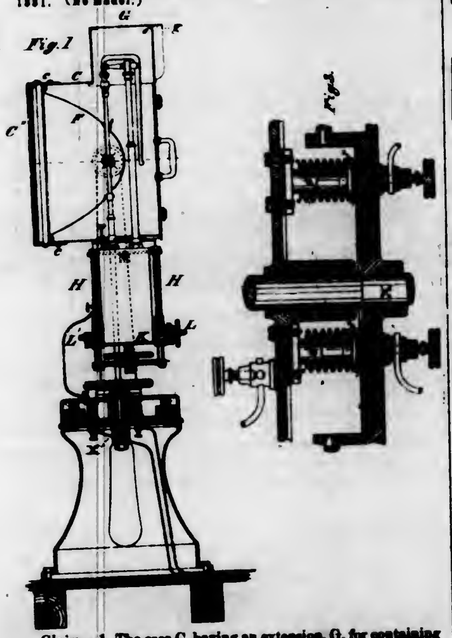
2. Concreted illuminating-gratings made by combining soft-metal ornaments with the concrete and glasses as a foot-surface, substantially as and for the purposes herein set forth and illustrated.

255,512. TOBACCO-SCRAP CUTTER. ANNE INGRAM, Philadelphia, Pa., assignor of one-half to Joseph B. DeYoung, same place. Filed Dec. 17, 1881. (No model.)

Claim.—1. In a tobacco-scrap-cutting machine, a bed-knife having a flat top, in combination with a weighted vertically-movable compressing-roller, which bears thereon to press the tobacco between them, a pair of feed-rollers for supplying the tobacco to said compressing-roller and knife, and a rotary cutter, which finally acts on the tobacco, substantially as and for the purpose set forth.

255,512.

2. An independently-weighted upper feed-roller, a lower feed-roller, and an independently-weighted compressing-roller, in combination with the stationary and rotating cutters, substantially as and for the purpose set forth.



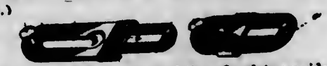
3. In a tobacco-cutting machine, an upper feed-roller, a lower feed-roller, an endless apron, a driving-shaft, two independent sets of gearing, an independently-weighted compressing-roller, and the rotary cutter and bed-knife, combined and operating substantially as and for the purpose set forth.

255,513. COMBINED TOOL. THOMAS D. ISDELL, Bentonville Ark. Filed Feb. 14, 1882. (No model.)

Claim.—In a combined tool, the blade A and pick B, having a common eye, and provided with the projection D, in combination with the handle E, provided with the jaws *e e* and the ring F, all constructed to operate substantially as and for the purpose set forth.

255,514. ADJUSTABLE REFLECTOR FOR ELECTRIC LAMPS. JAMES R. F. KELLY, Brooklyn, assignor to the United States Electric Lighting Company, New York, N. Y. Filed Mar. 6, 1881. (No model.)

Claim.—1. The case C, having an extension, G, for containing the upper portion of an electric-lamp frame, open at the back and provided with a door which leaves, when closed, a space, *g*, for the escape of the heated air from within the case.



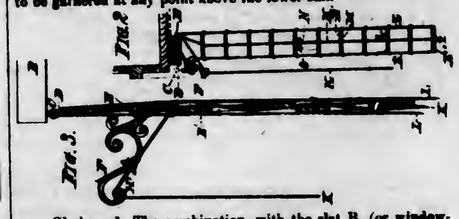
2. The combination of a sheet-metal case, C, and a strengthening-band, *c*, having an internal flange, *f*, to which is attached the rim of a parabolic reflector, F, as shown.

3. The hollow trunnion M, having a translucent indexed plate, in combination with a pin-hole, *n*, in the reflector F, for adjusting the position of the arc, substantially in the manner described.

4. The combination, with case C, of an electric lamp and a frame for supporting the same, provided with stationary base and vertically-adjustable plate for raising and lowering the lamp, as and for the purpose set forth.

5. The combination, with the stationary base and vertically-adjustable plate of the lamp-supporting frame H, of the plate K' and horizontal adjusting mechanism L L', substantially as described.

255,515. CUFF-FASTENER. ROLLIN E. KELSEY and CHARLES H. SHUTTLEWORTH, Corunna, Mich. Filed Aug. 26, 1881. (No model.)

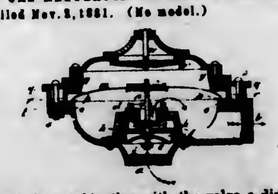


Claim.—1. A cuff-fastener consisting of a plate provided with a stem and stud, and having a slotted eye to engage a shirt-sleeve button or stud, and in connection therewith a slotted spring latch-plate adapted to be closed in over the eye, substantially as described.

2. A cuff-fastener consisting of a plate provided with a slotted eye to engage a shirt-sleeve button or stud, and having a stem provided with a rigidly-attached stud or button elongated in the direction of the length of said slotted eye, and a latch-plate sliding upon said eye-plate and arranged to prevent the disengagement of the sleeve-button therefrom, substantially as described.

3. A cuff-fastener consisting of a plate having a stem and a stud and a slotted eye, in combination with a sliding slotted spring latch-plate and a retaining-flange, *a*, substantially as described.

255,516. INSIDE BLIND. JOHN KRIEBEL, Lockport, N. Y. Filed Jan. 13, 1882. (No model.)



Brief.—The upper slat is hung by the inner edge to the window-frame, and is provided with screw-eyes near each end and a bracket in the center, through and over which the operating-cords pass. Loops in the cords for the insertion of a pin enables the slats to be gathered at any point above the lower slat.

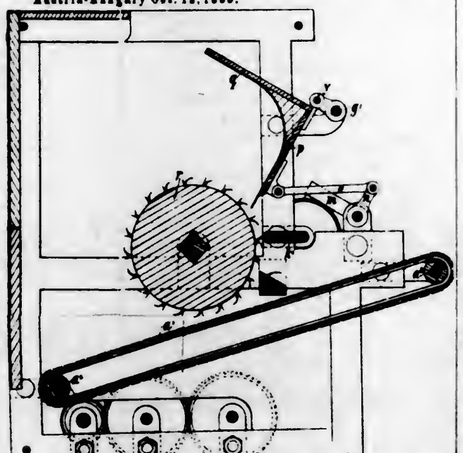
Claim.—1. The combination, with the slat B, (or window-frame,) having the screw-eyes C, of the slat E, having the screw-eyes D and I I', bracket F, with rollers G G' H H', slats E', tapes L L', and cords M, K, and K', the whole being constructed for operation substantially as and for the object specified.

2. In Venetian blinds, the combination, with the slats E', of the cords K K', said cords being provided with loops N, adapted for reception of pins or analogous means, O, substantially as described, whereby the said slats may be gathered at any point above the lower slat, as and for the object stated.

255,517. GAS-REGULATOR. GRIFFIN B. LACEY, New York, N. Y. Filed Nov. 2, 1881. (No model.)

Claim.—1. In combination with the valve *c*, diaphragm *m*, inlet *a*, and outlet *b*, each constructed as described, the auxiliary valve *e* and its valve-seat *f*, said valve *e* being arranged to slide vertically upon the rod *i*, and its valve-seat *f* being provided with the perforations *h*, as and for the purpose set forth.

2. The combination of the lodge *o*, ring *p*, and annular plate *q*, provided with the projections *r*, for the purpose of clamping the diaphragm, as shown and described.



255,518. SPINDLE-STEP RAIL FOR SPINNING-FRAMES. FRANCIS LECLERC, Philadelphia, Pa. Filed Dec. 21, 1881. (No model.)

Brief.—The step-rail is provided with yielding spring bearings, which, when in engagement with a set-screw, clasp the step rigidly, thus permitting the vertical adjustment of said step.

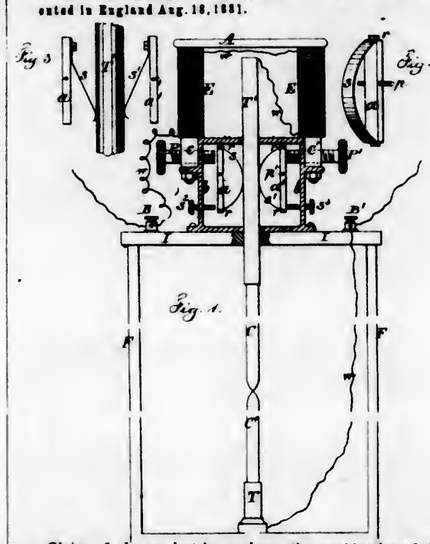
Claim.—A spindle-step rail, A, provided with a clasping-bearing, B, which is cast with the rail, said bearing having a rigid connection with the rail, as at *c*, and being free from said rail at all other points, substantially as and for the purpose described.

255,519. FEEDING DEVICE FOR CARDING-ENGINES. JEAN TH. LEMAIRE, Hodimont-Verviers, Belgium. Filed Oct. 3, 1880. (Model.) Patented in Belgium June 9, 1879, in France Aug. 28, 1879, and Aug. 12, 1880, in Germany June 3, 1880, and in Austria-Hungary Oct. 13, 1880.

Claim.—1. The collecting-cylinder *r*, provided with straight and crooked hooks or teeth, gear-wheel *u*, worm *t'*, shaft *t*, bevel-gear wheels *t* and *s*, and shaft *d*, and driving-shaft *a*, in combination with the combing apparatus *p q*, with drawing-comb *k'* and endless band *a'*, and means for operating the same, the whole arranged to operate substantially in the manner and for the purpose herein described.

2. The combing apparatus *p q*, in combination with levers *y* and *x*, connecting-rod *w*, and wheel *v*, shaft *g*, the rod *o*, levers *m* and *n*, connecting-rod *l*, gear-wheels *f*, *e*, and *c*, and driving-shaft *a*, the whole being arranged and combined to operate in the manner and for the purpose substantially as set forth.

3. In combination with the withdrawing-comb *k'*, the gear-wheels *h* and *i*, the connecting-rod *h*, and gear-wheels *e* and *c*, shaft *d*, and driving-shaft *a*, substantially in the manner and for the purpose described.



255,520. TOP-PROP FOR VEHICLES. WILLIAM LEPPER, Cleveland, Ohio. Filed Jan. 4, 1882. (No model.)

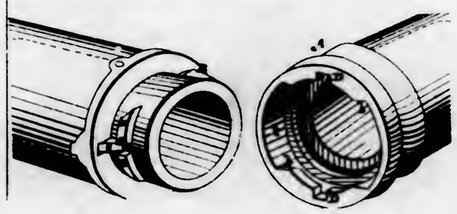
Claim.—1. In a vehicle-top support, the shell B, having flange *f'* and the removable cap C, provided with slots *c'*, whereby the cushion may be secured to the shell, as shown and described.

2. In a support for vehicle-tops, the combination, with the cushion D, arm A, and shell B, having flange *b'*, of the removable cap C, having slots *c'*, flange *c'*, and groove *b* and lugs *b'*, as shown and described.

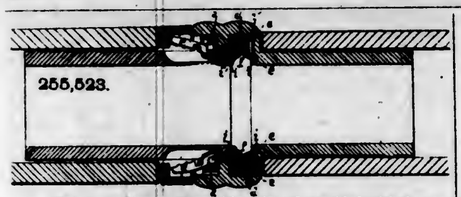
255,521. ELECTRIC LAMP. CHARLES LEVER, Bowdon, County of Chester, England. Filed Aug. 18, 1881. (No model.) Patented in England Aug. 18, 1881.

Claim.—1. In an electric-arc lamp, the combination of the eccentrically-pivoted armatures *a a'*, the springs *s s'*, and the electro-magnet E E, and circuit-connections to the carbon points, substantially as and for the purposes set forth.

2. In an electric-arc lamp, the electro-magnet in circuit with the carbons and the polarized adjustable stop-screws P P', inserted through the poles, in combination with armatures and with means for moving the carbon rod to adjust and regulate the distance between the carbon points, substantially as set forth.



3. In an electric-arc lamp, the electro-magnet E E, the eccentrically-pivoted armatures *a a'*, the springs *s s'*, and the polarized screws P P', substantially as and for the purposes specified.



255,522. VALVE FOR OIL AND WATER WELLS. ALDEN J. LEWIS, Bradford, Pa. Filed July 6, 1881. (Model.)

Claim.—In a valve, the combination, with a pipe or tube having a series of perforations in its sides and arranged to constitute the body of the valve and the conduit for the upward flow of water, of an expansible tube encircling the perforated tube or pipe, and packing material encircling the expansible tube, substantially as set forth.

255,523. PIPE-COUPLING. STAFFORD LIGHTBURN, Jr., San Francisco, Cal., assignor of one-half to J. R. McKenzie, same place. Filed June 27, 1881. (Model.)

Claim.—1. The elastic packing-ring *f*, provided with flanges *i i* and *i' i'*, in combination with the coupling A, provided with recesses *c c*, substantially as described, and for the purpose set forth.

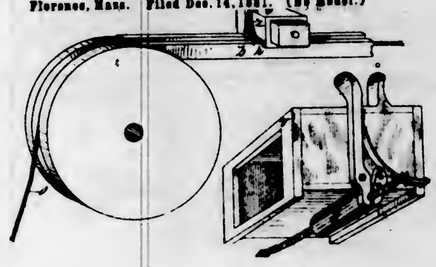
2. In combination with a coupling having the male portion provided with lugs B and locking latches or levers C, and a female portion having the corresponding groove or channel, *a*, and the notches D, the device E, having the tapering ends for compressing the latches simultaneously and releasing them from the notches, substantially as herein described.

3. The cap J, with the lugs Q, and spring-latches *r* to fit the groove *a* and the notches D of the coupling A, in combination with the cap M, fitting over the cap J and having the inclined grooves *o*, into which the ends of the levers *r* enter, and the stem or spindle I, provided with the springs *s*, by which it and the cap M are held or returned to a position which will allow the latches *r* to operate, substantially as herein described.

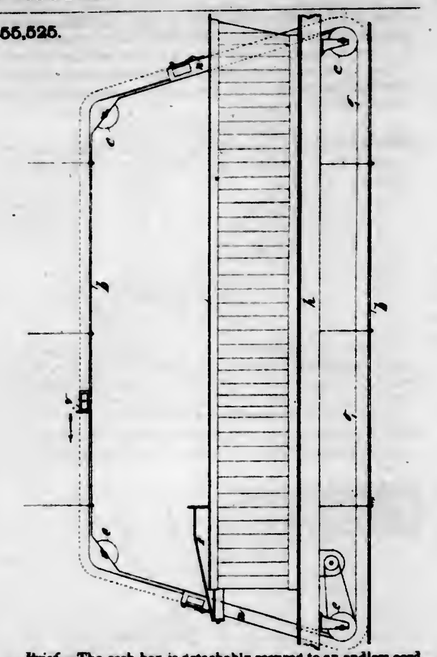
4. The end A of a hose or a pipe coupling having the groove or channel *a*, with projections *b*, beveled at each end, and the notches D, as shown, in combination with the main portion of the coupling, having the lugs B, with the triangular or inclined ends, and the spring locking-levers C, substantially as and for the purpose set forth.

255,524. ELECTRIC GAS-LIGHTER. ALEXANDER MASON and WILLIAM J. GARDS, Washington, D. C. Filed Feb. 20, 1882. (No model.)

Claim.—1. In an electric gas-lighter, the combination of two movable electrodes and a cock, whereby both electrodes are moved positively in relation to each other.



2. In an electric gas-lighter, the combination of a burner and two movable electrodes arranged, substantially as described, to pass each other in opposite directions in the gas-jet and then fall back on opposite sides of the burner, away from the flame.

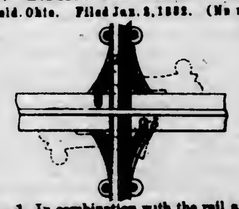


3. In an electric gas-lighter, the combination of a burner and two electrodes arranged to pass each other in opposite directions and fall back on opposite sides of the burner.

4. In an electric gas-lighter, the combination of two electrodes and connecting devices, substantially as shown, whereby the electrodes are moved positively in opposite directions in respect to each other.

5. The combination of the burner, the cock, the electrode attached rigidly to the cock, and the second electrode, sustained independently of the cock and connected therewith, substantially as shown, to turn in the opposite direction.

255,525. AUTOMATIC CASH-BOX SYSTEM. JOSEPH C. MARTIN, Burlington, Vt., assignor of one-half to Luther A. Martin, Florence, Mass. Filed Dec. 14, 1881. (No model.)



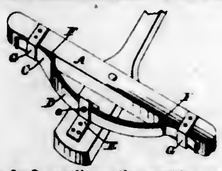
Brief.—The cash-box is detachably secured to an endless cord by a spring-actuated clamping-lever. The box rests on a grooved track, and is stopped by coming in contact with projections on the under side of a cover of a trough fixed to the track, into which the cash-box enters. The box is unclamped from the endless cord by the upper end of the clamping-lever and a projection on the box bearing against two spring-guides on the under side of the trough-cover. Raising the cover of the trough removes the spring-guides and the stops on the trough-cover from the cash-box, which is then engaged with and carried forward by the endless cord.

Claim.—1. In an automatic cash-box system, the track *b*, the endless cord *o*, the cash-box *v*, and appliances, substantially as described, for attaching said box to said endless cord and for automatically detaching said box therefrom, and a suitable motor to give a motion to said cord, all combined and operating substantially as set forth.

2. In combination, the grooved track *b*, the endless cord *o*, the hinged cover *e*, having the curved guards *w*, and the stops *f* thereon, the cash-box *v*, having the arm *r*, and the spring-actuated clamping-lever thereon, and a suitable motor, substantially as set forth.

255,526. ROSETTE FOR FENCES. SAMUEL W. MARTIN, Springfield, Ohio. Filed Jan. 3, 1882. (No model.)

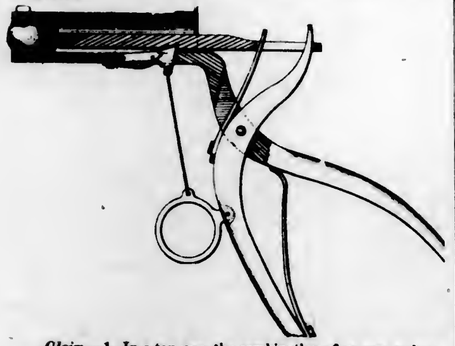
Claim.—1. In combination with the rail and the picket sustained directly thereby, the detachable rosette provided with the oppositely-arranged lips to engage with the rail, and with the open recesses to receive the picket.



2. As a new article of manufacture, a rosette having its ends provided with open recesses in the rear side and its edges provided with two lips extending upward and downward, respectively.

3. A rosette for fences, provided on the back at opposite sides with two lips, one extended upward and the other downward, as described, whereby the rosette is adapted for attachment to the rail by a rotary movement.

4. The rosette provided with the lips *a* and *b*, as described, and also with the supplemental malleable lip *c*, whereby the device may be locked fast after being secured by the lips *a* and *b*.

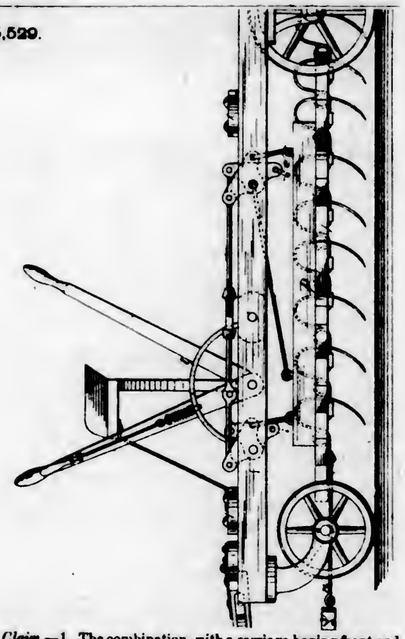


5. A rosette provided with locking-lips, substantially such as described and shown, adapted to engage with the fence-rail by a rotary motion of the rosette.

255,527. DRAFT-EQUALIZER. STEPHEN MARVIN and WILLIAM T. MARVIN, Burnettsville, Ind. Filed Dec. 9, 1881. (No model.)

Claim.—In draft-equalizers, the combination of the double-tree A, stay-spring C, re-enforcing spring D, center plate, E, bearings F F, and staples G G, substantially as and for the purposes described.

255,528. TOY GUN. CHRISTOPHER C. P. MCCORD and CHARLES D. CHURCHILL, Walnut Grove, Ark. Filed Jan. 11, 1882. (No model.)



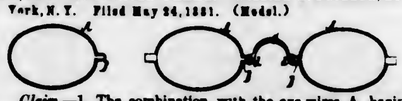
Claim.—1. In a toy gun, the combination of an arm or handle carrying at its upper end a cylinder or barrel, a follower sliding in said barrel and having at its rear end a longitudinal slot, a lever pivoted to said arm or handle and having its upper end adjusted in said longitudinal slot, and a spring attached to said lever and bearing with a forward pressure against said follower, substantially as set forth.

2. In a toy gun, the combination of an arm or handle carrying at its upper end a cylinder or barrel, a follower sliding in said barrel and having at its rear end a longitudinal slot, a lever pivoted to said arm or handle and having its upper end adjusted in said longitudinal slot, a spring attached to said lever and bearing with a forward pressure against said follower, and a spring suitably arranged to force the ends of said arm or handle and said lever automatically apart, substantially as set forth.

3. In a toy gun, the combination of an arm or handle carrying at its upper end a cylinder or barrel, a follower sliding in said barrel and having at its rear end a longitudinal slot, a lever pivoted to said arm or handle and having its upper end adjusted in said longitudinal slot, a spring attached to said lever and bearing with a forward pressure against said follower, a pivoted latch adapted to engage a notch in said follower, and mechanism for operating said latch, substantially as set forth.

4. In a toy gun, the combination of an arm or handle carrying at its upper end a cylinder or barrel, a follower sliding in said barrel and having at its rear end a longitudinal slot, a lever pivoted to said arm or handle and having its upper end adjusted in said longitudinal slot, a spring attached to said lever and bearing with a forward pressure against said follower, a pivoted latch adapted to engage a notch in said follower, mechanism for operating said latch, and a spring suitably arranged to force the ends of said arm or handle and said lever automatically apart, substantially as set forth.

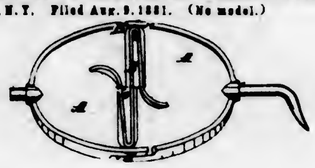
255,529. MOUNTED HARROW. AARON J. MELLIN, Pittsburg, Pa. Filed Oct. 31, 1881. (No model.)



Claim.—1. The combination, with a carriage having front and rear wheels, of a sectional floating harrow arranged between the wheels thereof and suspended entirely by loose link-connections, whereby the harrow may vibrate in all directions independently of the carriage, draft-bars attached directly to the floating harrow, and an independent guide-tongue attached to the carriage above and independently of the draft-bar, substantially as and for the purpose specified.

2. The combination of a carriage and a flexible or sectional floating harrow arranged between the wheels thereof and suspended therefrom entirely by loose link-connections, and pull-links or link-rods, which extend from the harrow in front of its transverse center to points on the carriage in rear of the transverse center thereof, substantially as and for the purpose specified.

3. The combination, with the carriage and floating flexible harrow arranged between the wheels thereof and suspended by loose connections or links *s*, of the elbow-levers pivoted on the carriage, the buckle-rod E, for coupling the elbow-levers, and the pull-link or link-rods M, for transmitting power from the floating harrow to the carriage, the elements relatively arranged and adapted to operate substantially as and for the purpose specified.

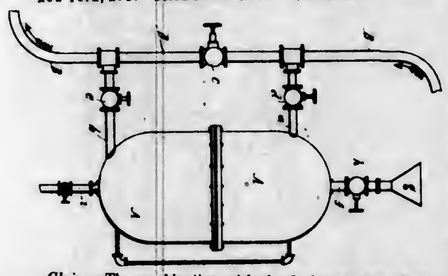


255,530. SPECTACLE-FRAME. WILLIAM H. PECKHAM, New York, N. Y. Filed May 24, 1881. (Model.)

Claim.—1. The combination, with the eye-wires A, having the spring-loops B, of the nose-piece C, attached directly to the spring-loops at its opposite ends in such a manner as to clamp the eye-wires to the lenses, substantially as described.

2. The combination, with the eye-wires A, having the spring-loops B, of the nose-piece formed with the sockets *d* at its opposite ends, whereby it is attached to the spring-loops, substantially as and for the purpose described.

255,531. STOVE-PIPE DAMPER. CHARLES W. PIERCE, Oak Hill, N. Y. Filed Aug. 9, 1881. (No model.)



Brief.—The damper-plate is bisected and the halves are connected by a spring, which presses them against the pipe when the damper is in position.

Claim.—1. The improved damper herein described, the plate of which is made in two separate parts, A, and united by the spring B, having its ends connected to said plates, respectively, substantially as described.

2. The combination of the circumferential overlapping lugs E with the plate of a stove-pipe damper, made in two separate parts, A, and united by a spring, B, having its ends, respectively, connected to said parts, substantially as described.

255,532. APPARATUS FOR FEEDING SCALING COMPOUNDS TO STEAM-BOILERS. HENRY PINDAR and GEORGE W. CLARK, New York, N. Y. Filed Jan. 18, 1882. (No model.)

Claim.—The combination, with the feed-water pipe B of a steam-boiler and a device for forcing the water through it, of the chambered cylinder A, provided with funnel *g* and cut-off valve A, and inlet-pipe *c*, having valve *d*, and outlet-pipe *b*, having valve *e*, attached to feed-pipe B, all arranged, applied, and operating substantially as and for the purposes as herein shown and set forth.

255,533. PICK. REINHARD R. RAY, Modio, Cal. Filed Dec. 7, 1881. (No model.)

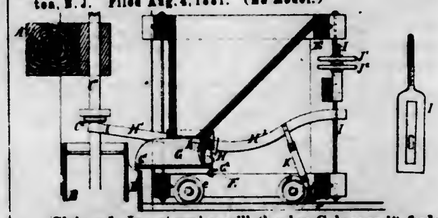
Claim.—1. The pick-stock A, the ends of which have the tongues *a* and the under sides, *m*, inclined, terminating in grooves *b*, with lips *c*, in combination with the points C, having sockets *h* and shoulders *g*, inclined upper sides, *n*, tongue *e*, and shoulders *f*, said stock and points being fitted together and secured by screw-bolts E E, substantially as and for the purpose herein described.

2. In a pick the points of which are independent of the stock and adapted to be secured thereto by screw-bolts E E, as herein described, the groove F, formed in the sides of said points, whereby said points may be used as wrenches to remove said screw-bolts, substantially as and for the purpose herein described.

255,534. ARTIFICIAL OR TOY EASTER EGG. ADDISON A. REEVE, Boston, Mass. Filed Feb. 4, 1882. (No model.)

Claim.—1. As a new article of manufacture, an artificial Easter-egg composed of the frame or shell A and covering B, substantially as specified.

2. In a toy Easter-egg, the combination of the frame or shell A, covering B, and bird C, substantially as shown and described.



255,535. HEATING BATH-TUBS BY STEAM. JAMES REILLY, Brooklyn, N. Y. Filed Nov. 3, 1881. (No model.)

Brief.—The water is heated by contact with the steam-heater D, located within the tub. The tube E enables the water to circulate through the heater.

Claim.—The combination, with a bath-tub, of surface steam-heating pipes placed within the tub, arranged and operating substantially as herein set forth.

255,536. STAMPING-MILL. HERMANN O. REINHARDT, Arlington, N. J. Filed Aug. 4, 1881. (No model.)

Claim.—1. In a stamping-mill, the shoe G, hopper K', feeder H, spring K, and the stamper-rod C', provided with the collar C', combined and arranged as and for the purposes herein specified.

2. In a stamping-mill, a reciprocating feeder, in combination with the shoe G, having a beveled rise, G', at the front, as herein specified.

3. In a stamping-mill, a reciprocating feeder, H, mechanism C', to actuate it in one direction, and a spring or analogous gentle force to actuate it in the other direction, in combination with the movable rod I, provided with suitable adjusting means, J' J', arranged to allow the adjustment of the feed, as herein specified.

4. The combination, with a suitable mortar, of one or more stampers and operating means therefor, a reciprocating feeder, means for actuating the feeder backward by the mechanism and forward by a spring or analogous gentle force, means for limiting the travel of the feeder forward, and means for automatically limiting the travel of the feeder backward by the quantity of material in the mortar, all substantially as and for the purposes herein specified.

255,537. APPARATUS FOR ROASTING ORES. HERMANN O. REINHARDT, Arlington, N. J. Filed Aug. 4, 1881. (No model.)

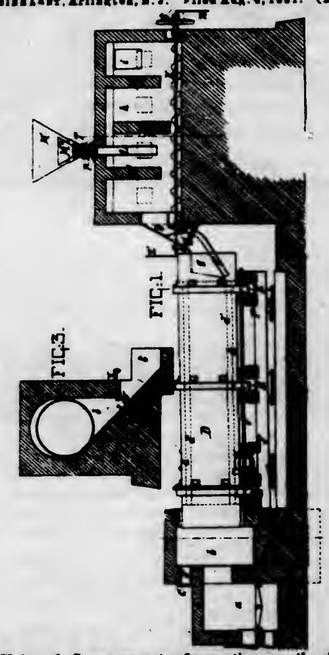


FIG. 1.

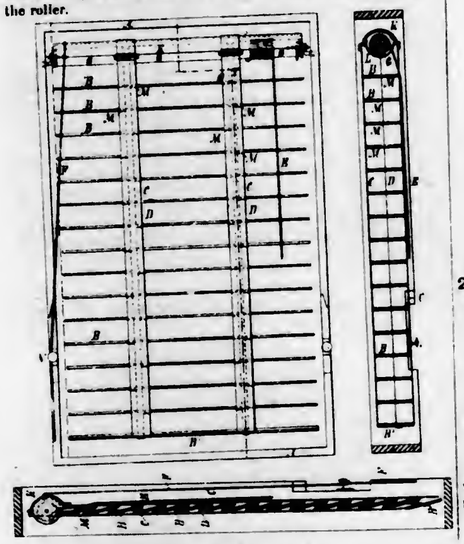
FIG. 3.

Claim.—1. In an apparatus for roasting ores, the chamber A having partial partitions H' H', and means for supplying fresh ore and allowing the escape of the gases from the roaster, mounted

higher than the roaster and connected by one or more inclined passages, in combination with the revolving roaster D, furnace *a*, and stack J, as herein specified.



2. In an apparatus for roasting ores, the chamber A, having the partial partitions H' H², with liberal spaces to allow the settling of the dust, in combination with the feeding means K, arranged in the contracted base thereof, and with the duplex inclined passage *g g'*, revolving roaster D, furnace *a*, and stack J, as herein specified.

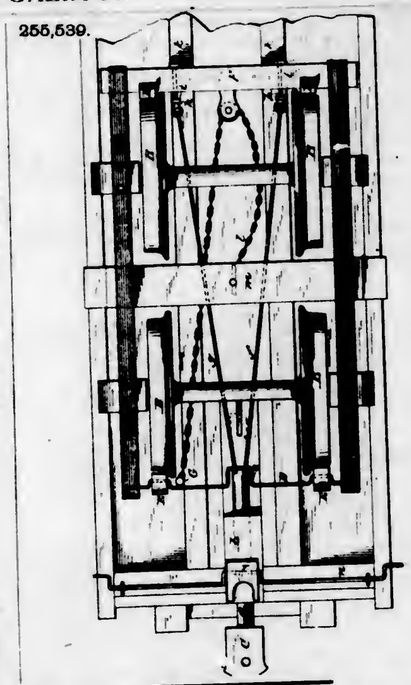
3. The transverse feeding-screw P and its inclosing pipe M and one or more feed-hoppers thereon, in combination with the dust-chamber A, having partial partitions H' H², and with the feeding-screw K in the base of said chamber, as herein specified.

4. The descending pipe L, in combination with the dust-chamber A, having partial partitions H' H², bottom screw, K, top screw, P', connections G, and revolving roaster D, as herein specified.

255,538. INSIDE BLIND. FRANZ RUHR, Teplitz, Austria. Filed Sept. 3, 1881. (No model.) Patented in Belgium Aug. 31, 1881, in Italy Aug. 31, 1881, and in Germany Oct. 13, 1881.

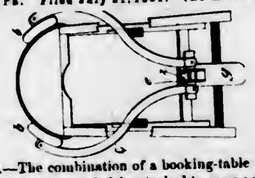
Brief.—The cover to the roller is fulcrumed eccentrically, and the bands to which the edges of the slats are fastened are attached to the cover, while the central band is attached to and winds upon the roller.

Claim.—1. In a Venetian blind, the oscillating cover K, the edges of which are of unequal distance from the fulcrum, in combination with the broad bands C C, attached to the edges of said cover K, and connected by strings M M, supporting the slats B, and the slats B B, in the manner and for the purpose described.



2. The combination, in a Venetian blind, of the arbor G, with bands D D, passing through the slats and attached to the last slat, B', the oscillating cover K, with broad bands C C and strings M M, supporting the slats B, and the cords F and E, the whole being arranged to operate in the manner and for the purpose set forth.

255,539. CAR-BRAKE. JOHN G. SCHILLER, Youngstown, Ohio. Filed Feb. 14, 1882. (No model.)



Claim.—1. The draw-head C and crank-rod D, having connected thereto the brake-shoes E, in combination with the timber F, brake-shoes H, and the rods *g f*, connected to said timber, substantially as and for the purpose specified.

2. The combination, with the timber F, carrying brake-shoes H, the chain *l*, and rods *f g*, of the draw-head C, crank-rod D, and the rod *n*, carrying yoke I, combined and arranged to operate substantially as and for the purpose specified.

3. The draw-head C, crank-rod D, carrying brake-shoes E, and the yoke I, in combination with the timber F, brake-shoes H, and rods *f g*, said rods being connected to said timber by eyebolts *k* and the gage-nuts *i k*, substantially as and for the purpose specified.

255,540. TOBACCO-BOOKING TABLE. CHARLES SEBL, Philadelphia, Pa. Filed July 21, 1881. (No model.)

Claim.—The combination of a booking-table for leaf-tobacco with movable holding-pads *b b*, attached to arms *c c*, and these connecting with a treadle, *g*, all substantially as set forth.

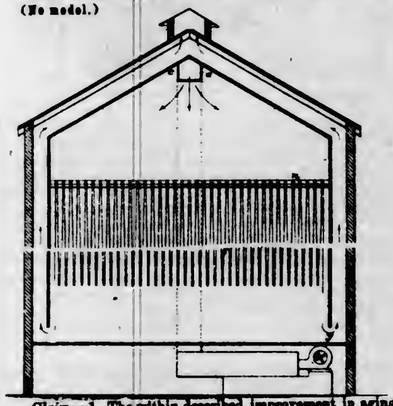
255,541. BEARING FOR MILL-SPINDLES. GEORGE F. SWAIN, New York, N.Y. Filed June 1, 1881. (No model.)

Claim.—1. As a new article of manufacture, the spindle or journal bearing B C, formed of rough metallic castings and lined with the anti-friction bushing D, said bushing being formed of a mixture of about one part of ground or crushed mica, one part of ground plumbago, and two parts of a fibrous binding material such as described, together with liquid silicate of soda or silicate of potash sufficient to form the mass into a stiff paste, of which the said bushing D is formed, as described and set forth.

2. The bushing D of a spindle or journal bearing, formed of the plastic anti-friction material, as described, indurated in the surrounding casing B C and provided with air grooves or passages *d*, so as to permit a current of air to flow continuously through the bearing by the side of the journal or spindle, substantially as described and set forth.

3. A journal-bearing or bushing material formed of a mixture of about one part of ground or crushed mica, one part of ground plumbago, and two parts of a fibrous binding material such as described, together with liquid silicate of soda or silicate of potash sufficient to form the mass into a stiff paste, of which the said bearing or bushing is formed, as described and set forth.

255,542. CARTRIDGE. THOMAS SHAW, Philadelphia, Pa. Filed Nov. 29, 1881. (No model.)

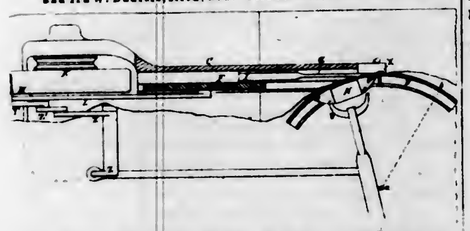


255,542

Claim.—1. The combination, with the ball or other projectile, of a cartridge equal in diameter to the ball, divided by partitions into a series of closed chambers each containing an explosive, and a coiled wire or its equivalent extending through the chambers for successively exposing each charge to the ignition caused by the explosion of the preceding one, substantially as set forth.

2. The combination, with a cartridge having a series of closed chambers each containing an explosive, of a wire secured to the ball and coiled through the chambers, and a central passage extending from the rear of the cartridge to the front chamber, and a supplemental cartridge, *c*, adapted to the end of a tube or passage, substantially as and for the purpose set forth.

255,543. PROCESS OF AND APPARATUS FOR AGING FABRICS. THOS. SIMPSON, Philadelphia, Pa. Filed Jan. 17, 1882. (No model.)



Claim.—1. The within-described improvement in aging fabrics, the same consisting in subjecting the fabrics properly prepared to the action of currents of moist, heated air directed downward over the suspended fabrics, substantially as set forth.

2. In an apparatus for aging fabrics, the combination, with a case or house and with devices for suspending the fabrics therein, of an inlet-opening at the top, an outlet at the bottom, and appliances whereby currents of heated, moist air are passed into and out of the suspension-chamber from the top downward, substantially as specified.

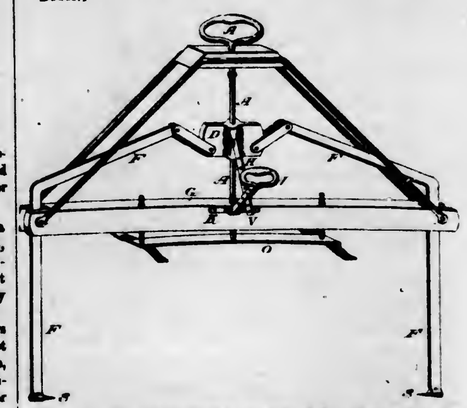
3. The combination of the outer walls provided with openings at the top, the inner lining with openings at the bottom, an inlet air-pipe, and appliances for passing warm, moist air to said pipe, whereby currents of the warm, moist air are forced downward within the inner chamber and upward between the inner and outer walls, substantially as set forth.

255,544. SEWING-MACHINE. FRANKLIN R. SMITH, Syracuse, N. Y., assignor of two-thirds to Willis S. Barnum, same place, and Ira W. Daniels, Ilion, N.Y. Filed Nov. 3, 1881. (No model.)

Claim.—1. The shuttle-race having angular or V shaped face and the shuttle having the reverse form, and being pressed therein by an extensible spring-pressed horned arm of the shuttle-driver, substantially as described.

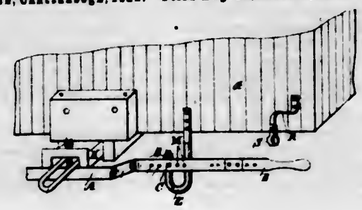
2. The shuttle-driver S, having extensible spring-pressed horns U, and being arranged on a larger radius than that of the shuttle-race, substantially as described.

3. The combination, with a shuttle passing through a loop each way of its traverse, of the horned driver S U, arranged on a larger radius than that of the shuttle-race, substantially as described.



4. The combination of the reciprocating plate F, having a duplex cam-groove, as described, lever G, and connecting-rod L with the driving-shaft and needle-bar of a sewing-machine, substantially as described.

255,545. CLIP FOR HOLDING BOOKS OPEN. MILAN STEDWELL, Watertown, Dak. Filed Nov. 28, 1881. (No model.)

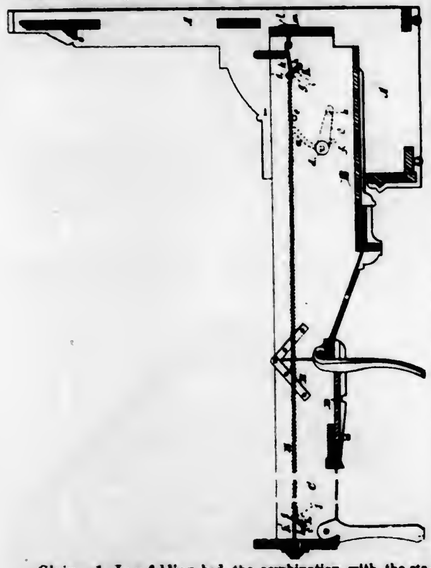


Claim.—As an improved article of manufacture, the plate C, having slotted ears J J, rivet *f*, rod H, having a flat rear end with rounded under corner, and a thumb-piece, *g*, and the cross-bar E, all adapted to be applied to a book in the manner and for the purposes set forth.

255,546. BARREL ROLLING AND HANDLING MACHINE. GEORGE W. STEPHENS, Milford, Mich. Filed Aug. 4, 1881. (No model.)

Claim.—The combination of the arms F F, with the points or spurs S S, the box D, lever H, and handle I, operating the arms F F, with points S S, the gage O, and handle A, working the gage and equalizing the draft of the whole machine for moving barrels by revolving on points or spurs in the center of the head of the barrel, all substantially as set forth.

255,547. CAR-COUPLING ATTACHMENT. THOMAS C. STRAWN, Chattanooga, Tenn. Filed Aug. 24, 1881. (No model.)



Claim.—1. The combination, with the draw-head K, of the lever A, the bracket-arm E, and the loose collar D on the bracket-arm E, substantially as herein shown and described, and for the purpose set forth.

2. The combination, with the draw-head K, of the lever A, the bracket-arm E, provided with a shoulder, N, at its outer end, and the loose collar D, to which the lever A is pivoted, substantially as herein shown and described, and for the purpose set forth.

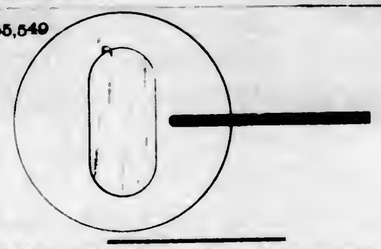
3. The combination, with the draw-head K, of the lever A, the bracket-arm E, provided with a shoulder, N, at its outer end, the loose collar D, and the pintle C, provided with a fixed collar or enlargement, Q, substantially as herein shown and described, and for the purpose set forth.

4. The combination, with the lever A, pivoted to an arm or bracket at the end of a car, of a spring-clamp, S, attached to an arm or bar, R, attached to the end of the car, substantially as herein shown and described, and for the purpose of holding the lever A when the same is not in use.

255,548. WARDROBE OR FOLDING BED. ALEXANDER W. STEWART, Chicago, Ill. Filed Sept. 5, 1881. (No model.)

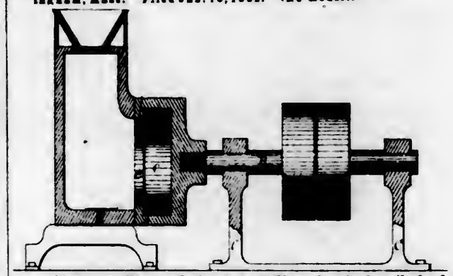
Claim.—1. In a folding bed, the combination, with the stationary part A, provided with the groove *a* and stop *f*, of the swinging part B and the link *c*, pivoted at or near one end to the part A by a fixed pivot, *b*, and having at its other end a pivot, *d*, arranged to travel in the groove *a*, substantially in the manner and for the purpose described.

2. In a folding bed, the combination, with the stationary part A, provided with the curved groove *a* and stop *f*, of the swinging part B, having the stop *e* and the link *c*, pivoted near one end to the part A by a fixed pivot, *b*, to form a rearward extension to said link, and having at its other end a pivot, *d*, arranged to travel in the groove *a*, said stop *e* on the part B being adapted to strike the extension of the said link, all substantially in the manner and for the purpose described.



3. The top or cover D, having eccentric hinges *a*, with the stop or projection *e* for forming a lock, substantially as set forth.

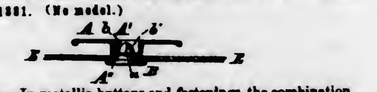
4. In combination with the folding sections B and C and an elastic or spring mattress, E, a series of rigid hooks, *h h'*, arranged at each end of the mattress, and having a pivotal connection at one end with each mattress and at the other end with the head and foot boards, respectively, of the folding sections, substantially as and for the purpose hereinbefore set forth.



255,549. FAN. JOHN C. ST. JOHN, New York, N. Y. Filed July 11, 1881. (No model.)

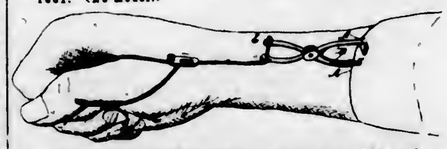
Claim.—A fan the body of which is constructed of two united layers of paper or other similar opaque material, and with an opening or openings having inserted therein between said two layers a sheet or piece of mica or other transparent material, substantially as and for the purpose described.

255,549



255,550. ATTRITION-MILL. THOMAS L. STURTEVANT, Framingham, Mass. Filed Jan. 16, 1883. (No model.)

Claim.—1. The method, substantially as herein described, of grinding various substances, which consists in compelling one portion of the mass of material to be ground to remain in a passive state, while another portion revolves in a compact or coherent body upon it, the intermediate shifting portion being ground by friction or attrition between its own particles, the entire mass itself thus providing not only the grinding-surface, but the material to be ground, and the supply being continuously furnished to the hopper.

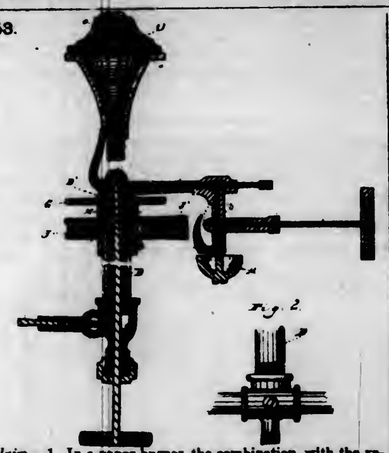


2. The mill herein described, consisting of, the rotary chambered head, in combination with the hopper arranged to communicate with and supply the chamber of such head, substantially as set forth

255,551. BUTTON. DAVID M. J. WALL, Buffalo, N. Y. Filed July 8, 1881. (No model.)

Claim.—In metallic buttons and fastenings, the combination, with the button A, having the depression A' and a cross-bar, *a*, of a fastening consisting of a disk, B, having centrally a slotted stud, *b b'*, provided with a transverse aperture, *b''*, said fastening being adapted for passage through the cloth or garment E, as described, and to hook onto the cross-bar *a*, substantially in the manner, as and for the object stated.

255,552. LADY'S SLEEVE-GRIPE. LOUISIANA P. WEBSTER, Washington, D. C., assignor of two-thirds to Douglas Pendleton and Michael Newmyer, both of same place. Filed Dec. 7, 1881. (No model.)



Claim.—1. The combination, in a sleeve-gripe, of the spring-actuated jaws and a draw-cord for closing the same, having a thumb-loop formed on it, substantially as described.

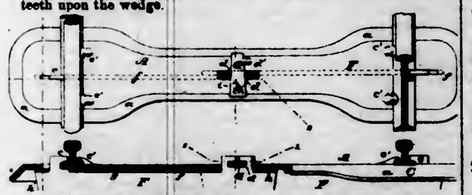
2. The spring-actuated griping-jaws, the draw-cord, and the adjustable loop of the cord, substantially as described.

3. The combination of the griping-jaws A A, the pivoted levers B B, the eyes *b b'*, the draw-cord, the loop, and a griping-slide therefor, substantially as described.

255,553. VAPOR-BURNER. JOSEPH WHITTINGHAM and FORREST A. LYMAN, Cleveland, Ohio. Filed Jan. 2, 1882. (No model.)

255,553.

Claim.—1. In a vapor-burner, the combination, with the vaporizing-chamber and tube D, for conducting the gasoline thereto, of a T-joint secured to the lower end of the tube and having a stuffing-box secured to its lower end, through which passes the screw-shaft of a needle-valve, said T-joint being connected with the supply-pipe, and a valve for governing the flow of gasoline from the supply-pipe to the tube D, substantially as set forth.



2. In a vapor-burner, the combination of a needle-valve with a screw-shaft and a jam-nut and a depending tube arranged within the upper end of the tube that supports said screw-shaft, said jam-nut being adapted to rest against the depending tube when the valve is closed to prevent the enlargement of the jet-orifice, substantially as set forth.

3. In a vapor-burner, the combination, with the tube D, of the adjustable commingling-chambers O and J, the latter surrounding and being supported upon said tube, substantially as set forth.

4. In a vapor-burner, the combination, with the tube supporting the screw-shaft which controls the needle-valve, of the commingling-chamber supported upon said tube, a heater-plate also supported therein, and a perforated chamber interposed between said commingling-chamber and heater-plate, whereby flame from the perforated chamber will impinge upon said plate, substantially as set forth.

255,554. METALLIC RAILWAY TIE AND FASTENING. FRANCIS A. WILLIAMS, New York, N. Y., assignor of one-fourth to John A. Burke, same place. Filed Dec. 27, 1880. Renewed Aug. 30, 1881. (No model.)

Brief.—A tie consisting of a flat plate, upon which are clamps arranged longitudinally of the tie, with their body portions beneath the same, and provided with a nose projecting above the plate to engage the rail, and with a shoulder to engage a wedge which rests upon the upper surface of the plate. Adjacent to the shoulder is an overhanging lip, which extends over the wedge. The body portions of the clamps have an extended bearing-surface, and are provided with elongated ends extending downwardly with laterally-projecting flanges. To prevent the displacement of the wedge a fixed lug is provided upon the tie to engage with ratchet-shaped teeth upon the wedge.

Claim.—1. A metallic railway-tie consisting essentially of a substantially flat plate extending from rail to rail, and provided with stationary stops for engaging the base of each rail on one side, in combination with clamps arranged longitudinally of the tie, with their body portions beneath the same extending downward therefrom in the form of substantially flat blades or ribs, capable of engaging the earth or ballast beneath the tie, and each provided with a nose extending up through the tie and engaging the base of the rail upon the opposite side from said stationary stop, and with a shoulder opposed to said nose and adapted to be engaged by a wedge, in combination with said wedge adapted to force said nose against the rail, substantially as and for the purpose set forth.

2. A metallic railway-tie, A, consisting essentially of a substantially flat plate extending from rail to rail, and forming a seat therefor, and provided with stationary stops *c' c'* to engage one side of the base of each rail, in combination with clamps F F, arranged beneath the tie, each having a nose, *e*, projecting up through the tie and engaging the base of the rail on the opposite side, a shoulder, *d*, to engage a wedge, and projecting ends *h*, extending beneath the tie beyond said shoulders, in contact with the under surface of the tie, substantially as and for the purpose set forth.

3. A railway-tie, A, consisting essentially of a flat plate of metal extending from rail to rail and forming a seat therefor, in combination with clamps F F, each arranged beneath the tie with an upward bearing against the under side thereof, provided with a nose, *e*, projecting up through the tie and engaging the base of the rail, and with an upward projection bearing shoulders *d* and *e* to engage the wedge G, and the said wedge arranged on the top surface of the tie and adapted when driven to force the toe *e* against the rail, substantially as set forth.

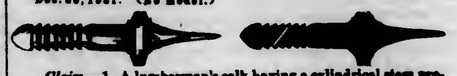
4. A metallic tie, A, provided with a rail-fastening consisting of clamps F F, arranged to be forced into engagement with the rails by a wedge or wedges, and arranged beneath the tie, longitudinally thereof, extending downward therefrom in the form of substantially flat blades or ribs, and provided with flanges *g g*, arranged to bear against the under surface of the tie, substantially as set forth.

5. The combination of the tie A, the fixed lugs *c' c'*, the clamps F F, having noses *e e* and shoulders *d d* and *e e*, and the single wedge G, engaging both clamps, substantially as set forth.

6. In a rail-fastening for metallic ties, the combination of a clamp to engage the base of the rail, a wedge to force said clamp against the rail, and the ratchet-projection *i* and notch or notches *h h*, arranged beneath the wedge, so as to be concealed thereby, substantially as and for the purposes set forth.

7. In a rail-fastening for metallic ties, the combination of the clamp F, adapted to engage the rail, the wedge G, formed of slightly-elastic material, and provided with ratchet-notches *h h* on its under side, and the fixed teeth or projection *i* on the tie, adapted to engage one of said notches when the wedge is driven and to be concealed thereby, substantially as set forth.

255,555. WASH-BOARD. CHARLES H. WILLIAMS, Cleveland, Ohio. Filed Feb. 10, 1882. (Model.)

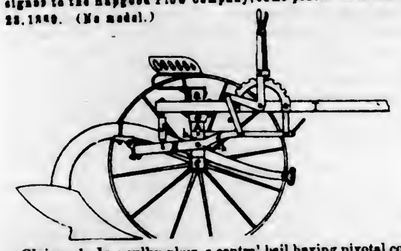


Claim.—1. A wash-board provided with a cross-piece, B, in combination with a removable protector-piece, F, and a locking device, whereby the protector and cross-piece may be brought together edge to edge and locked to form one continuous supporting-surface, as set forth.

2. A wash-board provided with a cross-piece, B, in combination with a removable protector-piece, F, the cross-piece or protector having interlocking devices on their adjacent edges, whereby the protector may be locked to the cross-piece and the two form one continuous surface, as and for the purpose set forth.

3. In combination with the cross-piece B of a wash-board, a removable protector, F, locking devices, substantially as described, for retaining the protector in line with the cross-piece, and the pivoted and slotted arms E E, as set forth.

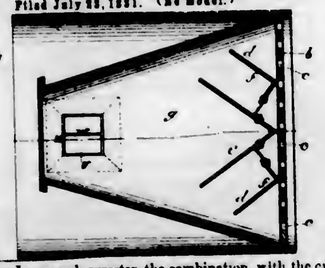
4. The combination, with the cross-piece B, provided with a groove, *b*, of the protector F, provided with a tongue, *c*, and the slotted and pivoted arms E E, as set forth.



255,556. CALK. EPHRAIM WITHAM, Carrituck, No. Filed Dec. 26, 1881. (No model.)

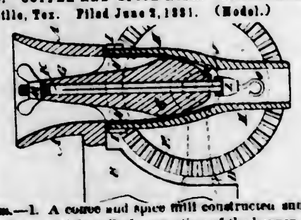
Claim.—1. A lumberman's calk having a cylindrical stem provided at its upper end for about two-thirds of its length with annular grooves the lower sides of which are horizontal while the upper sides are beveled upwardly and inwardly, as herein described for the purpose set forth.

2. A lumberman's calk having a cylindrical shank or stem provided at its upper end for a portion of its length, with annular grooves, a beveled or gradually-tapering point, and an intermediate disk or enlargement having beveled or concave shoulders on its upper and under sides, substantially as described, for the purpose set forth.



255,557. SULKY-PLOW. WILLIAM B. YOUNG, Alton, Ill., assignor to the Hapgood Plow Company, same place. Filed Dec. 23, 1880. (No model.)

Claim.—1. In a sulky-plow, a central bail having pivotal connection with the axle, and an arm extending connecting by a link with the operating-lever, a plow mounted loosely upon said bail, and a spring acting upon the said bail in rear of the axle to elevate the plow, substantially as shown.

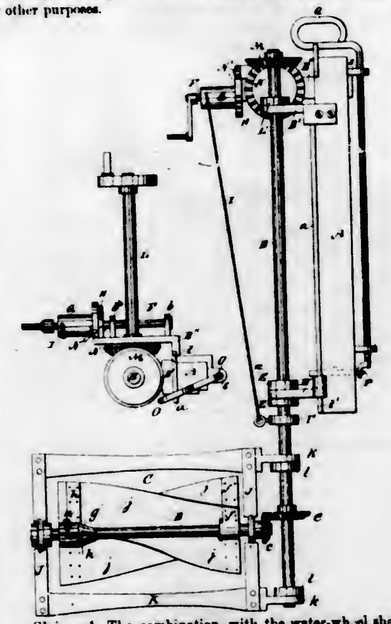


2. In a sulky-plow, the combination of an axle elevated in the center, with perpendicular sides and horizontal arms, one arm extending and having the wheel rotating thereon, a central bail having pivotal connection with the axle, and an arm extending connecting by a link with the operating-lever, a plow mounted loosely upon said bail, a spring having one end connected to the bail in rear of the axle and the other end connected above to the frame or tongue, and the spring acting upon the bail to elevate the plow, substantially as and for the purpose set forth.

255,558. SPARK-ARRESTER. JAMES D. ALLEY, Allegheny City, Pa. Filed July 23, 1881. (No model.)

Claim.—In a spark-arrester, the combination, with the cylinder *a*, flue-sheet *b*, and smoke-stack *p*, having the inverted funnel *r* at its lower end, of the flaring chamber *g*, the funnel *u*, and the vertical angle-plates *d d* and *e*, constructed and operating substantially as and for the purposes set forth.

255,559. COFFEE AND SPICE MILL. THOMAS A. ANDREWS, Beageville, Tex. Filed June 2, 1881. (Model.)



Claim.—1. A coffee and spice mill constructed substantially as herein shown and described, consisting of the hopper A, having arms B C D cast upon it, the inner stationary burr, G, the outer rotary burr, H, the supporting-rod K, the gear-wheels I E, and the crank F, as set forth.

2. In a coffee and spice mill, the combination, with the hopper A, provided with the stationary inner burr, G, of the rotating outer burr, H, cross-bar J, and the suspending-rod K, substantially as herein shown and described, whereby the outer burr is supported from and swiveled to the inner burr, as set forth.

3. In a coffee and spice mill, the combination, with the hopper A, provided with the stationary inner burr, G, having a central orifice, of the outer rotating burr, H, having cross-bar J, rod K, having shoulder L, and screw-threaded at its upper end, thumb-nut M, and hook O, substantially as described, and for the purposes set forth.

255,560. AUXILIARY POWER-WHEEL FOR SHIPS. KITTIL ANDERS, Winchester, Wis. Filed Jan. 16, 1882. (Model.)

Brief.—A wheel something like a screw-propeller hangs over the side of the vessel in such manner as to be raised and lowered. When the wheel is in the water the motion of the ship causes it to rotate, and the power thus obtained may be used for pumping or other purposes.

Claim.—1. The combination, with the water-wheel shaft D, gear *c e*, and shaft B, provided with collars E L', of the bar A, having plate *a*, the bracket-bearing B', fixed to said bar, and the sliding bracket D', as and for the purpose specified.

2. The combination, with the water-wheel shaft and shaft B, having collars *l l*, of the vertical cross-pieces J J, the horizontal arms K K, having perforated heads *k k*, and the cog-wheels *c e*, as and for the purpose specified.

3. The combination, with the shaft B, connected by bevel-gear with the water-wheel shaft, and having collars E, the brackets B' D', and the bar A, having plate *a*, of the detachable pin P, projecting through the bar and plate and over the bracket D', for the purpose specified.

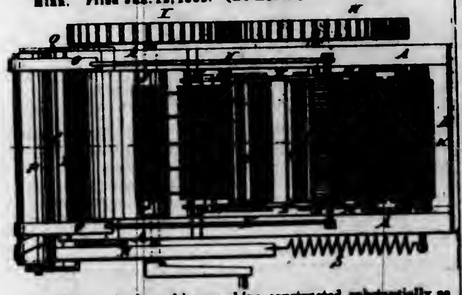
4. The combination, with the shaft B and water-wheel C, of the shaft F, drum G, rope I, and cramp-collar I', substantially as and for the purposes set forth.

5. The bar A, faced with the plate *a* and provided with the bracket B', in combination with the sliding bracket D', shaft B, wheel C, and means for raising and lowering the shaft and wheel, substantially as described.

6. The combination, with an eyebolt or pin, P, movable in its socket, of the rod O, having crank *q*, the bar A, having projections *s s*, and the plate *a*, having notches *t*, as and for the purpose specified.

7. The water-wheel formed of the shaft D, having the fixed arms *f*, the collar *g*, having the arms *h*, and of the blades *j*, the collar being adapted to be turned upon the shaft, as and for the purposes set forth.

255,561. SPONGE-FISHING NET. EDWARD ARAPIAN, New York, N. Y., assignor to himself and Rezillos Kirilake Mesopolos, same place. Filed Feb. 14, 1882. (No model.)



Claim.—A net of bag shape for fishing sponges or the like, having attached to the mouth thereof a frame one portion of which

255,561.

is composed of metal or other weighty material and the remainder of wood or other buoyant material, substantially as and for the purpose described.

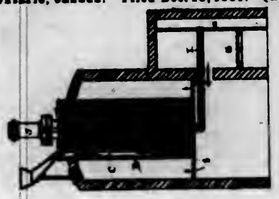
255,562. WASHING-MACHINE. JOHN H. ATWATER, Medford, Minn. Filed Jan. 18, 1882. (No model.)

Claim.—1. A washing-machine constructed substantially as herein shown and described, and consisting of the tub A B, the cylinder of corrugated rollers G, the flexible chain of rollers L, the endless apron K, and a driving mechanism, as set forth.

2. In a washing-machine, the combination of the tub A B, of the cylinder of corrugated rollers G, the flexible chain of rollers L, the endless apron K, and the crank-shaft J and gear-wheels I H, substantially as herein shown and described, whereby the clothes will be carried between the said rollers and cylinder by the said endless apron and quickly and thoroughly washed, as set forth.

3. The hook-rods N, attached to the flexible chain of rollers L, the straps O, the shaft P, the strap R, and the spiral spring S, combined in a washing-machine, as shown and described.

255,563. COMBINED FOOT-RAIL AND DASH ATTACHMENT. FRANK C. ATHA, Columbus, Ohio. Filed Jan. 16, 1882. (No model.)



Claim.—1. The combination of the dash-frame with dash-foot constructed and applied to connect said dash-frame to the vehicle-body and to the foot-rail, substantially as set forth.

2. A dash attachment for vehicles, consisting of the foot having each a dash-clamping part, *a'*, a body-fastening part, *a*, and an elevated part, *c*, for the foot-rail, *d*, substantially as described.

3. The dash-attaching device herein described, consisting of the dash-foot bent or raised at each end, the foot-rail having a middle support, and the clamping screw-bolt, substantially as and for the purpose specified.

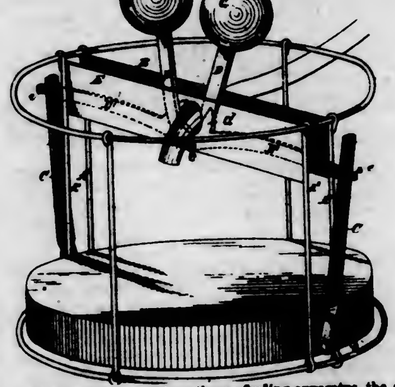
4. As a new manufacture, a foot-rail including provision by which it is attached to and forms a support for the dash-frame of the vehicle, substantially as described.

255,564. APPARATUS FOR DRYING GRAIN. JOS. RADCLAY, Toronto, Ontario, Canada. Filed Dec. 15, 1881. (No model.)

Claim.—1. The combination, with two perforated cylinders placed one within the other and adapted to hold grain between them, of a furnace, means for supplying heated air under pressure, and passages for conveying the products of combustion from the furnace to one side of the cylinders and heated air under pressure to the other side of said cylinders, substantially as and for the purpose specified.

2. The combination, with two revolving perforated cylinders adapted to hold grain between them, of a furnace and a pressure-fan, said furnace discharging its products of combustion into a chamber surrounding the cylinders, and the pressure-fan forcing air through said furnace to the interior of the cylinder and through the sides of the same, substantially as described, and for the purpose specified.

3. In a machine for drying oats and other grain through the application of artificial heat, and in which the grain is contained between two revolving perforated cylinders, the one being placed within the other, the top of the inner cylinder being closed and its bottom connected to a blast-pipe leading from a pressure-fan, vertical partitions arranged to divide the space between the two cylinders into compartments, in combination with a floor placed below the revolving cylinder and provided with a hole communicating with a spout, through which the grain is discharged, substantially as specified.



4. The combination, with a receptacle for holding grain and a chamber surrounding the same, of a furnace adapted to discharge its products of combustion into said chamber, an air-passage leading through said furnace from an air-space close to the latter and adapted to discharge heated air within the space inclosed by the grain-receptacle, substantially as and for the purpose specified.

5. The combination, with a receptacle for holding grain, of a furnace, and means, substantially as described, for separately conducting the products of combustion of said furnace and the air heated by the same to the grain-receptacle, whereby the air acting against one face thereof will prevent the smoke and gases from passing through the opposite face to the grain, as set forth.

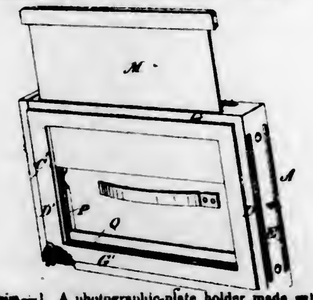
6. The combination, with the perforated revolving cylinders B C, of the chamber surrounding said cylinders, the furnace G, the air-passage I, passing through said furnace, and the perforated plate *b* at the base of the cylinders, substantially as and for the purpose specified.

7. The combination, with the revolving cylinders B C, of the furnace G and pipes I, the former discharging at the exterior of the cylinders and the pipes at the interior of the same, and means, substantially as described, for gradually discharging the grain from the space between the cylinders, as and for the purpose specified.

255,565. AUTOMATIC SAP-FEEDING APPARATUS. HERBERT C. BARBER, Pawlet, Vt. Filed Oct. 18, 1881. (No model.)

Claim.—1. In an automatic sap-feeding apparatus, the combination, with a float, *d*, pivoted arms adjustably connected with said float and a supply-tube leading from a reservoir and passing between said pivoted arms, said tube being constructed wholly or in part of elastic material and adapted to be opened by the descent of the float and closed by its ascent, substantially in the manner, and for the purposes set forth.

2. In an automatic sap-feeding apparatus, the combination, with a rising-and-falling float, of two lever-arms pivoted upon the same bolt, each having formed thereon a spur or projection, be-



tween which the supply-pipe passes, and arms pivoted to said float and adapted to engage adjustably with the extremities of the said lever-arms, all substantially as and for the purposes set forth.

3. The combination, with a suitable frame having transverse supports E, of the lever-arms D D, having each a long arm, D', said lever-arms being pivoted at a common point, e, and the pivoted arms C, substantially as and for the purposes set forth.

4. As a new article of manufacture, an automatic sap-feeding apparatus consisting of a suitable supporting-frame having transverse plates E E, two bell-crank levers D D D' D', pivoted to a common point between said plates E E, and having spurs or projections *d*, a supply-tube passing through the plates E and between the spurs or projections *d d*, and arms C, having apertures *a a a*, adapted to engage with the extremities of the lever-arms, the latter being provided with weights G G, substantially as and for the purposes set forth.

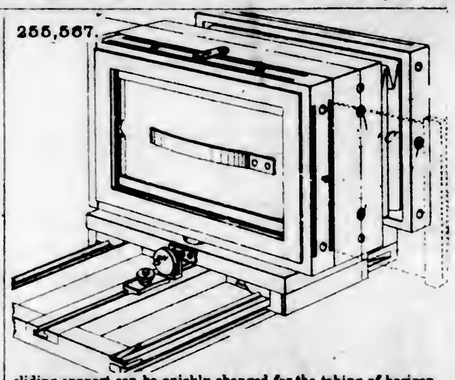
5. The combination, in an automatic sap-feeding apparatus, of pivoted compressing-arms, an elastic supply-tube, and a rising-and-falling float, whereby said arms are operated, substantially as and for the purposes set forth.

255,566. PHOTOGRAPHIC-PLATE HOLDER. ERASTUS B. BARKER, New York, N. Y., assignor to E. & H. T. Anthony & Co., same place. Filed Dec. 31, 1881. (Model.)

Claim.—1. A photographic-plate holder made, substantially as herein shown and described, with slide apertures or slots both at the sides and ends, whereby a slide may be used either at the side or end of the plate-holder, as described, and as set forth.

2. The frame of the plate-holder A, constructed with end apertures or slots, E, and grooves Q, for the reception of an end slide, K, and with side apertures or slots, H, and grooves P, for the reception of a side slide, M, substantially as herein shown and described, and for the purpose set forth.

3. The combination, in a photographic-plate holder, of an end cut-off and slide and a side cut-off and slide, substantially as herein shown and described, and for the purpose set forth.

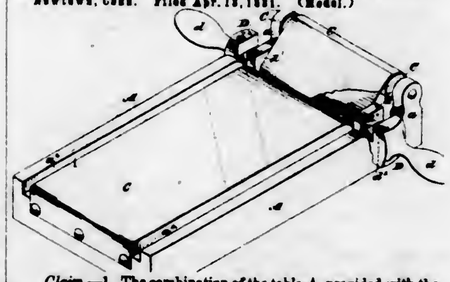


4. The combination, with a photographic-plate holder provided with a slide-receiving slot which contains a cut-off in one of the edges, of a cut-off at right-angles to the slotted edge and parallel with the direction of the movement of the slide, whereby the slide will be guided by this cut-off parallel with the direction of the movement of the slide, substantially as herein shown and described, and for the purpose set forth.

5. In a photographic-plate holder, the combination of the following elements, namely: a grooved and slotted frame with cut-offs and slides adapted to permit the insertion of a vertically-movable slide and a horizontally-movable slide, substantially as herein shown and described, and for the purpose set forth.

6. In a photographic-plate holder, the combination of the following elements, namely: a grooved and slotted frame with cut-offs and slides adapted to admit the insertion of two vertically-movable slides and two laterally-movable slides, substantially as herein shown and described, and for the purpose set forth.

7. In a photographic-plate holder, the combination of the following elements, namely: a plate-holding septum, a grooved and slotted frame with cut-offs and slides adapted to permit the insertion of a vertically-movable and a horizontally-movable slide, substantially as herein shown and described, and for the purpose set forth.

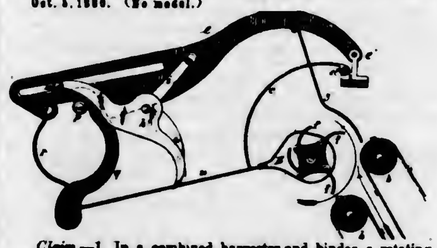


255,567. CAMERA-BOX. ERASTUS B. BARKER, New York, N. Y., assignor to E. & H. T. Anthony & Co., same place. Filed Dec. 31, 1881. (Model.)

Claim.—1. A reversible camera-box made, substantially as herein shown and described, with adjusting attachments for securing the box in different positions upon the under frame and sliding support, whereby the position of the box upon the frame and sliding support can be quickly changed for the taking of horizontal or vertical pictures without altering or affecting the operations of the sliding support and focusing-screws, as set forth.

2. The combination, with the camera-box, under frame, and sliding support, of the adjusting devices adapted to secure said box in a vertical or horizontal position, as shown and described, for the purpose set forth.

255,568. CIGARETTE-MACHINE. FERDINAND S. BARTRAM, Newtown, Conn. Filed Apr. 18, 1881. (Model.)

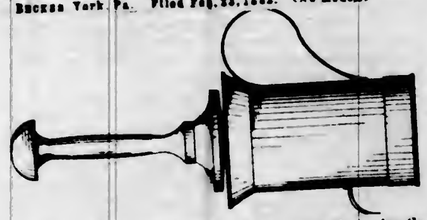


Claim.—1. The combination of the table A, provided with the grooves a^3, with the shaper D, having the lugs d' and d^3, substantially as and for the purpose shown.

2. In combination with the flexible apron C, the shaper D, provided within one side with a recess, d^3, substantially as and for the purpose set forth.

3. The herein-before-described apparatus for making cigarettes, consisting of the table A, provided with the recess a', grooves a^3, and roller B, the apron C, secured upon said table and roller, and the combined shaper and gage D, having the lugs d' and d^3 and recess d^3, said parts being combined to operate in the manner and for the purpose specified.

255,569. GRAIN-PACKER. WILLIAM BAYLEY, Springfield, Ohio, assignor to Whitsley, Fassler & Kelly, same place. Filed Oct. 5, 1880. (No model.)

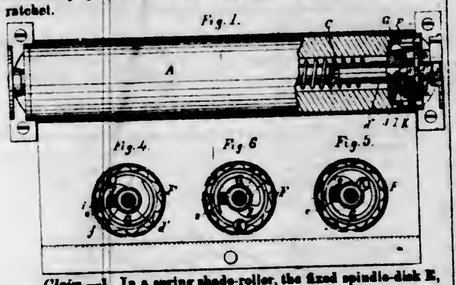


Claim.—1. In a combined harvester and binder, a rotating grain-packer provided with shafts *a*, having partial revolutions in bearings in the revolving brackets P, and provided with rake-teeth *f*, and levers *g n*, operated by the stationary cam C', combined with the slotted inclosing-case E, united at its back to and supported by the table *a*, and the deflector *c*, whereby the operative mechanism is set in motion, the gatherer *h*, band-carrier, and compressor *q*, substantially as set forth.

2. In a combined harvester and binder, a rotating grain-packer provided with shafts *a*, levers *g n*, and cams C' and C'', in combination with inclosing-case C, whereby the cams and levers are covered and protected, as and for the purpose set forth.

3. In a combined harvester and binder or combined gleaner and binder, a rotating grain-packer having shafts *a* and S and levers *g n*, combined with cams C' and C'', attached to the inner surface of the inclosing-case C, substantially as and for the purpose specified.

255,570. VEGETABLE MASHER AND STRAINER. LEANDER BECKER, York, Pa. Filed Feb. 23, 1882. (No model.)



Claim.—1. The combination, with the receptacle having the handle and the sleeve-bottom, of the plunger having the handle and the head adapted to fit within the receptacle.

2. The receptacle having the projection for resting upon the vessel into which the contents of the receptacle are to be discharged.

3. The combination of the receptacle having the handle, the sleeve-bottom, and the projection for resting on the edge of the receiving-vessel, with the plunger having the handle and head, the whole arranged and operated substantially as described.

255,571. SPRING CURTAIN-ROLLER. GREGOR T. BOTTENCURT, Providence, R. I. Filed Jan. 20, 1882. (No model.)

Brief.—Upon a slight downward pull of the shade the locking-ball is held between the polygonal hub of the annular ratchet and the annular scrolled disk, keeping it from engagement with the ratchet while the shade is ascending at any speed. To lock the roller the shade is drawn down, revolving the disk far enough to allow a projection on the spindle to strike the ball, when it falls to the bottom of the ratchet, when letting go the shade causes the ratchet by its centrifugal force to carry the ball up against the cammed projection on the disk and holds it between it and the ratchet.

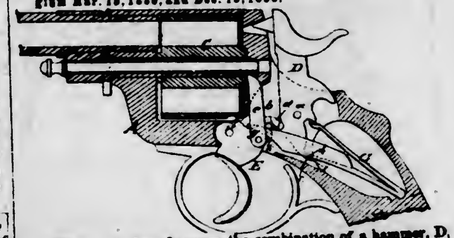
Claim.—1. In a spring shade-roller, the fixed spindle-disk E, provided with the stop *e* and pocket *d'*, the annular scrolled band G, stationary friction-washer J, spring J, locking-roll K, and the polygonal hubbed annular ratchet F, all combined and operating substantially as described.

2. In combination with a spring shade-roller, an oscillating scrolled disk, G, frictionally associated with the roller and having a limited motion therewith, a ratchet, and locking roll or ball K, all arranged to operate substantially as described and set forth.

3. In a spring shade-roller having a locking roll or ball and an internal ratchet, the combination therewith of an oscillating annular scrolled disk operating, substantially as described, to prevent engagement between said locking-roll and ratchet when the shade is ascending at any speed, as set forth.

4. In combination with a shade-roller provided with a spiral spring for rolling up the shade, a locking-roll, an annular internal ratchet, and an annular scrolled disk adapted to change its position with relation to the spindle and ratchet, all so arranged that in one operation the roll will engage with the ratchet on drawing down and releasing the shade and in another operation the roll will not so engage the ratchet when the shade is ascending at any speed, substantially as described.

5. In combination with a shade-roller provided with a spiral spring for winding up the shade, a ratchet, a locking-roll, and an oscillating scrolled disk hung upon the circular portion of the polygonal hubbed annular ratchet, which is secured to the shade-roller and moves therewith, said parts being arranged, substantially as described, so that in one operation the locking-roll, on the descent of the shade at any speed, will automatically assume such position that it will engage with the ratchet and lock the shade-roller on letting go of the shade without any manipulation, and in another operation, when the shade is ensued to ascend at any speed, will not engage with said ratchet, as set forth.



255,572. RULING-MACHINE. EDWARD W. BLACKBALL, Toronto, Ontario, Canada. Filed Oct. 6, 1881. (No model.)

Claim.—1. A pen for ruling-machines, consisting of a thick metal plate having grooves cut in its face and having its lower edge beveled and its upper end provided with a spring-plate, substantially as and for the purpose specified.

2. As a pen for a ruling-machine, a sheet-metal plate having longitudinal grooves or lines cut in its face, and being of sufficient width to leave a metal support on each side of the said lines, the said plate being flexibly connected to the pen-clamp, substantially as and for the purpose specified.

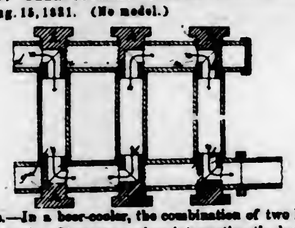
255,573. LOCK FOR FIRE-ARMS. HENNARD BLEE, Paris, France. Filed Jan. 20, 1882. (No model.) Patented in Belgium Mar. 15, 1880, and Dec. 15, 1880.

Claim.—1. In a fire-arm, the combination of a hammer, D, having front catch, *b*, near the lower end, the spring G, having upper and lower branches, and the trigger E, having an upper back projection, *d*, with notch in its end, and a lower rear projection, *h*, as and for the purpose specified.

2. The combination, with a spring having the beveled flattened portion *h* and the hammer having the back lower projection, *e*, of the secondary spring, *i*, rounded in front, whereby the projection *e* is pressed away from portion *h* of the mainspring and a slight back motion allowed to the hammer, for the purpose specified.

3. The combination, with the hammer D and the trigger E, constructed and arranged for operation with each other as described, of the mainspring G, having upper and lower branches, and having its lower branch constructed with a flattened portion, *h*, and with a secondary spring, *i*, for operation on the hammer, essentially as set forth.

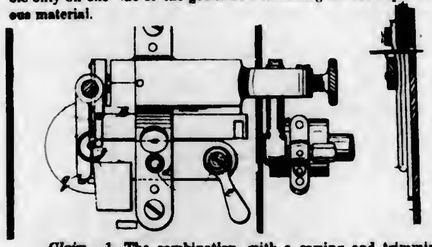
255,574. HITCHING-STRAP. FRANK BONELLI, Vicksburg, Miss. Filed Jan. 5, 1882. (Model.)



Claim.—1. A latch for a hitching-strap, which consists of the plates *b* and *c*, slotted at one end, and having pivoted between them the spring-hook *d*, the whole being adapted by means of staples *f* for attachment to a hitching-strap, substantially as specified.

2. In combination with the strap A, the latch C, having staples *f* for its attachment to the said strap, and the spring *g*, to retard the sliding movement of the latch longitudinally of the strap, substantially as and for the purpose specified.

3. In combination with the plates *b* and *c*, the former having projections to separate them, the spring-hook *d* and means for its attachment to a strap, substantially as specified.



255,575. BEER-COOLER. CHARLES J. BOPP, Boston, Mass. Filed Aug. 15, 1881. (No model.)

Claim.—In a beer-cooler, the combination of two longitudinal pipes, a series of transverse pipes intersecting the longitudinal pipes at points between the ends of the latter, and a series of removable plugs extending transversely through the longitudinal pipes at points opposite the ends of the transverse pipes, and constructed to direct the flow of beer from the longitudinal into the transverse pipes, all substantially in the manner and for the purposes set forth.

255,576. MACHINE FOR SEWING WELTS OR HEMS ON FABRICS. STOCKTON BEATON, Philadelphia, Pa., and CHARLES H. WILLCOX, New York, N. Y., assignors to the Willcox & Gibbs Sewing Machine Company, New York, N. Y. Filed July 8, 1881. (Model.)

Brief.—For sewing a welt or hem with a seam which is visible only on one side of the goods and trimming off the superfluous material.

Claim.—1. The combination, with a sewing and trimming machine, of a guide having its guiding-edge between the line of stitching and the line of trimming, substantially as described.

2. The combination, with a sewing and trimming machine, of an adjustable edge-guide capable of adjustment toward and away from the needle between it and the line of trimming, substantially as described.

3. An edge-guide for sewing-machines, notched for the passage of the needle, and having the guiding-edge in advance of the needle oblique to the line of feed, substantially as described.

4. An edge-guide for sewing-machines, having the guiding-edge in advance of the needle oblique to the line of feed, in combination with a presser-foot cut away opposite the guiding-edge to allow it to act in close proximity to the needle, substantially as described.

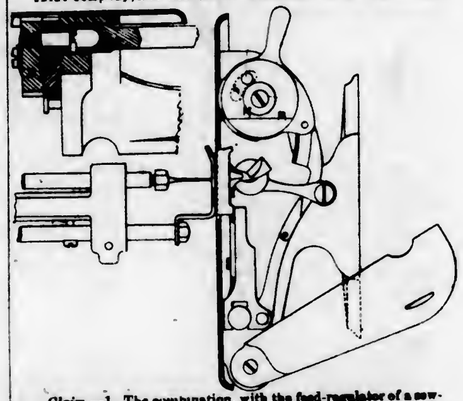
5. The combination, with the cutters of a sewing-machine trimmer and an edge-guide, of a presser-foot cut away to the right of the needle-hole to allow said cutters and guide to act in close proximity to the needle, substantially as described.

6. The combination of an adjustable edge-guide secured to the cloth-plate of a sewing-machine, with its guiding-edge in advance of the needle oblique to the line of feed, and a presser-foot cut away opposite the guiding-edge of said guide to permit its adjustment close to the needle-hole, substantially as described.

7. The combination of an edge-guide secured to the cloth-plate, a presser-foot, and a projection from the said foot extending laterally over said guide, substantially as described.

8. The combination of the edge-guide, the presser-foot cut away to the right of the needle-hole opposite the said guide, and the projection of the presser-foot partly surrounding the needle-hole and extending laterally over said guide, substantially as described.

9. An edge-guide for attachment to the cloth-plate of a machine, having the guiding-edge of greater depth opposite the toe of the presser-foot than opposite the needle-hole, substantially as described.



10. A holding-finger adjustably connected with the presser-bar of a sewing-machine, substantially as described.

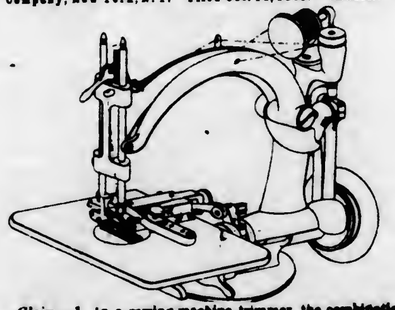
11. The combination of the cutters of a sewing-machine trimmer, a holding-finger, presser-foot, and edge-guide, substantially as described.

12. The method of hemming or welting fabrics by folding the fabric, automatically guiding the folded fabric to sewing mechanism, and simultaneously sewing and trimming the welt or hem, substantially as described.

13. In a sewing-machine, the combination, with means for guiding a fold of material to the stitch-forming mechanism, so that the needle will pass through the said fold, of a trimming mechanism for trimming off the edge of the surplus material extending beyond the fold simultaneously with the sewing, substantially as described.

255,577. FEED MECHANISM FOR SEWING-MACHINES. STOCKTON BEATON, Philadelphia, Pa., and CHARLES H. WILLCOX, New York, N. Y., assignors to the Willcox & Gibbs Sewing Machine Company, New York, N. Y. Filed Dec. 26, 1881. (Model.)

Claim.—1. The combination, with the feed-regulator of a sewing-machine, of a locking device for preventing alteration of the feed by the operator, substantially as described.



2. The combination of a feed-regulator, clamping-plate, and locking-bolt, substantially as described.

3. A locking screw-bolt, in combination with a slotted feed-regulating cam and clamping-plate, substantially as described.

4. The combination of the slotted feed-regulating cam, its supporting-pin, the clamping-plate, the spring-washer, and the locking-bolt, substantially as described.

5. The combination, with the adjustable feed of a sewing-machine, of locking mechanism for preventing alteration in the feed-movement, except by a special key or device for that purpose, substantially as described.

255,578. TRIMMER FOR SEWING-MACHINES. STOCKTON BEATON, Philadelphia, Pa., and CHARLES H. WILLCOX, New York, N. Y., assignors to the Willcox & Gibbs Sewing Machine Company, New York, N. Y. Filed Oct. 14, 1880. (Model.)

Claim.—1. In a sewing-machine trimmer, the combination, with the cutting-shears, of means, as indicated, for clamping and thus holding stationary the fabric on opposite sides of the line of cutting during the operation of the shears, substantially as described.

2. In combination with the presser-foot, feed, and stitch-forming mechanism of a sewing-machine of ordinary or suitable construction, a stationary cutter, a vibratory cutter, and a holding finger or device, said presser-foot and holding finger or device being

arranged to clamp the fabric during the cutting operation, the one upon the stationary cutter and the other upon a surface on the opposite side of the line of cutting, substantially as described.

3. In combination with automatic shears, a holding finger or device roughened or provided with teeth and operating substantially as described.

4. In combination with a sewing-machine, a trimming attachment comprising a movable cutter, a stationary cutter formed of a bar or plate arranged substantially at right angles to the plane of movement of said movable cutter and adjustable independently thereof, and mechanism for operating said movable cutter so that the edges of the two cutters do not entirely separate but cross each other at all times in operation, substantially as described.

5. In a sewing-machine trimmer, the combination, with a stationary cutter formed of a bar or plate and a vibratory cutter, of a holding finger or device arranged to clamp the material to be sewed and trimmed between itself and said plate or bar, substantially as described.

6. In combination with the cloth-plate, presser-foot, feed, and stitch-forming mechanism of a sewing-machine, a vibratory cutter, a stationary cutter formed of a plate or bar, and a holding finger or device arranged above said plate or bar, and connected with means for relieving its pressure intermittently, substantially as described.

7. The combination, with the eye-pointed needle and other elements of a sewing-machine, and a trimming attachment for trimming goods as sewed by said machines, of a presser-foot and an upright projection or shield in front of the needle's path, substantially as described.

8. A presser-foot cut away at the front to form a toe, and provided with an upright projection in front of the needle-hole, substantially as described.

9. A presser-foot having a portion cut away close to the needle-hole on one side and provided with an upright projection in front of the needle-hole, substantially as described.

10. In a shearing device, the combination, with a stationary cutter or blade and a vibratory cutter or blade, arranged to operate in connection with each other, and one being capable in operation of a line-movement substantially at right angles to the cutting-edges, of a spring arranged to act upon the blade capable of the aforesaid movement and press said edges into contact with each other, substantially as described.

11. The combination of a rock-shaft capable in operation of endwise movement, a spring connected with said shaft, a vibratory cutter or blade attached to said shaft, and a bar or plate having a cutting-edge and capable of adjustment, substantially as described.

12. A pair of shear-blades or cutters having cutting-edges slightly oblique to each other, and one of said cutters or blades being capable in operation of a line-movement approximately at right angles to the cutting-edges, in combination with a spring arranged to act upon the blade capable of the aforesaid movement and hold said cutting-edges in contact, substantially as described.

13. The combination of a rock-shaft capable of endwise movement, cutter or shear-blade attached to said shaft, stationary cutter or blade with oblique cutting-edge, and spring arranged to force said shaft and cutter attached thereto in the direction to maintain the cutting-edges of the two cutters in contact with each other, substantially as described.

14. The combination, with a cutter or blade stationary during its operation but capable of adjustment, of a vibratory cutter or blade, rock-shaft carrying said cutter, spring, and adjustable back stop for said shaft.

15. The combination, with a stationary and a vibratory cutter or blade having cutting-edges slightly oblique to each other, of a rock-shaft carrying said vibratory blade or cutter, a spring, and an adjustable back stop for said shaft, substantially as described.

16. The combination of the rock-shaft, spring, adjustable back stop, vibratory cutter or blade, bar, or plate, with cutting-edge at one end, and means for securing said bar or plate in position and for permitting its adjustment at, or approximately at, right angles to the cutting-edge.

17. The combination, with the stitch-forming and feed mechanism of a sewing-machine of ordinary or suitable construction, of a rock-shaft connected with and operated by a suitable moving part of said machine, a vibratory cutter or blade attached to said shaft, means for adjusting the position of the said shaft and cutter nearer to or further from the needle-hole of the sewing-machine, and a second cutter or blade stationary during its operation and also adjustable, substantially as described.

18. In a sewing-machine trimmer, a rock-shaft, and vibratory cutter or blade attached to and carried by said shaft, combined with a stationary cutter or blade, as described, said shaft being arranged below the line of the cutting-edge of the stationary cutter or blade, so that in operation the severed portion of the goods may pass over said shaft.

19. In a sewing-machine trimmer, a cutter or blade formed of a plate or bar with the cutting-edge at the end thereof, in combination with a rock-shaft arranged below the plane of the upper surface of said bar or plate, so that said surface if extended would pass over said shaft, and a vibratory cutter or blade attached to said rock-shaft, substantially as described.

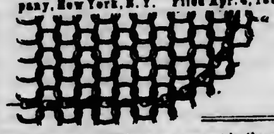
20. An automatic trimmer for operation in connection with a sewing-machine of ordinary or suitable construction, comprising the following elements: a stationary bar or plate with oblique cutting-edge at the end thereof, means for adjusting said bar or plate, a finger or device for holding stationary the work, or a portion thereof, while cutting, a vibratory blade or cutter, a rock-shaft, spring, and adjustable back stop, substantially as described.

21. The combination, with a sewing-machine and a shearing attachment, of adjusting mechanism, as described, comprising a thumb or set screw adapted to regulate mechanically—that is, by its own proper motion—the position of the cutting device forming part of said attachment relative to the stitching devices of the sewing-machine, substantially as described.

22. In a sewing-machine trimmer, a flat cutter bar or plate held between fixed guides in or on the cloth-plate, and a clamping device arranged to bear against said bar or plate, so that the latter can be withdrawn by loosening without removing said clamping device, substantially as described.

23. In a sewing-machine with trimming attachment, the flat blade held against the end of the rock-shaft by a screw and prevented from turning on said screw by a suitable projection, such as a steady-pin, substantially as described.

24. In a sewing-machine with trimming attachment, the rock-shaft carrying the vibratory cutter, and supported, as described, on the cloth-plate, so that the trimmed-off strip will pass over the shaft, substantially as described.



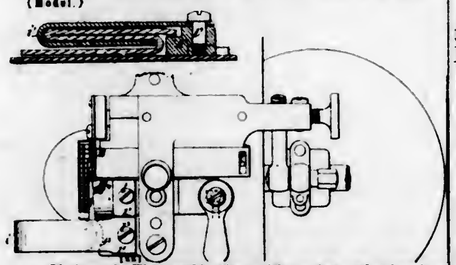
25. In a sewing-machine with trimming attachment, the combination, with the rock-shaft supported in bearings on the cloth-plate and cutter attached to said shaft, of an inclined plate located in front of the rock-shaft, substantially as described.

26. The combination, with a sewing-machine having a looper-shaft below the cloth-plate, of a rock-shaft supported back of the presser-foot and looper-shaft and extending from a point close to the presser-foot over the edge of the cloth-plate, a cutter secured to the end of said rock-shaft adjacent to the presser-foot, so as to project toward the needle of the sewing-machine, substantially at right angles to said shaft, and an operating-arm attached to the overhanging end of the rock-shaft aforesaid and connected with an eccentric on the looper-shaft, as set forth.

27. In a sewing-machine with trimming attachment, the combination, with the presser-foot, finger, and vibratory cutter working between said foot and finger, of an elongated bar or plate adjustably supported in guides on the cloth-plate and projecting under the said finger, so as to co-operate with said vibratory cutter to trim the fabric as it is sewed, substantially as described.

28. The combination, with the cloth-plate, presser-foot, and looper-shaft of the sewing-machine, of the frame carried by said cloth-plate, the rock-shaft supported in bearings in said frame and extending from a point close to the presser-foot beyond the edge of the cloth-plate, an eccentric on the looper-shaft, connections between the projecting end of the rock-shaft and said eccentric, a vibratory cutter attached to the opposite end of the rock-shaft, and an elongated bar or plate supported parallel with said cloth-plate and adapted to co-operate with said vibratory cutter, substantially as described.

255,579. ART OF MANUFACTURING HOSIERY. STOCKTON BEATON, Philadelphia, Pa., and CHARLES H. WILLCOX, New York, N. Y., assignors to the Willcox & Gibbs Sewing Machine Company, New York, N. Y. Filed Apr. 4, 1881. (No model.)



Claim.—1. The improvement in the art of manufacturing hosiery, consisting in sewing the seam or seams with straight-ahead stitches equal, or approximately equal, in length to the gage of the fabric, substantially as described.

2. The method of uniting hosiery so as to form with rapidity and economy strong closely-trimmed seams by running on a sewing-machine straight-ahead seams of stitches equal, or approximately equal, in length to the gage of the fabric, and simultaneously with

the sewing operation trimming off the excess of material beyond the seam in a continuous manner, substantially as described.

255,580. MACHINE FOR SEWING WELTS OR HEMS ON FABRICS. STOCKTON HORTON, Philadelphia, Pa., and CHARLES H. WILLCOX, New York, N. Y., assignors to the Willcox & Gibbs Sewing Machine Company, New York, N. Y. Filed Jan. 10, 1882. (Model.)

Claim.—1. The combination, with sewing and trimming mechanism, of an overhanging guide adapted to enter the fold of a welt or hem and arranged with respect to said sewing and trimming mechanism substantially as described.

2. The combination, with sewing and trimming mechanism and a folded-edge guide, of an overhanging guide adapted to enter the fold guided by the aforesaid folded-edge guide, substantially as described.

3. The combination, with sewing and trimming mechanism, of means for controlling the width of a welt or hem folded as described, and for guiding said welt or hem to the aforesaid mechanism, substantially as set forth.

4. The combination, with an edge-guide having its guiding-edge arranged relatively to the stitching mechanism of a sewing-machine as described, of an overhanging guide adapted to enter a fold and having its guiding-edge in front of the guiding-edge of said edge-guide and substantially in line therewith, so as to crowd the fold against the latter, substantially as described.

5. The combination, in a machine for sewing welts or hems on fabrics, of the folded-edge guide and the overhanging horizontal arm adapted to form a guide within the fold guided by the aforesaid folded-edge guide, and also by guiding or supporting the welt or hem itself to control the width thereof, substantially as described.

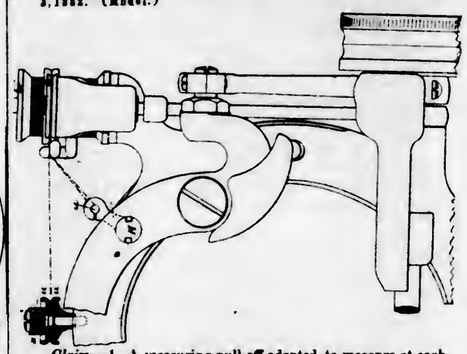
6. The combination, with a guide formed by an overhanging arm adapted to enter a fold, of a guide recessed opposite the end of said arm, substantially as described.

7. The combination, with a guide formed by an overhanging arm adapted to enter a fold, of an edge-guide recessed opposite the end of the arm and provided with a guiding-edge in line or approximately in line with said end, substantially as described.

8. The combination, with a presser-foot having a turned-up toe, of an edge-guide alongside of said foot with its upper surface curved upward corresponding with said toe, substantially as described.

9. A sewing-machine guide adapted to guide the outer edge of a fold and located adjacent to and alongside of the presser-foot, and having a guiding-edge entirely in front of and in close proximity to the needle and slightly oblique to the line of stitching, substantially as described.

10. A set of guides for welting or hemming fabric, and comprising, in combination, a folded-edge guide and an overhanging guide attached to an elevation on the folded-edge guide back from the guiding-edge, the said edge being recessed or cut away opposite said overhanging guide, substantially as described.



11. A presser-foot having an upright projection in front of needle-hole, with lateral extension flush, or nearly flush, at its lower edge with the bottom of the presser-foot, substantially as described.

12. The combination, with a presser-foot having a lateral extension, of the folded-edge guide cut away or grooved, as described, beneath said extension, as set forth.

13. The combination, with a presser-foot such as described, of a folded-edge guide adapted to guide the outer edge of the fold and located adjacent to and alongside of said presser-foot, and an overhanging guide supported in front of the presser-foot and adapted to enter the fold guided by the aforesaid edge-guide, substantially as described.

14. The combination, with an overhanging guide, of a folded-edge guide having its guiding-edge of considerable depth opposite the said overhanging guide and diminishing in depth beyond the same, substantially as described.

255,581. THREAD-CONTROLLING APPARATUS FOR SEWING-MACHINES. STOCKTON HORTON, Philadelphia, Pa., and CHARLES H. WILLCOX, New York, N. Y., assignors to the Willcox & Gibbs Sewing Machine Company, New York, N. Y. Filed Jan. 3, 1882. (Model.)

Claim.—1. A measuring pull-off adapted to measure at each stitch the amount of thread therefor, in combination with an automatic or intermittent tension between said pull-off and the stitching mechanism, and a tension between the spool or supply of thread and the pull-off, substantially as described.

2. The combination, with an adjustable pull-off, of an intermittent clamping-tension and a resisting-tension, substantially as described.

3. The combination of an automatic or intermittent tension, a constant tension, and a measuring pull-off arranged to act upon the thread between the two, substantially as described.

4. The combination, with an intermittent tension and a constant tension, of an adjustable pull-off arranged to act on the thread between the two, substantially as described.

5. The combination of the measuring pull-off and the intermittent clamping-tension between itself and the stitching mechanism, substantially as described.

6. The combination of an adjustable pull-off and an intermittent clamping-tension between itself and the stitch-forming mechanism, substantially as described.

7. The combination of the measuring pull-off, the intermittent clamping-tension, the check-tension, and the resisting-tension, substantially as described.

8. The combination of the needle-lever, pull-off, and adjustable connection, substantially as described.

9. The combination, with a vibratory part of the sewing-machine, such as the needle-lever, of a pull-off rigidly attached to and carried by said part, so that the eye or portion of the pull-off which acts upon the thread moves in a circular arc with the fulcrum of said vibratory part as the center, said pull-off being adjustable to bring said eye or operating portion of the pull-off nearer to or farther from the said fulcrum, substantially as described.

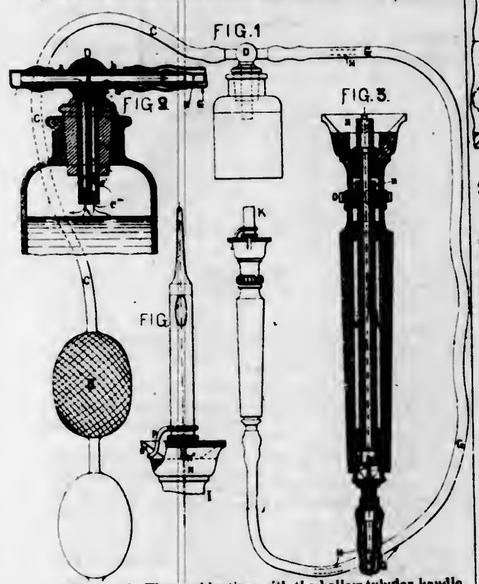
10. The combination, with a moving part of a sewing-machine, such as the needle-lever, of a pull-off rigidly attached and pivoted thereto, so as to be carried thereby and adjustable on its pivot as a center, so as to alter its action upon the thread, substantially as described.

11. The combination, with an adjustable pull-off, of means, as explained, for locking it in position, requiring a special key for releasing the same, substantially as described.

12. The combination of the adjustable pull-off, needle-lever, and holding-screw, substantially as described.

13. The combination of the needle-lever, pull-off, holding-screw, and spring-washer, substantially as described.

14. In an automatic or intermittent tension, the combination, with the eccentric-rod, of an independent clamp-stud and a tension-disk fixed thereto, substantially as described.



15. In a sewing-machine forming stitches by means of a looper, a measuring pull-off, and intermittent clamping-tension, combined with operating mechanism, and timed, as explained, so as to deliver the measured thread gradually during the ascent of the needle-bar, substantially as described.

16. The check-tension formed by an annular washer, combined with a stationary disk, supporting-pins, and independent tension-springs for holding said washer against said disk, substantially as described.

17. The combination, with an intermittent tension, of an annular spring-check tension surrounding a disk of the intermittent tension, substantially as described.

255,582. CAUTERIZING APPARATUS. EDME THEODORE BERSOT, Paris, France. Filed Mar. 1, 1882. (No model.) Patented in France Feb. 18, 1881.

Brief.—The supply of fuel is regulated by a valve manipulated at the base of the handle, and the supply-tube is double, carrying both air and fuel in separate compartments.

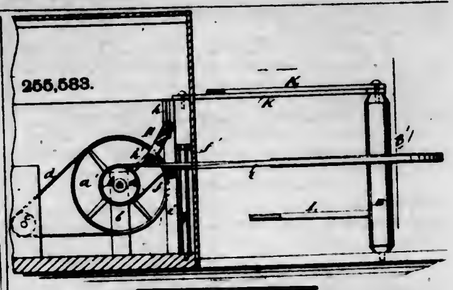
Claim.—1. The combination, with the hollow tubular handle of the cauterizing-iron, of means, as indicated, for controlling the supply of fuel, adapted to be operated by the hand which grasps said handle by means of a thumb-nut or its equivalent, substantially as described.

2. The combination, with the cauterizing-iron and its handle, of the two tubes for conveying air and carbureted air or other suitable fuel to the handle, wherein they mix, substantially as described.

3. The combination, with the carbureting-vessel and stopper, of the connection-piece having inlet and outlet passages and two or more openings into the outlet-passage, and adapted to be moved in and out, so as to cover or uncover one or more of said openings, and thus regulate the flow of the carbureted air, substantially as described.

4. The combination of the air-forcing bulb, the carburetor, the hollow handle, the tube leading from the air-forcing bulb to the carburetor, the two tubes leading from the latter to the hollow handle, and the valve apparatus connected with said handle, substantially as described.

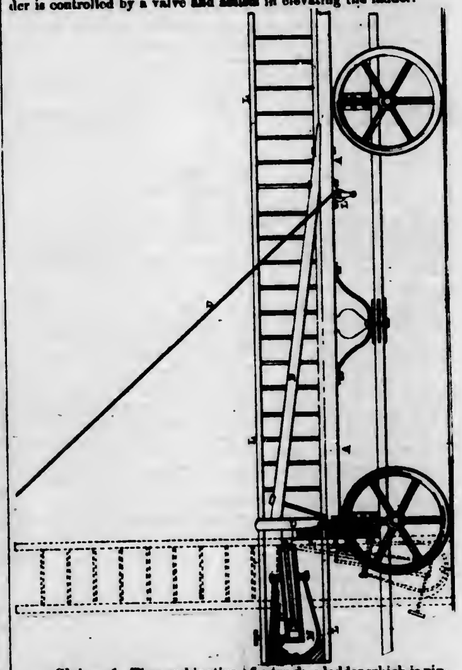
5. The combination, with the cauterizing-iron, its sheath and handle, of a movable piece adapted to engage the said iron and its sheath so that they can be turned without burning the operator's fingers, substantially as described.



6. The combination, with the handle and its valve apparatus, of the carburetor, the movable connection-piece, with inlet and outlet passages, and two or more openings into the outlet-passage, and the two tubes connecting the handle with said connection-piece, substantially as described.

7. The combination, with the handle and its valve apparatus, of the two concentric tubes, one inside the other, for conveying air and carbureted air or other gaseous fuel into said handle, substantially as described.

255,583. HORSE-POWER. THOMAS A. BROWN, Oliver, Ga. Filed Sept. 24, 1881. (No model.)



Claim.—1. The shaft A, carrying the small pulley *a* and the larger pulley *a'*, in combination with the main power-wheel B', the vertical belt-guides *g g*, the horizontal guide or roller *f*, the swinging tightener H, and the belts *e* and *d*, substantially as and for the purposes set forth.

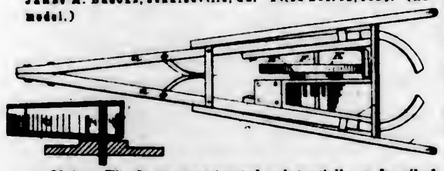
2. The horizontal roller *f* and the vertical guide-rollers *g g*, in combination with the belt-tightener H, pulley *a*, power-wheel B', and the belt *e*, substantially as and for the purposes set forth.

255,584. FIRE-ESCAPE LADDER. RICHARD F. BRIDEWELL, San Francisco, Cal. Filed Dec. 19, 1881. (No model.)

Brief.—The ladder is pivoted to the journal of the wheel for adjusting the angle of the ladder, which has an opening through it for the ladder to pass through sidewise. A chamber containing compressed air is secured to the lower part of the ladder, and contains also a cylinder and piston. The flow of air into the cylinder is controlled by a valve and assists in elevating the ladder.

Claim.—1. The combination of a truck, a ladder which is pivoted or hinged to a swiveled pivot, and a mechanism, substantially as shown, for inclining the ladder after it has been raised to a vertical position, substantially as described.

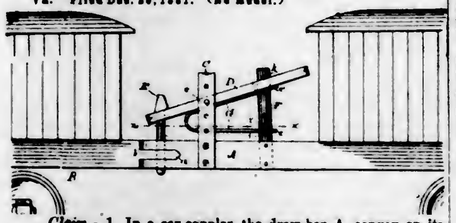
2. The combination of a truck, a ladder which is pivoted or hinged to a swiveled pivot, a wheel on said pivot having an opening through its top for the ladder to pass through, and a pinion for turning the wheel, whereby the ladder can be inclined toward either side of the truck by turning the pinion, substantially as set forth.



3. The combination of a truck, a ladder which is pivoted to a swiveled pivot, a mechanism for inclining the ladder, and mechanism, substantially as herein described, which is secured to the end of the ladder for assisting to raise the ladder into position, substantially as specified.

4. The combination of a truck, a mechanism, substantially as herein shown, for inclining the ladder after it is raised, a ladder which is pivoted so as to be raised from a horizontal to a vertical position, a chamber containing compressed air and having a cylinder placed inside of it, a piston which is placed inside of the

cylinder, and a valve for controlling the flow of the air to the piston, substantially as shown.

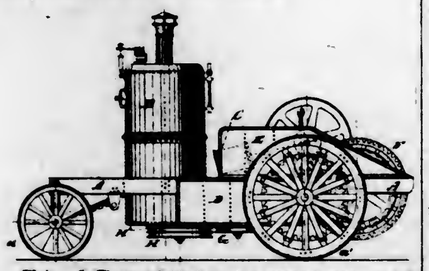


5. The combination of the truck, a ladder which is pivoted to a swiveled pivot, a mechanism, substantially as described, for inclining the ladder after it has been raised to a vertical position, the air-chamber secured between the ends of the ladder, the cylinder placed in the air-chamber, and the piston which has its outer end pivoted to the wheel, by means of which the ladder is inclined, and a suitable mechanism for lowering the ladder after it has been raised, substantially as described.

255,585. COTTON-SEED PLANTER. ENOCH M. BROOKS and JAMES M. BROOKS, Jenkinsville, Ga. Filed Dec. 13, 1881. (No model.)

Claim.—The hopper constructed, substantially as described, with the forward end wider at the bottom than the top, the rear end wider than the forward end, but having a uniform width from top to bottom, in combination with V-shaped frame and the distributing mechanism, substantially as specified.

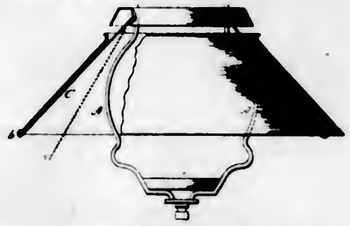
255,586. CAR-COUPLING. MATTHEW W. BRUCE, White Stone, Va. Filed Dec. 20, 1881. (No model.)



Claim.—1. In a car-coupler, the draw-bar A, convex on its end, and the draw-bar B, correspondingly concaved to receive the end of the bar A, in combination with the pin E and operating-lever D, substantially as shown and described.

2. In a car-coupler, the draw-bar A, having the recess *a*, and the draw-bar B, having the tenon *b*, in combination with the pin E and operating-lever D, substantially as shown and described.

3. The combination, in a car-coupler, of the draw-bars A and B, constructed substantially as described, and the yoke C, standard F, spring G, operating-lever D, and pin E, substantially as shown and described.

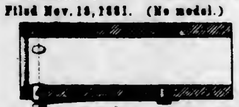


255,587. STEAM-PLOWING. FRITZ BAUTSCHKE, Berlin, Germany. Filed July 9, 1881. (No model.)

Claim.—1. The snatch-block carriage mounted upon swiveled wheels I I′, and composed of a frame, Q Q′, sheave P, having pinion *b*, cog-wheel *a*, having concentric pulley *c′*, band *d*, shaft *e*, sheave or pulley R, keyed upon said shaft, and provided with the clutch *f*, band-drum S, vertically adjustable upon shaft *e*, means for adjusting said drum, clutch *f′*, fixed in the bottom plate, Q′, of the carriage-frame, and band V, having the link or eye W at its free end, constructed and combined substantially as and for the purpose herein shown and specified.

2. The combination, with a fixed pair of anchors, Z Z′, of a snatch-block carriage, engine, and chains connecting the snatch-block with the engine, as described, so that after the band which connects the snatch-block carriage with anchor Z has been shifted to and coupled with the next anchor, Z′, the snatch-block carriage may be drawn into its operative position in a line with anchor Z′ and the engine by the operation of the latter and the chains which connect it with the snatch-block, substantially as and for the purpose herein shown and set forth.

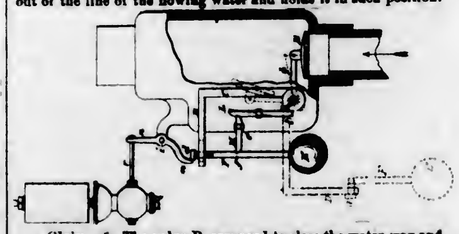
255,588. SHADE-HOLDER. EDSON L. BUTLER, Ansonia, Conn., assignor of one-half to Wallace & Sons, same place. Filed Feb. 1, 1882. (No model.)



Claim.—1. In a lamp-fixture, the rigid hangers C, hinged at their upper ends and hooked below to engage the lower edge of the shade, substantially as described.

2. In a lamp-fixture, the combination of the ring B, attached to the lamp-supports, with the rigid hangers C, hinged thereto, extending downward, and hooked at their lower ends to engage the lower edge of the shade, substantially as described.

3. In a lamp-fixture, the combination of the ring B, made adjustable vertically on the lamp-supports, the rigid hangers C, hinged to said ring and vertically adjustable therewith, their lower ends hooked to engage the lower edge of the shade, substantially as described.

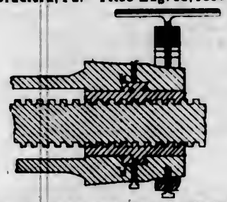


255,589. MILLING-TOOL. WILLIAM M. BUCKLEY, Meriden, Conn. Filed Nov. 18, 1881. (No model.)

Claim.—The herein-described turning, polishing, or burnishing tool, consisting of the hollow tool presenting a cutting device at its mouth, combined with one or more burnishers arranged in rear of the cutting portion and movable radially in the tool, with a spring to apply inward pressure to the said burnisher or burnishers, substantially as described.

255,590. VALVE FOR FIRE-EXTINGUISHERS. ALBERT M. BURRITT, Waterbury, Conn., assignor to the A. Burritt Hardware Company, same place. Filed Dec. 24, 1881. (No model.)

Brief.—When released the weight causes the valve to swing out of the line of the flowing water and holds it in such position.

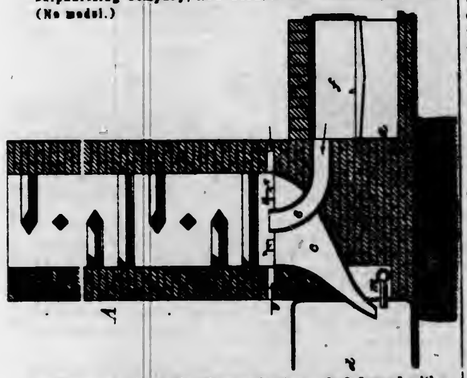


Claim.—1. The valve B, arranged to close the water-way and hung at one side of the water-way, combined with mechanism, substantially such as described, whereby after said valve is permitted to leave its seat it will be automatically turned out of line of the flowing water, substantially as described.

2. The valve B, arranged to close the water-way and hung upon a rock-shaft at one side of the water-way, combined with a lever extending from said rock-shaft, a weight suspended by a trip, a latch to hold the said trip, a cam on the said rock-shaft to operate said latch, whereby the first part of the movement of said valve will release the said weight and cause it to turn said rock-shaft and throw the valve out of the line of the water-way, substantially as described.

3. The valve B, arranged to close the water-way and hung at one side of the water-way, combined with mechanism, substantially such as described, whereby after said valve leaves its seat it will be automatically turned out of line of the flowing water, and with an alarm engaged with said mechanism, so that by the said movement of the valve the alarm will be sounded, substantially as described.

255,591. TEMPER-SCREW BOX FOR OIL-WELLS. JOHN D. CAMERON, Bradford, Pa. Filed Aug. 22, 1881. (No model.)



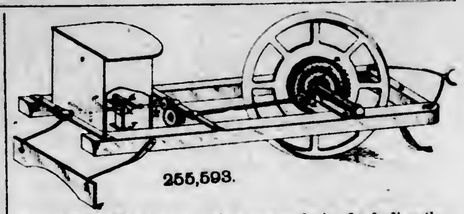
Claim.—1. A temper-screw box of cylindrical shape, having removable semi-cylindrical screw-boxes supported by means of a flange or half-collar projecting from their bodies, substantially as described, and in the manner set forth.

2. A temper-screw having a box provided with removable screw-boxes attached by means of dovetails, substantially in the manner described.

3. A temper-screw having a box provided with dovetail grooves, in combination with removable screw-boxes having dovetails, substantially as described.

4. A temper-screw box having removable dovetailed screw-boxes fitting within dovetailed grooves, and hand-screws for holding the screw-boxes in place.

255,592. ROASTING OR REVIVIFYING FURNACE. JOHN CAMPBELL, Allegheny City, Pa., assignor to the Campbell Desulphurizing Company, New York, N. Y. Filed May 5, 1881. (No model.)

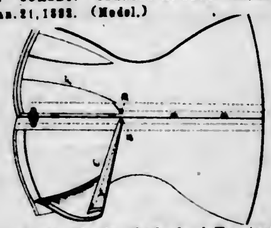


Claim.—1. A roasting furnace having a shaft formed with a series of bars extending across its passage, with their sides inclined to the axis of the shaft and arranged one above the other at various angles in spiral order, substantially as and for the purpose set forth.

2. In a roasting-furnace, a shaft provided with a series of hollow bars permanently built into it, said hollow bars having inclined upper and lower surfaces and arranged one above the other in spiral order, substantially as and for the purpose specified.

3. The combination, with the shaft A, provided with air-passages *e*, the furnace *f*, and the receptacle *d*, located at opposite sides of said shaft, of the chute C, having its upper end of substantially the same size as the interior of the shaft, and the blast-pipe *c*, extending into the shaft through the center of the chute C, the lower ends of the pipe *c* and chute C extending through opposite walls of the shaft and entering respectively the furnace *f* and the receptacle *d*, substantially as shown and described.

255,593. COTTON-SEED DROPPER. RAINSFORD CANTELOU, Edgefield, S. C. Filed Jan. 12, 1882. (No model.)



255,593.

Claim.—1. In a cotton-seed dropper, the combination of the following elements, viz: a plunger or seed-expeller, a hopper having a discharge-aperture, a cut-off or wire carried by the plunger and pivoted to the hopper, and an arm or device for feeding the seed into the discharge-opening of the hopper, substantially as herein set forth.

2. The combination of the crank-shaft having spirally-arranged feed-fingers and a vertically-operating plunger with a hopper having an apertured bottom, as and for the purpose set forth.

3. The combination of the radial feed-finger having an obliquely-bent horizontal part provided with a beveled end face with the crank-shaft, the plunger, and the apertured hopper-bottom, as and for the purpose set forth.

255,594. CORSET. CHARLES N. CHADWICK, Brooklyn, N. Y. Filed Jan. 21, 1882. (Model.)

Claim.—A corset having the busks A B, extending from the top to the bottom of the corset, secured in the front meeting edges, combined with arms C C, pivoted to the busks, the front edge of the breast portion of the corset attached to said arms, and so as to turn with the said arm upon its pivot away from and so as to expose the breast, with the band G, extending from the side above the breast-opening at the top to the back, substantially as described.

255,595. CONSTRUCTION OF BUILDINGS. ANDREW J. CHASE, Boston, Mass. Filed Feb. 7, 1882. (No model.)

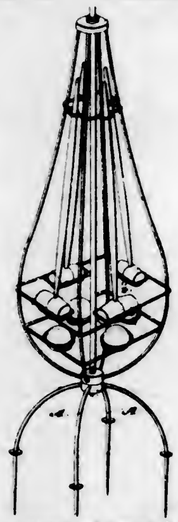
Brief.—Wall consists of a frame composed of studding with outer layers of paper, boarding, furring, boarding, and clapboarding. Vertical and horizontal rails divide the spaces between the studding into panels.

Claim.—1. The wall consisting of a frame composed of studding with the outer layers of paper, boarding, furring, ordinary boarding, and clapboarding, arranged substantially in the order described.

2. In a wall for a house, the frame of studding with an outer covering of paper, and the vertical and horizontal rails dividing the spaces between the studding into panels, substantially as described.

3. A wall composed of a frame of studding with an outer covering of paper, the rails dividing the spaces between the studding into panels, and the layers outside of the paper, consisting of wood, furring, and paper, and clapboarding, substantially as described.

4. A wall made substantially as described, in which the studding and the hard-rolled paper or wood-pulp board becomes a part of the inner finish.



255,596. CROQUET-STAND. HERBERT C. CHESTER, Meriden, Conn. Filed Jan. 3, 1882. (No model.)

Claim.—1. A combined croquet-stand and center wicket, substantially as and for the purpose specified.

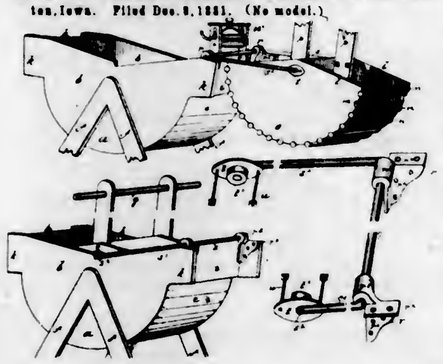
2. A stand for supporting croquet mallets and balls, secured to or upon the upper end of a center wicket, substantially as and for the purpose shown.

3. A croquet-stand provided with a series of pockets for the reception of balls arranged horizontally around an axial center, a series of pockets for the reception of the heads of mallets similarly arranged at a point above said ball-pockets, and a series of sockets

255,596.

or recesses adapted to receive and contain the upper ends of the handles of said mallets, substantially as and for the purpose set forth.

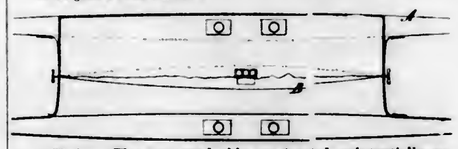
255,597. GALVANIC BATTERY. WILLIAM A. CHILDS, Englewood, N. J., and FRANK SHAW, New York, N. Y. Filed May 10, 1881. (No model.)



Claim.—1. The combination of the non-conducting cover, the detachable zinc electrode passing through the aperture in the cover and provided with the flange or enlargement above the cover, and a washer between said flange and cover, substantially as and for the purpose herein set forth.

2. The compound carbon element constructed, substantially as herein set forth, of two or more plates of carbon clamped at their upper ends to a conducting and supporting plate of carbon impregnated with paraffine or other like substance.

3. The combination, substantially as hereinbefore set forth, of the jar, the non-conducting cover, and the carbon electrode inserted in the aperture of the cover, and composed of the impregnated central or supporting plate, and the plates connected thereto by the hard-rubber rivet.



255,598. WASHING-MACHINE. BENJAMIN F. COKELY, Vinton, Iowa. Filed Dec. 9, 1881. (No model.)

Claim.—1. The combination, with the semicircular box *a*, having end boards, *i h*, of the brackets *r r*, secured to the end board *i*, having bearings r^2 and flanges r^3, rod *s*, passing through the eyes of the bearings and bent so as to form the angular parts *s' s'* of the rods, plates *t t*, each having a tubular projection, *t'*, adapted to receive the bent end s^2 of the rod *s*, and rubber *o*, swiveled to the bent ends of the rod *s*, as set forth, whereby the rubber can be oscillated back and forth to wash the clothes or raised out of the box and swung over in line therewith, substantially as described.

2. The combination of the box *a*, constructed as set forth, brackets *r*, having bearings r^2, flanges r^3, rod *s s' s²*, plates *t*, each having a tubular projection, *t'*, rubber *o*, constructed as set forth, and wringer *w*, clamped to the end board *i* between the ends of the box and rubber, substantially as described.

255,599. CONSTRUCTION OF VESSELS. WILLIAM COPPIN, London, England. Filed Feb. 8, 1882. (No model.) Patented in England June 16, 1879.

Claim.—The compound ship constructed, substantially as shown and described, of three hulls of narrow beam, the two outer hulls being longer than the central hull, and the whole decked over and combined as one vessel.

255,600. MANUFACTURE AND TREATMENT OF LINE, CORD, ROPES, CABLES, AND OAKUM. JNO. CODLSON, St. Petersburg, Russia. Filed Sept. 2, 1881. (No specimens.) Patented in England Apr. 7, 1881.

Claim.—The preservative compound for treating fibrous materials and articles made therefrom, composed of fir-tar and naphtha, in about the proportions and in the manner herein set forth.

255,601. CAR-COUPLING. LUCIDAS J. CHALLE, Santa Rosa, Cal. Filed Feb. 10, 1882. (No model.)

Claim.—1. The draw-head A, open at the top and front, provided with inwardly-projecting lugs *a a* upon its upper edges, and adapted to receive the coupling hook and link, substantially as shown and described.

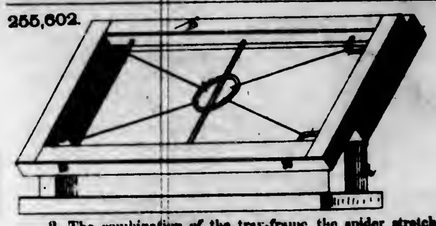
2. In a car-coupler, the coupling-hook B, pivoted to the forward portion of the draw-head, and provided with upwardly-projecting hooks *b b* upon its front end, and an arm, *b'*, all arranged to operate as set forth.

3. In a car-coupler, the coupling-hook B, provided on its forward end with the upwardly-projecting hooks *b b*, and with the arm *b'*, pivoted in the forward portion of and in combination with the draw-head A, substantially as shown and set forth.

4. The shaft C, provided with downwardly-projecting arms *c c²*, the arm *c* being adapted to operate the coupling and the arm c^2 to lock the said coupler when the link is within it, substantially as shown and described.

5. The L-shaped lever D, pivoted to the draw-head A, attached to the arm *c* by the lever *c'*, and provided with an arm, *d*, by which it is pivoted by the lever *d'* to the coupler-arm *b'*, and adapted to elevate or depress the coupling-hook B, substantially as shown and described.

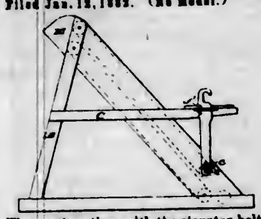
6. The combination of the shaft C, its arms *c c²*, rod *c'*, lever D, and rod *d'* with the coupling-hook B and draw-head, all arranged to operate substantially as shown and described.



7. The combination of the coupler-hook B with the shaft C, its arm *c*, and arm c^2, provided with a keeper, c^4, arranged to operate substantially as shown and described.

8. In combination with the coupler-hook B, the keeper c^4, pivoted to the arm c^2 of the shaft C, and retained in position on the draw-head by the link c^3, substantially as and for the purpose shown and described.

255,602. FRUIT-DRIER. CHARLES A. CURRAN, Albany, Oreg. Filed Jan. 21, 1882. (No model.)

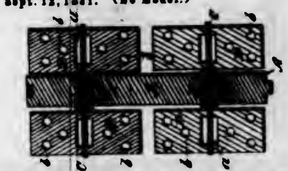


Claim.—1. The combination of the sectional hinged frame D and the door *i* applied to this frame, for the purpose specified.

255,602.

2. The combination of the tray-frame, the spider stretched therein, the angular corner-pieces, and the tightening-nuts, substantially as described.

255,603. HARVESTER-ELEVATOR. JAMES H. CURVIE, St. Paul, Minn. Filed Jan. 12, 1882. (No model.)



Claim.—1. The combination, with the elevator-belt, the cover formed of flexible fabric and situated above said belt, and a frame which holds the lower end of said flexible cover fixed relatively to its upper end, of the bar F, loosely connected to said frame, and the pivot *f'*, which prevents the bar and frame from swinging toward the elevator and permits them both to swing away therefrom, substantially as set forth.

2. The combination, with the lower revolving elevator, the upper elevator revolving upon the lower roller, G, and the upper roller, G', and the bars $F' E^2$, carrying said lower roller and swinging around the axis of the upper roller, of the vertically-adjustable bar F, which supports vertically the lower roller of the upper elevator and the frame E^2, substantially as set forth.

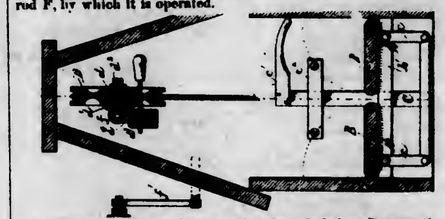
3. The combination, with the lower elevator, the bars E^2, the upper elevator having the gudgeons or shaft of its lower roller projecting through said bars and through the elevator-frame, of the vertically-adjustable bars F F', arranged to support said gudgeons or shaft outside of the elevator-frame, substantially as set forth.

4. The combination, with the lower elevator-belt and the upper elevator-belt arranged to swing at the lower end, of the supporting-bars F F', engaging with the journals of the swinging roller by the slots *e*, whereby said supporting-bars are adapted to permit said roller to swing outwardly and to prevent it from swinging inwardly, substantially as set forth.

255,604. CHURN-DASHER. DAVID E. DAVIS, Marion, Va. Filed Sept. 12, 1881. (No model.)

Claim.—The combination of the dasher-staff A, having transverse thimbles B, projecting on both sides thereof, arms C, inserted loosely through said thimbles, and S-shaped wings D, secured upon arms C, and having the apertures *a b*, substantially as and for the purpose herein shown and specified.

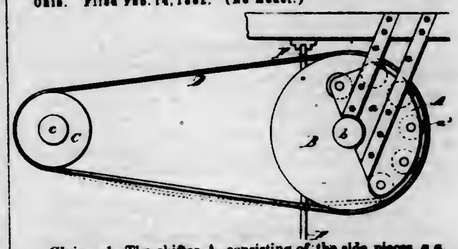
255,605. MATCH-IGNITER. JAMES R. DONNELLY, New York N. Y. Filed Dec. 31, 1881. (No model.)



Claim.—1. In a match-igniter, the combination of the igniting-surface A and the spot or surface B, having luminiferous coating *a* arranged upon the back of a glass plate, D, in the opening *f* of the igniter-body E, as shown and described.

2. As an article of manufacture, the match-igniter made substantially as herein shown and described, consisting of the base E, igniting-surface A, glass D, a coating of some luminous substance, *a*, and the backing *b*, as set forth.

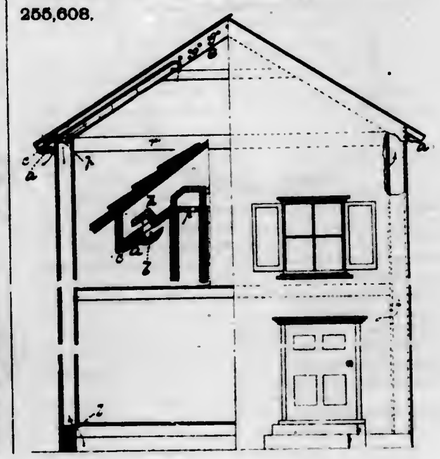
255,606. WELL-CURB AND WATER-DRAWER. LINDLEY H. DUNNA, Chester Hill, Ohio. Filed Dec. 22, 1881. (No model.)



Brief.—B B are trap-doors that cover the well, and are raised either by lever C or by the bucket in passing up from the well. The wheel D is beveled on one side at *d'*, where it gears with *f* on rod F, by which it is operated.

Claim.—1. In a well-house, the pivoted shelves B, operating in combination with the T-lever C and connecting-rods *c*, substantially as and for the purposes specified.

2. The pulley D, its axle-box *d*, and gear *d'*, operating in combination with the axle d^3, bracket d^2, lug d^4, crank-shaft F, and gear *f*, substantially as shown and described.



255,607. BELT-SHIFTER. EDWIN C. DURAND, Greenwich, Ohio. Filed Feb. 14, 1882. (No model.)

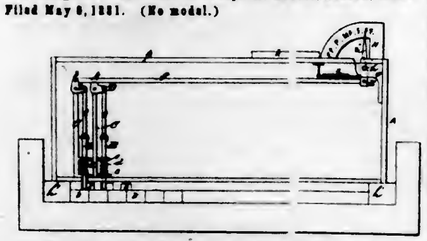
Claim.—1. The shifter A, consisting of the side pieces, *a a*, formed as shown, secured together by the strips a^2 a^3, and having journaled between them the pulleys a^4, and adapted to be secured to the joist E by the braces *c c*, substantially as shown and described.

2. The shifter A and its pulleys a^4, in combination with the pulley B and shifting-bar F, all arranged to operate as set forth.

255,608.

255,608. CONSTRUCTION OF HOUSES FOR PURPOSES OF VENTILATION, &c. PRESCRIBE G. EATON, Springville, N. Y. Filed Feb. 9, 1882. (No model.)

Brief.—The plancher and end rafters are perforated to permit a draft of cold air under the roof. The sills are beveled to allow the air from the cellar to pass up between the lath and plaster and the siding of the house to join the current under the roof. A guard-molding protects the perforations in the plancher.



Claim.—1. The plancher *a*, having the aperture or perforations *b* and the perforated end rafters, *c*, combined substantially as specified.

2. The plancher *a*, having the aperture or perforations *b* and the rabbeted guard-molding *e*, combined substantially as specified.

3. The combination, with the perforated plancher *a* and the perforated end rafters, *c*, of the air-passages *l* in the sills and the opening *p* in the top of the wall, substantially as specified.

4. The combination, with the perforated plancher and the perforated end rafters, of the air-passages in the sills, the side-wall air-passages, and the air box or conduit leading from the top of the side-wall air-passages to the end rafter, as specified.

255,609. KEY-BOARD ATTACHMENT FOR MUSICAL INSTRUMENTS. GILBERT R. ELLIOTT, Moncton, New Brunswick, Canada, assignor of one-half to Joseph A. Harris, Boston, Mass. Filed May 6, 1881. (No model.)

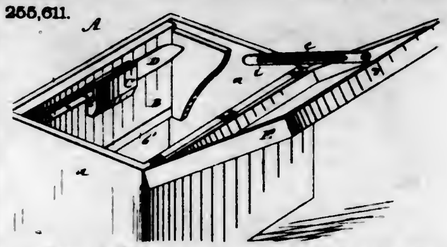
Claim.—1. In a key-board attachment for a piano, organ, or like musical instrument, a series of pins or hammers, B B B, with spirals *d d*, arranged in a position oblique or diagonal to the length of said key-board, substantially as and for the purpose described.

2. In a key-board attachment for a piano, organ, or like musical instrument, the series of posts C C C, to which the knee-levers and hammers are attached, arranged in a position oblique or diagonal to the length of said key-board, substantially as and for the purpose described.

3. In a key-board attachment for a piano, organ, or like musical instrument, the series of knee-levers D D D, fulcrumed on the posts C C C, arranged in a position oblique or diagonal to the length of said key-board, substantially as and for the purpose described.

255,610. BRACELET. CHARLES A. PAAS, Brooklyn, assignor to himself and George A. Eaton, New York, N. Y. Filed Jan. 30, 1882. (No model.)

Brief.—The bracelet is made in two sections with slip-joints at the ends, and is provided with helical springs within the sections, through which the wires pass.



Claim.—1. The combination, in a bracelet, of two or more hollow sections, chains, or wires passing from one section into the other at both ends of the sections, and helical springs within the sections, through which the wires or chains pass, and to which they are attached at the inner ends, as set forth.

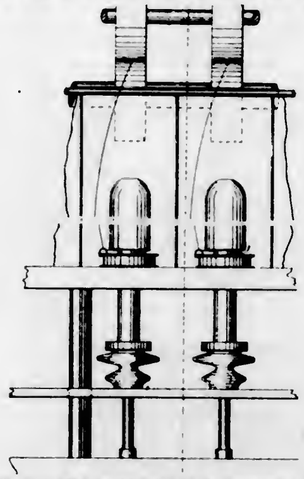
2. The combination, in a bracelet, of two or more sections, couplings at the respective ends of the sections, springs within the sections, a wire or chain passing from one section into the other at each end of the section, and abutments for the ends of the springs, through which abutments and springs the wires or chains pass and are attached, substantially as set forth.

255,611. BREAD-BOX. JOSEPH FOURNIER, Jr., New York, N. Y. Filed Mar. 1, 1882. (No model.)

255,611.

Claim.—1. The bread-box A, provided with the loaf-supporting board B, adapted to be held inside of the box when not in use, substantially as described.

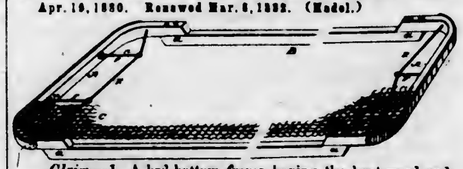
2. The box A, provided upon the inside with the cleats *b* and *b'*, in combination with the board B, substantially as described.



3. The board B, having the slotted block C secured to it for holding the bread-knife, substantially as described.

4. The board B, rounded at its ends, in combination with the box A, provided upon the inside with the cleats *b* and *b'*, substantially as described.

5. The combination, with the box A, provided upon the inside with the cleats *b* and *b'*, of the board B, rounded at its ends and provided with the slotted block C, substantially as described.



255,612. DRAWING, SPINNING, AND TWISTING APPARATUS. FREDERICK WILLIAM FOX, Windhill, County of York, England. Filed Jan. 12, 1882. (No model.) Patented in England Nov. 29, 1881.

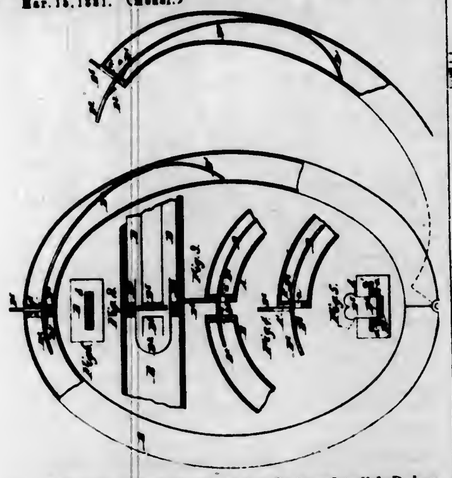
Brief.—Stationary caps are secured to the tops of the spindles. In operation the top of the traveler is slightly above the level of the bottom edge of the cap, so that the yarn as it is wound upon the bobbin is brought in contact with said bottom edge, thereby wrapping the loose or projecting fibers around the body of the yarn.

Claim.—The combination of the spindles, caps, whirls, and operating devices of a cop-spinning machine with a ring-rail, rings, and travelers, all substantially as set forth.

255,613. BED-BOTTOM. ABEL H. PEASE, Chicago, Ill. Filed Apr. 16, 1880. Renewed Mar. 6, 1882. (Model.)

Claim.—1. A bed-bottom frame having the bent-wood end rails and straight side rails joined in the vertical planes of the side rails, substantially as described.

2. Combined with the side rails, B, the end rails, A, of bent wood, secured to the upper edges of the side rails, substantially as and for the purposes set forth.



3. A removable bed-bottom frame having end rails of bent wood, forming round corners, secured to the upper edges of the side rails, substantially as described, and for the purposes set forth.

4. The combination, with the bent-wood end rails, of the rod E and strut or struts F, arranged to flex the end rails by pressure supported by the side rails, substantially as described.

5. In combination with an extensible fabric, C, the bed-bottom frame having its ends of bent wood and adjustably trussed to secure central relative elongation of the frame, substantially as and for the purpose described.

6. The combination with a bed-bottom frame having bent-wood rounded corners, of the transverse rods E, adapted to contract the frame laterally, and thereby to longitudinally extend the same, substantially as described.

255,614. BRACELET. ISAAC L. GARSIDE, Paterson, N. J. Filed Mar. 15, 1881. (Model.)

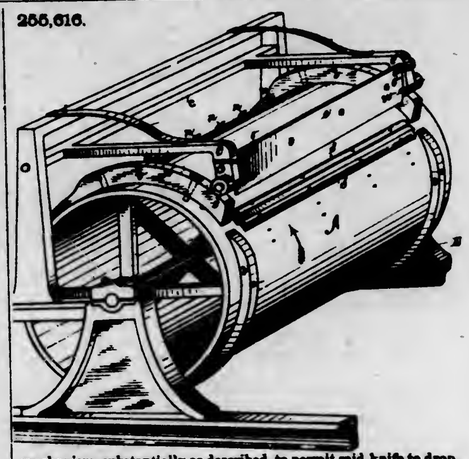
Claim.—1. The spring composing the bracelet-click D, having the root D', body D², and shoulders D³, adapted to be engaged and retained in the part *a a'* of a bracelet by its own elasticity, as herein specified.

2. The click described, having the shoulder D³ and the shoulder or shoulders D³, in combination with a bracelet having hollow parts, one part, A, having a mortised end adapted to receive the main body of the click and to permanently retain it by reason of the shoulders D³, and the other part, B, having a mortised end adapted to engage and release the shoulder D³ at will, as herein specified.

3. The click D, bearing inward or toward the arm of the wearer at the catch end, in combination with a bracelet and with the knob D⁴, arranged to release the click by a tensile strain, as herein set forth.

4. The knob D⁴, formed integral with the body D² and arranged to serve as the operating means for disconnecting by a tensile strain, and also to serve with the shoulders D³ to hold the click against being forced inward, as herein specified.

255,615. WATERPROOFING COMPOUND. JAS. E. GILLESPIE, Warwick, N. Y. Filed Nov. 19, 1881. (No specimens.)

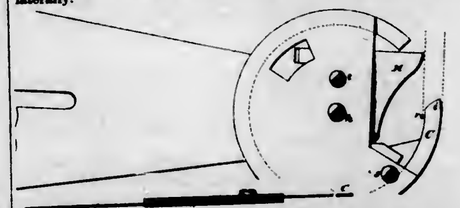


Claim.—A waterproofing compound composed of vulcanized india-rubber, paraffine-wax, and oil in about the proportions herein set forth.

255,616. PAPER-CUTTING DEVICE FOR PRINTING-PRESSES. SIDNEY A. GRANT, Malden, Mass. Filed Sept. 3, 1881. (No model.)

Claim.—1. The combination, with the printing-press cylinder A, provided with the nippers *n*, of the adjustable strips *s s*, the adjustable cams *v v*, the pivoted knife-frame *c*, and the knife *e*, pivoted to oscillate in said frame, substantially as set forth.

2. The combination, in paper-cutting devices for printing-presses, of the cylinder A, having a grooved knife-bed adjustable to different positions upon its periphery, the oscillatory knife *e*, and



255,616.

mechanism, substantially as described, to permit said knife to drop upon said knife-bed and to lift said knife therefrom as said bed passes under said knife, substantially as set forth.

255,617. SEWING-MACHINE GUIDE. JAMES F. J. GUNNING, New Haven, Conn. Filed Jan. 25, 1882. (No model.)

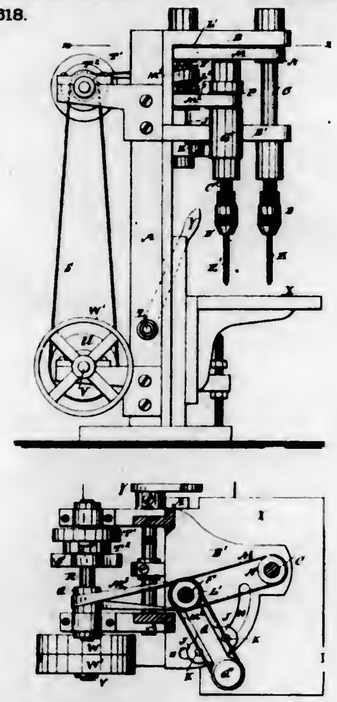
Brief.—To provide for forming pockets of different sizes the segmental guide which is interposed between the fabric being united is adjustable circumferentially and the guide co-operating therewith on the opposite side of the line of sewing is adjustable laterally.

Claim.—1. The herein-described sewing-machine guide, consisting of the segment-shaped tongue C, arranged upon its holder so as to be rotated thereon, with its end *i* to lie between the thicknesses of fabric to be stitched together, substantially as described.

2. The herein-described sewing-machine guide, consisting of the segment-shaped tongue C, arranged upon its holder so as to be rotated thereon, with its end *i* to lie between the thicknesses of fabric to be stitched together, combined with an adjustable tongue, H, substantially as described.

3. In a sewing-machine guide, the combination of a tongue arranged to lie between the two thicknesses of fabric to be stitched together, and an adjustable tongue arranged to bear between the fabrics against the line of stitches being made, while the other tongue lies upon the opposite side of said line of stitches, substantially as described.

255,618. DRILLING-MACHINE. HENRY HAGUE, Elizabeth, N. J. Filed Jan. 11, 1882. (No model.)

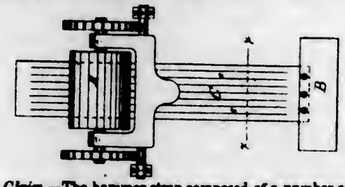


Claim.—1. A drilling-machine made, substantially as herein shown and described, with a fixed drill-shaft and a circularly moving or swinging drill-shaft, as set forth.

2. In a drilling-machine, the combination, with a suitable supporting-frame, of a fixed drill-shaft and a circularly movable drill-shaft, and devices for rotating both shafts simultaneously, substantially as herein shown and described, and for the purpose set forth.

3. In a drilling-machine, the combination, with the fixed drill-shaft C and the circularly-movable drill-shaft C', of the intermediate pulley-shaft F, and belts for transmitting the motion from the shaft F to the shafts C C', substantially as herein shown and described, and for the purpose set forth.

4. In a drilling-machine, the combination, with the shafts C, C', and F, of the swinging arm G and the plate B', provided with a guide-slot, H, substantially as herein shown and described, and for the purpose set forth.



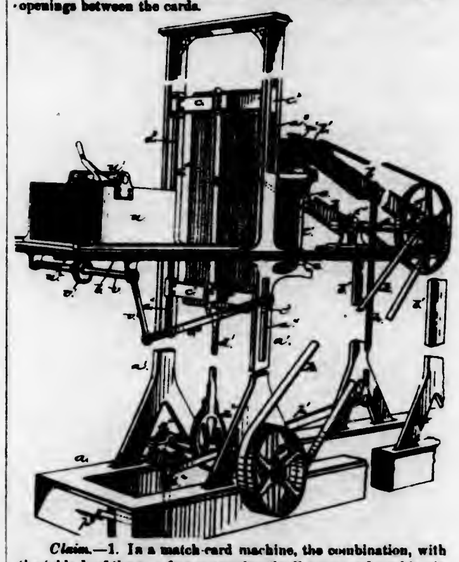
255,618.

5. In a drilling-machine, the combination, with the shafts C, C', and F, of the swinging arm G, the plate B', provided with a guide-slot, H, and of devices for locking the arm G in any desired position on the plate B', substantially as herein shown and described, and for the purpose set forth.

6. In a drilling-machine, the combination, with the shafts C, C', and F, of the swinging arm G, the plate B', provided with a guide-slot, H, and the screws K, passing though the slot H into lugs J of the arm G, substantially as herein shown and described, and for the purpose set forth.

255,619. DROP-HAMMER. CHARLES A. HAGUE, Chicago, Ill. Filed Dec. 16, 1881. (No model.)

Claim.—The hammer-strap composed of a number of narrow strips united at their ends, substantially as specified.



255,620. CLASP. D. FRANK HALE, Springfield, Mass. Filed Mar. 17, 1881. (No model.)

Claim.—As an improved article of manufacture, a combined hook and clasp made of one piece of sheet metal bent at its upper end so as to form the hook with two thicknesses of metal, and overlapping spring-jaws, each jaw being provided with projections or elevations, which elevations of the metal are located near the upper part of one of the spring-jaws, and the other near the clamping portion of the other jaw, the same being provided with a slide which is adapted to move over the elevation near the clamping-jaws, but which will be retained upon the clasp by the projection in the upper part of the other jaw and overlapping portion of the clasp, substantially as shown and described.

255,621. MATCH-CARD MACHINE. GEORGE HARGRAVES, Detroit, Mich. Filed July 30, 1881. (No model.)

Brief.—The blank is sawed into cards, and the cutters behind the saws descend through the end of the saw-kerfs to enlarge the openings between the cards.

Claim.—1. In a match-card machine, the combination, with the table *b*, of the saw-frame carrying the jig-saws and working in the slotted standards *a'*, the sliding carriage *u*, having clamp *u'* and rack u^2, the shaft *v*, carrying pinion *v'*, arms v^3 v^3, the latter connected to the saw-frame, and the loosely-pivoted arms *l*, carrying the rotary cutters *n* and the rods *p p' p²* and treadle p^3, substantially as specified.

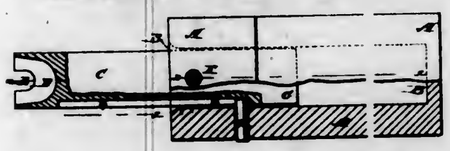
2. In a match-card machine, a saw-frame carrying jig-saws placed side by side, the central saw, *d*, being arranged to project slightly in advance of the others, substantially as and for the purposes specified.

3. In a match-card machine, the combination, with the jig-saws supported in a saw-frame working in the slotted standards *a'*, of the aligned separators *c'* and the aligned rotary cutters *n*, supported in bearings in the arms *l*, loosely pivoted on the shaft *f* and operated by rods *p p' p²* and treadle p^3, substantially as specified.

4. In a match-card machine, the combination, with the jig-saws, the aligned separators *c'* in rear thereof, and the aligned rotary cutters *n*, supported in bearings in the pivoted arms *l*, working on the shaft *f* and operated by rods *p p' p²* and treadle p^3, of the presser-rolls *s e*, substantially as specified.

5. In a match-card machine, the combination of the cutter-shaft *m*, the arms *l*, and the vertically-sliding bearings *t* on the guides *t'* with the blocks *q*, supported on the arms *r* by springs *r'*, whereby a vertical motion is given to the shaft *f* when the arms *l* are operated, substantially as specified.

255,622. BUTTON-HOLE ATTACHMENT FOR SEWING-MACHINES. JOHN K. HARRIS, Springfield, Ohio. Filed Oct. 31, 1881. (Model.)

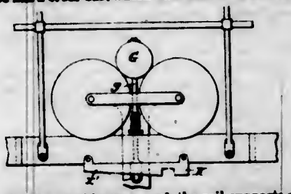


Brief.—The device is so constructed that the feed will be reversed at the middle of the ship-over movement, so that when one side of the button-hole has been completed the end may be strongly barred, or an eyelet may be worked by proper manipulation of the lever, which reverses the feed and shifts the work for the purpose of bringing the opposite side of the button-hole in position to receive the action of the stitch-forming mechanism of the sewing-machine.

Claim.—1. The combination, with a base-plate, a ship-over slide carrying an oscillating cloth-clamp, and a feeding device for said cloth-clamp arranged to be adjusted with said ship-over slide, of a device connected to the base-plate, ship-over slide, and feeding device, and constructed, as described, to effect the reversal of the feed in the middle of the ship-over movement, as and for the purpose described.

2. The combination, with the feed-clutch I for the cloth-clamp, having pin *p* and the ship-over slide J, of a lever, H, having a cam for working the said slide, and a groove or slot, *n*, having its end sections described about different radii and running into each other in the middle, substantially as and for the purpose set forth.

255,623. CAR-COUPLING. SAMUEL A. V. HARTWELL, Valley Centre, Kans. Filed Dec. 8, 1881. (Model.)



Claim.—1. In a car-coupling, the combination, with a longitudinally-perforated bumper and a coupling-pin, of a sliding centre-bar having its outer end recessed and adapted to be partly withdrawn from the said bumper, substantially as and for the purpose set forth.

2. In a car-coupling, the combination, with the bumper A, provided with the longitudinal perforation B and the stop-pin H, and the coupling-pin F, of the sliding center bar, C, provided with the recess D, the slot E, and the longitudinal groove G, substantially as and for the purpose set forth.

255,624. STORE-SERVICE APPLIANCE. HARRIS H. HAYDEN, New York, N. Y. Filed Mar. 8, 1881. (No model.)

Brief.—The rail consists of a thin metal shell stiffened by a filling. The rail-supports consist of adjustable lateral arms, constructed to carry both rails on the same side of the hanger. The receptacle has a curved bottom to direct its contents under the rail. A pivoted retaining-hook on the carrier, adapted to inclose the rail, is locked in place by a pivoted crank-arm having a pivoted handle depending by the receptacle. The handle is operated by a socketed pole. A spring-actuated brake on the carrier consists of a depending rod having a pad at its upper end bearing on the wheels and lateral pins at its lower end which engage a notched incline on the rail. The receptacle is open at one end, which has an adjustable elastic retaining-band carrying a weighted bumper. The carrier-wheels are formed with a metallic body and grooved periphery of material molded upon the body. A counterbalanced laterally-sliding frame carrying switch-rail sections is held by a retaining-lever released by the carrier and shifts to a siding. The shifting-frame has a cross-bar, which bars the main line in shifting.

Claim.—1. The combination, with the rail-supports of a cash-service system, of a rail consisting of a thin metal shell stiffened by a filling, substantially as set forth.

2. The combination, with the hanger or standard, of brackets constructed, substantially as set forth, to carry both rails on the same side, for the purpose specified.

3. The combination, with the supporting-bar and rails, of lateral arms in sections, each supporting a rail, and adjustable in respect to the bar and independently of the other arm, as set forth.

4. A carrier for a store-service system, provided at one side with a handle attached thereto and extending downward to a point below the frame, as specified.

5. The socketed pole N, adapted to the handle F of the carrier, provided with locking device, as and for the purpose set forth.

6. The combination, in a carrier, of a retainer, locking device and handle extending below the frame, connected to the locking device and constructed to release the latter when the weight of the carrier is on the handle, as set forth.

7. The combination, in a carrier, of the retainer D, crank E, and handle F, substantially as and for the purpose specified.

8. The combination, with the carrier, of a brake device and appliances arranged on or adjacent to the rail, to apply the brake to the wheel, substantially as set forth.

9. The combination of the brake G, arranged to bear on the wheels *n n*, brake-frame *g*, and stop having an inclined edge, *x'*, and notch *i*, adapted to receive a pin on the brake-frame, substantially as set forth.

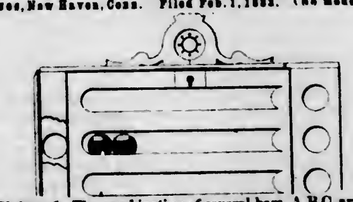
10. The combination, with a carrier-frame, of a receptacle extending at both sides of the frame, with a bottom inclined toward the central line of the rail, substantially as described.

11. The receptacle open at one end and provided with a retaining-band, as set forth.

12. The combination of the receptacle, band, and adjustable attachments, as specified.

13. The combination, with the band, of a weight, as set forth.

14. The combination, with the retaining-band, of an elastic bumper, as specified.



15. The carrier provided with wheels having metallic bodies and grooved peripheries of material molded upon the bodies, substantially as set forth.

16. In a store-service system, the combination, with the rail extending between the counters and desk, of a siding and appliances, substantially as described, for transferring the car from one to the other, substantially as set forth.

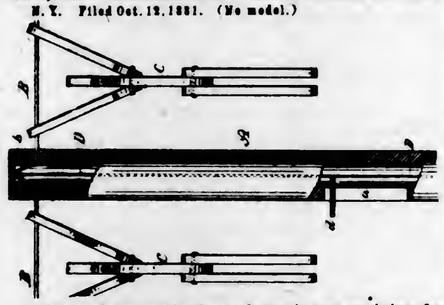
17. The combination, with the main track extending between the desk and counters, of a track-section, E', siding, and appliances, substantially as described, whereby the said section may be brought to connect with the main track or siding.

18. The combination of the main and siding rails, frame counterbalanced and carrying a switch-section and retaining device, and appliances, substantially as described, arranged to be struck by the car to release the frame when a carrier is upon the switch-section, substantially as set forth.

255,625. POOL-RACK. ALFRED S. HUGG and GEORGE H. JUDSON, New Haven, Conn. Filed Feb. 1, 1882. (No model.)

Claim.—1. The combination of several bars, A B C, arranged in the form of a rack and in a case, within which it is made longitudinally movable, corresponding openings in the case for the insertion of the balls to the respective pockets or bars of the rack, the longitudinal movement of the rack within the case opening the several pockets for the removal of the balls, substantially as described.

2. The combination of several bars, A B C, arranged in the form of a rack and in a case, within which it is made longitudinally movable, corresponding openings in the case for the insertion of the balls to the respective pockets or bars of the rack, the longitudinal movement of the rack within the case opening the several pockets for the removal of the balls, and a stop to prevent the return of the balls from the rack to the mouth through which they are inserted, substantially as described.



3. The combination of several bars, A B C, arranged in the form of a rack and in a case, within which it is made longitudinally movable, corresponding openings in the case for the insertion of the balls to the respective pockets or bars of the rack, the longitudinal movement of the rack within the case opening the several pockets for the removal of the balls, and a stop to arrest the balls on the rack and prevent their passing to the discharge-openings, with a trip on the rack to remove the said stop when the rack is moved for the discharge of the balls, substantially as described.

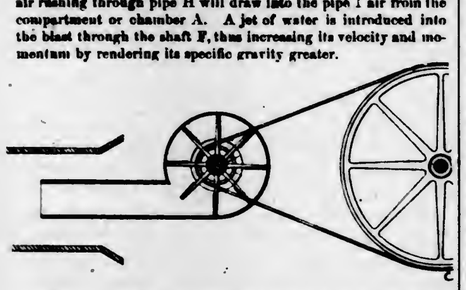
4. The combination of several bars, A B C, arranged in the form of a rack and in a case, within which it is made longitudinally movable, corresponding openings in the case for the insertion of the balls to the respective pockets or bars of the rack, the longitudinal movement of the rack within the case opening the several pockets for the removal of the balls, and a stop, *n*, arranged to permit the balls to pass out from the pockets when opened, but prevent their return, substantially as described.

5. The combination of several bars, A B C, arranged in the form of a rack and in a case, within which it is made longitudi-

nally movable, corresponding openings in the case for the insertion of the balls to the respective pockets or bars of the rack, the longitudinal movement of the rack within the case opening the several pockets for the removal of the balls, and a registering mechanism, substantially such as described, to record each longitudinal movement of the rack, substantially as described.

255,626. ACROBATIC TOY. JOHN H. HOLMES, Glens Falls, N. Y. Filed Oct. 12, 1881. (No model.)

Claim.—A new article of manufacture in toys, consisting of a hollow handle, A, provided with a slot, *a*, in combination with the bar B, provided with a crank, *b*, puppets C C, actuating-rod D, and its pin *d*, operating in the slot *a*, substantially as and for the purposes specified.

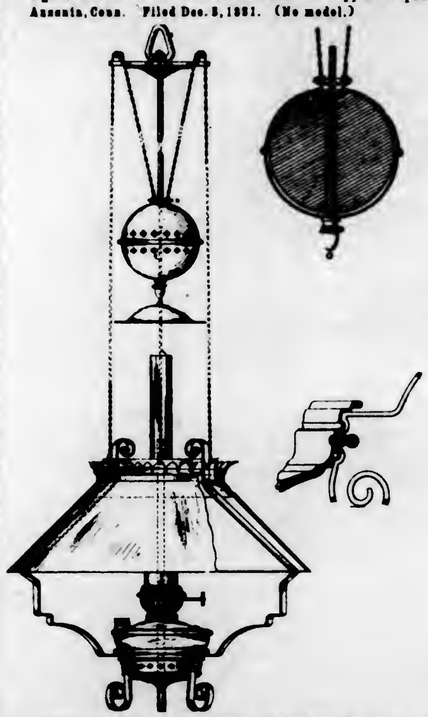


255,627. BOTTLE-STOPPER. JOHN Q. HOUTS and OSCAR ERICSSON, Sioux Falls, Dak., assignors of two-thirds to said John Q. Houts. Filed Aug. 10, 1881. (Model.)

Claim.—An improved bottle-stopper made substantially as herein shown and described, consisting of cork A, central flanged tube, B, provided with cross-bar *f*, exterior tube, C, provided with cap C', valve-rod D, and spiral spring E, arranged as set forth.

255,628. VENTILATING APPARATUS. SAMUEL W. HUDSON, Hudsondale, Pa. Filed Dec. 7, 1881. (No model.)

Brief.—A driving-pulley, C, operates a blast or blower located in a closed chamber at the top of a mine. The blast-pipe H extends into a larger pipe, which leads from the chamber, so that air rushing through pipe H will draw into the pipe I air from the compartment or chamber A. A jet of water is introduced into the blast through the shaft F, thus increasing its velocity and momentum by rendering its specific gravity greater.



Claim.—1. The combination of the ventilating-shaft of a mine, the closed chamber placed over or in communication with the shaft, a blast apparatus situated within the chamber, its blast-pipe, and the pipe or opening into which it projects, the parts being arranged substantially as and for the purpose set forth.

2. The combination of the blast apparatus, its blast-pipe, a pipe, I, into which the blast-pipe projects, and a water-inlet within the blast apparatus, substantially as set forth.

3. The combination of the ventilating-shaft, the closed chamber, the blast apparatus, its blast-pipe, the pipe into which the blast-pipe projects, the hollow perforated shaft of the blast apparatus, and mechanism for driving the blast, substantially as set forth.

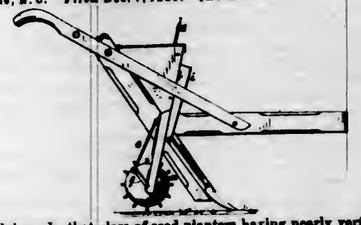
255,629. LAMP. WOLCOTT A. HULL, New York, N. Y., assignor of one-half to the Ansonia Brass and Copper Company, Ansonia, Conn. Filed Dec. 5, 1881. (No model.)

Claim.—1. The combination of a sheet-metal shade-ring consisting of a cylindric portion and a lower flange-like portion, chains supporting the shade-ring from the cylindric portion, but leaving the flange-like portion free, arms extending from the cylindric portion, and a lamp-holder supported by said arms, substantially as specified.

2. The combination of a sheet-metal shade-ring consisting of a cylindric portion and a lower flange-like portion, chains supporting the shade-ring from the cylindric portion, but leaving the flange-like portion free, a lamp-holder, and arms extending from the cylindric portion of the shade-ring to the lamp-holder, but made of separate pieces from both the shade-ring and the lamp-holder, substantially as specified.

3. The combination of a lamp holder or support having circumferential ribs, a shade-support, arms extending from the lamp holder or support to the shade-support and having their inner surfaces bent to grasp the ribs of the lamp holder or support, and a single screw for securing each arm to said holder or support, substantially as specified.

4. In a lamp or other illuminating apparatus, the combination, with a shade, of a ring supporting the shade when the latter is placed outside it, and an ornamental crown independent of the means whereby the shade-ring is supported and fitting loosely outside the upper part of the shade, substantially as specified.



5. The combination of a lamp-reservoir holder composed of an outer part of ornamental metal and an inner part of cheap strong metal fitting closely to it, a shade-support, and arms fastened to both of the component parts of the reservoir-holder and fastened to the shade-support, substantially as specified.

6. In a lamp, the combination, with a rod or like device and a counterbalance-weight fitting the same, of washers of leather or like material affixed to the interior of the counter-balance and fitting the rod or like device, whereby the scratching of the latter by the weight is obviated, substantially as specified.

7. In a lamp, the combination, with a guide-rod for a counterbalance-weight and an ornamental tip provided with a screw-socket for fastening it to the end of the rod, and with a smaller socket extending from the screw-socket downward, of a hook for a smoke-bell inserted in the last said socket and extending through the lower end of the said tip, substantially as specified.

8. In a lamp, a counterbalance-weight consisting of a heavy body, an ornamental exterior shell made in two parts, united together, the upper having formed on it by spinning or otherwise a neck, to which may be conveniently attached the chains or like devices, whereby the weight is sustained, substantially as specified.

255,630. CORN-PLANTER. WILLIAM L. HUTSON, St. Lawrence, N. C. Filed Dec. 7, 1881. (No model.)

Claim.—In that class of seed-planters having nearly vertical reciprocating seed-slides moving in grooved ways, the hopper having inclined apertures *h*, slides or elevators *e*, having inclined apertures *g*, working in separate divisions of the hopper, in combination with the double-cranked axle, on which the spiked operating-wheel is secured to revolve, thus imparting motion to the seed-slides, substantially as shown and described.

255,631. PANTALOONS. WILLIAM HYAMS, New York, N. Y. Filed Jan. 25, 1882. (No model.)

Claim.—1. In pants, the combination of a rear piece, A, having the tongue *b*, and two front pieces, B, having each a flap, *d*, as and for the purpose specified.

2. In a pair of pants, the combination, with the rear and front leg portions, *a* and *f*, of the lower leg-pieces, C, provided at the upper edge with a raised part, *g*, the upper ends of the leg-pieces C being overlapped by the lower ends of the leg portions *a* and *f*, substantially as herein shown and described, whereby the pants will have a double thickness of material at the knees, which double part is largest over the knee-pan, as set forth.

255,632. MACHINE FOR CUTTING AND SCORING PASTEBOARD, &c. GUSTAV L. JAEGER, New York, N. Y. Filed Aug. 15, 1881. (No model.)

Claim.—1. In a machine for cutting and scoring pasteboard and other materials, the combination of mechanism, such substantially as described, operating to continuously and uninterruptedly feed the material forward, with a cutter-cylinder revolving in stationary bearings and a cutter-stock automatically moved toward and from the cutter-cylinder during the operation of the machine for successively cutting and scoring the material without changing the plane of its movement between the cutter-cylinder and cutter, the said combination being and acting essentially as and for the purposes set forth.

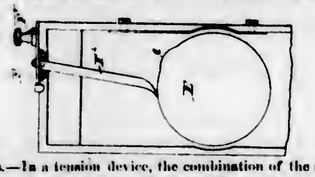
2. In a machine for cutting and scoring pasteboard and other material, the combination of mechanism, such substantially as described, operating to continuously or uninterruptedly feed the material forward, with a cutter-cylinder revolving in stationary bearings, a cutter-stock arranged adjacent to the cutter-cylinder and carrying a cutter, and mechanism, substantially such as set forth, connected with the cutter-stock and acting to automatically move the same toward and from the revolving cutter-cylinder, whereby the pasteboard or other material can be successively cut and scored without changing its plane of movement between the cylinder and the cutter.

3. The combination of a continuously-operating feeding mechanism operating to feed the material uninterruptedly, with a cutter-cylinder revolving in stationary bearings, a cutter-stock arranged adjacent to the surface of said cylinder and carrying a cutter, a rock-shaft, and a tappet thereon acting on the cutter-stock for imparting motion thereto, substantially as and for the purposes described.

4. In a machine for cutting and scoring pasteboard and other materials, the combination of mechanism, such substantially as described, operating to continuously and uninterruptedly feed the material forward, with a cutter-cylinder revolving in fixed bearings, a cutter-stock carrying a cutter arranged adjacent to the surface of the cylinder, a rock-shaft, a tappet mounted on said rock-shaft and acting on the cutter-stock to move it in one direction, and a spring arranged to move the cutter-stock in the opposite direction, substantially as and for the purpose described.

5. In a machine for cutting and scoring pasteboard and other materials, the combination of mechanism, such substantially as described, operating to continuously and uninterruptedly feed the material forward, with the cutter-cylinder revolving in fixed bearings, the cutter-stock arranged adjacent to the surface of the cylinder, the rock-shaft, the tappet arranged on said rock-shaft and acting on the cutter-stock to move it in one direction, a spring arranged to move the cutter-stock in the opposite direction, the vibrating arm fixed to the rock-shaft, and the cam for actuating the vibrating arm, substantially as described, for the purposes set forth.

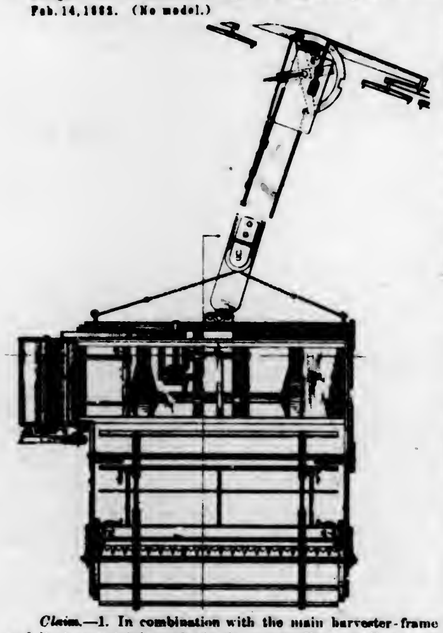
6. In a machine for cutting and scoring pasteboard and other materials, the combination of mechanism, such substantially as described, operating to continuously and uninterruptedly feed the material forward, with a cutter-cylinder revolving in stationary bearings, a stationary cross-head above the same, a bracket arranged thereon, and a cutter-stock automatically moved upon said bracket toward and from the revolving cutter-cylinder to successively cut and score the pasteboard or other material supported by the said cylinder.



7. In a machine for cutting and scoring pasteboard and other materials, the combination of mechanism, such substantially as described, operating to continuously and uninterruptedly feed the material forward, with a cutter-cylinder revolving in stationary bearings, a stationary cross-head arranged above the same, a series of laterally-adjustable brackets arranged thereon, a series of cutter-stocks supported on said brackets, and mechanism, substantially such as set forth, automatically moving the cutter-stocks on the said brackets toward and from the cutter-cylinder for successively cutting and scoring the pasteboard or other material.

255,633. SEWING-MACHINE. DAVID L. KELLER, Grand Rapids, Mich. Filed July 11, 1881. (No model.)

Claim.—1. The combination, with the feed-shaft having crank D^2 and the shuttle-lever provided with the slotted tubular projection E^3, of the journal-box E^2, embracing said crank and having a sliding movement thereon, and fitted to slide vertically in said tubular projection and to permit the same to rock upon it, substantially as described.



2. The combination, with the feed-bar F, carrying the feed-dog F', of the arm F^3, pivoted to said feed-bar, the rod F^4, jointed to said arm F^3 at one end, and having its other end adjustably secured, the cam D^4, fixed upon the shaft D, and a suitable spring for returning the feed-bar after its forward stroke, all constructed and arranged to operate substantially as described.

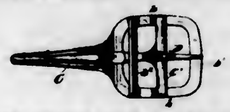
255,634. TENSION FOR SEWING-MACHINES. DAVID L. KNELER, Grand Rapids, Mich. Filed July 11, 1881. (No model.)

Claim.—In a tension device, the combination of the spring-plate F, secured at one end upon the top of the machine-head, the arm F^a, projecting downward from said spring-plate, and the disk E, fixed upon the driving-shaft, connected by a wrist-pin and cam-plate with the needle-bar, and having the bulge or cam e upon its periphery arranged to force arm F^a upward, and thereby lift the spring-plate to release the thread, substantially as described.

255,635. HARVESTING-MACHINE. JOHN KUVA, Beloit, Kans., assignor of one-half to George W. Port, same place. Filed Feb. 14, 1882. (No model.)

Claim.—1. In combination with the main harvester-frame and its two sustaining-wheels, the rearwardly-extending vertically-pivoted tongue, the swiveled steering-wheel mounted on the tongue, and the chains extending from the main frame backward and connected with the steering-wheel, substantially as shown.

2. The main frame, its wheels, and the levers supporting said wheels, in combination with the jointed rearwardly-extended tongue, its sustaining-wheel, the lever mounted on the tongue, and the chains extending from said lever to the wheel-sustaining levers, substantially as shown, whereby the frame may be adjusted in height at will and maintained in a substantially horizontal position.



3. The revolving receiver having its shaft arranged to slide laterally, in combination with the notched disk and locking-stud, whereby the receiver is held in position until unlocked by the pressure of the accumulated grain.

4. In combination with the rotary receiver arranged to yield laterally, the pinion thereon and the stationary driving-pinion arranged, as described, to engage with the receiver-pinion only when the latter is moved outward.

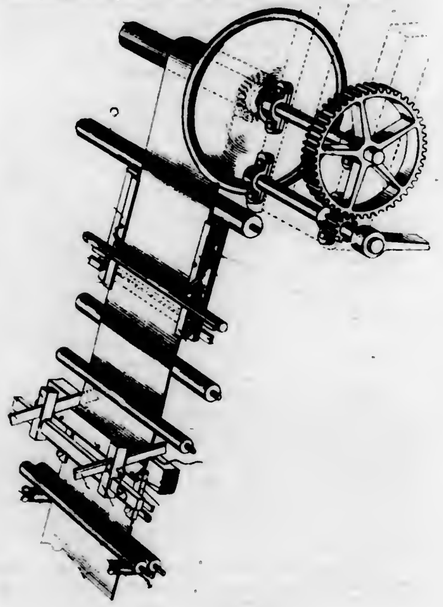
5. In combination with the rotary side moving receiver and its pinion and notched disk, the locking-stud and the stationary driving-pinion, as shown and described.

6. In combination with the rotary side moving receiver and its locking devices, the grain-packing devices, substantially as shown, whereby the receiver is caused to move sidewise and unlock whenever a predetermined amount of grain has accumulated therein.

255,636. COMBINED BUCKLE AND SNAP-HOOK. FREDERICK KIENKNAPP, Faribault, Minn. Filed Jan. 27, 1882. (No model.)

Claim.—The combined buckle and snap-hook consisting of the metal frame having the curved hook, the side bars, the end bar b', the raised cross-bar b^2, and the pivoted jaw C, extended beyond its pivot, and having the cross-bar C', carrying the movable tongue D, the whole adapted to co-operate with a strap in the manner set set forth.

255,637. CARRIAGE-WRENCH. PRESCOTT B. KINSMAN and JOSIAH MERRILL, Great Falls, N. H. Filed Jan. 10, 1882. (Model.)



Claim.—1. The combination, with the stock A, having a fixed end jaw, B, and opening b, the slot c, extending between said opening and fixed jaw, and the ribs d d, arranged in said slot, of the screw C, swiveled in said fixed end jaw and adapted to receive the movable jaw B' from the opening b, as described.

2. A carriage-wrench having the jaws and the oiler D arranged on the same side of its stock and at right angles thereto, said oiler being placed between the handle and jaws, whereby the thumb of the same hand which holds the wrench can operate the oiler without reversing the wrench, as described.

3. The combination of the stock A, having an opening, b, and longitudinal slot c, communicating with opening b, the oiler D, movable jaw B', the fixed jaw B, and the operating-screw C, arranged to pass through the head or fixed jaw end portion of the wrench, substantially as shown and described.

255,638. BELT-TRIMMING MACHINE. AUGUST C. KRUEGER, Chicago, Ill., assignor to the Chicago Rawhide Manufacturing Company, same place. Filed June 13, 1881. (No model.)

Claim.—1. In a machine for trimming belting, one or more obliquely-arranged straight-cutting blades, one or more concave-trimming blades, arranged relative to each other, as and for the purpose described, and means for guiding and conducting the belting to said blades.

2. The combination, with the adjustable and straight-cutting blades, having their cutting-edges at an oblique angle, as described, of the laterally-adjustable blocks carrying said blades.

3. The combination, with the straight-cutting blade, of guide-plates arranged in front of said blades and adapted to embrace the edges of and direct the belting in a straight line to said blades.

4. In combination with the straight-cutting blades, vertical guide-rollers and a horizontal pressure-roller intermediate the vertical roller and the cutting-blades.

5. The combination, with the pressure-rollers and with mechanism for drawing the belting through the machine, of a tension clamping-plate and a base-support for the same, arranged between said mechanism and roller, for the purpose described.

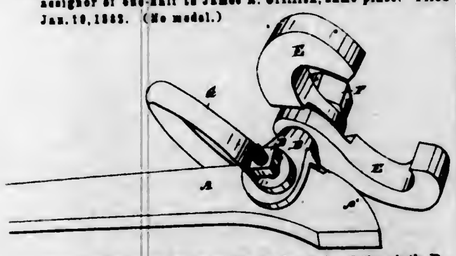
6. The combination, with the pressure-rollers and with the actuating mechanism, of an adjustable and swinging tension-plate, arranged substantially as and for the purpose described.

7. In combination with the straight-cutting blades, a tension-plate arranged below and just in front of said blades, as and for the purpose described.

8. In combination with the cutting-blades and with the swinging tension-plate, guides arranged in the rear of said blades and adapted to embrace the edges of the belting, as set forth.

9. The vertical guide-rollers, pressure-rollers, guide-plates C C, and tension-plate, in combination with the cutter-blades, all arranged and operating substantially as described.

10. The tension-plate and pressure tension-roller H, in combination with the obliquely-arranged cutting-blades between said plate and roller.



11. In a machine for trimming belting, the combination, with the guides, of one or more concave blades simultaneously adjustable laterally, as described.

12. The combination, with the concave guides and one or more corresponding trimming-blades, of a coiling-drum and an anti-friction roller intermediate said blades and drum and arranged in a plane above the drum, as and for the purpose described.

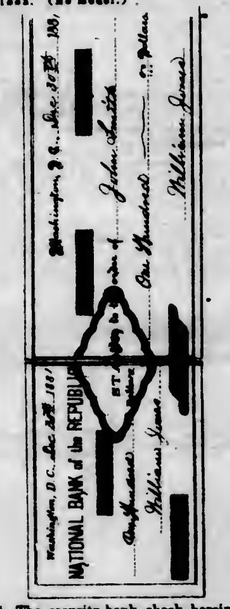
13. The combination, with a revolving shaft, of a winding-drum removably sleeved upon said shaft and provided with means, substantially as described, to prevent its rotation with the shaft.

14. The combination, with a revolving shaft having a projection T-shaped in cross-section, of a two-part hinged drum having a corresponding groove and means for detachably securing said drum to the shaft, as and for the purpose described.

255,639. CAR-MOVER. JAMES D. LAWRENCE, Carroll, Iowa, assignor of one-half to James E. Griffith, same place. Filed Jan. 19, 1882. (No model.)

Claim.—The combination, with the lever A, of the pintle B, pivoted thereon, the jaws E, pivoted on this pintle, and the clevis G, loosely mounted on the bolt of the pintle B, substantially as herein shown and described, and for the purpose of automatically closing the jaws, as set forth.

255,640. BUTTON. MARCUS LOEWENTHAL, New York, N. Y. Filed Jan. 19, 1882. (No model.)



Claim.—1. The combination, in a button, of a back piece, a front piece, a tubular post on the one having a shoulder at the rear end, a rigid shank on the other adapted to enter the said post, and a spring or springs attached to said shank at the outer end, diverging from said shank rearwardly, and adapted to engage with the shoulder of the post, substantially as specified.

2. The combination, in a button, of a back piece, a front piece, a tubular post on the one having a shoulder at the rear end, a rigid sharp-pointed shank on the other adapted to enter said post, and a spring or springs attached to said shank at the point, diverging from the shank rearwardly, and adapted to engage with the shoulder of the post, substantially as specified.

3. The combination, in a button, of a back piece, a front piece, a tubular post on the one having a shoulder at the end, a shank on the other adapted to enter the said post, and a spring inserted in a hole in the shank and folded over to form two barbs adapted to engage with the shoulder of the post, substantially as specified.

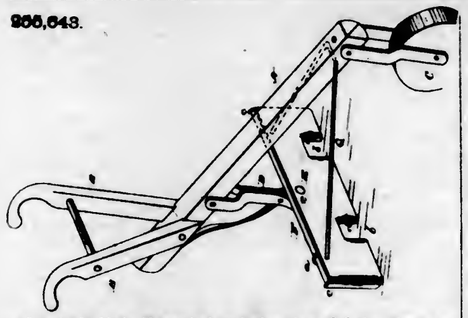
255,641. BANK-CHECK. EDWIN S. LOOMIS, Washington, D. C. Filed Jan. 6, 1882. (No model.)

Claim.—1. The security bank-check herein described, consisting of two separable parts, one of which bears the name of the bank and the figures identifying the check, and the other of which parts has the name of the person in whose favor it is drawn and the amount, without the name of the bank, and both of which are to be signed by the drawer, as and for the purpose described.

2. The security bank-check consisting of the bank-notice A and the pay-order B, both printed on the same piece of paper, and having the revenue-stamp bisected by the line dividing the said bank-notice from the pay-order, as and for the purpose described.

255,642. BOTTLE AND BOTTLE ATTACHMENT. DAVID LUBIN, Sacramento, Cal. Filed Feb. 1, 1882. (No model.)

Claim.—1. The combination of the cup or funnel with the neck B, provided with passages b, substantially as described.



2. The combination of the cup or funnel, the graduated marks thereon, the neck B, and passages transversely through this neck, substantially as described.

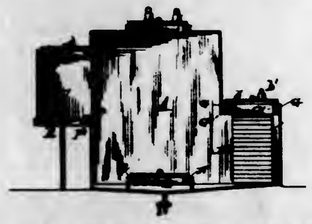
3. The combination of a neck, B, provided with perforations b, the stopple C, and a cup or funnel formed on said neck, substantially as described.

255,643. COTTON-CHOPPER. DANIEL W. MASSEE, Marshallsville, Ga. Filed Jan. 3, 1882. (No model.)

Claim.—The combination, with the beam A and standard D,

255,643.

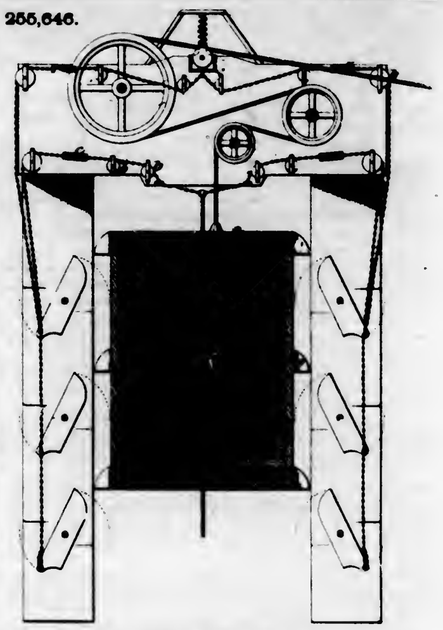
of a single blade, E, notched at *b*, the wings *d d*, the wings *c c*, formed on said blade, and the stiffening-bar F, secured to said blade at the back thereof by means of a bolt, *e*, and the eyes *a a* on the braces (f f), substantially as described.



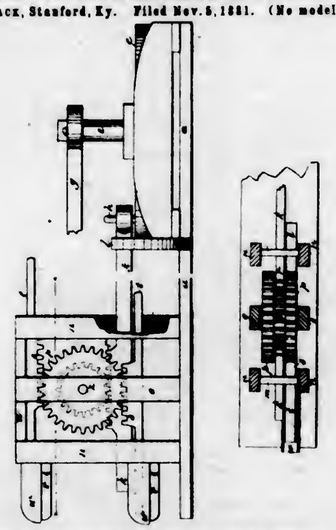
255,644. BEARING FOR SPINDLES OF SPINNING AND TWISTING MACHINES. THOS. MAYON, Providence, R. I. Filed May 9, 1881. (No model.)

Brief.—The invention is an improvement on that disclosed by Letters Patent No. 215,142. Bent-wire springs are interposed between the bolster and bolster-case, so as to form a yielding resistance to the oscillation of the bolster on the ball-and-socket support.

Claim.—The combination, with the spindle A, the sleeve-whirl B, and bolster-case C, of the bolster D, provided with the ball *d*, and the wire springs *e e*, secured to the ball *d* and resting in notches in the bolster end, constructed to limit the oscillation of the bolster, as and for the purpose set forth.



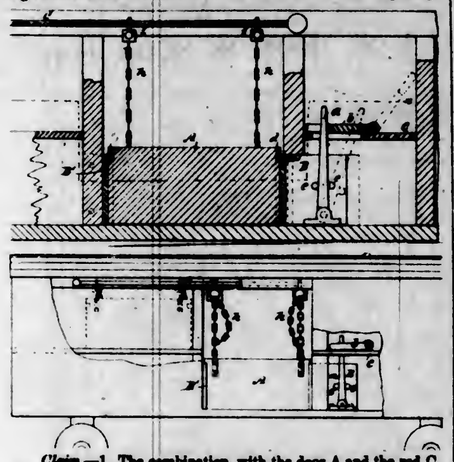
255,645. PROVISION-PRESERVING ROOM. EDWIN E. MCCALL, Lockport, N. Y. Filed Dec. 23, 1881. (No model.)



Claim.—1. In a food-preserving room, the combination of inspection-chamber C, preserving-room A, having ventilators M and M', and door *b*, having recess G, and flange G'.

2. The combination of inspection-chamber C, having cover *h*, and bottom E, and room A, substantially as shown, and for the purpose described.

255,646.



255,647. STAVE-DRESSING MACHINE. WILLIAM C. MCCORMACK, Stanford, Ky. Filed Nov. 5, 1881. (No model.)

Claim.—The combination of the cam-wheel *c*, cam-rod *k*, provided with the rack *r*, cog-gears *p p q*, plungers *t t*, having racks *s s*, and stave-boxes *w*, provided with stationary knives, said plungers operating to force the staves past the knives, all substantially as described, and for the purpose set forth.

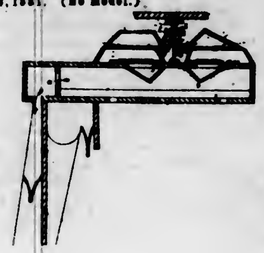
255,648. FREIGHT-CAR DOOR. THOMAS MCNALLY and WILLIAM H. GLASGOW, St. Louis, Mo. Filed Oct. 11, 1881. (No model.)

Brief.—A door narrower than the opening has one end resting in the groove of a fixed plate and the other in the groove of a sliding plate. Projections in the plates engage notches in the door. The movable plate is operated by a lever pivoted to the floor and passing up between two pins on the plate and through a slotted fixed piece. The lever is locked by a pivoted latch. The door is provided with hooking-chains passing through blocks sliding on a horizontal rod above and at one side of the door-opening.

Claim.—1. The combination, with the door A and the rod C, of the chains h and the sliding blocks *i*, substantially as shown and described, whereby the door is adapted to be elevated and removed out of the doorway, as set forth.

2. The combination, with the door A, of the laterally-sliding cleat B and the lever *a*, hinged to the bottom of the car and engaging with the said cleat, substantially as and for the purpose set forth.

3. The combination, with the door A, of the laterally-sliding cleat B, provided with the pins *c* and the lever *a*, substantially as and for the purpose set forth.



4. The combination, with the sliding cleat B and the lever *a*, of the hinged locking-plate *b*, substantially as and for the purpose set forth.

255,649. MUSIC-HOLDER. ARTHUR H. MERRILL, Cromwell, Conn. Filed Nov. 16, 1881. (No model.)

Claim.—As an article of manufacture, the herein-described book-holder, consisting of the slotted plate A, recessed upon its back and fitted for attachment to the rack, combined with the stud *f*, constructed with a head to take a bearing upon the inside of the rack, the stud extending outward through the slot in the plate, and a finger arranged upon said stud outside the plate and so as to bear on the plate, with a clamping device on said stud outside the finger, whereby the stud and finger are made adjustable in the slot in the plate and secured at any desired position, substantially as described.

255,650. ORGAN. WILLIAM L. HARRIS, Fredericktown, Ohio. Filed Apr. 19, 1881. (No model.)

Claim.—1. In an organ, the pivoted valves and valve-operating rods provided with feet to engage the said valves, combined with mechanism, substantially as described, under control of the operator, to change the position of the said feet and vary their action upon the valves, as and for the purpose set forth.

2. The valve and valve-operating rods provided with feet to engage the said valves and having pinions connected therewith, combined with a rack-bar meshing with the said pinion and means to move it longitudinally, whereby the operator is enabled to rotate all the said rods simultaneously to control their operation on the valves, substantially as described.

3. In an organ, two series of reeds and valves therefor, combined with a series of valve-operating rods, each provided with feet arranged and adapted to engage and operate a valve of each series simultaneously or to engage a valve of either series, as desired, independently of the other series, substantially as described.

4. The wind-chest and reeds mounted thereon, combined with the sound-re-enforcing device in the said wind-chest and the independent chamber below the reeds in the wind-chest, provided with an orifice or aperture above the said re-enforcing device, substantially as and for the purpose set forth.

5. The wind-chest and reeds, combined with the chamber common to a series of the said reeds, and having one or more of its sides mounted on hinges or pivoted and provided with means to move it thereon, whereby the form and size of the said chamber may be varied to modify the quality of the sound produced, substantially as described.

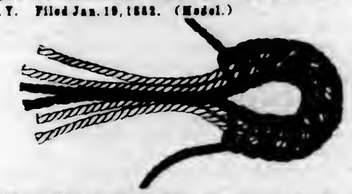
6. The combination, with the key and rod operated thereby, of the spring to maintain the rod in engagement with the said key, it consisting of the elastic arms and the spiral portion connecting them, substantially as and for the purpose described.

7. The reed-tongue consisting of a plane portion of usual form, provided with a stiffening-flange at one edge only, whereby a peculiar vibrational movement and novel quality of sound are produced, substantially as described.

255,651. ORE-SEPARATOR. GEORGE A. HUTCALF, Malden, Mass. Filed July 16, 1881. (No model.)

Claim.—The tank A, having the perforated diaphragm B and water-space beneath it, as described, and provided with a gate for the discharge of the heavier metal above the diaphragm, and a gate or overflow in a higher plane for the escape of the lighter material, in combination with a rotary agitator adapted to act simultaneously on all portions of the mass, for the purpose set forth.

255,652. COMBINED SLATE-CLEANER AND PENCIL-HOLDER. WILLIAM H. HUTCALF, Brooklyn, N. Y. Filed July 18, 1881. (Model.)



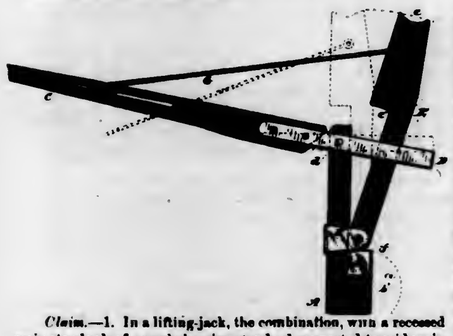
Claim.—The slate-cleaner and pencil-holder consisting of apertured water-receptacle *a*, cork *d*, sponge *c*, and pencil-clamp *b*, combined for use substantially as shown and described.

255,653. BRAKE FOR COAL-CARS. JAMES A. HILLHOLLAND, Cumberland, Md. Filed Feb. 28, 1882. (No model.)

Claim.—The combination, in a compartment-car, of a cranked brake-beam having shoes adapted to the wheels C C, a brake-beam, D, having shoes adapted to the wheels B B, and connecting devices, substantially as described.

255,654. SUSPENDER-STRAP. AUGUSTA METZNER, New York, N. Y. Filed Jan. 19, 1882. (Model.)

Claim.—The described improvement in the art of making a suspender-strap, which consists in first forming its loop of two core-cords, then surrounding these at the middle by two wrapped cords knotted at each wrap, then doubling both the wrapped and knotted cords, and finally forming the body of six core-strands, surrounded by two of the wrap-strands knotted at each wrap, as shown and described.



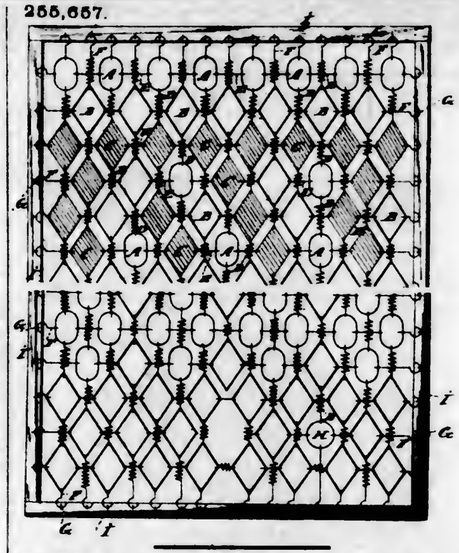
255,655. BOTTLE-STOPPER OF CELLULOID OR ANALOGOUS MATERIAL. STEPHEN S. NEWTON, Binghamton N. Y. Filed Dec. 9, 1881. (No model.)

Claim.—1. As a new article of manufacture, a bottle-stopper the discharge-tube of which is made of celluloid, substantially as set forth.

2. A bottle-stopper having a discharge-tube made of celluloid and a hood or cap made of vulcanized rubber, substantially as set forth.

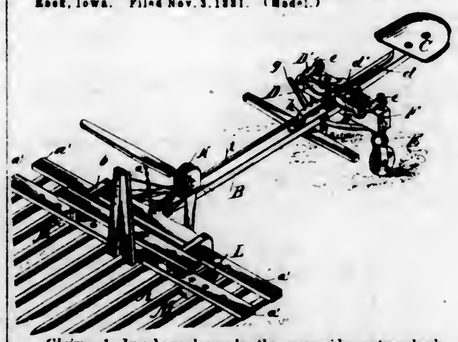
255,656. LIFTING-JACK. JACOB NIXON, Winfield, Kans. Filed Feb. 8, 1882. (No model.)

Claim.—1. In a lifting-jack, the combination, with a recessed main standard, of an axle-bearing standard connected to said main standard by a pivot and loop-guide, an operating-lever provided with a metallic loop pivoted to the main standard, and a connecting-rod secured at one end to the operating-lever and at its opposite end to the axle-bearing standard, substantially as set forth.



2. In a lifting-jack, the combination, with a standard provided with a slotted step, of a bearing-block pivoted to the standard and adapted to rest on said step or be turned away from the latter, substantially as set forth.

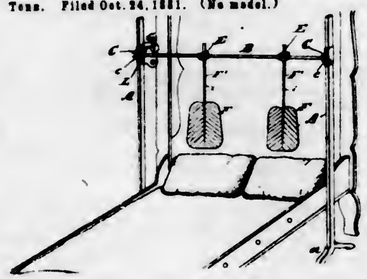
3. The combination, with the recessed standard A, having the slotted step *a*, of the pivoted block B, the recessed standard E, connected to the standard A by the loop-guide F and pivot *f*, the operating-lever C, connected to the standard A by the metallic loop D and pivot *d*, and the connecting-rod G, substantially as set forth.



255,657. BED-BOTTOM. JOHN B. NORTON, Madison, Wis. Filed Jan. 23, 1882. (No model.)

Claim.—The combination, in a spring bed-bottom, of the frame I, having staples G, staple-hooks F, double-looked coupling-wires E, double-hooked spiral springs D, flat springs A B H, and rhombic plates C', as set forth.

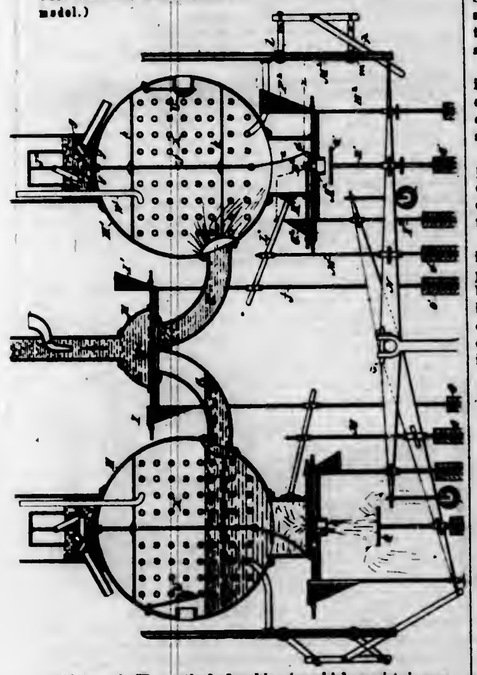
255,657.



255,658. HORSE HAY-RAKE. ASHBEL A. MOYER, Steamboat Rock, Iowa. Filed Nov. 3, 1881. (Model.)

Claim.—1. In a horse hay-rake, the rear guide, caster-wheels E, each having a shank, *e*, passing directly up through the outer end of the beam F, which is fixed to the pole B, near the seat C, and the double levers D D', connected with the heads of said shanks and operated by means of the handle *d*, pivoted to pole B, substantially as described.

2. The rake A, pivoted to the end of pole B, and having on each side of its head the frame M, fixed to the parallel bars *a' a'* of said rake and carrying the wheel or roller L, which does not project above said bars so as to interfere with the hay, and only sufficiently far below to give a bearing for the rake when it is moving on the ground, substantially as set forth.



255,659. AUTOMATIC FAN. GEORGE W. OVERALL, Memphis, Tenn. Filed Oct. 24, 1881. (No model.)

Claim.—1. The combination of the standards A A, having bottom supports, *a a*, adjustable sleeves C C, having cam *c c* and set-screws D D, rock-shaft B, perforated at one end, screw-bolt M, inserted through the perforated rock-shaft, and provided with the adjusting-nuts *m m*, motor H, incased in a box contiguous to and forming part of one of the adjustable sleeves C, disk I, having adjustable wrist-pin K, and pitman L, connecting said wrist-pin and the screw-bolt M, all constructed and combined to operate substantially as and for the purpose herein shown and set forth.

2. The combination of the oscillating fan-shaft B, sleeves E, each having a socket, E', and pair of set-screws, *e* and *f*, and fans F, having shafts or handles F', provided with universal joints *i*, having set-screws *h*, substantially as and for the purpose herein shown and specified.

255,660. METHOD OF AND APPARATUS FOR MAKING ICE. OLIN PARKER, Washington, D. C. Filed July 30, 1881. (No model.)

Claim.—1. The method of making ice which consists in compressing air by the direct contact, hydrostatic pressure, and dynamic force, of running water, and simultaneously eliminating the heat thus generated by the said passing current of water, and subsequently allowing the air to expand to effect the reduction in temperature, substantially as described.

2. The method of reducing the temperature of compressed air which consists in allowing a portion of said compressed air to expand in the immediate presence of the rest of the compressed air, and then be dissipated or allowed to escape as waste, substantially as described.

3. The method of compressing air in a hydraulic ice-machine which consists in introducing a quantity of air with a head of water and utilizing this head of water to displace and compress another body of air in a closed chamber, while the induced portion of air is at the same time being eliminated from the air in said chamber to augment the quantity of compressed air, as described.

4. The method of making ice which consists in expanding a portion of compressed air to reduce the temperature of the remaining compressed air, then using this compressed air of reduced temperature by expansion in a freezing-room to freeze the water, and utilizing the air escaping from the freezing-room to chill the water before being admitted to the pans, as described.

5. A receptacle for compressing air by displacement with water, combined with a conduit or coil for the compressed air, located within the receptacle and opening in the top of the same, whereby the heat is eliminated in the same receptacle in which it was generated, as described.

6. The combination of a receptacle for compressing air by the direct displacement of water, a dome provided with valves opening into the same, and a float arranged in the dome and connected with the water-discharge valve of the main receptacle, as described.

7. The combination, with the dome V', the receiver H', and valves *f*, of the float J' and rod *j*, and the plug-valve *g*, rod *i*, and arm *h*, as and for the purpose described.

8. The combination, with the receivers H', of the air-inlet valve U', hinged directly above and at a point remote from its seat, as and for the purpose described.

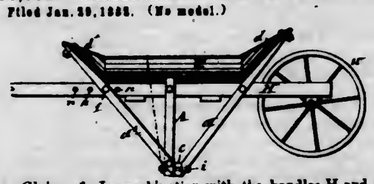
9. The combination, with two receivers, H H', with floats and valves, and a valve, F, directing the flow alternately to the receiver, as described, of one or more walking-beams provided with tables Q', to receive the impact of the discharged water and operate the valves, substantially as described.

10. The combination, with the air-eduction pipe from the receivers, of the water-trap composed of leg M', having valves *l* and *m*, and a connection with the walking-beam, arranged, as described, to keep one of these valves open and the other shut alternately, as described.

11. The combination, with the receiver, its float, and the walking-beam, of the compound outlet-valve consisting of a main valve connected to and operated by the walking-beam and a supplemental or initial valve connected with and operated by the float, as described.

12. A tank for cooling compressed air, having several compartments, combined with a series of coils connected for continuous circulation, each of said coils having an escape-vent for successive cooling by expansion of the air in the said coils, as and for the purpose described.

13. The combination of the water-tank D, provided with cooling-coil O', opening into the freezing-room, the freezing-room C, placed just beneath it, and a compressed-air-cooling device located beneath the freezing-room, having a compressed-air pipe opening into an expansion-chamber through a pressure-valve, and another compressed-air pipe arranged in proximity to the said expansion-chamber, and then opening through a pressure-valve into the freezing-room, substantially as described.

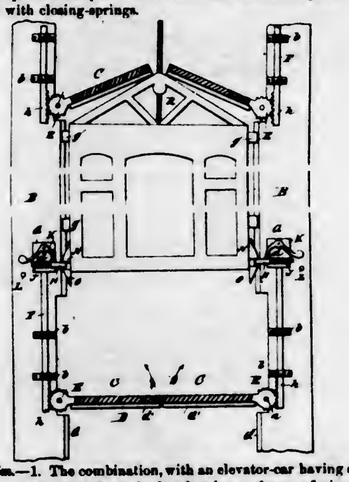


255,661. DEVICE FOR CONNECTING WIRES IN ELECTRICAL APPARATUS. WILLIAM PAUL, Ansonia, Conn., assignor to Wallace & Sons, same place. Filed Jan. 25, 1882. (No model.)

Claim.—1. The herein-described device for connecting wires in electrical apparatus, consisting in the cylindrical bearing-piece arranged in a correspondingly-shaped opening parallel with the wire-aperture, a portion of the wire-aperture being formed in the said cylindrical bearing-piece, and mechanism, substantially such as described, to clamp the said bearing-piece upon the wire, substantially as described.

2. The herein-described device for connecting wires in electrical apparatus, consisting in the cylindrical bearing-piece arranged in a correspondingly-shaped opening parallel with the wire-aperture, a portion of the wire-aperture being formed in the said cylindrical bearing-piece, with a set-screw, its end resting in a cavity in the surface of the bearing-piece, substantially as and for the purpose described.

255,662. WHEELBARROW. ABNER D. PAGE, Jordan, N. Y. Filed Jan. 20, 1882. (No model.)



Claim.—1. In combination with the handles H and tray T, mounted thereon, the leg A, disposed at right angles from the handle and shouldered against the under side thereof and bolted on the side of the same, the cross-bar *c*, applied to the front of the foot of the legs, the brace *a*, bolted onto the side of the handle, and having its upper extremity bearing against and bolted to the front end board, *d*, and its lower extremity resting against and secured to the cross-bar *c* by the bolt *e*, passing through the said parts and through the leg A, and the brace *a'*, bolted to the side of the leg A

and having its upper end bolted to the side of the handle H and to the rear end board, *d'*, substantially as described and shown.

2. The combination, with the handles H, tray T, leg A, cross-bar *c*, and brace *a*, arranged as described, of the brace *a'*, bolted to the side of the foot of the leg A, and having its upper end resting against the rear end board, *d'*, and adjustably connected to the handle H by a bolt, *f*, passing through said brace and through one of a series of holes, *a a*, in the handle, all substantially as described and shown.

255,663. AUTOMATIC HATCHWAY-DOOR OPERATOR. JOHN L. PETERS, New York, N. Y. Filed Jan. 23, 1882. (No model.)

Brief.—Circular racks on the inner corners of swinging horizontal doors engage racks on vertically-sliding rods on the posts. Boxes on the upper ends of the rods carry spring-bolts, which engage notched inclines on the lower corners of the car in its descent. The bolts are withdrawn by an angular latch-lever in each box striking a pin on the post. The doors are counterweighted and provided with closing-springs.

Claim.—1. The combination, with an elevator-car having side projections, and with the swinging hatchway-doors, of circular racks attached to the pivoted ends of the doors, and of vertically-sliding rack-bars engaging with the circular racks on the doors and carrying boxes at the upper ends, which boxes contain bolts and latch-levers for withdrawing these bolts, substantially as herein shown and described, and for the purpose set forth.

2. The combination, with the elevator-car A, having side projections, N, at the bottom, and with the swinging hatchway-doors C, each provided with a circular rack, E, of the sliding bars F, provided with racks *h* at the lower ends, the sliding bolts H, the pivoted angular latch-levers K, and the studs L, substantially as herein shown and described, and for the purpose set forth.

3. The combination, with the elevator-car, A, having side projections, N, at the bottom, and with the swinging hatchway-doors C, provided with circular racks E, of the sliding spring-bolts H, provided with projections *d*, the pivoted angular latch-levers K, and the studs L, projecting from the standards B, substantially as herein shown and described, and for the purpose set forth.

4. The combination, with the elevator-car A, provided with the side projections, N, and the beveled bottom projections, O, and the swinging hatchway-doors C, provided with circular racks E, of the sliding rack-bars F, the bolts H, the latch-levers K, and the studs L, substantially as herein shown and described, and for the purpose set forth.

5. The combination, with the standards B, the elevator-car A, and the swinging hatchway-doors C, of the counterbalance-weights S, the closing-springs T, and of devices for automatically opening the hatchway-doors, substantially as herein shown and described, and for the purpose set forth.

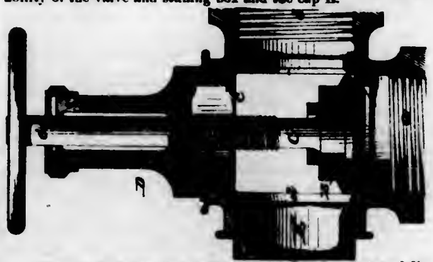
255,664. CEMENT-PIPE WELL. GEORGE D. PETTINGILL, Asbury Park, N. J. Filed Sept. 27, 1881. (No model.)

Brief.—The sections are inserted at the top in an opening bored for a short distance by a large auger; then, by boring with a smaller auger and removing the earth from under the tubing, the latter settles to place, and sections are added at the top as the depth of the well may require. The sections are provided with conical rabbet-joints cemented together.

255,664.

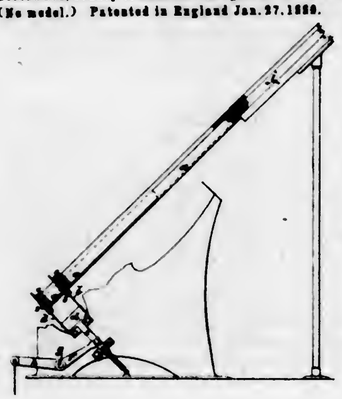
Claim.—1. The herein-described method of forming a well, which consists in first boring with an auger into the ground a given depth to form an opening, then inserting, joint by joint, sections of curbing of the form described, and thereafter sinking the sections so inserted by boring with a smaller auger and removing the earth beneath and adding joints from the mouth of the well, as and for the purpose set forth.

2. The curbing for wells, formed with conical corresponding joints B B', in combination with the cement filling or packing for said joints, as and for the purpose specified.



255,665. SIGNAL-FLAG. THOMAS H. PETTY, Oswego, N. Y. Filed Jan. 20, 1882. (No model.)

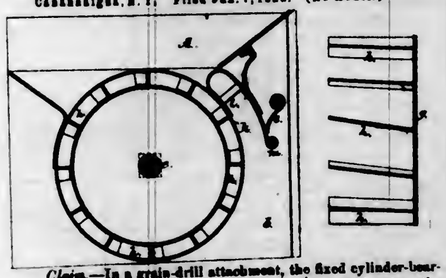
Claim.—A signal-flag holder consisting of a cylinder provided with a slot through its side for each one of the flags used, and two or more rollers, around which the flags are rolled, each one of the rollers being provided with a head or projection, by means of which the flag can be wrapped around the roller, substantially as shown.



255,666. VALVE. JULIUS P. PFAU, Lansingburg, N. Y. Filed Jan. 14, 1882. (No model.)

Brief.—The construction is such that the inlet for the fluid may be changed from one branch to the other by the interchangeability of the valve and stuffing box and the cap E.

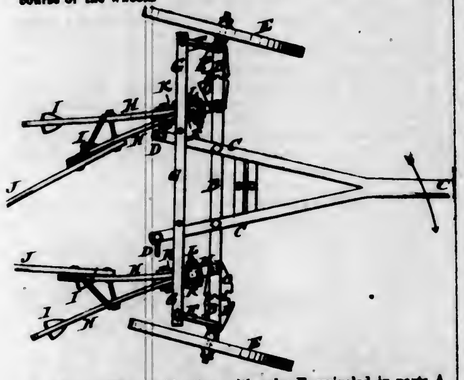
Claim.—A globe-valve shell unprovided with an internal diaphragm or division-wall, and having its inlet and outlet branches, which are provided with internal valve-seats at right angles to each other, in combination with cap E and stuffing-box D, adapted to be interchangeably screwed upon the other two branches of the valve-shell, and the valve B, as and for the purpose set forth.



255,667. TYPE-SETTING MACHINE. THOMAS J. PORTER, Fleetwood, County of Lancaster, England. Filed Oct. 25, 1881. (No model.) Patented in England Jan. 27, 1880.

Claim.—1. In a type-setting machine, the combination, with the reciprocating punches *d'*, and means, substantially as described, for operating them, of the series of inclined troughs *a*, alternating in length and provided with the stop-plates *b* and the guard-plate *c*, as and for the purpose set forth.

2. In a type-setting machine, the combination, with the inclined troughs *a*, alternating in length, and provided with the stop-plates *b* and guard-plates *c*, of the bar *d*, the punches *d'*, the sliding rod *e*, provided with studs, the levers *f*, having forked or slotted ends, the rock-shaft *g*, and lever *h*, connected to a treadle, substantially as and for the purpose set forth.



255,668. GRAIN-DRILL ATTACHMENT. HENRY C. PRATT, Canandaigua, N. Y. Filed Jan. 7, 1882. (No model.)

Claim.—In a grain-drill attachment, the fixed cylinder-bearing *c*, the opening *d* in the hopper-wall opposite said bearing, the lateral rotary disk *g*, having the obliques distributing-arms *h* passing around the cylinder-bearing, and the automatic throat-plate *l*, substantially as specified.

255,669. CULTIVATOR. THOS. A. PURNELL, Charleston, Kans. Filed Mar. 24, 1881. (No model.)

Brief.—The wheel-spindles are vertically swiveled, and have on them sectors which mesh with similar sectors, upon the front ends of the drag-bars, so that swinging the drag-bars changes the course of the wheels.

Claim.—The combination, with axles F, swiveled in parts A B G substantially as described, of the gears P, rigidly attached to said axles, and the gears O, connected with a pivoted beam-coupling, as shown and described.

255,670. HUB-BLOCK-BORING MACHINE. JOHN G. REID, Muncie, Ind. Filed Jan. 11, 1882. (No model.)

Brief.—The block is centered on the pith-points, then swung to the clamping-dogs in line with the auger.

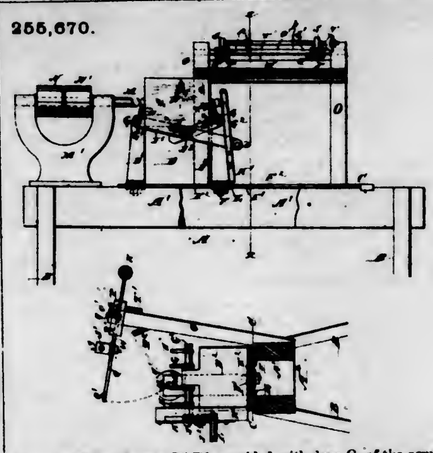
Claim.—1. In a boring-machine, the combination, with a clamping frame or carriage, of a swing-frame provided with pith-points adapted to be forced into pith in the ends of the blocks to be bored, substantially as herein shown and described, whereby provision is made for so adjusting the block that the auger will bore through the pith-line of the said block, as set forth.

2. In a boring-machine, the combination, with the frame A, carrying the sliding block-clamping frame D, of the swinging block-adjusting frame W, substantially as herein shown and described, and for the purpose set forth.

3. In a boring-machine, the combination, with the frame A, carrying sliding frames D' D', provided with dogs G, of the arms J' J', adapted to slide on each other, and of the handle L, attached to the end of the arm J', substantially as herein shown and described, and for the purpose set forth.

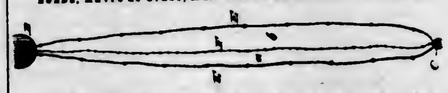
4. In a boring-machine, the combination, with the frame A, carrying the sliding frames D' D', provided with dogs G, the arms J' J', adapted to slide on each other, and the handle L on the end of the arm J', of the guide-standard K for guiding the arm J', substantially as herein shown and described, and for the purpose set forth.

5. In a boring-machine, the combination, with the frame A, carrying a sliding block-holder, of the standards O, the swinging frame W, and the strip or rail T', upon which the frame W rests when inclined downward, whereby the pith-points Q' at the end of the frame W will be on a line with the center of the auger M when the frame W is inclined downward as far as the rail or strip T' permits, substantially as herein shown and described.



6. In a boring-machine, the combination, with the frame A, carrying a sliding block-holder, D, of the standards O, the swinging frame W, the strips or slats T' T', and the weights R, substantially as herein shown and described, and for the purpose set forth.

7. In a boring-machine, the combination, with the frame A, carrying a sliding block-holder, D, of the standards O, the shaft O', the loose blocks P, and the arms Q, passing into these blocks and provided at the ends with pith-points Q', substantially as herein shown and described, and for the purpose set forth.

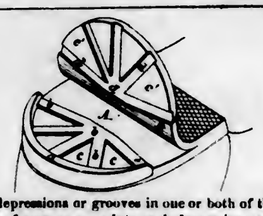


8. In a boring-machine, the combination, with the frame A, carrying a sliding block-holder, D, of the standards O, the shaft O', the blocks P, the rods Q, provided at the ends with pith-points Q', the nuts S on the rod S', and the rod S', provided with opposite screw-threads at the ends, substantially as herein shown and described, and for the purpose set forth.

9. In a boring-machine, the combination, with the frame A, carrying a sliding block-holder, D, of the standards O, the shaft O', and the pith-arms Q, being in length from the shaft O' to the pith-points Q' equal to the distance from the shaft O' to the longitudinal axis of the auger, substantially as herein shown and described, and for the purpose set forth.

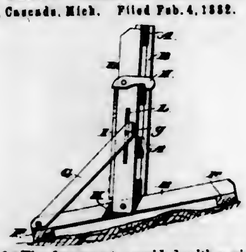
255,670.

255,671. GILL-NET. MATTHEW REYNOLDS and THOMAS REYNOLDS, Havre de Grace, Md. Filed Oct. 21, 1881. (No model.)



Claim.—The improved gill-net herein shown and described, composed of a middle net, F, or gill-net proper, placed between two nets, E and E, to form the pockets *a* and *b*, the inner net being of finer mesh than the two side nets between which it is placed, substantially as set forth.

255,672. PROCESS OF SECURING METAL WEARING-SURFACES TO RUBBER BOOTS AND SHOES. FREDERICK RICHARDSON, Providence, R. I. Filed Dec. 22, 1881. (No specimens.)



Claim.—The process herein described for securing metal wearing-surfaces or guards to rubber boots or shoes, the same consist-

255,672.

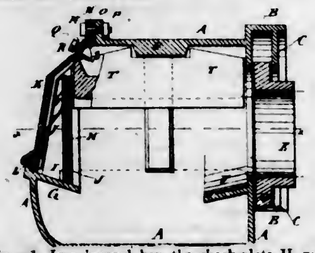
ing in forming depressions or grooves in one or both of the sheets, placing the plate, frame, or arms into such depressions, and securing the two sheets together by cementation, as described.

255,673. FENCE. ALBERT D. ROBINSON and HERBERT W. THOMPSON, Cascade, Mich. Filed Feb. 4, 1882. (No model.)

Claim.—1. The fence-post provided with a pivoted latch for engaging the rail of a fence, and with a spring adapted to maintain the latch in its engagement with the fence-rail, substantially as described.

2. The fence-post pivoted to a base, E, and provided with means for connecting it with the fence, in combination with the inclined brace, pivoted at one end to the base and at its other end carrying a stud or pin working in a slot in the post, substantially as described.

255,674. HAT. SAMUEL D. ROBINSON, Foxborough, Mass. Filed Feb. 11, 1882. (Model.)

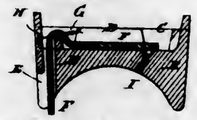


Claim.—1. As a new article of manufacture, a hat or other head-covering for ladies and children, made of cloth composed in part of cotton and in part of wool, the latter having a longer staple than the cotton, a nap or pile being raised upon the surface of said cloth of substantially the composition herein described.

2. A hat or other head-covering for ladies and children, composed of two pieces of cloth of the kind described, fastened together with the nap or face side exposed.

3. A hat for the purposes specified, composed of the cloth described, having a nap upon its upper surface of the composition described, and an under lining of silk or other ornamental character.

255,675. CAR-AXLE BOX. HENRY ROTH, New York, N. Y., assignor of one-half to Lena R. Rose, New Orleans, La. Filed Oct. 22, 1881. (No model.)

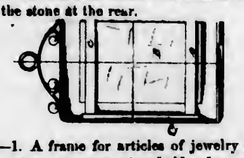


Claim.—1. In a journal-box, the check-plate H, made with beveled recesses J in the upper part of its outer side and the lower part of its inner side, substantially as herein shown and described, whereby the said check-plate can be reversed when worn, as set forth.

2. In a journal-box, the combination, with the check-plate H and the cap K, of the spring V, substantially as herein shown and described, whereby the said check-plate is held from rattling, as set forth.

3. In a journal-box, the combination, with the cap K, having oil-hole Q, of the spout S, substantially as herein shown and described, whereby the oil is conducted into the interior of the brass, as set forth.

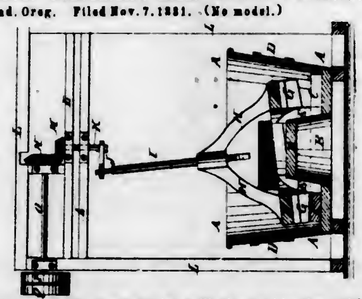
4. In a journal-box, the washer D and guard-tube E, made of rubber and in one piece, substantially as herein shown and described, whereby the said washer can be placed upon axles varying in size, as set forth.



255,676. CAR-AXLE BOX. HENRY ROTH, New York, N. Y., assignor to himself and Joseph G. Fountain, New Orleans, La. Filed Oct. 22, 1881. (No model.)

Claim.—The combination of the journal-box having the central projection, D, the brass having recess C, apertures E I, and holes H, and the wicks F, secured to brass by bent wires G, and having their ends twisted together as shown and described.

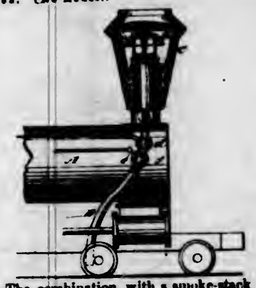
255,677. LOCKET. JAMES ROTHSCHILD, Newark, N. J. Filed Jan. 31, 1882. (No model.)



Brief.—The central opening is slightly beveled to hold the setting in front. Narrow strips are soldered against the longer inner sides of the frame to receive the ends of cross-bars, which firmly hold the stone at the rear.

Claim.—1. A frame for articles of jewelry having a central opening for a stone or ornament and side edges at right angles to each other, in combination with interior side bars, C C, and cross-bars c c, substantially as described.

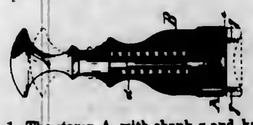
2. In a locket or analogous article, the hollow frame A, having face a and rim a' at right angles to each other, having within the inner surfaces of its longer sides strips C C, in combination with cross-bars c c, all arranged as described, adapted to hold the setting B firmly in position within said frame A, as and for the purpose intended, substantially as described.



255,678. PULVERIZING-MILL. WILLIAM C. SALMON, Portland, Oreg. Filed Nov. 7, 1881. (No model.)

Claim.—1. In a pulverizing-mill, the combination, with the ring-shaped pulverizer F, provided with radial dies G and means for giving a wabbling movement thereto, of the vessel A, provided with the central projection, B, having curved blocks E attached to its sides, and the die C in the bottom of the said vessel, substantially as and for the purpose set forth.

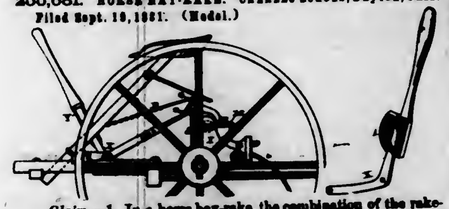
2. In a pulverizing-mill, the combination, with the ring-shaped pulverizer F, provided with the radial removable dies G, the spider H, the shaft I, the crank J, and the driving mechanism of the vessel A, having screen-covered openings in its sides, and provided with the central inclined projection, B, having curved blocks E attached to its sides, and the ring-shaped die C in its bottom, substantially as and for the purpose set forth.



255,679. SPARK EXTINGUISHING AND DISCHARGING DEVICE. WILLIAM E. SCHENNERHORN, Schenectady, N. Y. Filed Jan. 11, 1882. (No model.)

Claim.—The combination, with a smoke-stack and spark-arrester substantially as described, of the discharge-pipe provided with two valves arranged as shown and described, whereby an injector may operate upon the solid products of combustion in the pipe, as described.

255,680. APPARATUS FOR FILLING CAPSULES. JOHANN SCHMIDT, Nuremberg, Bavaria, Germany, assignor to Verghe, Ruhling & Co., Chicago, Ill. Filed Sept. 23, 1881. (No model.)



Brief.—The stamp is pressed upon the upper half of a wafer, which is retained on points *g*, and is moistened by pressure upon the absorbent pad, then pressed upon the lower half containing the medicament and the sleeve B allowed to ascend, thus disengaging the points, when the edges of the two wafers will stick together.

Claim.—1. The stamp A, with shank *a* and knob *b*, in combination with the sleeve B, spring *d*, and points *g*, all substantially as and for the purpose set forth.

2. The stamp A, with shank *a* and knob *b*, and the sleeve B, with spring *d* and points *g*, in combination with the rubber plate D, having perforations *f*, all substantially as and for the purpose described and shown.

255,681. HORSE HAY-RAKE. CHARLES SCHOLS, Dayton, Ohio. Filed Sept. 19, 1881. (Model.)

Claim.—1. In a horse hay-rake, the combination of the rake-head A, the castings C, secured to its ends and extending backward, the locking-plates I, pivoted at their rear ends upon these castings and extending forward, the driving-wheels having notches in the inner ends of their hubs, and an operating mechanism, the lower ends of the locking-plates being provided with flanges for catching in the notches in the hubs, substantially as shown.

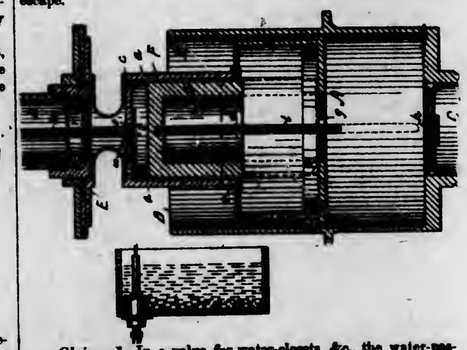
2. The combination of the rake-head, the castings C, secured thereto, the locking-plates I, pivoted at their rear ends upon these castings, and having flanges upon their lower ends to engage with the hubs of the driving-wheels, the bar or rod L, journaled upon the rake-head and pivoted eccentrically to the locking-plates, and the driving-wheels having notches made in the inner ends of their hubs, substantially as described.

3. The combination of the rake-head A, the driving-wheels having notches J in the inner ends of their hubs, the pivoted locking-plates I, provided with flanges I', and the rod or bar L, eccentrically pivoted to the locking-plates, by means of which the said locking-plates are operated, substantially as set forth.

4. The combination of the pivoted locking-plates I, the rake-head A, and the driving-wheels provided with hubs having notches J in their inner ends, the rod or bar L, eccentrically pivoted to the locking-plates, an arm, M, which is attached to the rod or bar L, and a spring for drawing the rod or bar back into position, and thereby releasing the wheels from the locking-plates, substantially as specified.

5. The combination of the locking-plates I, the driving-wheels provided with notches in the inner ends of their hubs, the rod or bar L, eccentrically pivoted to the locking-plates, an arm, M, which is secured to the rod or bar L, and which has a spring attached to its rear end, and which is adapted to engage with the loop 3 at its front end, substantially as shown.

6. The combination of the rake-head A, which is hinged to the tongue-frame, the loop 3, which is pivoted to the rake-head, and an arm, M, which is secured to the rod L, which is eccentrically pivoted to and operates the locking-plates I, the upper end of the loop being made to strike against the tongue-frame when the rake-head tilts forward, substantially as described.



7. The combination of the rod or bar L, provided with an arm which extends beyond it on both sides, and which arm has a spring secured to its rear end and a chain to its front end, and is provided with a notch, with a pivoted loop that is carried by the rake-head in its tilting movement, the eccentric points or projections on the rod or bar, the locking-plates, and the driving-wheels provided with notches on the inner ends of their hubs, the parts being arranged to operate substantially as specified.

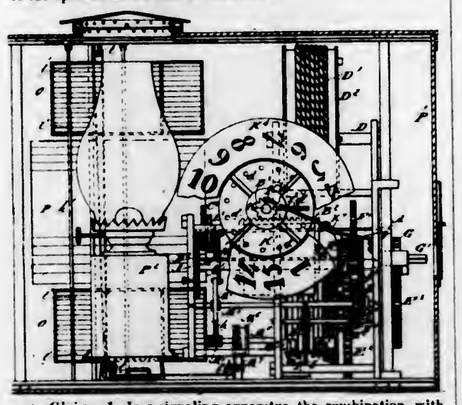
8. In a horse hay-rake, the combination of the cranked or bent lever X, for dumping the rake, and a handle which is pivoted to the lever so that it can be turned back out of the way, substantially as shown.

9. In a horse hay-rake, the combination of the cranked or bent lever X, for dumping the rake, and a handle which is pivoted to the lever so that it can be turned back out of the way, and provided with a suitable guide for controlling its movement, substantially as described.

255,682. VALVE FOR WATER-CLOSETS. WILLIAM SCOTT, Malden, Mass. Filed Nov. 25, 1881. (No model.)

Brief.—The case A has an induction, B, and eduction C. E is the valve proper and F is to allow the after-wash, which it does by *b* falling first after the main flow and seating on *f*. The flow is thus stopped until rod *l* rests on A, when, as *a* descends, *b* rises from the seat *f* and allows the water contained above said seat to escape.

Claim.—1. In a valve for water-closets, &c., the water-passage A, having an inlet-port, B, and an outlet-port, C, valves E and F, attached to a common stem, and the one, F, made in two parts arranged to move upon each other, and separate seats for the two valves, all constructed, arranged, and combined together to secure in one operation of the valve the simultaneous opening of the inlet and outlet ports, a then separate and independent closing of the outlet-port, and an after opening of the outlet-port as and while the inlet-port is closing, substantially as described, for the purposes specified.



2. In a valve for water-closets, &c., the water-passage, A, having an inlet-port, B, and an outlet-port; C, valves E and F, attached to a common stem, and the one, F, made in two parts arranged to move upon each other and having a passage in outer part, *a*, opening to the inner part, *b*, and separate seats for the two valves, all constructed, arranged, and combined together to secure in one operation of the valve the simultaneous opening of the inlet and outlet ports, a then separate and independent closing of the outlet-port, and an after opening of the outlet-port as and while the inlet-port is closing, substantially as described, for the purposes specified.

3. In a valve for water-closets, &c., the water-passage A, having an inlet-port, B, and an outlet-port, C, valves E and F, attached

to a common stem, and the one, F, made in two parts arranged to move upon each other, separate seats for the two valves, and an open passage, D, through the valve E, all constructed, arranged, and combined together to secure in one operation of the valve the simultaneous opening of the inlet and outlet ports, a then separate and independent closing of the outlet-port, and an after opening of the outlet-port as and while the inlet-port is closing, substantially as described, for the purposes specified.

255,683. SIGNALING APPARATUS. WILLIAM C. SHATON, Quebec, Quebec, Canada. Filed July 30, 1881. (No model.)

Brief.—The invention consists of a lantern provided with eclipsing-screens and mechanical devices by which flash-signals of any desired combination, duration, and frequency may be made, and with means by which the character of the signals is indicated to the operator at the rear of the lantern.

Claim.—1. In a signaling apparatus, the combination, with the transmitting-wheel C, the cogged signal-cylinder B, and the driving mechanism, of the eclipsing-train consisting of the cog-wheel C^2, the pinion I_4, the face-plate M, link M', cogged crank M^3, and pinion M^4, substantially as and for the purpose set forth.

2. In a signaling apparatus, the combination, with the driving mechanism and the governor-shaft I, of the signal-cylinder B, the cog-wheels A^2 H^3, pinions H H^4, and worm-wheel H^5, substantially as and for the purpose set forth.

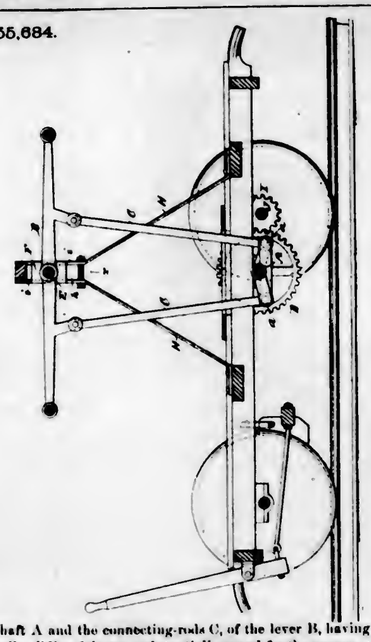
3. In a signaling apparatus, the combination, with the guide-rods *k*, the pulleys *l l'*, the drive-pulley M^4, and the cord M^7, of the screens O, provided with eyes or lugs *l'*, substantially as and for the purpose set forth.

4. In a signaling apparatus, the combination, with the signal-shaft A', provided with the cog-wheel A^2, the eclipsing-train, and the regulating-gear, of the wheel H^2, loosely mounted upon the said signal-shaft, substantially as and for the purpose set forth.

5. In a flash-light signaling apparatus, the combination, with the transmitting wheel and shaft C C' and cog-wheel C^2, of the pinion I_4, face-plate M, link and cogged crank M' M^3, pinion M^4, and pulley M^4, substantially as herein shown and described, whereby intermittent motion is transmitted through suitable cords or chains to the eclipsing-screens, as set forth.

6. In a flash-light signaling apparatus, the combination, with the signal shaft and cylinder A' B, of the arms B' B', rack B^3, pinion B^2, and shaft K, substantially as herein shown and described, whereby said signal-cylinder may be moved laterally, as set forth.

7. In a signaling apparatus, the combination, with the shaft K, provided with spline *f*, of the perforated disk K', button K^2, arms *f'*, grooved sliding collar K^3, arm *f''*, and regulating-wheel K^4, substantially as and for the purpose described.



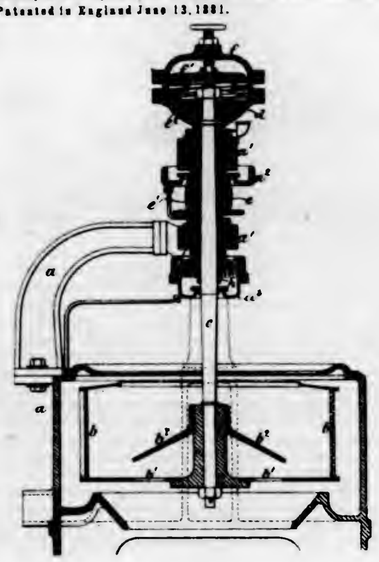
8. The combination, with the shaft K, arms *f' f'*, disk K', button K^2, and sliding collar K^3, of the pivoted dog K^5, substantially as and for the purpose described.

9. In a signaling apparatus, the combination, with the lantern provided with two colored lights and an eclipsing-screen, of the revolving disk R', provided with glass of two colors, and fixed at the rear of the lantern so as to be rotated synchronously with the operation of eclipsing-screen, substantially as herein shown and described, whereby the color displayed by the lantern is indicated inboard, as set forth.

255,684. HAND-CAR. HENRY H. SESSIONS, Palestine, Tex. Filed Jan. 4, 1882. (No model.)

Claim.—1. In a hand-car, the combination, with the crank-

255,684.



shaft A and the connecting-rods C, of the lever B, having a vertically-sliding fulcrum, substantially as and for the purpose set forth.

2. In a hand-car, the combination, with the bars H, having parallel portions *i*, forming ways *h*, of the lever B, the spindle E, and the sliding blocks F, substantially as and for the purpose set forth.

3. In combination with the crank-shaft having the diagonal cranks *a a*, the lever B, having a movable fulcrum, as and for the purposes set forth.

4. The crank-shaft A, having the diagonal cranks *a a* and carrying the cog-wheel D, the lever B, and the blocks F F, adapted to move in the ways *h h*, substantially as and for the purposes set forth.

255,685. CENTRIFUGAL MACHINE. WM. SHRAND, Bankside, County of Surrey, England. Filed Jan. 3, 1882. (No model.) Patented in England June 13, 1881.

Claim.—1. The combination of the framing, the tubular axis supported by and revolving in the bearings of the framing, the basket, the inner axis by which the basket is suspended, the cup or enlargement at the upper end of the tubular axis, and the spring-controlled block secured to the upper end of the inner axle and received by the cup of the tubular axis, substantially as and for the purpose hereinbefore set forth.

2. The combination of the basket, its suspending-axis, the tubular axis, the cup or enlargement of the tubular axis, the block by which the suspending-axis is supported in said cup, and the spring in the cup acting upon said block, substantially as and for the purpose hereinbefore set forth.

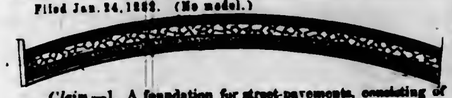
3. The combination of the basket, its suspending-axis, the tubular axis, the cup or enlargement of the tubular axis, the block by which the suspending-axis is supported in said cup, and the springs in said cup above and below the supporting-block of the suspending-axis, substantially as and for the purpose hereinbefore set forth.

4. The combination of the basket, its suspending-axis, the driven tubular axis, the cup thereof, the block by which the suspending-axis is supported in said cup, and the clutch-connection between said block and cup, substantially as and for the purpose hereinbefore set forth.

5. The combination of the basket, its suspending-axis, the driven tubular axis, the cup thereof, the cup-cover, the adjustable plate, the block by which the suspending-axis is supported in said cup, and the spring interposed between said plate and block, substantially as and for the purpose hereinbefore set forth.

6. The combination of the basket provided with the apertures in its bottom, the suspending-axis with which the basket revolves, and the shield fixed to the basket-hub and overhanging the apertures, substantially as and for the purpose hereinbefore set forth.

255,686. SHOW-CASE. GEORGE W. SIMONS and JOHN F. SIMONS, Philadelphia, Pa. Filed Jan. 13, 1882. (No model.)



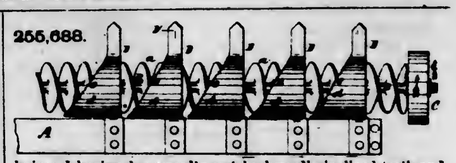
Claim.—1. The combination, in a show-case, of the body A, constructed for the reception of canes or umbrellas, with the glazed frame G, surmounting the same, and with a perforated partition, D, all substantially as described.

2. The combination of the body A, having steps *b b'* on its base, and a perforated conical top, D, with the glazed frame G, substantially as specified.

3. The combination of the body A, adapted for the reception of canes or umbrellas, with the glazed frame G, surmounting the body and having a glazed lid, H, as specified.

4. The combination of the body A with the glazed frame comprising the ring *e*, ribs *f*, glass segments *m*, and screw-bolts *h*, as set forth.

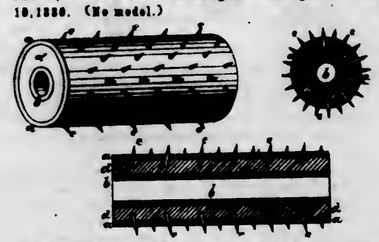
255,687. PAVEMENT. CHARLES A. SNYDER, New Orleans, La. Filed Jan. 14, 1882. (No model.)



Claim.—1. A foundation for street-pavements, consisting of planks arched transversely across the street, and connected by longitudinal wooden strips secured at intervals across said planks in a direction parallel with the sides of the street, and a top covering of earth, substantially as shown and described.

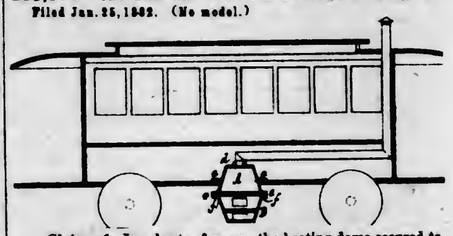
2. A street-pavement consisting of planks arranged transversely across the street, and connected at intervals by longitudinal wooden strips secured to said planks, a layer of dirt resting on the foundation, a layer of broken stones or shells placed above the dirt, and a top dressing of fine gravel, substantially as shown and described.

255,688. SICKLE-BAR FOR MOWING AND REAPING MACHINES. EDMUND T. SPOTTSWOOD, Perryville, Ind. Filed Sept. 8, 1881. (No model.)



Claim.—The combination, with the main bar A and the rotary sickle-bar B, provided with spiral cutting-edges, of the circular guards D, provided with the diagonal and upwardly-curved

255,688.



knives *d*, having downwardly and backwardly inclined teeth and extending from the forward edge of the said bar to the horizontal diameter of the revolving sickle-bar, substantially as and for the purpose set forth.

255,689. ROLLER FOR LOOM-TEMPLES. JOHN B. STANCOUR, Philadelphia, Pa., assignor of one-half to Thos. Cunningham, Horatio B. Lincoln, Frank P. Pendleton, George Brown, Lucian Brown, and Herman E. Cunningham, same place. Filed May 10, 1880. (No model.)

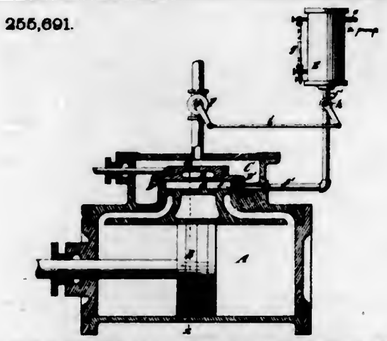
Claim.—A temple-roller having a core or body of vulcanized fiber, into openings in which the pins are driven, and by which said pins are retained, as set forth.

255,690. CAR-HEATER. JOSEPH E. STRONG, New York, N. Y. Filed Jan. 25, 1882. (No model.)

Claim.—1. In a heater for cars, the heating-dome secured to the bottom of the car and connected at its upper portion with a smoke-pipe, in combination with a fire-box detachably connected with the bottom portion of the heating-dome, and provided with a grate and means for feeding the fuel onto the grate, substantially as described.

2. In a heater for cars, a heating-dome provided with flanges supported by the bottom of the car, and provided with a device at its upper portion which is attached to a smoke pipe or flue, in combination with the fire-box detachably connected with the bottom portion of the heating-dome, and provided with a grate and an inclined feeding-chute, substantially as described.

3. A heater for cars combining in its structure a heating-dome secured to the bottom of the car and provided with grooves *e e* in its lower side portions, and a fire-box provided with flanges *f f*, adapted to slide horizontally in said grooves, substantially as described.



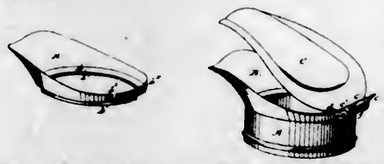
4. The combination, in a car-heater, of the heating-dome having flanges *e*, supported by the bottom of the car, and provided at its lower side portions with longitudinal grooves *e*, with a fire-pot having flanges *f*, adapted to slide in said grooves in the heating-dome, and provided with a grate and an inclined fuel-feeding chute, *i*, substantially as described.

255,691. BALANCING SLIDE-VALVES. ALEXANDER H. SULLIVAN, New York, N. Y., Administrator of John James, deceased. Filed Jan. 17, 1882. (No model.)

Claim.—1. The method of balancing and lubricating a slide-valve, consisting in exposing the face of the valve to the action of the pressure of lubricating material which is contained under pressure in a reservoir or supply-vessel, substantially as herein described.

2. The method of balancing a slide-valve, consisting in exposing the face of the valve to the action of the pressure of a liquid

255,691.



which is contained in a reservoir or supply-vessel separate from the boiler or source of supply of the motive agent which acts upon the back of the valve, substantially as herein described.

3. The combination of a valve-seat and a slide-valve having a cavity between them, and a pipe or passage for supplying liquid under pressure to said cavity, substantially as and for the purpose herein described.

4. The combination of a valve-seat and a slide-valve having a cavity between them, a pipe or passage for supplying liquid to said cavity, and a reservoir or supply-chamber in which a constant pressure is to be maintained, communicating with said pipe or passage, substantially as and for the purpose herein described.

5. The combination, with an engine-cylinder and a slide-valve having a cavity between the valve face and seat, and a pipe or passage for supplying liquid under pressure to said cavity from a reservoir distinct and separate from the boiler or source of supply of the motive agent, of a throttle-valve for controlling the admission of the motive agent to the valve-chest, a valve for controlling the admission of liquid to said cavity, and devices connecting said valves so that they may be operated simultaneously, substantially as and for the purpose herein described.

255,692. TOP FOR SIRUP-PITCHERS. CHARLES H. TALLMAN and BENJAMIN F. DAY, Bellaire, Ohio. Filed Mar. 5, 1881. (No model.)

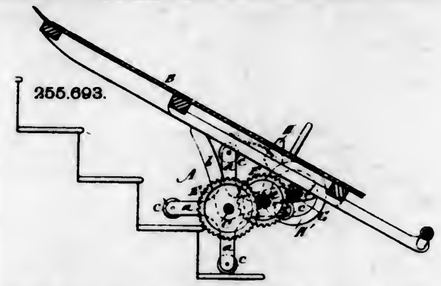
Claim.—1. The neck or nose piece B, with flanges *b b'*, stamped in one piece out of sheet metal, substantially as described.

2. The combination of the neck or nose piece B, with flanges *b b'*, and the body A, with flange *a* and circular opening *a'*, the flange *b'* of the neck or nose piece B being designed and adapted to fit into the circular opening of the body A, substantially as described.

3. The lower hinge-plate, D, with hinge-ears *d d*, in combination with the neck or nose piece B, having the slits *b² b²*, substantially as and for the purposes set forth.

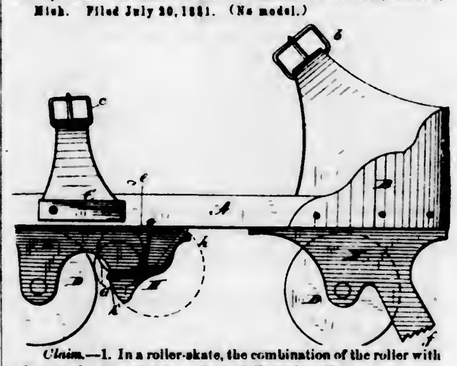
4. The combination, with the cover C, of the neck or nose piece B and lower hinge-plate, D, substantially as described.

5. The combination of the cover C, the neck or nose piece B, the lower hinge-plate, D, and the hinge-pin *e* and spiral spring *f*, substantially as described.



255,693. STAIR-TRUCK. JOHANN C. TAUBER, Plain City, Ohio. Filed Aug. 15, 1881. (Model.)

Claim.—1. A stair-truck having a shaft, C, provided with radial arms *a* at each end, and mechanism by which said shaft may be rotated, as described.



2. The armed wheels A, secured upon the axle C, in combination with the gear-wheels E F, and the pinions *e f*, and the crank-shaft G, substantially as and for the purposes set forth.

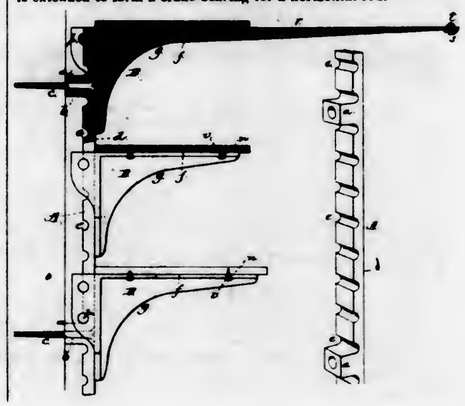
3. The stair-truck herein shown and described, consisting of the platform B, armed wheels A A, secured upon the shaft C, and the crank-shaft G, and the gear-wheels E and F, and the pinions *e* and *f*, the side of the truck being provided with the brake H, substantially as described.

255,693.

255,694. ROLLER-SKATE. ELMORE W. TAYLOR, Detroit, Mich. Filed July 30, 1881. (No model.)

Claim.—1. In a roller-skate, the combination of the roller with a loose and automatic stop, substantially as described.

2. In a roller-skate, a frame for the roller having a chamber for a loose friction-roller, substantially as shown and described.



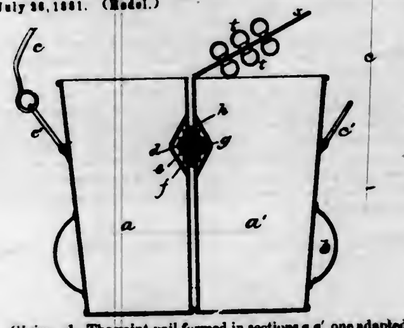
3. The frame E, having partition *e*, combined with roller D and spring H, substantially as set forth.

4. The rear frame, F, in which are mounted the rollers D', provided with a serrated lower edge, *f*, substantially as set forth.

5. In a roller-skate, and in combination with the rollers, an automatic stop which is capable of being moved out of contact with the rollers when desired, substantially as described.

255,695. BRACKET AND SHELVING SUPPORT. FRANCIS M. TAYLOR, Mason City, Ills. Filed Jan. 28, 1882. (No model.)

Brief.—The shelf-brackets, adjustable on an upright, have rear extensions, which embrace the upright, and are secured by transverse pins engaging pin-seats in the rear of the upright. The edges of the horizontal part of the brackets have notches, in which the shelf-screws are seated. The bracing-rib of the uppermost bracket is extended to form a crane-bearing for a horizontal rod.



Claim.—1. The wall-upright having the rib-support A in front of the wall-bearings *a*, transverse pin-seats *c* in rear of the front edge, *d*, of the rib-support, and the bracket B, having the rear bearing, *h*, provided with perforated cheek-flanges *k*, in combination with the transverse holding-pins *p*, substantially as specified.

2. The bracket B, having the horizontal bearing *f*, notched at *s*, the under rib, *g*, the vertical rear bearing, *h*, and the perforated cheek-flanges *k*, substantially as specified.

3. The shelf-bracket having the bracing under rib, *g*, extended in front to form a crane-bearing, *r s*, for the display of goods over a counter, substantially as specified.

255,696. PAINT-PAIL. JAMES THOMAS, Newark, N.J. Filed July 26, 1881. (Model.)

Claim.—1. The paint-pail formed in sections *a a'*, one adapted to be emptied independently, having a single cover adapted to engage alternately with either of the sections, substantially as and for the purposes set forth and shown.

2. A paint-pail adapted to hold two colors or varieties of liquid paint, formed in sections *a a'*, pivoted together substantially as and for the purposes herein set forth and shown.

3. The combinations of the sections *a a'*, pivoted together substantially as described, the cover having the brush-receptacles thereon, the bail *c*, and handles *b*, arranged and operating substantially as and for the purposes set forth and shown.

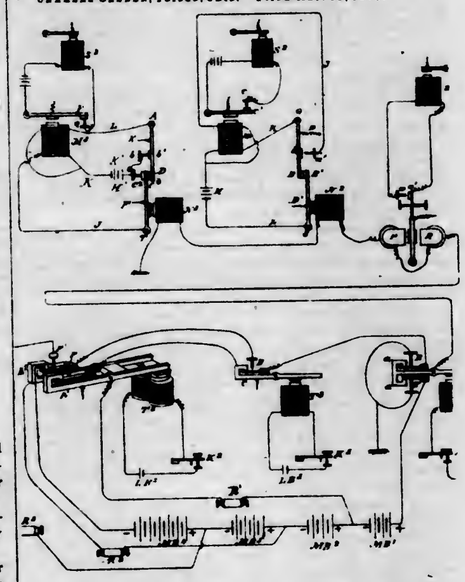
4. In a paint-pail having the pivotal sections *a a'*, the cover secured to one of said sections and adapted to engage alternately with either, and carrying upon each side thereof the brush-receptacles, substantially as and for the purposes set forth and shown.

5. In a paint-pail having sections pivoted together, caps *g* adapted to prevent the escape of paint, arranged and operating substantially as and for the purposes set forth and shown.

6. In a paint-pail, the pivoted sections *a a'*, the pivotal bolt *d*, and the washers, all arranged and operating substantially as and for the purposes set forth and shown.

255,697. COFFEE-POT. HUNTON THOMAS, Elmsford, N. Y. Filed Aug. 25, 1881. (No model.)

Claim.—1. The sliding rod *h*, provided with loops *i' i² i³* at its upper extremity, in combination with the cup *x* and the arms *d e f*, so that by sliding the rod up or down the apparatus may be used in pots of different depths, substantially as shown.



2. The flexible wire rods *d e f*, curved at the upper part, at *m*, to admit of extension and contraction, in combination with the slotted band-holders *g h i* and with the loops *i' i² i³* of the sliding rod *h*, substantially as and for the purpose described.

3. The band-holders *g h i*, each provided with slots *o p o' p'*, for holding the coils of the circular band *r*, in combination with the projections or rests *a b c*, resting upon the upper edge of the pot, and with the arms *d e f*, for holding the coils of the circular band, as and for the purpose substantially as set forth.

4. The annular band *r*, arranged in coils and passing through the slots *o p* of the band-supporters *g h i*, in combination with the band-supporters, arranged, as described, so as to be held in circles of different sizes in order that it may hold in its turn the rests *a b c* in positions to fit pots of different diameters, substantially as shown and described.

5. In a coffee-pot, the combination of the receptacle *x* and its sliding rod *h*, loops *i' i² i³*, flexible arms *d e f*, band-supporters *g h i*, slots *o p*, band *r*, and spring-catch *z*, all arranged to operate as above shown and described.

255,698. MULTIPLE TELEGRAPH. BENJAMIN THOMPSON and CHARLES SHLDEN, Toledo, Ohio. Filed Mar. 10, 1879.

Claim.—1. A differential repeating-sounder, a local battery, supplemental contact-lever, and a conducting-stop therefor, in combination with an armature-lever which, when fully attracted, breaks the circuit of the local battery through both coils of the differential sounder, substantially as described.

2. A receiving electro-magnet, an armature-lever therefor, and a supplemental contact-lever, in combination with a repeating-sounder and a reading-sounder, the whole so arranged that the local of the reading-sounder will be broken when the armature-lever of the receiving-relay is against its back stop, but closed when said armature-lever is either in an intermediate position or against its front stop.

3. A differential electro-magnet and a local battery, one pole of which is connected directly to the relay-armature, the other pole being connected to one end of both coils of the differential electro-magnet, in combination with a supplemental contact-lever connected to the other end of one of the differential coils.

4. A differential electro-magnet and a local battery connected directly to the relay armature-lever, in combination with a supplemental contact-lever connected to one of the differential coils and arranged to make contact with the relay armature-lever on the side opposite the relay electro-magnet.

5. A differential electro-magnet, a local-circuit battery connected thereto, and a relay armature-lever connected directly with one pole of said battery, in combination with a supplemental contact-lever connected to one of the differential coils and making contact on one and the same side with the relay armature-lever, and with a stop connected to the other of the differential coils.

6. The combination of a differential electro-magnet, a local battery therefor, a relay armature-lever connected directly to one pole of the local battery, a supplemental contact lever and stop connected to the differential coils, and springs so applied to said levers as to oppose one another's action when the levers are in contact with one another.

7. A relay armature-lever connected directly with one pole of local battery, whose other pole is connected to a differential electro-magnet, and a supplemental contact-lever with stops and connections, substantially as described, in combination with retractile springs so applied to said levers as to oppose one another's action, and so adjusted that the armature-lever shall overcome the spring of the supplemental lever.

8. The combination of a differential electro-magnet, a local

battery therefor, a relay armature-lever, and a supplemental contact-lever in circuit with one coil of the differential electro-magnet when against its stop, and so arranged with relation to the relay armature-lever as to be removed from said stop when the armature is carried forward against the stress of its retracting-spring.

9. The combination of a differential electro-magnet, a local battery, a relay armature-lever, an electrical back contact therefor, and a supplemental lever and electrical back contact for the latter, and connections, substantially as described, so that both differential coils will be closed when the relay armature-lever is against its back contact.

10. The combination of a differential electro-magnet, a local-circuit battery, a relay armature-lever, an electrical back contact therefor, connected directly with one pole of the local battery, and a supplemental contact-lever whose stop is connected with the same pole of the local battery, so that when the armature-lever is fully attracted both coils of the differential electro-magnet are out of circuit, but when partially drawn forward the local-battery circuit through one of said coils is closed.

11. The combination of an armature-lever provided with a back contact-stop, and a supplemental lever having a contact-stop upon the same side as the armature-lever, so that the latter, when moved forward to break its own circuit, may also break the circuit formed by the supplemental lever.

12. The combination of an armature-lever provided with a back contact-stop, a supplemental contact-lever provided with an independent contact-stop upon the same side as that of the armature-lever, and retracting-springs so applied to both levers as to oppose the action of the relay electro-magnet.

13. The combination of an armature-lever provided with a back contact-stop, and a supplemental lever, also having a contact-stop, and insulated from said armature-lever, in combination with retractile springs acting upon said levers in the same direction, the spring for the supplemental lever being adjusted to higher tension than that of the armature-lever.

14. In combination in a multiple telegraph, a main-line magnet, N^3, with armature-lever S, point B', and tension-spring D', and swinging supplemental contact-lever G, points B a' a'', and tension-spring D, local battery H, one pole of which is connected directly to the main armature-lever S, and differentially-wound local upstroke electro-magnet M^3, with its connecting-wires J, K, and L, substantially as and for the purpose set forth.

15. In a multiple telegraph, the main-line magnet N^3, with armature-lever T, tension-spring F, points c^3 a^3, swinging supplemental contact-lever A, insulated at its extremity at a point on the opposite side of lever T from contact a^3, points b and b', and tension-spring E, substantially as and for the purpose set forth.

16. In a multiple telegraph, the main-line magnet N^3, in combination with levers A and T, provided with independent electrical contact-stops electrically connected together and to the same pole of the local battery, and tension-springs acting on said levers in the same direction, but with unequal strength.

17. In a multiple telegraph, the main-line electro-magnet N^3, in combination with armature-lever T, tension-spring F, points c^3 a^3, swinging supplemental lever A, and points b b' and D^3, spring E, local battery H', differentially-wound local magnet M^3, and its armature and points P Q, with connecting-wires J, K, K', and L, substantially as and for the purpose set forth.

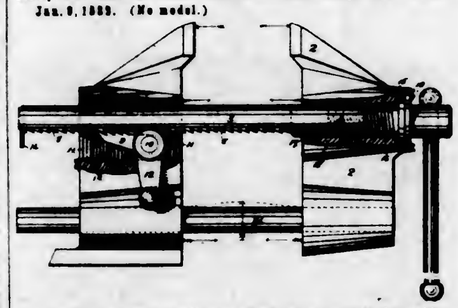
18. In a multiple telegraph, main battery M B' M B^2 M B^3 M B', in combination with the transmitters T P C', T^2, and T^3, local batteries L B' L B^2 L B^3, and keys K', K^2, and K^3, and their connecting wires and points, substantially as shown and described.

19. In a multiple telegraph, the transmitters T P C', T^2, and T^3, in combination with main battery M B' M B^2 M B^3 M B' and inserted resistances R' R^2 R^3, connected substantially as shown and described, and for the purpose set forth.

20. In a multiple telegraph, the transmitter T P C', with its circuit-connections, as described, whereby it acts as a pole-changer irrespective of the position of the transmitters T^2 T^3, in combination with said transmitters T^2 T^3 and circuit connections and points, as described, whereby the latter of said transmitters, when operated alone, places main-line battery M B' M B^2 M B^3 M B' to line, and when operated simultaneously with T^3 places main battery M B' M B^2 M B^3 to line, for the purpose herein set forth.

21. The combination of a double-point tension key or transmitter, T^3, batteries M B^3, M B^2, and M B^3, connected in the manner described to said key, and a single-point key or transmitter, T^2, whose spring is connected to a pole-changer, substantially as described.

22. The combination, substantially as described, of two receiving-relays for responding to changes of tension in the main-line circuit irrespective of polarity, independent local circuits for said relays, and two tension-transmitters for sending two messages over the same wire by variations of tension without reversal of polarity.



23. The combination, substantially as described, of two intensity-transmitters at the transmitting-station of a telegraph-line and two locally-independent neutral relays in the main line at the receiving-station.

255,699. BLIND-SLAT HOLDER. JOHN S. THOMPSON, Brooklyn, N. Y. Filed May 5, 1881. (No model.)

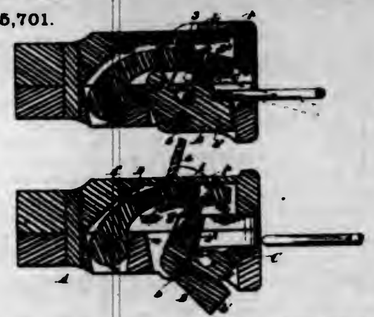
Claim.—The blind-slat holding-spring herein described, adapted to lie between the end of the slat and the shutter-frame and to move in a circle concentric with the slat-pivot, composed of a single piece of spring metal bent, as shown, to form a loop, *a*, adapted to be sprung upon the end of the slat, a spring-tongue, *b*, adapted to have frictional contact with the inner surface of the shutter-frame, and an inwardly-extending arm, *c*, extending over the clamp *a*, upon which arm the impinging end of the slat while being raised will strike, and thereby lift the spring-arm and free it from the frame in case it binds, substantially as and for the purpose specified.

255,700. BENCH-VISE. JOHN THOMSON, Brooklyn, N. Y. Filed Jan. 9, 1882. (No model.)

Claim.—1. The combination of the jaws, as 1 2, the guide-rods 20 21, rigidly attached to one of the jaws and sliding in the other jaw, the sliding rod, as 5, having bearings in both jaws, and provided with the nut, as 4, and ratchet, as 8, with the pawl, as 9, and screw, as 3, and means for operating said pawl and screw, substantially as described.

2. The combination of the jaws, as 1 2, a guide-rod rigidly secured to one jaw and sliding in the other, a sliding rod, as 5, having bearings in both jaws, a mechanism for locking said rod 5 in different positions in one of the jaws, and a screw and nut, as 3 4, and means for operating said screw and nut, substantially as described.

3. The combination of the jaws, as 1 2, a guide-rod rigidly secured to one jaw and sliding in the other, a round sliding rod, as 5, having bearings in both jaws and provided with a feather, as 17, for holding it in position, a mechanism for locking said rod 5 in different positions in one of the jaws, a screw and nut, as 3 4, and means for operating said screw and nut, substantially as described.



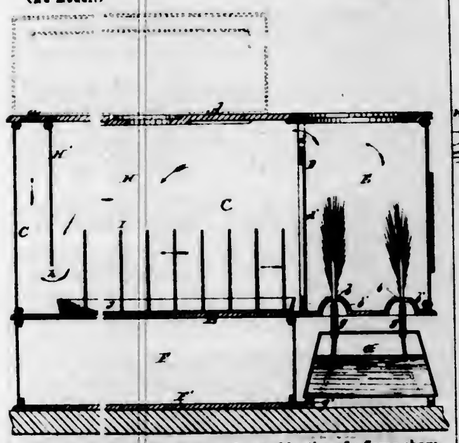
4. The combination of the jaws, as 1 2, a guide-rod rigidly secured to one jaw and sliding in the other, the sliding rod, as 5, having bearings in both jaws, and provided with the nut, as 4, with the screw, as 3, having shoulder 15, and the cap, as 19, substantially as described.

255,701. CAR-COUPLING. HILTON E. THURBER, Scranton, Pa., assignor of one-half to James E. Carmalt, same place. Filed Jan. 6, 1882. (No model.)

Claim.—1. The combination, with the draw-head having the perforation *p* for the passage of an ordinary coupling-pin and the elongated openings S in its sides, of the cam-lever L and the cross-bolt *c* and latch D, the top of said cam-lever operating to close the pin-perforation when the latch is down, so as to entirely prevent the passage of snow, rain, &c., into the draw-head through said perforation, substantially as described.

2. The combination, with the draw-head having the elongated openings in its sides and the latch and angular lever carrying the pin, of the cross-bolt *c*, the cam-lever and its cams, and the stops on the sides of the draw-head, substantially as described.

255,701.



3. The pin C on the angular lever B, having the projection *c'* on its rear side, forming a positive angular shoulder for holding the link in horizontal position, substantially as described.

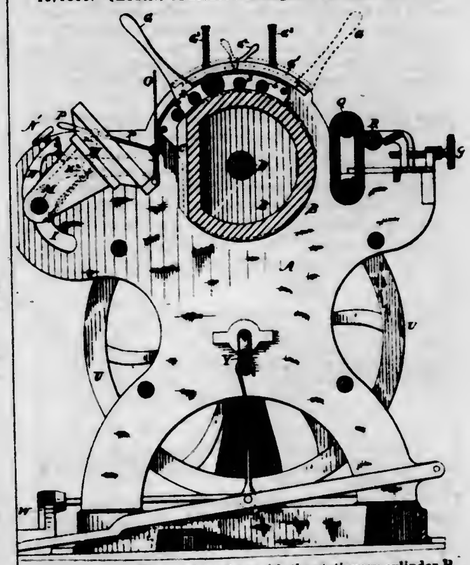
255,702. MILKING-PAIL. ANNA C. TRACY, Lone Rock, Wis. Filed Aug. 29, 1881. (No model.)

Claim.—A combination wire and cloth strainer arranged within the flanges *b* and *c* of a milk-pail cover, and operating substantially as and for the purposes set forth.

255,703. LAMP-STOVE. DAVID P. TROFRY, Chicago, Ill., assignor to Sarah E. Trofry, same place. Filed Oct. 17, 1881. (No model.)

Claim.—1. In a lamp-stove, the combination of a flame-chamber and a cooking-chamber arranged side by side, substantially as shown, a mica partition dividing said chambers opposite the flame, a passage connecting the flame and cooking chambers, and a suitable outlet from the latter, substantially as and for the purposes set forth.

2. In combination with the flame and cooking chambers arranged side by side, divided by mica opposite the flame, and having a connecting-passage for the products of combustion, the elevated open shelf I, arranged to support the article being cooked horizontally opposite or above the flame, substantially as and for the purposes set forth.



3. The combination, in a lamp-stove, of the chambers E and H, arranged side by side, as shown, the mica partition D, the passages *d* and A, relatively arranged, as indicated, and the open shelf I, horizontally opposite the flame in the chamber E, substantially as and for the purposes set forth.

4. The lamp-stove herein described, composed of the flame-chamber, roasting-chamber, and warming-chamber, said flame and roasting chambers being arranged side by side and supported by the warming-chamber, said warming-chamber extending only beneath the roasting-chamber, thereby leaving a space beneath the flame-chamber for the lamp, as described.

5. In a lamp-stove having flame and cooking chambers arranged side by side and communicating by a passage leading from the upper part of the flame-chamber, a pot-hole in the top of the cooking-chamber, substantially as described.

6. The front edge of the base F', notched to admit the legs or base of the lamp-reservoir G, whereby the tubes *g* are brought in proper relation to the apertures *b*, substantially as and for the purpose set forth.

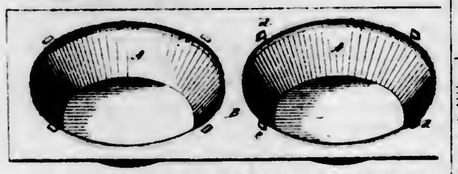
255,704. PRINTING-PRESS. HENRY P. TRUEMAN and JOHN G. NEW, Birmingham, County of Warwick, England. Filed Oct. 13, 1880. (Model.) Patented in England Nov. 8, 1879.

Claim.—1. The combination, with the stationary cylinder B, rotary shaft D, the vertically-arranged apron Q, and roller R, of the series of rollers 1 2 3 4 5, one of which is spirally grooved, and the roller-gates E E, one of which is fast on said shaft, so that the rollers are carried around between the apron and cylinder, as shown and described.

2. The combination, with the cylinder B, having a type-bed C, and mounted loose on its supporting-shaft, of the lever G for adjusting said cylinder and the spring-pressed plate for locking the lever, as shown and described.

3. The combination of the rod or lever P with the frisket-arms O and a platen, H, said lever being adapted for attachment to the frame at a fixed point, as shown and described, for the purpose specified.

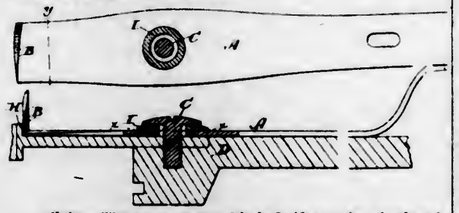
255,705. WHIFFLETREE-IRONS. OLIVER VANDEMAN, Racine, Wis. Filed Jan. 29, 1881. (Model.)



Claim.—1. The combination, with the single and double trees, of the two castings C and H and the bolt Q, the parts being arranged to operate substantially as shown.

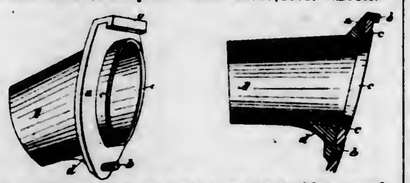
2. The combination, with the single and double trees, of the casting C, having the part D to catch under the double-tree, and the part F, provided with a circular flange to catch upon its top, and the part G to extend up over the top of the whiffletree, with

the casting H, which is held in position by the flange upon the part F, and the bolt Q, which passes down through all of the parts, substantially as set forth.



255,706. PATTY-PAN. AIMÉ VUILLIER, Portland, Conn., assignor to the United States Stamping Company, same place. Filed Feb. 16, 1882. (No model.)

Claim.—The herein-described improvement in patty-pans, consisting in the plate constructed with openings corresponding to but of less diameter than the pans, combined with the pans, the one constructed with tongues to pass through corresponding perforations in the other, the edge of the plate around the openings being struck down into the pans and the tongues being turned down to secure the two together, substantially as described.



255,707. SEWING-MACHINE TRIMMER. ALONZO WARREN, Boston, Mass. Filed Jan. 24, 1882. (No model.)

Brief.—A bushing is interposed between the pivot-screw and the vibratory knife-carrying shank to prevent said pivot-screw from working loose and to enable the shank to be adjusted longitudinally to insure the proper relation of the knife to the raised throat-plate, against which it bears.

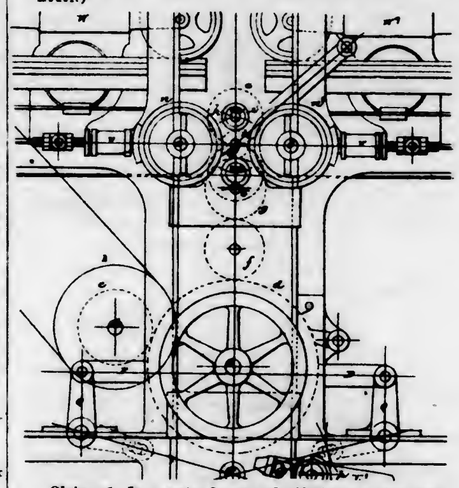
Claim.—The combination, with the knife-carrying shank and its pivot, of the interposed bushing, substantially as and for the purposes set forth.

255,708. HOE. ULRICH WAGENER, Cincinnati, Ohio, assignor to Martin Baro, same place. Filed Oct. 27, 1881. (Model.)

Claim.—1. In a hoe, the shank A, provided with surrounding flange *a*, annular flange *c*, ears *d*, and one or more rivets, *b*, all formed of one piece, in combination with the blade of a hoe, substantially as described.

2. The hollow shank or eye A, provided with annular flange *c* and surrounding flange *a*, having one or more rivets *b* and guard *b'*, all formed in one piece, in combination with the blade of a hoe, substantially as described.

3. In combination with the blade of a hoe, the eye A, having annular flange *c*, ears *a'*, rivets *b*, and braces *d*, formed in one piece, substantially as described.



255,709. METALLIC HARNESS AND BRIDLE LOOP. JOHN WATTERS, New York, N. Y. Filed Dec. 29, 1881. (No model.)

Claim.—1. The combination of the box-loop B, having outwardly-projecting flanges *d*, with the bottom plate, A, having flanges *b*, forming grooves *a*, adapted to receive the flanges *d*, said bottom plate being made longer than the loop B to allow the flanges *b* to be crushed and bent down and form obstructions *c* against the ends of the flanges *d*, substantially as specified.

2. The plate A, having holes *a* and grooved flanges *b*, in combination with the loop B, having outwardly-projecting ungrooved flanges *d*, as set forth.

255,710. MOTOR FOR EMBROIDERING-MACHINES. CARL WEGMANN, St. Gallen, Switzerland. Filed July 19, 1881. (No model.)

Claim.—1. In a motor for an embroidering-machine, gear-wheels *d e f g h i' o o'* and friction-wheels *m m'*, the axis *a*, and driving-shaft pulleys *b b'*, in combination with friction-wheels *n n' o o'* and needle-carriages driven thereby, substantially as shown and described.

2. The shaft *e* and spring *s*, gear-wheel *d*, friction-wheel B, eccentrics U D, disk E, provided with notches F F', the pins *i i'*, latches L M, and disk K, provided with offset G, substantially as shown and described.

3. The eccentric U, levers S, and three-armed hand-lever R provided with friction-wheels *m m'*, substantially as shown and described.

4. The eccentric U, lever S, and lever R, provided with friction-wheels *m m'*, in combination with the friction-wheels *n n'*, shafts *o o'*, and needle-carriage W W', substantially as shown and described.

5. The friction-wheels *n n'*, in combination with the brakes *v v'*, as shown, and means for alternately releasing the wheels *n n'*, as shown and described.

6. The lever R, provided with the plates X X, in combination with the wheels *n n'*, brakes *v v'*, arms *w w'*, and plates *y y'*, as shown and described.

7. The loop P of the lever S, having the arms P^2 P^4, the angle-levers Q Q', the double lever S^2, pivot T, and the eccentric D, for operation as described.

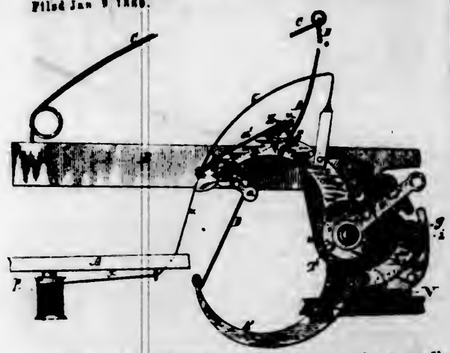
8. The latch-tripping mechanism consisting essentially of the pedal L', provided with pawl Z, ratchet Y Y', shaft *p*, and rod S^3, provided with shoulder E', substantially as shown and described.

9. The spring-pressed latches L M and stud N, in combination with the disk E, having notches F F', and mechanism for releasing said latches from disk E, substantially as shown and described.

10. The combination, with the disk E, provided with notches F F', and latches L and M, of the rod S^3, provided with shoulder E', ratchets Y Y', shaft P, and pedal L', having pawl Z, substantially as shown and described.

11. The combination of the geared friction-wheel *d*, spring A, friction-wheel B, eccentrics U and D, and disk E with the pins *i i'* and the disk K, provided with the offset G, substantially as shown and described.

12. The combination, with the pins *i i'*, of the wheels *d* and B, latches L M, and spring A, whereby eccentrics U D are at each half-turn released from the action of wheel *d* and momentarily stopped, substantially as shown and described.



255,711. AX. WILLIAM ANDREWS, Haddon, assignor of one-half to Zachariah H. Williams, Beach Springs, Miss. Filed Nov. 15, 1881. (No model.)

255,711.

Claim.—An ax constructed with a solid head or poll, C, and a detachable bit, B, said poll having formed through its lower portion the rectangular slot *d'*, which has projecting into it the projections *c c*, provided with square shoulders *c' c'*, and the detachable bit B, having in its upper portion the grooves *b b*, and terminating in a rectangular head, *b'*, having square shoulders *b' b'*, said shoulders *b'* forming square dovetail joints with the shoulders *c' c'* when the bit is placed in the ax, and the whole secured together by the screws *d*, placed through the lower portion of the head and the bit, substantially as shown and described.

255,712. GRAIN-BINDER. JOHN F. APPLEBY, Beloit, Wis., assignor to the Minneapolis Harvester Works, of Minnesota. Filed Jan. 9, 1882.

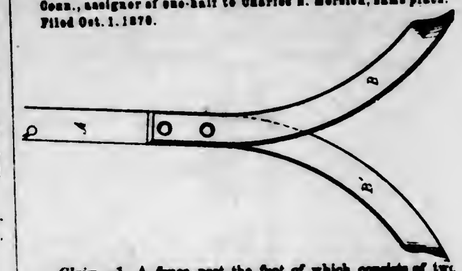
Claim.—1. In combination with the wire-carrying or needle arm G and the band-twisting or band-fastening mechanism, carried wholly on said arm, the movable device or mechanism which operates when at rest to effect the periodical movements of the band-twisting mechanism, and which is itself operated from the arm G, all substantially as set forth.

2. In combination with the arms G and E, the connecting links or arms K and L, pivoted thereto, as described, and to each other by a pin, *g*, and the means for controlling the direction of movement of the pin *g*, in the manner and for the purpose set forth.

3. The fixed and swinging cams M and N, constructed to operate as specified, in combination with the arms K and L, pin *g*, arms G and E, and heel-piece *q*, whereby all the necessary motions of the arm E are derived from that of the arm G, as set forth.

4. The intermittingly-rotating rack-wheel T, provided with a series of alternately-arranged racks *w* and plane surfaces *y*, and actuated by the agency of the arm G, in combination with the pinion *v*, delay-shoe *x*, and shaft S, mounted on said arm, and means for holding said rack-wheel still during the descent of the arm G, as set forth.

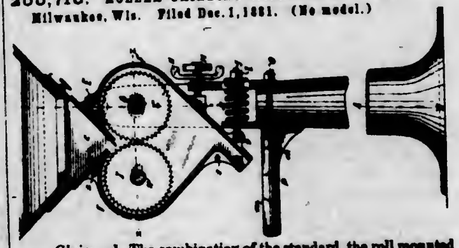
5. In combination with the gear-wheel *n* of the band-twisting mechanism, the band-severing knife W, the connecting-rod *a'*, and crank-pin Z, all arranged and operating substantially in the manner and for the purpose set forth.



255,713. WAX-THREAD SEWING-MACHINE. FRANK BEAN and EDWIN E. BEAN, Boston, Mass., assignors to the National Sewing Machine Company, of Connecticut. Filed June 26, 1880. (No model.)

Claim.—1. In a waxed-thread sewing-machine, the combination, substantially as hereinbefore set forth, of the thread-carrier *a*, awl *d*, and a hooked needle, the axes of all three being in substantially the same vertical plane.

2. In a waxed-thread sewing-machine, the combination, substantially as hereinbefore set forth, of the tube A, thread-carrier *a*, and guide d^3, awl *d*, awl-carrier D, and a hooked needle, for the purposes specified.



255,714. FENCE-POST. HENRY H. BENEDICT, New Haven, Conn., assignor of one-half to Charles B. Mersick, same place. Filed Oct. 1, 1870.

Claim.—1. A fence-post the foot of which consists of two curved pieces of angle-iron standing in opposite directions, with the corners of the angles facing each other, the parallel flanges of said two pieces being placed one upon the other at their junction and secured together, substantially as described, and for the purpose specified.

2. In a fence-post, the foot formed of curved angle-iron and having a portion of one of its flanges turned over into substantially the same plane as its fellow flange, substantially as described, and for the purpose specified.

255,715. ROLLER GRINDING-MILL. RICHARD BIRKHOLZ, Milwaukee, Wis. Filed Dec. 1, 1881. (No model.)

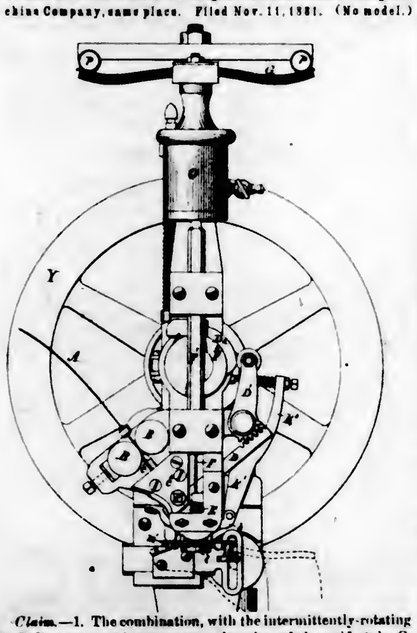
Claim.—1. The combination of the standard, the roll mounted in fixed bearings in the standard, the hopper-frame pivoted to the standard, and the movable roll journaled in and supported by the hopper-frame, as described and shown, whereby a proper relation is maintained between the hopper and rolls and the weight of the hopper applied to aid in forcing the rolls together.

2. The combination of the standard, the roll mounted in fixed bearings thereon, the swinging hopper-frame, the movable rolls sustained by the hopper-frame, and a spring applied, substantially as described, to urge the hopper downward.

3. The combination of the standard, the fixed roll, the swinging hopper-frame, a second roll sustained by the hopper-frame, and a stop device, substantially such as shown, to limit the swinging motion of the hopper-frame.

4. The combination of the standard, the roll mounted in fixed bearings therein, the hopper-supporting frame having a pivotal connection with the standard, the second roll sustained by the hopper-frame, the spring tending to swing the hopper-frame downward, and an adjustable device, substantially as shown, to limit the movement of the hopper under the action of the spring.

5. In combination with the standard, the stationary roll mounted therein, and the movable roll, the swinging hopper frame or casing adapted to inclose the two rolls and pivoted to the standard at a point above the axes of the rolls.



6. The combination of the forked standard, the roller-casing pivoted to and within said standard, and the two grinding-rolls mounted within the casing and supported one by the standard and the other by the casing, substantially as described and shown.

7. In combination with the grinding-roll mounted in fixed bearings, the second roll mounted in a support which swings from the center above the axis of the stationary roll, and pinions connecting the two rolls, as shown, whereby motion is imparted from the first roll to the second and the strain of the driving-pinion caused to assist in urging the movable roll downward.

8. The combination of the standard, the fixed roll, the movable roll, the swinging roll-supporting frame encircling the shaft of the stationary roll, and the frame-supporting belt E, proportioned in

relation to the other parts to break or give way when the mill is subjected to excessive strain.

255,716. BOOT AND SHOE NAILING MACHINE. WILLIAM G. BUNLOSH, Providence, R. I., assignor to the Eureka Nailing Machine Company, same place. Filed Nov. 11, 1881. (No model.)

Claim.—1. The combination, with the intermittently-rotating rolls B B, constructed to corrugate the wire, of the guide-tube C, provided with a tapering end extending between the rolls and arranged to conduct the wire to the cutter, as described.

2. In a boot and shoe nailing machine, the detachable plate C^3, secured to the frame and constructed to support the tube C and die-tube C', substantially as before set forth.

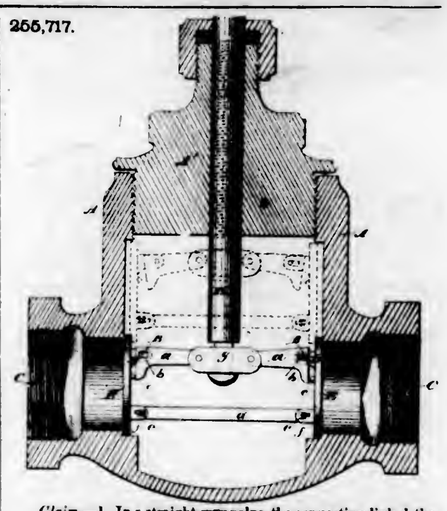
3. The combination, with the cutter D and the die-tube C', of the removable plate C^3, provided with locking-screw C^4 and channeled at its lower end to allow the cutter to reciprocate, as described.

4. The combination, substantially as before set forth, of the reciprocating driver, the oscillating carrier, the reciprocating cutter-bar provided with a triangular cutter, and the fixed die-tube for supporting the wire in cutting pointed nails therefrom.

5. The combination, with the driver and the carrier E of a boot and shoe nailing machine, of the work-feeding device consisting of the arm *h*, provided with a roughened face held to the work by the stop h^2, and hinged to a bell-crank lever operated by an eccentric on the main driving-shaft, as described.

6. The combination, in a boot and shoe nailing machine, with the driver and the nail-forming devices, of the carrier E, secured to the end of the shaft E', and means for partially rotating the shaft and locking the same, as described.

7. The combination, with the cam H, of the rack *h* and pinion *h'*, constructed to impart oscillating motion to the carrier E, as described.



8. The combination, with the device for feeding and indenting the wire, of the cutter D, provided with a rack, the arm D', provided with a pinion, and the cam D^2, constructed to separate the nail from the wire, as described.

9. In a boot and shoe nailing machine, the sole-edge guide consisting of the disk *i*, slide *i'*, and the recessed bolt *w'*, constructed to regulate the distance of the nails from the edge of the sole, as described.

255,717. STRAIGHT-WAY VALVE. DANIEL R. BURNS, Dayton, Ohio, assignor of one-half to Francis J. McCormick, same place. Filed Dec. 30, 1881. (No model.)

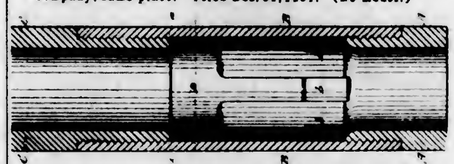
Brief.—The lower movement of the gates is regulated by the projections *f*. The angular levers, pivoted as shown, press the gates to their seats, and the link *d* prevents them from swinging inward on opening the water-ways.

255,717.

Claim.—1. In a straight-way valve, the connecting-link *d*, the valve-disks E E, having attaching-lugs, and the angular levers *a a*, connected to and operated by a valve-stem, arranged substantially as shown, and for the purpose set forth.

2. In a straight-way valve, the combination of the angular levers *a a*, the disks E, having bearing-points *e e*, and the connecting-link *d*, attached to the lower sides of said valve-disks, all arranged for operation substantially as set forth.

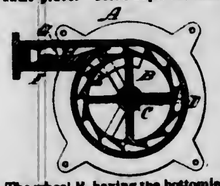
3. In a straight-way valve, the combination of the angular levers *a a*, pivoted to a swivel, *g*, on the valve-stem, and having slots *b*, with the valve-disks E, having bearing-points *e e*, and the connecting-link *d*, attached to slotted lugs *e e*, all arranged for operation substantially as specified.



4. The valve herein described, consisting of a shell, A, having openings C C and projections *f f*, the stem H, cross-head or swivel *g*, angular levers *a a*, the disks E E, having bearing-points *e e*, and the connecting-link *d*, attached as shown, and all constructed and arranged for operation substantially as shown and specified.

255,718. MOWING-MACHINE. JEAN ANNE CARLES, Toulouse, France. Filed July 31, 1881. (No model.)

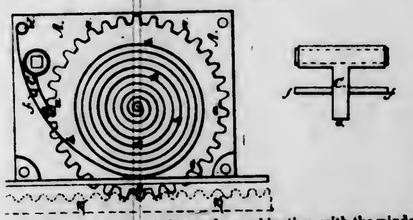
Claim.—The combination, in a mowing-machine, of a rotary cutter-disk, a supporting-frame therefor, a rotary guide-shell above the disk, and a deflector, I, at the discharge side of the machine, substantially as described.



255,719. CORE-LIFTER FOR ANNULAR ROCK-DRILLS. GEO. F. CASS, Claremont, N. H., assignor to the Sullivan Machine Company, same place. Filed Dec. 31, 1881. (No model.)

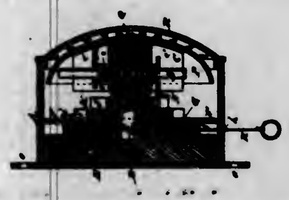
Claim.—In a core-lifter, the combination, with the drill-rod and its head, curved or rounded at its upper end, substantially as

described and shown, of the metallic ring or band D, provided with the depending prongs or springs *b*, enlarged and made wedge shape at their lower ends, substantially as described, shown, and for the purpose set forth.



255,720. WATER-WHEEL. WILLIAM T. CHRISTY and EDWARD C. SHERIDAN, Newark, N. J.; said Sheridan assignor to said Christy; said Christy assignor of one-third to William J. Greason, Jr., same place. Filed Sept. 20, 1881. (No model.)

Claim.—1. The wheel B, having the bottomless buckets D and working in the case A, in combination with the plate or table E and chute F, substantially as and for the purpose specified.



2. The combination of the case A, wheel B, buckets D, table E, chute F, and gate G, substantially as and for the purpose set forth.

255,721. SASH-BALANCE. FREDERIC B. COCHRAN, Boston, Mass. Filed Dec. 28, 1881. (No model.)

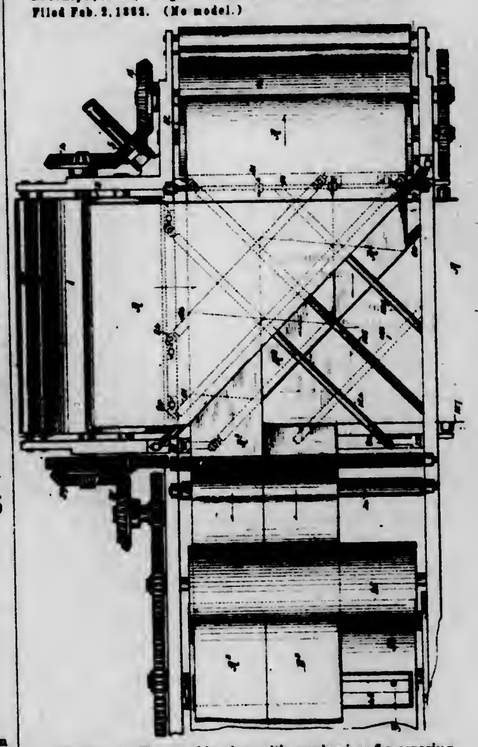
Claim.—In a sash-balance, the combination, with the window sash provided with the rack B, of the cog-wheel *a*, adapted to engage said rack, coiled springs *b*, connected at one end to the journal of said cog-wheel, and pawl C, having operating-knob D and projecting arms *f*, over which said springs pass and bear thereon, substantially in the manner, as and for the purpose herein shown and described.

255,722. BURGLAR-ALARM. GEORGE P. COSART, Geneva, assignor of two-thirds to Albert E. Lytle, Geneva Lake, Wis., and Carlos A. Cook, Chicago, Ill. Filed July 28, 1881. (Model.)

Claim.—1. In an alarm or signal, a cord or its equivalent, in combination with a drum, a bell, and intervening mechanism, whereby a series of intermittent sounds are emitted from the bell by striking of the hammer upon pulling out the cord, when arranged with said hammer, and a pawl-and-ratchet device to free the hammer and prevent its striking upon the cord being wound up again, substantially as and for the purpose specified.

2. In an alarm or signal, a wheel and a cord adapted to be wound upon said wheel, in combination with a bell, a reciprocating hammer, and intermediate ratchet devices, whereby a single pull upon the cord produces a series of intermittent rings from the bell, substantially as and for the purpose specified.

3. In an alarm or signal, a wheel and a cord adapted to be wound upon said wheel by a spring, in combination with a bell, a reciprocating hammer, a spring adapted to impart both the striking momentum and recoil to the hammer, and connecting devices, whereby a single pull upon the cord produces a series of intermittent rings from the bell, substantially as and for the purpose specified.



4. In an alarm or signal, a hammer to strike the bell, provided with two pins or stops, in combination with a spring, said spring alternately pressing against each of said stops to impart the striking momentum to the hammer, and also produce the recoil, substantially as and for the purpose specified.

5. In an alarm or signal, the combination of case A, stud B, provided with head C, wheel F, spring G, cord H, wheel K, provided with ratchet-teeth I and J, pawl L, hammer S, spring O, pins M and N, bell P, and cap R, substantially as and for the purpose specified.

6. In an alarm or signal, the ratchet-teeth J, in combination with stud B, provided with head C, hammer S, spring O, adapted to produce both the striking momentum and recoil to the hammer, and bell P, substantially as and for the purpose specified.

7. A hammer device for an alarm or signal, consisting of the head C, provided with slots *c* and *c'*, hammer S, provided with pins M and N, and spring O, adapted to produce both the striking momentum and recoil to the hammer, all constructed substantially as and for the purpose specified.

255,723. WEB-PRINTING MECHANISM. LUTHER C. CROWELL, Brooklyn, N. Y., assignor to R. Hoe & Co., New York, N. Y. Filed Feb. 2, 1881. (No model.)

Claim.—1. The combination, with mechanism for severing two webs into sheets, of mechanism for associating alternate sheets severed from one web with the sheets severed from the other, all substantially as described.

2. The combination, with mechanism for severing three webs into sheets, of mechanism for associating alternate sheets severed from one web with the sheets severed from the other two, all substantially as described.

3. The combination, with mechanism for severing three sets of webs into sheets, of mechanism for associating alternate sheets severed from one set with the sheets severed from the other two, all substantially as described.

4. The combination, with web-turners arranged to transfer two webs laterally over or under a third web, of mechanism for associating alternate sheets severed from the middle web with those severed from top and bottom webs, all substantially as described.

5. The combination, with two sets of web-turners, each arranged to transfer two webs laterally over or under third webs, of

mechanism for severing the six webs into sheets and mechanism for associating alternate sheets severed from the middle webs with those severed from the top and bottom webs, all substantially as described.

6. The combination, with two web-turners arranged to transfer two webs laterally over or under two other webs, of a transverse cutting mechanism adapted to operate upon both sets of associated webs, all substantially as described.

7. The combination, with two web-turners arranged to transfer two webs laterally over or under two other webs, of transverse cutting and folding mechanisms adapted to operate upon both sets of webs, all substantially as described.

8. The combination, with web-turners arranged to transfer four webs laterally over or under a fifth web, of mechanism for severing the five webs into sheets and mechanisms for associating alternate sheets severed from the middle web with the pairs of sheets severed from the top and bottom pairs of webs, all substantially as described.

9. The combination, with two sets of web-turners, each arranged to transfer two webs laterally over or under other webs, of transverse cutting mechanism adapted to operate upon both sets of webs, all substantially as described.

10. The combination, with two sets of web-turners, each arranged to transfer two webs laterally over or under other webs, of transverse cutting and folding mechanism adapted to operate upon both sets of webs, all substantially as described.

11. The combination, with mechanism for severing three webs into sheets, the sheets from one web being one-half the length of the sheets from the others, of mechanism for associating alternate short sheets with the longer sheets severed from the other two webs, all substantially as described.

12. The combination, with web-turners arranged to transfer two webs laterally over or under another web, of mechanism for severing the webs into sheets, the sheets from the middle web being of one-half the length of the sheets from the other two, and mechanism for associating alternate short sheets with the longer sheets from the upper and lower webs, all substantially as described.

13. The combination, with mechanism for severing two webs into sheets and mechanism for folding said sheets, of mechanism for severing a third web into sheets and mechanism for associating alternate sheets from the said third web with the sheets severed from the other two, all substantially as described.

14. The combination, with mechanism for severing two webs into sheets and mechanism for folding said sheets, of mechanism for severing a third web into sheets of one-half the length of the sheets severed from the other webs and mechanism for associating alternate sheets from said third web with the longer sheets from the other two, all substantially as described.

15. The combination, with mechanism for severing two sets of webs into sheets and mechanism for folding the same, of mechanism for severing a third set of webs into sheets of one-half the length of the sheets severed from the other sets and mechanism for associating alternate sheets from said third set with the longer sheets from the other two sets, all substantially as described.

16. The combination, with mechanism for severing three webs, of mechanism for associating alternate sheets from one of the webs with the sheets from the other two and mechanism for folding the sheets so that the said alternate sheets shall be inset, all substantially as described.

17. The combination, with mechanism for severing three sets of webs into sheets, of mechanism for associating alternate sheets from one set with the sheets from the other two sets and mechanism for folding the sheets so that the said alternate sheets shall be inset, all substantially as described.

18. The combination, with mechanism for severing two sets of webs into sheets and mechanism for severing a single web into sheets, of mechanism for associating alternate sheets from said single web with the sheets severed from said sets and mechanism for folding said sheets so that the sheets from said single web shall be inset, all substantially as described.

19. The combination, with two rotary sheet-carrying mechanisms, of a third rotary sheet-carrying mechanism adapted to associate the sheets carried by it alternately with those carried by the other two, all substantially as described.

20. The combination, with two rotary cutting and sheet-carrying mechanisms, of a third cutting and sheet-carrying mechanism adapted to associate the sheets carried by it alternately with those carried by the other two, all substantially as described.

21. The combination, with two rotary cutting and sheet-carrying mechanisms, of a third sheet cutting and carrying mechanism adapted to associate the sheets carried by it alternately with those carried by the other two, and rotary folding mechanisms adapted to fold the sheets so that the said alternate sheets shall be inset, all substantially as described.

22. The sheet-holding pins, as 77, in combination with means for protruding them to such a position that they will pass in contact with a sheet or web without impaling it, all substantially as described.

23. The pins 77, in combination with cylinder 50 and cam 108, said cam being so shaped as to protrude the pins to impale the web or sheet and then carry their points forward, so as to be out of contact with a passing web or sheet, substantially as described.

24. A sheet-carrying cylinder, as 50, provided with two sets of sheet-holding pins, in combination with means for protruding said pins to impale a sheet or web at the same point, a second means acting on one set of the pins to protrude them still farther, and means for retracting the sets at different points, all substantially as described.

25. The combination, with the cylinder, as 51, of the cylinder, as 50, provided with two sets of sheet-holding pins and means for protruding one set of said pins to such a position that they will pass in contact with the sheet or web upon the former cylinder without impaling it, all substantially as described.

26. The combination of cylinder 50, pins 74 77, bell-cranks 99 100, and cams 107 108, said cam 108 being so shaped as to give two outward movements to pins 77, substantially as described.

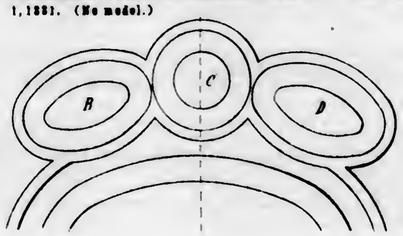
27. A folding-blade, as 55, provided with a reversible operating-arm, as 116, in combination with a folding-cylinder having devices for locking said arm when reversed, all substantially as described.

28. The combination, with the cylinder, as 63, carrying one member of a cutting mechanism, and the cylinder, as 50, carrying the other member of a cutting mechanism, and mechanism for retaining sheets upon its surface, of the sheet-carrying cylinders, as 36, 51, and 78, all substantially as described.

29. The combination of the sheet-carrying cylinders, as 50 51, the two being so timed that the leading ends of the sheets transferred from the former to the latter will fall slightly in the rear of the sheets carried by the latter, substantially as described

---

255,724. PULLEY-SHEAVE. CHARLES H. DABOLL, New London, Conn. Filed Oct. 3, 1881. (No model.)



Claim.—A pulley-sheave having anti-friction rollers I and the surfaces L Q on which they roll, as also the rings K and pivots K', made and finished in soft cast-iron and subsequently treated at a high temperature with the solution described, so as to both harden and preserve from oxidizing influences, substantially as herein specified.

255,725. HARDENING METALS. CHARLES H. DABOLL, New London, Conn. Filed Aug. 26, 1881. (No specimens.)

Brief.—Sheave, roller, bushing-shell, and rings are cast of ordinary cast-iron in sand molds. The parts are turned to shape and size in an ordinary lathe. All the parts are heated separately and plunged vertically in the bath, are hardened clear through, and are allowed to remain in bath until they acquire a blue-black oxide coating. On removal from bath the articles are soaked in lime-water to neutralize the acid in the pores.

Claim.—The hardening solution described, composed of water, sulphuric acid, salt, saltpeter, and cyanide of potassium, combined in about the proportions herein specified.

255,726. DINNER-PLATE. JACOB DAVIS, Brooklyn, assignor of one-half to William E. Johnson, New York, N. Y. Filed Aug. 1, 1881. (No model.)

Claim.—In a compartment dinner-plate, a horizontal rim carried around and between each section in such a manner that the compartments are divided and separated from each other in such a manner as to be in effect two or more plates attached to each other by a horizontal rim, and leaving a space between each section, compartment, or plate in such a manner that plates of the same size will fit into each other and nest when piled on top of each other, as shown and described.

255,727. BUTTON. WELLINGTON P. DOLLOFF, Providence, R. I., assignor to Voss & Southwick, same place. Filed Dec. 27, 1881. (No model.)

Claim.—1. In a button, the combination of the post B, having its angular cross-bar *b* offset to one side of the center of the post, retaining-plate D, provided with the lips *e* and *f*, made one longer than the other, and spring C, all arranged and operating substantially as described.

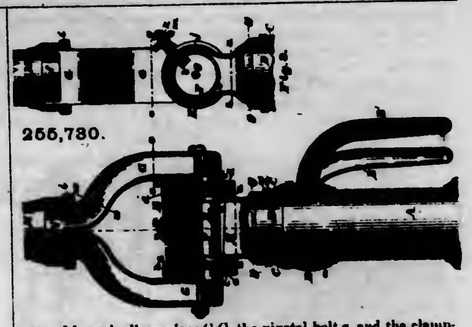
2. In a button, the spring-plate C, provided with the spring-tongue *c*, shortened, as described, and acting at its end upon the pivot-bar of the post, and having its flexibility increased by the shear-cut splits *a a*, made to extend beyond the slots *d d* at each side of the tongue, substantially as and for the purpose specified.

255,728. BARBED FENCE-WIRE. LEMUEL E. EVANS, East Orange, N. J., assignor to the Washburn & Moen Manufacturing Company, Worcester, Mass., and Isaac L. Ellwood, De Kalb, Ill. Filed Nov. 1, 1881. (Model.)

Claim.—A barbed fence-wire consisting of sections or links interlocked by inserting the end of each section or link into a twisted eye formed upon and standing across the adjacent link or section, and by afterward bending said ends at, or nearly at, right angles outward to complete the fastening and form barbs, substantially as described.

255,729. PACKING FOR PUMP-PISTONS, &c. BENJAMIN HOLLAND, Jr., Newport, R. I., assignor to Thomas S. Howell, Trustee, Boston, Mass. Filed Nov. 11, 1881. (No model.)

Brief.—The cup-shaped flexible ring *a* is held in place by the perforated metal ring *b*, through which perforations the water enters and holds the flexible cup closely against the cylinder or joint to be packed.



Claim.—1. As a means of packing joints water-tight, the combination of a cupped ring of leather or other flexible material, and a metal ring placed within said cup and provided with the annular grooves *b'* and *b²* and the orifices *c* and *c'*, substantially as and for the purposes described.

2. As a means of packing joints to render them water-tight, the combination of the cupped packing-ring *a* and the metal ring *b*, provided with the annular grooves *b'* and *b²* and the orifices *c* and *c'*, and divided upon one side, substantially as and for the purposes described.

255,730. HOSE-PIPE. BENJAMIN HOLLAND, Jr., Newport, R. I., assignor to Thomas S. Howell, Trustee, Boston, Mass. Filed Aug. 11, 1881. (No model.)

Claim.—1. In combination with a hose or other pipe, the T-shaped section E, provided with a screw-thread for securing it to the hose or other pipe, and an inwardly-projecting annular lip or flange in each end, the two curved branch elbow-pipes G G, the axial pivot-bolt *g*, and the clamping-nut *i*, all constructed, arranged, and adapted to operate substantially as described.

2. The combination of the pipe or coupling section A, the T-section E, the frusto-conical coupling-rings C and D, the two

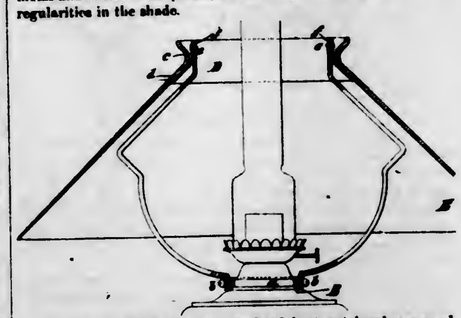
255,730.

curved branch elbow-pipes G G, the pivotal bolt *g*, and the clamping ring-nut *i*, all constructed, arranged, and adapted to operate substantially as and for the purposes described.

3. The combination of the pipe or coupling section A, the frusto-conical rings C and D, the T-shaped pipe-section E, the hollow frusto-conical valve F, the two curved elbow-pipes G G, the clamping pivot-bolt *g*, and the ring-nut *i*, all arranged and adapted to operate substantially as described.

4. The combination of the pipe or coupling A, the T-shaped pipe-section E, provided with the circumferential slot *j*, the frusto-conical valve F, the curved elbow-pipes G G, the ring-nut *i*, the screw-handle *k*, and the thumb-nut *m*, substantially as described.

5. In combination with a hose pipe or butt, the hook-shaped horns B', attached permanently thereto, substantially as and for the purposes described.



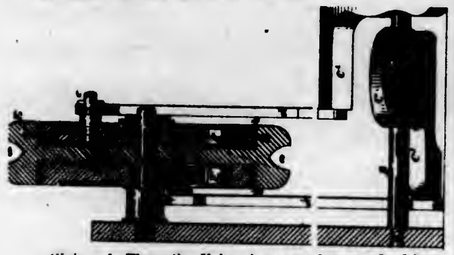
6. In combination with a hose pipe or butt, the swiveling-ring B, provided with one or more hook-shaped horns, B', all arranged and adapted to operate substantially as and for the purposes described.

7. The combination of the pipe or coupling section A, the swiveling-ring B, provided with one or more hook-shaped horns, B', the frusto-conical coupling-rings C and D, the T-shaped pipe-section E, the curved elbow-pipes G G, the pivot-bolt *g*, and the ring-nut *i*, all arranged and adapted to operate substantially as described.

8. The combination of the pipe or coupling section A, the swiveling-ring B, provided with one or more hook-shaped horns, B', the frusto-conical rings C and D, the T-shaped pipe-section E, provided with the slot *j*, the frusto-conical valve F, the two curved elbow branch pipes G G, the pivotal binding-bolt *g*, the ring-nut *i*, the valve-screw handle *k*, and the thumb-nut *m*, all arranged and adapted to operate substantially as and for the purposes described.

255,731. SHADE-HOLDER FOR LAMPS. WOLCOTT A. HULL, New York, N. Y., assignor of one-half to the Ansonia Brass and Copper Company, same place and Ansonia, Conn. Filed Jan. 30, 1882. (No model.)

Brief.—The flange which supports the shade is made of sheet metal and is free at all points, so as to adapt itself readily to all irregularities in the shade.



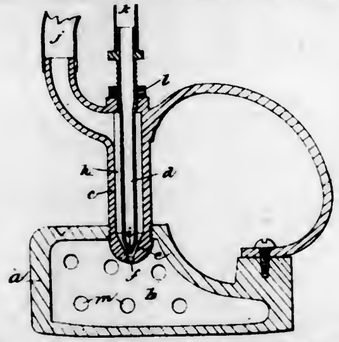
Claim.—1. A shade-holder made of sheet metal and composed of a cylindric portion and a lower flange-like portion adapted to yield and accommodate itself to a shade placed on it, substantially as specified.

2. The combination, with a shade-holder made of sheet metal composed of a cylindric portion and a lower flange-like portion, of supports therefor connected to the upper part of the cylindric por-

tion and leaving the flange-like portion free to yield and accommodate itself to a shade, substantially as specified.

3. The combination of the shade-holder D, the ring B, and the arms C, made separate from the holder and ring and secured thereto, substantially as specified.

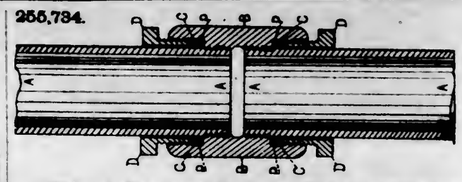
255,732. TREADLE MECHANISM. ROBERT S. MANN, Brockton, Mass. Filed Nov. 7, 1881. (No model.)



Claim.—1. The pulley E, loosely mounted upon a fixed bearing, and provided with an annular recess in its opposite radial sides and adapted to carry and impart motion to a belt, the two disks F and F', each provided with a pocket, *e*, a ball in each of said pockets, and mechanism for imparting to each of said disks alternately an intermittent oscillating motion about its axis, substantially as described.

2. In combination with two treadles, the pulley E, provided with recesses upon its opposite sides and adapted to carry a driving-belt upon its periphery, mounted loosely upon a fixed bearing, the two disks F and F', each provided with a crank-pin and having formed in its periphery a recess or pocket, *e*, the two balls *f*, and two connecting-rods, all arranged and adapted to operate substantially as and for the purposes described.

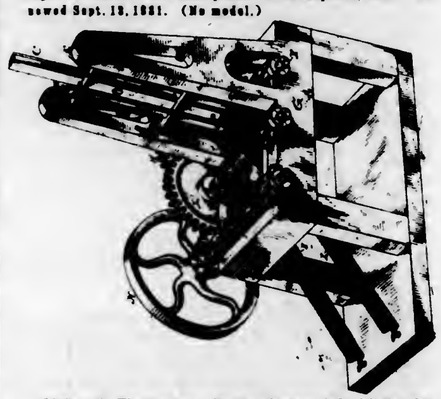
3. The combination of the treadles C and C', provided with the offsets C² and C², respectively, the connecting-rods *d* and *d'*, disks F and F', each provided with a crank-pin and a pocket, *e*, the two balls *f f*, and the pulley E, all constructed, arranged, and adapted to operate substantially as and for the purpose described.



255,733. SAD-IRON. ALBION L. F. MITCHELL and W. FRED DANA, Lawrence, Mass., assignors to themselves and Milton B. Townsend, same place. Filed June 2, 1881. (No model.)

Claim.—1. The combination of the chambered iron *a* and the burner entering the upper portion of said iron, said burner being composed of the air-pipe *c*, adapted to be connected to suitable air-forcing apparatus, and having the central outlet, *f*, and the gas-pipe *d*, having its end located above and close to the outlet *f*, whereby a stream of gas and a surrounding stream of air under pressure are directed upon the bottom of the iron, substantially as and for the purpose set forth.

2. The combination of the chambered iron *a* and the burner composed of the air-pipe *c*, adapted to be connected to suitable air-forcing apparatus, and having the contracted outlet *f* and valve-seat *e*, and the adjustable gas-pipe *d*, having the tapered end *i*, located over the valve-seat, whereby the supply of air and the heat of the flame can be regulated, as set forth.



255,734. JOINT FOR PIPES AND FITTINGS. JOHN R. HOOKS, Brooklyn, N. Y., assignor to Joseph Annis, same place. Filed Aug. 20, 1881. (No model.)

Claim.—1. The coupling B, of greater internal diameter at its ends, and screw-threaded internally, as shown, in combination with the pipe-sections A, screw-threaded at their ends, the screw-threaded gland D, packings P, and washers C.

2. The combination of the screw-threaded section A with the screw-threaded coupling B, the packing P, the washer C, and the packing-gland D, all substantially as shown and described.

255,735. DEVICE FOR CONVERTING RECIPROCATING INTO ROTARY MOTION. WILLIAM H. RUTHER, Somonauk, Ill., assignor to Clark & Co., same place. Filed Sept. 23, 1880. Renewed Sept. 13, 1881. (No model.)

Claim.—1. The reciprocating bar C, provided with the clips *b b*, combined with the bars E E, each provided with the dogs D D, springs *g* and *i*, chain or cords *d*, and drums H, as set forth.

2. The reciprocating bar C, provided with clips *b b*, combined with the reciprocating bars E E, provided with dogs D D, weighted at the back, so as to fall out of engagement, and spring *g*, near the bottom of the reciprocation, to push said dogs into position for engagement, as set forth.

3. A device for converting motion, to be placed intermediately between the prime mover and the machine to be driven, provided with springs or weights whereby the machinery may be driven, and winding-drum actuated by the reciprocation of the prime mover, whereby the motion imparted to the driver-machine is not made irregular by fluctuations of speed of the prime mover.

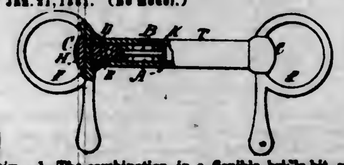
4. A motor actuated by springs or weights combined with mechanism driven by a reciprocating pitman, whereby during the operation of said motor said springs or weights are being constantly wound up and their tension renewed.

5. The reciprocating bars E E and the dogs D D, combined with the reciprocating bar C, provided with clips *b b*, and the intermediate swinging gate, P, for the purpose set forth.

6. A reciprocating bar or pitman, C, combined with two parallel alternately-reciprocating bars, E E, provided with mechanism, whereby said bars will be alternately engaged with said pitman to be actuated thereby, and connected with said bar E rotary reciprocating drums mounted upon a revolving shaft, with automatic clutches and retracting springs or weights, whereby the alternating reciprocation of said bars E E and their connected drums is converted into a continuous rotation of said shaft, as set forth.

7. The reciprocating bar C, provided with the clips *b b*, combined with the bars E E, each provided with the dogs D D, springs *g g* and *i i*, chains or cords *d d*, and drums H H, as and for the purpose set forth.

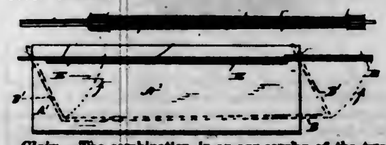
255,736. VEHICLE-BOLSTER. DYAS SHELTON, Santa Rosa, Cal. Filed Jan. 3, 1882. (No model.)



Claim.—In a vehicle, the sand-board D, having plate C connected thereto by means of screws *f f*, said plate having lugs E E, in combination with elliptical plate B, which is attached to ellip-

255,736.

tical shank of bolster A', said bolster having tapering arms A A, the whole being secured by the king-bolt F in the manner and for the purposes set forth.



255,737. BRIDLE-BIT. BURGESS S. SQUIRE, Newark, N. J. Filed Jan. 21, 1881. (No model.)

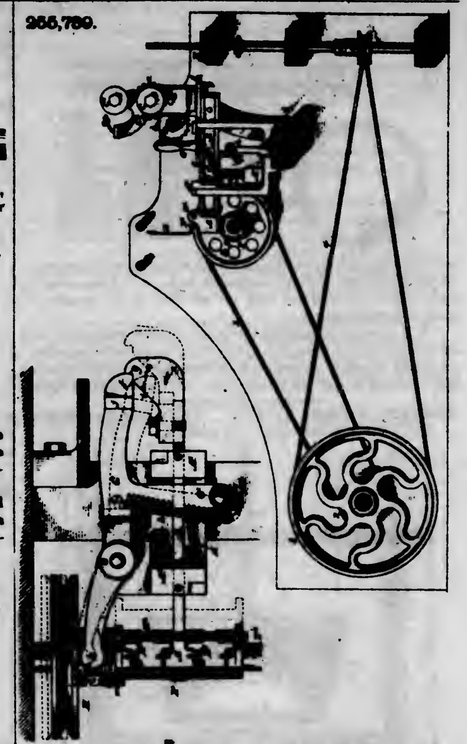
Claim.—1. The combination, in a flexible bridle-bit, of the bead or bulb C, having the recess D and the tongue or shank E, to which the end of the flexible core K is riveted, and the flexible covering T, substantially as and for the purpose specified.

2. A bridle-bit having the bead or bulb C, constructed and arranged substantially as described and shown, in combination with a flexible covering, T, said covering being provided with the section I, substantially as and for the purpose set forth.

255,738. EGG-CASE. JOHN E. STEVENS, Chicago, Ill., assignor, by direct and mesne assignments, to George A. Smith and Edward Hempstead, both of same place. Filed Dec. 13, 1881. (Model.)

Claim.—The combination, in an egg-carrier, of the two rectangular blanks secured transversely near their ends and placed one across the other, the ends being secured by means of a string or wire passing through apertures in the flaps in such manner that the parts may be set up in the form of a rectangular box or folded flat without detaching such parts, substantially as specified.

255,739. STOP-MOTION FOR WINDING AND TWISTING MACHINES. JAS. S. WYLEY, Pawtucket, R. I. Filed Oct. 27, 1881. (No model.)



Brief.—The movable drop-wire head, when in operative position, serves to hold in place a horizontal shipping-lever, which is connected to the spindle-driving and feed mechanisms. When a thread breaks the drop-wire head is moved by a cam, and thereby releases the shipping-lever, which is acted upon by a spring, and forces the drop-wire head out of range of the cam, and also stops the spindle and feed-rolls.

Claim.—1. In combination with the spindle-driving and feed mechanisms, the pivoted spring-controlled shipping-lever engaging at one end the clutch of the spindle-driving mechanism and provided with an incline at its other end to act on the feed-roll stand, and the movable drop-wire head acting when in operative position to latch the lever in a position in which both spindle and feed are in gear with their drivers, substantially as and for the purposes hereinbefore set forth.

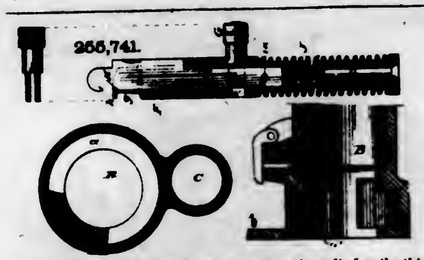
2. The spindle-driving and the feed mechanism and the spring-controlled shipping-lever provided with a handle and engaging said spindle-driving and feed mechanisms, substantially as described, in combination with the revolving stop-motion cam, the drop-wires, and the movable drop-wire head formed to engage and latch the lever and provided with a spring to move it in a direction opposite to that in which it is moved by the revolving cam, substantially as and for the purposes hereinbefore set forth.

3. The combination, with the spindle-driving and feed mechanisms, the drop-wire head, drop-wires, and stop-motion cam, of the horizontal spring-controlled shipping-lever engaging with one end the clutch of the spindle-driving mechanism and with the other the feed mechanism, and when released operating internally

255,739.

upon the drop-wire head to force the same out of range of the stop-motion cam, substantially as hereinbefore shown and described.

255,740. FEED-BAG FOR HORSES. FRANK WEBSTER, Brooklyn, N. Y. Filed Jan. 30, 1882. (No model.)

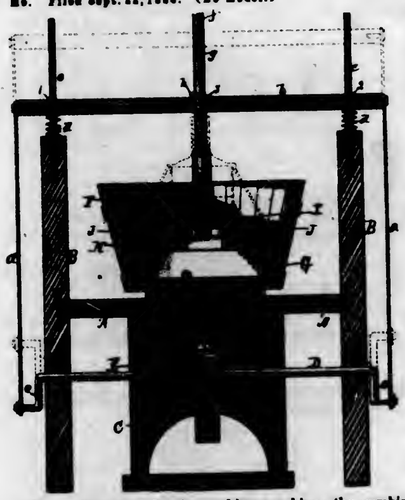


Claim.—The headstall A, provided with the nose-band B, the rings C at its ends, and the protecting-disks D, secured to the said ends under the rings, in combination with the feed-bag F, provided with the slots H and the rings E, and the strap G, secured to the rings E, passing through the slots H and the rings C to and around the upper ends of the bands, substantially as and for the purpose set forth.

255,741. CORD-KNOTTER FOR GRAIN-BINDERS. WILLIAM H. WHITELEY, WILLIAM BAYLEY, and ASA HUBB, Springfield, Ohio, assignors to Whiteley, Fassler & Kelly, same place. Filed Oct. 5, 1880. (No model.)

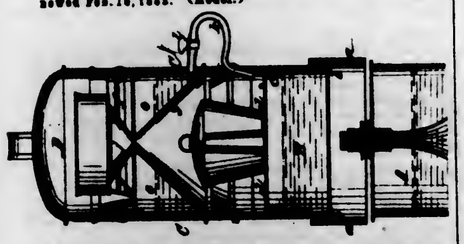
Claim.—1. A knotter-case or outer cylinder, B, with a flange, A, and an interior groove, *a*, as described, and a cylindrical shell, C, for the outside griper and cutter, both cast in a single piece, as described.

2. The combination of the cylinder F with a thimble jointed



255,741.

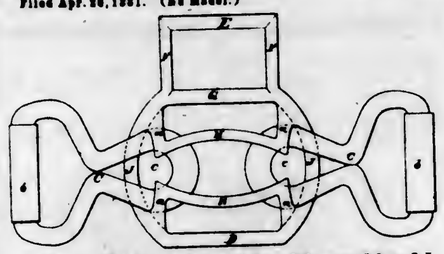
to the looping-hook and sliding therewith in the cylinder, the thimble provided at the end with a shoulder, and a part of the cylinder made smaller, so as to act with the shoulder on the thimble to guide and hold a spring.



2. A cylinder, D, combined with an inclosing stationary knotter-case cast in one piece, and having the groove *a* and a laterally-projecting flange, *b*, whereby said knotter may be bolted directly to the vertical side of the bridge-frame, substantially as set forth.

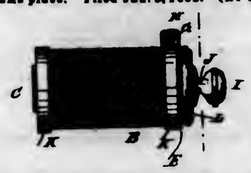
255,742. WASHING-MACHINE. ELIZA J. WHITLOW, Mexico, Mo. Filed Sept. 22, 1880. (No model.)

Claim.—In a pounder for washing-machines, the combination of the plunger-rod and plunger with the cone or truncated body G, provided on its interior with the cylindrical-shaped body H, which extends midway between its top and lower edge, as and for the purposes set forth.



256,743. COMBINED COOKING-VESSEL AND CONDENSER. SOLOMON S. WHITMORE, Waverly, Md. Filed May 26, 1877. Renewed Mar. 24, 1879. Again renewed Apr. 5, 1881. Again renewed Feb. 16, 1882. (Model.)

Claim.—1. In a portable cooking apparatus, the boiler B, with the steamer-partition *d* and the condenser *g* above it, whereby the cooking of the articles and the condensation of the steam are effected in the same chamber from which the condensed steam is collected, as set forth.

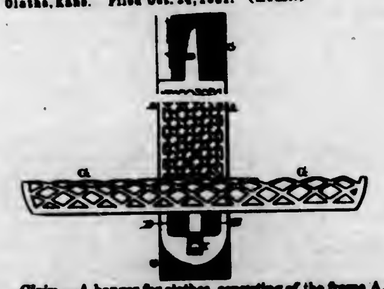


2. In a portable cooking apparatus and condenser, the outside pipe, *h*, provided with the cock *l*, said pipe connecting the upper water-chamber, *c*, with the boiler B, as and for the purpose set forth.

255,744. TRACE-CARRIER. ADAM B. WILHELM, Quincy, Ill. Filed Apr. 26, 1881. (No model.)

Claim.—A trace-carrier consisting of the curved bars J J, cross-bars D G, and curved arms *a a*, arranged in pairs opposite each other and connected by the curved braces H H, the said carrier provided with the proper connections for the harness, as shown and described.

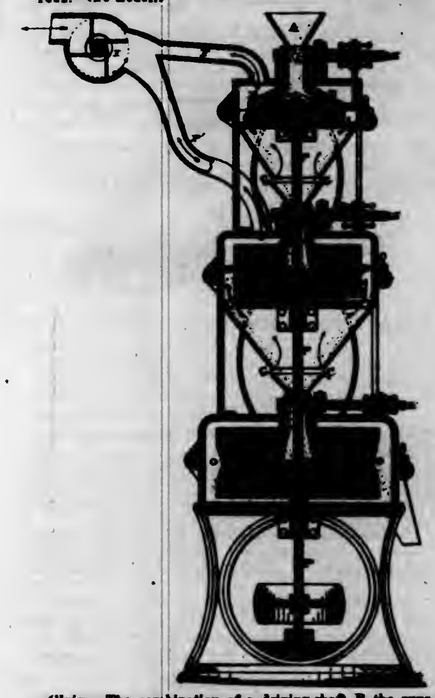
255,745. THREAD HOLDER AND CUTTER. PARR S. WILLIAMS, New York, N. Y., assignor to himself and Cornelius V. Shaddle, same place. Filed Jan. 3, 1882. (No model.)



Claim.—1. The rod A, having the head I at one end and threaded aperture at the other, in combination with a plate, C, having a threaded stem, D, adapted to screw into the aperture end of rod A, whereby the device may be used in connection with a spool, as described.

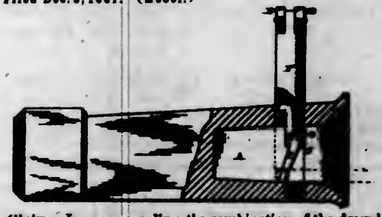
2. In a thread holder and cutter, the combination, with the button or head I, provided with a knife or blade, J, of the slotted plate E, provided at one end with a hook, G, and a thread-clamp H, substantially as herein shown and described, and for the purpose set forth.

3. The combination, with a rod fitting into a spool and a threaded stem adapted to be screwed into the inner end of the rod, of a thread-holding device held on the spool by the head of the rod, substantially as herein shown and described, and for the purpose set forth.



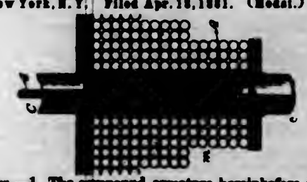
4. The combination, with the rod A, provided with a button or head, I, of the stem D, projecting from a plate, C, and the friction-plate N, substantially as herein shown and described, and for the purpose set forth.

255,746. HANGER FOR CLOTHES. THEODORE L. WIDWELL, Olathe, Kans. Filed Oct. 24, 1881. (Model.)



Claim.—A hanger for clothes, consisting of the frame A, having the supports B, and provided with a hook, D, at its upper end, the arm G, projecting at right angles to the frame, and a hook, I, at the lower end of the frame, as shown and described.

255,747. FLOUR-MILL. ABRAHAM H. WOLF, Allentown, Pa., assignor of one-half to Jos. Barber, same place. Filed Jan. 20, 1882. (No model.)



Claim.—The combination of a driving-shaft, F, the runs of stones B D C, placed one above the other, the upper stone of each run being provided with an adjusting-lever, E, a suction-fan, I, suitable connecting-pipes, F F, and an inclosing-frame for the stones, which has an opening, C, made through it below each run of stones for the upward draft of air, substantially as shown.

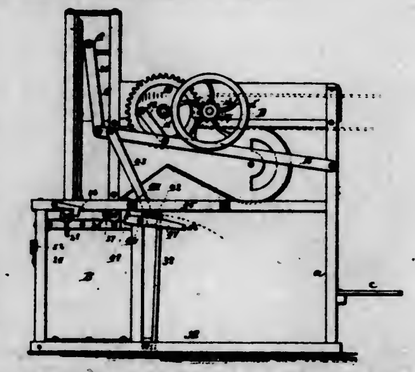
255,748. CAR-COUPLING. OLIVER P. WOOD, Baldwyn, Miss. Filed Dec. 5, 1881. (Model.)

Claim.—In a car-coupling, the combination of the draw-head A, extension B, standard C, lever D, pin F, and rod I, the pin and rod being provided with shoulders O J to prevent the rod from falling too far forward, substantially as shown.

255,749. ARMATURE FOR ELECTRO-MAGNETS. ORESCO C. WOOLSON, Newark, N. J., assignor to Chas. A. Cheever, Trustee, New York, N. Y. Filed Apr. 18, 1881. (Model.)

Claim.—1. The compound armature hereinbefore described, consisting of disconnected sections lying parallel with each other and with their energizing-coil and movable laterally parallel therewith, substantially as herein set forth.

2. The combination, substantially as hereinbefore set forth, of the energizing-coil and the expanding armature-sections inclosed and movable laterally therein parallel, or substantially parallel, with its axis.



3. The combination, substantially as hereinbefore set forth, of the energizing-coil, the expanding laterally-movable armature-sections inclosed therein, and the interposed supporting-frame of non-magnetic metal.

4. The combination, substantially as herein before set forth, of the energizing-coil, the armature-sections movable laterally therein, and its longitudinally-adjustable supporting-cage.

5. The combination, substantially as herein set forth, of a coil or helix, a supporting frame or tube movable therein, a cage or carriage movable in the supporting-frame, and an expanding armature movable in the cage.

6. The combination, substantially as herein set forth, of a coil or helix, a supporting frame or tube of non-magnetic metal movable therein, a cage or carriage movable in the supporting-frame, and a series of independent armatures movable laterally in and with the cage.

255,750. HAY-BALING MACHINE. PARVIS WRIGHT, Granite, Colo. Filed Mar. 4, 1882. (No model.)

Claim.—1. The process of baling cut hay, which consists in cutting the hay, then removing foreign matter, and finally compressing the clean cut hay into bales or stacks, substantially as set forth.

2. The process of putting up cut hay into sacks, which consists in cutting the hay, then compressing it into the sack, then closing the mouth of the sack, and finally uniting the seam while in the machine, substantially as set forth.

3. The combination, with a baling-machine, of a cutting-machine, whereby the hay may be cut and baled simultaneously, as and for the purpose set forth.

4. The combination, with a baling-machine and a cutting device, of a fan or blower, whereby the hay is cut, the foreign matter removed by the fan, and the cut hay compressed into bales, substantially as and for the purpose set forth.

5. The combination, with a baling-chamber, a cutting device, and a compressing means, of devices for closing the mouth of a sack or its equivalent, substantially as described.

6. In a baling-press, the combination of a cutting device, pressing means, and means for holding a sack or its equivalent under the pressing device, substantially as described.

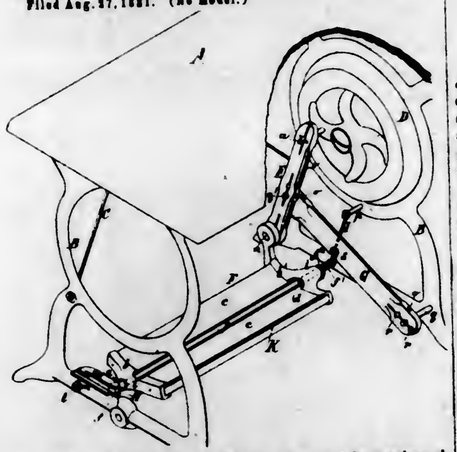
7. In a baling-press, the combination of two movable rollers and positive means for bringing them together so as to close the mouth of the sack or its equivalent, attached to the rollers, substantially as described.

8. In a baling apparatus, the two rollers 27 and 28, arranged at the receiving end of a baling-chamber, said rollers being corrugated and grooved, substantially as described.

9. In a baling apparatus, the combination, with a blower or its equivalent, of a reciprocating traverser, which is perforated for the passage of foreign matter separated from the cut hay, substantially as described.

10. In a baling-press, the combination, with a baling-chamber and a reciprocating traverser, of actuated means for retaining the partially-compressed bale while an additional charge is being inserted, substantially as described.

11. In a baling-press, the combination, with a bale-chamber and a reciprocating traverser, of automatically-actuated means for retaining the partially-compressed bale while an additional charge is being inserted, and trip mechanism, substantially as described.



12. In a baling-press, the combination, with the traverser 20, of the frame 38 and teeth 40, automatically operated by the traverser in its forward motion, as and for the purpose set forth.

13. The bale-chamber B, provided with the serrated racks 25 and 26, in combination with the rollers 27 and 28, substantially as and for the purpose set forth.

14. The bale-chamber B, in combination with the traverser 20, having transverse orifice 53, screen 51, and the stationary screen 54, substantially as and for the purpose set forth.

15. The combination of the hay-cutting device with the fan or its equivalent, whereby the hay may be cut and the foreign matter extracted prior to the baling operation, substantially as and for the purpose set forth.

255,751. TREADLE. GEORGE W. ZIEGLER, Tecumseh, Mich. Filed Aug. 27, 1881. (No model.)
